Brief.—A rail-joint in which the fish-bars are secured by double-headed bolts, one of the fish-bars being provided with inclined surfaces, against which the heads of the bolts bear, and by means of which inclines the joint is tightened up. The bolts are prevented from turning by a transversely-slotted plate; said slots fitting over the heads of the bolts, and the plate is prevented from displacement by two small bolts, which pass through one of the fish-bars, the outer end of the bolts being slotted, and a key driven down with bearings for it in grooves cut in the side of the plate.

1. The combination of the slotted rails A B, the fish-plates C C', the elongated slots *c*, inclines *c*, and the double T-headed bolts D, as described.

2. The combination of the rails A B, the fish-plates C C', the elongated slots *c*, inclines *c*, double T-headed bolts D, and the key-plate E, provided with its elongated slots and bolt-holes, as described.

3. The key-plate E, provided with the vertical and horizontal slots *i k* and the face-grooves *l*, and combined with the double-headed bolts D, upon which and the fish-plate said key-plate is secured by the bolts *g* and the keys *k*, as described.

166,380. HOLDERS FOR PRESERVE-CANS. C. Dewey How, Cincinnati, Ohio. [Filed July 19, 1875.]

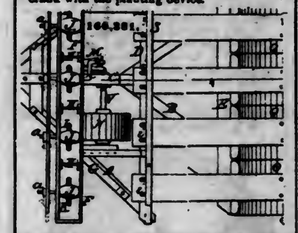
1. The perforated base-support, having directly attached thereto suitable handles or lifting device, as described, with an upper plate combined therewith adapted for the neck of the fruit-receivers, the whole constructed and adapted to operate substantially as described.

2. The supporting plate or base A, having guard *a'*, and feet *a''*, combined with handles or lifter B, and upper support C with openings *c'* for the fruit-receiver neck, substantially as and for the purposes set forth.

166,381. HARROWS AND SOWERS. Robert H. Hudgens, Laurens Court-House, S. C. [Filed May 20, 1875.]

Brief.—Mounted upon uprights on the front of two V-shaped harrow-frames, connected by a central beam, is a partitioned seed-box, in which is oscillated a series of distributers for forcing out the grain. Motion is imparted to the distributers by crank and connecting-bar, to which the cranks of the distributers are attached, the driving-wheel being journaled loosely to conform to the inequalities of the ground. To a transverse bar is flexibly attached a series of self-adjusting bars, to the rear ends of which inclined drag-boards are secured, for pulverizing the clods and covering the seed, in connection with removable rakes.

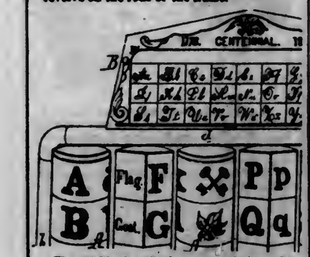
1. In a combined sower and harrow, the combination of an elevated partitioned seed box or troughs, F, a series of oscillating toothed distributing-shafts, J, a connecting and operating bar, L, a central crank-shaft, c, a pitman, M, and a rising-and-falling or self-adjusting ground-wheel, N, having a crank-shaft, V, all constructed and relatively arranged as herein shown and described.



2. The combination of the inclined drag-boards Q, and self-adjusting drag-bars P, with the harrow-frame and sowing mechanism, substantially as herein described.

3. The combination of the pressure-bar S, harrow connecting-bar D, and retaining-pins *i*, with the drag-boards and hangers, as and for the purpose described.

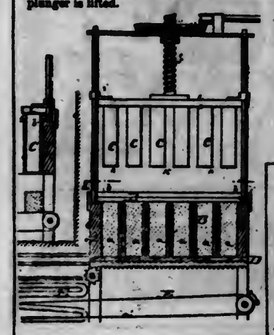
4. The combination, with the pivoted rising-and-falling drag-bars F, provided with the oblique drag-boards Q, of a rake, T U, attachable to the end of each board with the teeth U, having the same direction as the boards Q with respect to the surface of the ground, as and for the purpose herein set forth.



5. The combination, with the harrow, the seeder, and fertilizer-distributer, of the ground-wheel N, having one of its bearings in the pivoted arm O, and the other in the frame O, whereby the crushed end V of the axle is held rigid while the bearing O and wheel have sufficient freedom to rise and fall without interrupting the connection of the driving-crank with the planting device.

166,381.

166,382. LETTER-BLOCK APPARATUS. Benj. Irvgang, Philadelphia, Pa. [Filed May 31, 1875.]

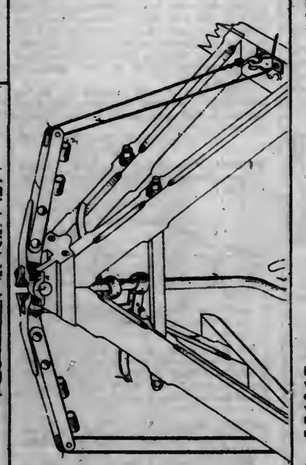


Brief.—The lettered blocks are arranged to revolve on the rods of the frame.

The within-described toy, consisting of a number of blocks, A, pivoted to a frame, and the piece B, secured to the top of the frame, all substantially as herein set forth.

166,383. MACHINES FOR PRESSING SUGAR INTO BLOCKS. J. W. Jarboe, Green Point, assignor to himself and Joseph Candelette, Brooklyn, N. Y. [Filed June 26, 1875.]

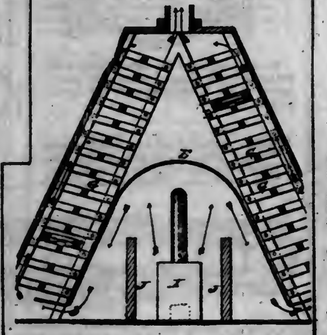
Brief.—The sugar from the drainer is poured into the molds, the plungers worked down onto the sugar and into the molds. The bottom is then withdrawn horizontally, and plungers advanced to push the sugar block onto a carrier. Heating-tubes range alongside the carrier. Rubber wipers on the lower end of each plunger clear each when the plunger is lifted.



1. In a machine for pressing sugar into blocks, the combination of the stationary cellular molds B with the intermittent compressing and discharging plungers C C, movable bottom D, and carrier E, substantially as and for the purpose hereinbefore described and set forth.

2. The combination of the heating apparatus F with the sugar-carrier E, to dry the sugar while it is on said carrier, substantially as herein shown and described.

3. The combination of the wipers *k* and the plungers C, substantially as and for the purpose specified.

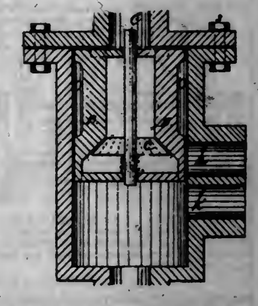


166,384. STUMP-PULLERS. W. O. Johnson, Alma, Mich. [Filed June 17, 1875.]

Brief.—An oscillating lever, centrally pivoted on the top of a stand, has a pulling-rod passed through a hole in its middle, and through a pair of eye-grippers, which are suspended by links to each side of the pivot of the lever. The oscillation acts on each griper alternately, to raise the pulling-rod.

A stump-pulling machine wherein a single oscillating beam is journaled in the top of a pyramidal frame, the said beam extending on each side of the said frame, and oscillated by power applied alternately to its ends, and having pendent from it on each side of its bearings a link connecting with an eye-griper to actuate a pulling-rod, substantially as described and shown.

166,385. FRUIT-DRIERS. Jesse Johnson, New York, N. Y. [Filed Apr. 6, 1875.]

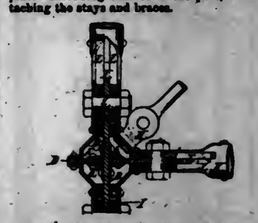


1. In a fruit-drier, the side shelving G G, in combination with the metal dome E, said dome extending from the front to the back of the drier, thus forming a reservoir for heated air, and supplying the same to the drier beneath the wings *e e*, all substantially as set forth.

2. In combination with the furnace I, provided with the deflectors J, the dome E, the top of which extends a considerable distance above said furnace to inclose a reservoir of heated air, and the lower edges or wings of which are provided with the upturned deflecting-flanges *e*, to cause the heated air to pass outwardly.

3. The combination, in a fruit-drier, of the furnace I, the dome E *e*, the passages *b b*, and the shelves G.

166,386. AIR-BRAKES. W. D. Jones, Hageman's Mills, N. Y. [Filed July 27, 1875.]

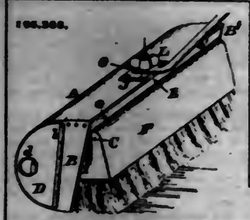


Brief.—Pressure being applied, the hollow piston-valve is forced over and closes the cylinder and exhaust ports. A check-valve is forced open by the pressure within the supply-pipe, allowing air to enter the reservoir. A reduction of pressure within the supply-pipes serves to open the port to the brake-cylinder, and allows air to enter the cylinder and set the brakes.

The combination, with the valve-casing having ports *g*, *g*, *h*, and *k*, of the hollow piston-valve and check-valve inclosed therein, to open with the pressure, the ends of the piston-valve having perforated cross-bars to support the stem of the check-valve, substantially as and for the purposes specified.

166,387. SPLICE-PLATES FOR METALLIC TRUSS-BRIDGES. Walter Kotte, St. Louis, Mo. [Filed June 21, 1875.]

Brief.—A splice-plate of cruciform section, which breaks the joint of the metallic post or column, and is provided with lugs or eye-plates extending outside of the post, for attaching the stays and braces.



1. The splice-plate with four radial wings, D, secured in the joint or splice of the post, substantially as set forth.

2. The splice-plate, as described, with extensions I from the wings D, forming lugs for the attachment of the stays and braces, substantially as set forth.

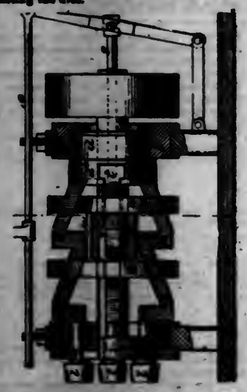
166,388. CARPET-SWEEPERS. John Kemper, Cincinnati, Ohio, assignor to Wagner, Kemper & Dorsene, same place. [Filed May 21, 1875.]

Brief.—A hinged vibrating brush retracted by a concealed spring.

166,888.

1. The combination, substantially as described, of the dust-pan A, provided with closed ends B B' D and a rear opening, C, covered by the hinged and vibrating brush *a d* F G, which latter is retracted by a concealed spring, H, said dust-pan having rigidly attached to it the handle E, for the purpose stated.

2. In combination with the dust-pan A B B' C and its hinged vibrating brush *a d* F G H, the bolt K *k*, nut L, and eye P, whereby the shank M of handle E may be rigidly secured in either of two positions to said pan, substantially as herein described.

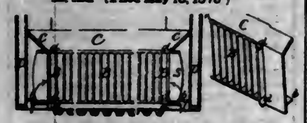


166,889. WRENCHING APPARATUS FOR WAGONS. John J. D. Kingsbery, East Bloomfield, N. Y. (Filed June 23, 1875.)

The bolster-bars *a a a a*, springs *d d*, and double-rods *i i*, arranged as specified, and combined with the wheels, axles, and platform or box of a wagon, in the manner and for the purposes set forth.

166,890. MACHINES FOR PUTTING BOTTLE-NECKS. Wm. Longwell, Atterclife, England, assignor to Baker Brothers & Co., Baltimore, Md. (Filed July 24, 1875.)

Brief.—A revolving spindle carries revolving adjustable dies, a face-plate, a cone, and levers and connections, for operating and adjusting the dies.



1. The combination of a revolving face-plate and adjustable dies, with a central plug or core, substantially as and for the purposes set forth.

2. The combination of the sliding guide-heads *h h'*, with the arms *h* and dies thereon secured, substantially as set forth.

3. The combination of the rod *g*, with the spindle *c*, guide-heads *h' h*, and arms *h*, substantially as and for the purposes set forth.

166,891. FURNACE-GRATE. Oliver H. P. Little and Francis J. Heuber, Indianapolis, Ind. (Filed May 16, 1875.)

1. A supplemental fire wall for protecting the water-legs of boiler-furnaces, consisting of two side and two end sections, B, equal in length and width to the fire-box, each having vertical grate-faces and an angular cap, C, with miter ends, and placed vertically in position to interlock and form a single structure, with the caps resting against the water-legs, and the sections upon base-bars, whereby any one of the sections B may be withdrawn and replaced without disturbing the others or the grate, as described.

2. The combination, with the grate-wall sections B, having angular intermatching ends and closed caps, of the lug projections *b*, extending from their lower edges against the furnace-wall, and the lug projections *d* at the ends of the side walls, whereby the grate-frames are supported in place upon the bottom bars *a*, braced against the furnace-wall, and locked in position with each other at their joining corners, both at top and bottom, as herein set forth.

3. The vertical wall sections B, having closed caps C integral therewith, and made angular at the ends, as and for the purpose set forth.

166,892. POST-HOLE BORERS. Obadiah Love, Saxonburg, Pa. (Filed June 26, 1875.)

The combination, in a post-hole borer, of a series of convergingly curved blades, E *d' d'*, having their front edges sharpened and inclined outwardly with the T-shaped handle, as and for the purpose specified.

166,893. GLOBE-VALVES. Frederick Lamheimer, Cincinnati, Ohio. (Filed May 19, 1875.)

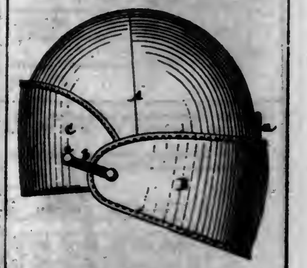
Brief.—The valve is locked to the stem, so that it can be turned in either direction when grinding the valve.

The combination of the collared stem C E, nut G, and valve D, all perforated for the reception of pin J, substantially as and for the purpose specified.

166,894. PUMP-PISTONS FOR ARTESIAN WELLS. Thos. Malcolmson, Oil City, Pa., assignor of one-half his right to David L. Trax, same place. (Filed Apr. 26, 1875.)

166,895.

Brief.—Segmental packing breaking joints are arranged around the central cylindrical body of the piston, and are retained in contact by a coiled spring and a suitable ring and follower. A sleeve enveloping them retains them in position till they are entered into the bore of the pump, when it is drawn upon the upper edge thereof, the upper portion of the piston passing down through it.



1. In the piston A, consisting of parts B and D, the combination therewith of the tapering sleeve K, substantially as described.

2. The pistons A B D, with the segmental packing-ring F, spring G, and follower H, constructed substantially as set forth.

3. The combination of a piston, A B D, with the ring K, sleeve K, packing-ring F, and follower H, all arranged as specified.

4. The combination of a piston, A B D, ball-valve C, and sleeve K, with a ring, E, packing-rings F, spring G, follower H, and coiled spring I, all constructed and arranged as and for the purpose set forth.

166,896. CAPS. Marcus Marks, New York, N. Y. (Filed July 23, 1875.)

As a new article of manufacture, the head covering consisting of the crown or body A, band C, ear and neck protector B, tape *a*, and fastenings *b c*, said protector being arranged upon the exterior of the article, substantially as described, and adapted to move up and down thereon.

166,897. STEAM-BELLS. Robert Marbach and Herman Marbach, Cleveland, Ohio. (Filed July 6, 1875.)

166,896.

166,898. PUMP-PISTONS FOR ARTESIAN WELLS. Thos. Malcolmson, Oil City, Pa., assignor of one-half his right to David L. Trax, same place. (Filed Apr. 26, 1875.)

166,899.

Brief.—Segmental packing breaking joints are arranged around the central cylindrical body of the piston, and are retained in contact by a coiled spring and a suitable ring and follower. A sleeve enveloping them retains them in position till they are entered into the bore of the pump, when it is drawn upon the upper edge thereof, the upper portion of the piston passing down through it.

1. In the piston A, consisting of parts B and D, the combination therewith of the tapering sleeve K, substantially as described.

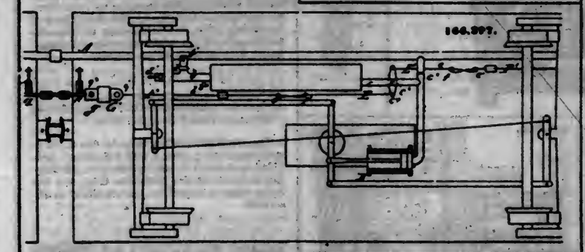
2. The pistons A B D, with the segmental packing-ring F, spring G, and follower H, constructed substantially as set forth.

3. The combination of a piston, A B D, with the ring K, sleeve K, packing-ring F, and follower H, all arranged as specified.

4. The combination of a piston, A B D, ball-valve C, and sleeve K, with a ring, E, packing-rings F, spring G, follower H, and coiled spring I, all constructed and arranged as and for the purpose set forth.

166,896. CAPS. Marcus Marks, New York, N. Y. (Filed July 23, 1875.)

As a new article of manufacture, the head covering consisting of the crown or body A, band C, ear and neck protector B, tape *a*, and fastenings *b c*, said protector being arranged upon the exterior of the article, substantially as described, and adapted to move up and down thereon.

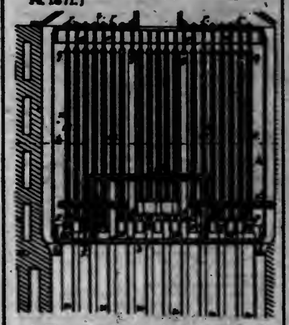


166,897. STEAM-BELLS. Robert Marbach and Herman Marbach, Cleveland, Ohio. (Filed July 6, 1875.)

166,900.

The vessel A, having gauge D D, post *a*, curved arms *b b*, with their supports *d d*, arms B B, side bails C C, arms A A, with the holders E E, all arranged as shown, and for the purpose described.

166,897. STEAM-ENGINE CAR-BRAKES. Thos. McIlvain, Philadelphia, Pa. (Filed Dec. 14, 1874.)



Brief.—Water from the supply-pipe enters a chamber and compresses the air therein, the force of which is automatically applied to the brake-cylinder when the cars are separated.

1. The combination of the conveying-tube A, brake-cylinder B, and air-chamber D, communicating by means of pipes *b* and *a*, having, respectively, a valve, *d*, and cock *d'*, as set forth.

2. The combination of the sliding plates G G', having suitable coupling A *h'*, with the cock *d'*, connected to said plates by rods or chains, substantially as described, and for the purpose set forth.

166,898. STEAM-GENERATORS. George T. McLouthlin, Boston, Mass. (Filed June 14, 1871.)

1. The removable ring *d'* and its springs F, combined with the main depending and the circulating tubes, for centering and holding the upper end of the circulating tube, substantially as set forth.

2. The main depending tube a, connected with the crown-sheet by means of screw-threads, as set forth, and the circulating-tube *g*, within the main tube, combined with removable centering devices, substantially as described, for centering the circulating-tube at bottom and top, as set forth.

3. The outer tube a, the vertical projections *i*, and the inner tube *g*, arranged with relation to each other, substantially as described, and so that the lower end of the inner tube is retained centrally, and its end left unobstructed for the passage of water, as set forth.

4. The outer tube a, provided with the removable plug, combined with the inner tube and removable centering mechanism, and arranged with relation to the steam-chamber and fire-box, so that the inner tube may be removed from the top or the bottom of the outer tube, substantially as set forth.

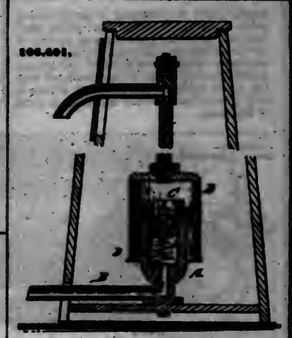
166,899. FURNACES FOR HEATING TUBES. Wm. L. McMakr, Allegheny, assignor to William Graff & Co., Pittsburg, Pa. (Filed June 28, 1875.)

Brief.—The blast is introduced into a heating-chamber, and is partially heated by the radiated heat from the red-hot roof. It passes from said chamber, by a pipe, into a flue running the entire length of the hearth, which is so formed as to make it double on itself, and run the entire length of the hearth again, after which it is admitted, by suitable valves, underneath the grates. In order that oxygen may be supplied to the inflammable gases, small apertures are provided in the bridge-wall, for carrying a portion of the blast to the top of the grates.

1. In a heating-furnace, the combination of the hot-air chamber A, pipe *i*, flue *j*, air-holes *l*, ash-pit *b*, fire-chamber *d*, hearth *c*, and flues *k*, substantially as shown.

2. The flue *j* for the blast, arranged under the welding or heating hearth, substantially as set forth.

166,900. SPRING-CATCHES FOR BOXES. Louis Messer, New York, N. Y. (Filed June 28, 1875.)



The casing-mouth *b*, formed of elastic sheet metal, with the slot *c*, and space *e e e*, in combination with the hook *a*, the lid B, and box A, constructed with the recess *d*, substantially as and for the purpose specified.

166,901. HYDRANTS. Joseph B. Moorby, Baltimore, Md., assignor to T. F. Hunt-Bateman & Co., same place. (Filed May 17, 1875.)

Brief.—A hydrant having stationary valve-box and a movable cylinder in connection with the valve mechanism, and moved with the discharge-pipe.

166,901.

1. The stationary valve-box A, with inlet-pipe B, piston C, attached to the box, and valve *b*, in combination with the exterior movable cylinder D and pipe E, substantially as and for the purposes herein set forth.

2. In a hydrant, the combination of the valve-box A, inlet-pipe B, piston C, with packing *a*, valve *b*, spring *d*, key-seat *e*, exterior movable cylinder D, pipe E, handle G, and spout I, all constructed substantially as and for the purposes herein set forth.

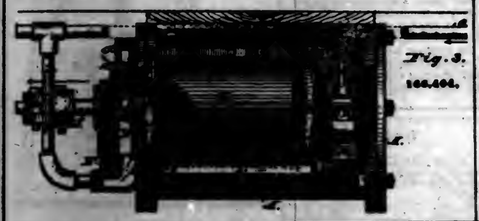
166,902. STOCKS. B. Westbrook Myers, New York, N. Y. (Filed Sept. 17, 1874.)

166,902.

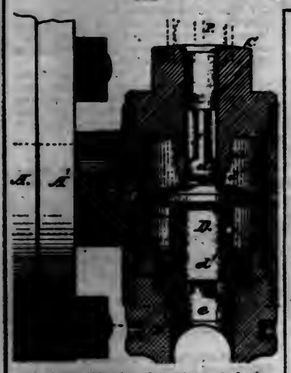
A stove-steel having its standard B flaring at its lower end *b*, to cover the pintle-bore D, and provided with a socket to receive the pintle *d*, upon the ends of which the steel is supported and revolves, the flange *b* being sufficiently broad to support the steel when removed therefrom, substantially as set forth.

166,903. SUGAR-SAWING MACHINES. Geo. P. Ostherhaasen, New York, N. Y. (Filed July 1, 1875.)

Brief.—The upper frame has a recess fit the block of sugar, and grooves in its under side at each end, to permit the passage throughout of the guiding projections on the rollers underneath it.



1. The combination, with the series of elevator-arms C, of the carriage F, provided with a series of parallel slots, *f*, and a cavity, *h*, near one end, for receiving and holding the sugar loaf, and constructed to be moved over the saw, in order to present the sugar loaf to the same for severing it into slabs, substantially as shown and described.



2. The combination of the carriage F, provided with the slots *f* and grooves *g*, and the rollers D, provided with the guide-flanges or collars *d*, substantially as and for the purpose herein described.

166,904. ARM-RESTS. H. Lansing Purdue, Freehold, N. J. (Filed May 26, 1875.)

Brief.—Air being applied to set the brakes also fills an auxiliary reservoir attached to the brake-cylinder.

supply-pipe is decreased, a double-seating valve closes the induction-port of the reservoir, and opens a port leading to the rear of the brake-cylinder, allowing air to pass into the brake-cylinder and force off the brakes. A double-seating valve is also combined with the brake-cylinder, and serves to automatically govern the induction and exhaust ports of the same.

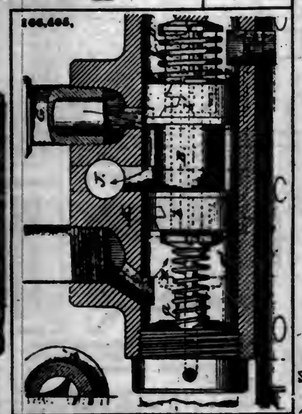
1. The combination of the piston of a brake-cylinder with an auxiliary reservoir and automatic valve, substantially as specified, whereby the brakes are forced off by means of compressed air stored within the auxiliary cylinder while the brakes are being forced on, the automatic valve being governed in its action by the varying pressure of the air within the pipe leading thereto.

2. The combination of the main supply and exhaust valve of the brake-cylinder and the automatic supply and exhaust valve of the auxiliary reservoir with a single supply-pipe, substantially as specified, whereby the compressed air, after having exerted its power upon either side of the piston, is exhausted from the cylinder directly into the atmosphere.

3. The combination of the differential check-valve D, having a grooved stem, d, with cap B, having an annular port, and cap C, the latter constituting a guide for the grooved stem, substantially as and for the purpose described.

4. The combination of the differential check-valve D, having a piston formed on the end of its grooved stem, with an auxiliary reservoir, brake-cylinder, and exhaust-ports, substantially as specified, whereby the valve, when caused by the pressure of air within the reservoir, allows the confined air to force off the brakes, and, when raised from its seat, allows the air to escape or exhaust from the cylinder.

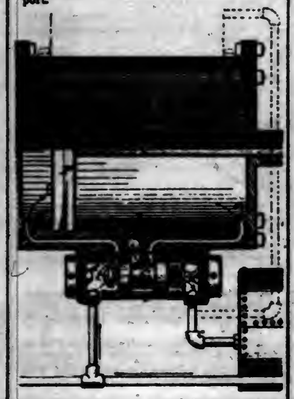
166,605. Air-Brakes. H. Lansing Farrine, Freehold, N. J. (Filed July 29, 1875.)



Brief.—When pressure is applied, the hollow piston-valve is forced toward one end of the valve-chest, until the supplemental valve strikes the wall of the chest, when the pressure opens communication with the reservoir, and allows air to enter the same. Pressure being reduced in the supply-pipe, the piston-valve moves in a reverse direction, and opens a port leading to the brake-cylinder, and allows air from reservoir to enter the cylinder and set the brakes. Pressure again being applied, the air is exhausted from the brake-cylinder.

The combination, with the valve-casing, having ports arranged substantially as described, of the hollow piston-valve and a supplemental wing-valve, the latter, when serving to admit air to the reservoir, opening against the pressure, as and for the purpose set forth.

166,607.



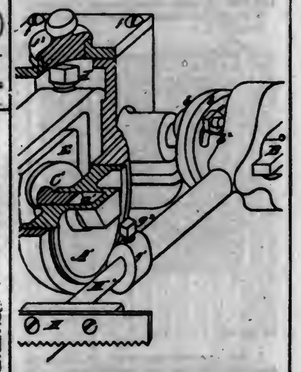
166,606.

166,606. Air-Brakes. H. Lansing Farrine, Freehold, N. J. (Filed July 7, 1875.)

Brief.—When air is supplied through the pipe, the hollow piston-valve is forced back, which opens an induction-port to the cylinder and applies the brake, and at the same time a check-valve in said piston-valve is opened to supply the reservoir with air. When the pressure in the supply-pipe is relieved, the pressure in the reservoir forces the piston-valve to its first position, opens the induction to the other end of the cylinder, and takes off the brakes, exhausting through the opposite port.

1. In an air-brake, a brake-cylinder having an exhaust and two ports, that alternately act as induction and eduction ports, and serve simultaneously one as an induction and the other as an eduction port, in combination with a chamber or reservoir containing air for use in forcing off the brakes, an intermediate valve, and a single line of supply-pipe, substantially as and for the purpose specified.

2. In an air or like brake, the combination of a storing chamber or reservoir, three-port brake-cylinder, an intermediate automatic valve, and a single line of supply-pipe, substantially as and for the purpose described.



3. In an air-brake mechanism, in which the brakes are positively applied and released, a valve, B, constructed with a hollow piston and an independently-movable valve-bar stem, co-operating automatically, for the purpose of supplying air to, and exhausting it from, opposite ends of the brake-cylinder simultaneously, substantially as described.

166,607. Outlemens for Carding-Machines. Charles Nicolas Fleurent, Rouen, France. (Filed Dec. 26, 1874.)

The combination of the cylinder of a carding-machine, having slots A, with the plates t, provided with teeth n, and the cement c, whereby the slots about the plates are filled, and the latter secured in position, substantially as described.

166,609. Mechanism for Operating Doffer-Combs. Josiah K. Procter, Philadelphia, Pa., assignor of one-half his right to James Smith & Co., same place. (Filed Apr. 23, 1875.)

Brief.—The journal of the comb-shaft is provided with a yoke, the opening through which is tapering, and in which slides a tapering block, through which is a conical opening, in which turns an eccentric cone, whereby the shaft is rocked and the comb vibrated. The operating parts are all inclosed in an oil-box.

1. The combination, with the rocking yoke D, having a flaring opening, of the tapered block E, fitting in said opening, substantially as shown and described.

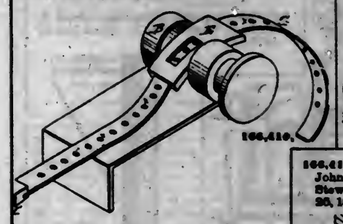
2. The combination of the comb-shaft B, having a journal, B', the receiving shaft C, having an eccentric cone, C', the yoke D for transmitting motion between said shafts, and the block E, the several parts being combined and arranged for operation substantially as shown and described.

166,609. Processes and Apparatus for Manufacturing Gas. Alonzo C. Read, Minneapolis, Minn. (Filed June 8, 1875.)

Brief.—The vaporizer is set vertically and provided with horizontal planes, perforated alternately at circumference and center. A pipe leads directly from the vaporizer to a heating regulator, provided at the top with a pivoted weighted arm, which is connected to the cock in the oil-supply pipe to the vaporizer.

166,609.

166,611.



1. The process for manufacturing gas for illuminating purposes by thoroughly combining and mixing the vapors of hydrocarbon of different specific gravities as they are generated in a vaporizer, for the purpose of forming a homogeneous vapor, and submitting the same, under uniform automatic pressure and in uniform quantities, to destructive distillation in heated retorts, substantially as herein set forth.

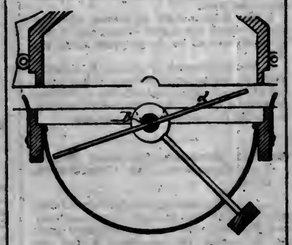
2. In the manufacture of illuminating-gas, the method of vaporization, which consists in automatically and proportionately regulating the feed and outflow of a vaporizer, and at the same time maintaining an equable pressure therein, as set forth.

3. The vaporizer B, provided with a series of perforated diaphragms, for mixing the vapor generated therein and rendering it homogeneous, and automatic devices for regulating the admission of hydrocarbon and controlling the pressure of vapor therein, in combination with the retorts A, for converting the vapor into fixed gas, substantially as set forth.

166,610. Feed-Guides for Printing-Presses. Jos. Reed, Jeffersonville, Ind. (Filed Feb. 4, 1876.)

Brief.—The base-plate, which is secured to the clamp of the platen, carries a cog-wheel, gearing with a perforated flexible strip passing through a curved guide. The strip carries at one end a recessed head, and has a spring curve, keeping it out of the way of the inking-rollers. One end of the shaft of the cog-wheel is extended and bears a button, by which the strip is adjusted.

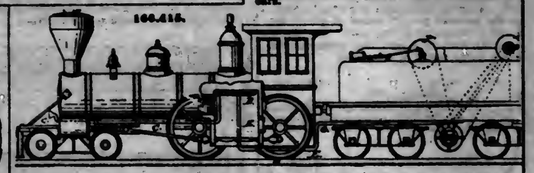
1. In a feed-guide for printing-presses, the flexible strip G, provided with the recessed head H and a series of equidistant perforations, a, in combination with a guide for the strip, and a cog-wheel, G, for operating the same, substantially as herein set forth.



2. The curved guide E, in combination with the flexible perforated strip G and cog-wheel G, substantially as and for the purposes herein set forth.

3. The combination of the plate A, box B, cog-wheel C, curved guide E, and flexible perforated strip G, with head H, substantially as and for the purposes herein set forth.

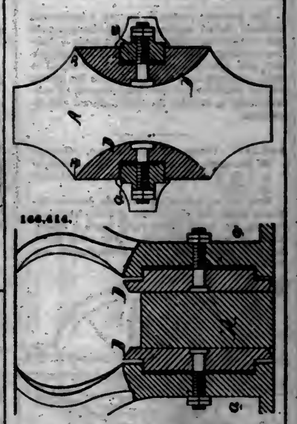
166,611. Skirts. Frederic A. Richardson, Boston, Mass. (Filed Mar. 23, 1875.)



As a new article of manufacture, a flapless shirt, constructed substantially as herein described, and being composed of the bosom d, entirely free at its lower end, to permit the bosom at that point to move easily over the person, of front a, extending from the bosom and under the arms as narrow bands f, and of a short back, neck-band, and shoulder parts, all as set forth.

166,612. Egg-Beaters. John F. Rote, Reading, Pa. (Filed Aug. 26, 1875.)

The combination, in an egg-beater, or a cooling, A, made in two sections, the upper of which is removable, the detachable shaft B, having prongs d, and the fixed bars c, all being constructed and arranged as set forth.



166,615.

166,615. Heating and Ventilating Railroad-Cars. Wellington Sager, Colchester, Vt. (Filed Dec. 3, 1874.)

Brief.—Air is drawn into a trumpet-mouthed pipe in front of the locomotive, passed through a coil in the fire-box, and discharged in the cars.

166,614.

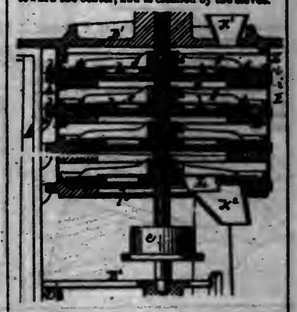
1. The combination of the hanger B and its fixed or adjustable guiding-plates D, having convex faces, with the axle-box A, in the sides of which are formed concave recesses, all as and for the purpose set forth.

2. The guiding-plates D, secured to the legs a of the hanger by means of central bolts, and provided at each end with recesses d d, in combination with the projections b b formed on each leg a, and adapted to the recesses d d of the plate, all as and for the purpose set forth.

166,615. Apparatus for Fish-Culture. John Roth, Duncannon, Pa., assignor to Stewart & Young, same place. (Filed Jan. 26, 1876.)

1. The box A, divided by partitions B B into compartments C and C' C', and provided with the water-inlets a a and b b, and outlets d d and e, with their respective gates, substantially as and for the purposes herein set forth.

2. In combination with the subject-matter of the above claim, the frame-work I and adjustable wire-cloth basket J, for the purposes herein set forth.

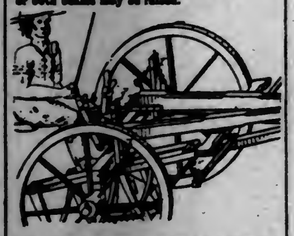


166,614. Car-Axle-Box Brasses. Thos. D. Rulon, Philadelphia, Pa., assignor of one-half his right to John H. Rulon, same place. (Filed June 2, 1875.)

Brief.—To compensate for the wearing of the axle-box.

The combination of the induction-pipe G, coil D, placed in the fire-chamber above the fire, as described, pipes F and G, fan H, pipe I, and a system of pipes and registers under the cars, to supply heated air to the interior thereof, substantially as and for the purpose hereinbefore described and set forth.

166,616. Grain-Decorticators. Wilhelm Seek, Bockenheim, Prussia. (Filed May 4, 1875.)



Brief.—The grain is decorticated in passing toward the center, and is cleaned by the sieves.

The counter plates D, having a horizontal radially-fluted surface, in combination with the horizontally fluted revolving disks G, having openings between their center and periphery, and provided with sieves h, arranged in said openings, and extending from the center of the disks toward its circumference, all substantially as and for the object shown and described.

166,417. WHEEL-CULTIVATORS. George W. Gilbreath, Geneva Lake, Wis., assignor to C. L. Herndon, same place. [Filed May 10, 1875.]

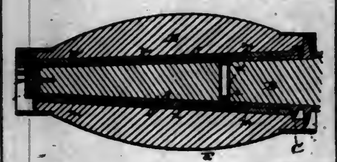
Brief.—Two levers side by side, having the chain from one plow-beam directly attached to one, the other lever rigid upon a crank-shaft, to which the chain of the other plow-beam is secured, by which arrangement one or both beams may be raised.

In a cultivator, substantially as described, the combination of the levers, E' for lifting cash out of sheaves, both placed at one side of the frame, one being rigidly secured to a rock-shaft, and the other turning independently of said rock-shaft, so as to be used separately or to be simultaneously drawn back by one hand, substantially as described and shown.

166,418. FRUIT-GATHERERS. Minor Smith, Cayuteville, N. Y. [Filed Mar. 20, 1875.]

Brief.—The upper jaw is fixed, and the sides are elongated to form a seat for the movable jaw. A spring is attached to a cross-bar and to the movable jaw, by means of which the mouth of the picker is kept open. It is closed upon the fruit by a cord that passes over a pulley in the throat of the picker

In a fruit-picker, the combination of the circular fixed jaw E, having a long shank, O, the bag D attached thereto, the movable jaw B, of sheet-metal form, the ends of which are pivoted at the angles of the fixed jaw E, the extensible spring h, operating-rope a, cross-bar S, provided with grooved pulley s, and the stapled cross-bar f, substantially as described, and for the purpose set forth.



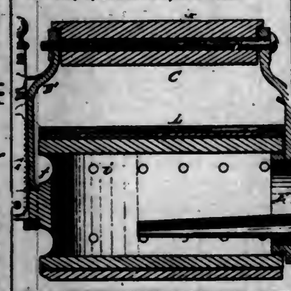
166,419. MILLSTONE-DRESS. G. T. Smith, Minnesota City, Minn. [Filed May 26, 1875.]

Brief.—The middlings-furrows, being of greater depth, shallower, and narrower than the main furrows, carry off that part of the material which is sufficiently ground, leaving the bran, &c., to be further acted on by the stones.

In combination with the main furrows A or B' B', the middlings-furrows a, substantially as set forth.

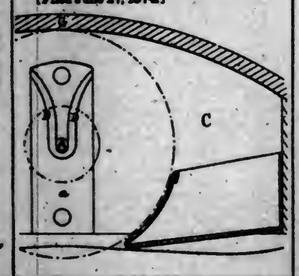
166,420. AXLE-SKEINS. J. D. Smith, Schuylerville, N. Y. [Filed June 18, 1875.]

1. The combination of the axle B, thimble-skein A, and vertical tube b, having packing s at its lower end, and a stopper, d, at its upper end, substantially as and for the purposes herein set forth.



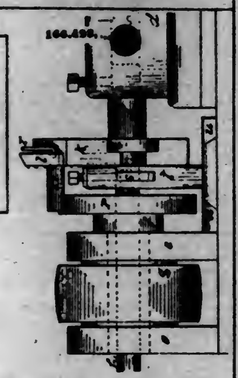
2. The thimble-skein A, formed with the shoulder-band C and sand or mud cap D, substantially as and for the purposes herein set forth.

3. The combination of the axle B, thimble-skein A, having shoulder-band C and sand-cap D, the oil-tube b, and axle-box J, forming bearings m m and oil-chamber n, substantially as and for the purposes herein set forth.



166,421. REVERSIBLE SAD-IRONS. Thomas T. Smothers, Bryan, Tex. [Filed July 24, 1875.]

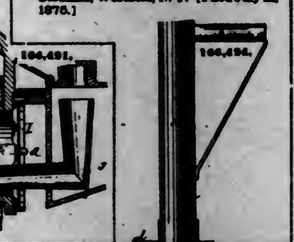
1. In combination with a reversible sad-iron provided with the openings f f, as described, and the lamp-reservoir H, the hollow journal B, having the recesses y y and the studs d d on its face, for allowing the air to circulate through the iron and between the journal B and the lamp-attaching plate I, substantially as and for the purpose set forth.



2. In combination with a reversible sad-iron having the ribs or beads s s, a detachable face-plate, having projecting ears or flanges m, and connected to the sides of the iron body by set-screws n, as set forth.

166,422. CARPET-SWEEPERS. Albert H. Spencer, Boston, assignor to Jno. J. Haley, Newton, and H. C. Morse, Boston, Mass. [Filed June 27, 1874.]

The combination, in a carpet-sweeper, of the case C, cover G, spindle A, brush-shaft B, and open vertically-slotted bearing-plate D, substantially as and for the purpose set forth.



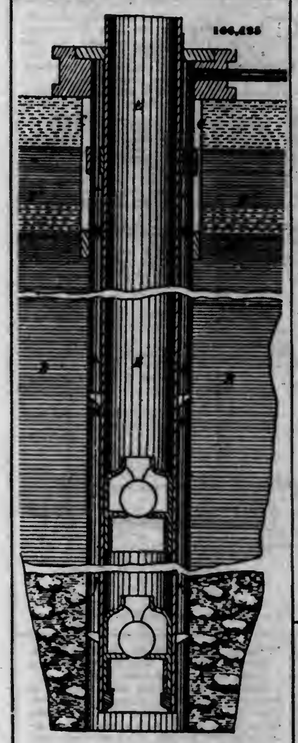
166,423. MACHINES FOR SHAPING THE HEADS OF METAL SCREWS. Christopher M. Spencer, Hartford, Conn. [Filed Dec. 7, 1874.]

Brief.—A tool-stock carried in a rotating head, provided with a ways-block, in which slides a tool-holder, the tool in which is held away from the work by a spring, except when forced up to it by a former rotating under the projection n, which former may be of any desired contour.

2. The combination of the hollow stock-holding shaft f, the rotating former p, the ways-block h, the tool-stock l, and the tool m, all substantially as shown and described.

3. The combination of the slide c, rotating head d, ways-block h, reciprocating tool-holder l, and rotating former p, all operating substantially as shown and described.

166,424. CLOTHES-POUNDERS. Oscar F. Stedman, Westfield, N. Y. [Filed July 21, 1875.]



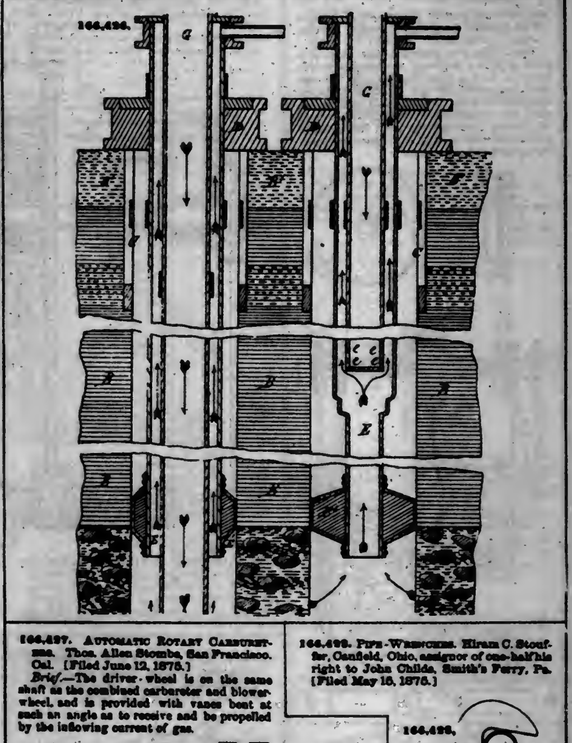
In connection with a clothes-pounder, the combination of the disks c and a with the basin B, substantially in the manner and for the purpose set forth.

166,425. PETROLEUM-WELLS. Elisha McCurdy Stevenson, Pulaski Township, Lawrence County, Pa. [Filed Apr. 21, 1875.]

Brief.—Employs a reducing-tube closed or sealed at the bottom, to so diminish the capacity of the well that the commingled oil and gas will rise to the discharge without separating, and by the expansive force of the gas.

166,425

1. In a petroleum-well, a reducing tube, pipe, or cylinder, closed or sealed at its lower end, and employed substantially as herein described, for diminishing the sectional area of the space within the walls of the well, so as to prevent the separation of the gas from the oil, whereby the gas, when passing from the wall by the annular space between the tube and the well, is caused to carry with it the oil with which it is incorporated, substantially as set forth.

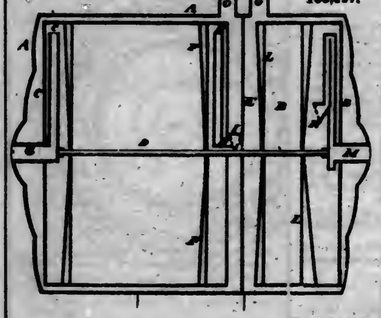


166,426. PETROLEUM-WELLS. L. Stewart, Titusville, Pa. [Filed Apr. 1, 1875.]

Brief.—Reduces the discharging capacity of flowing-tubes of oil-wells by introducing a reducing-rod or closed tube, to facilitate spontaneous discharge. Employs also the reducing-tube, raised up and adjusted to either the flowing-tube or the well itself, for the introduction of benzine or steam for the removal of paraffine, under such conditions that the benzine or water of condensation is carried up by the mingled oil and gas without the use of a pump.

1. The combination, with the well, of the flowing-tube B, the packer D', and the reducing-tube G, substantially as set forth.

2. In a petroleum-well, a reducing-tube, diminishing the discharging capacity of the well, and arranged as shown and described with relation to the discharging-outlet of the well, that benzine introduced to remove the paraffine, or the water arising from the condensation of steam used for the same purpose, shall be carried up by the ascending column of oil and gas without the use of a pump, substantially as set forth.

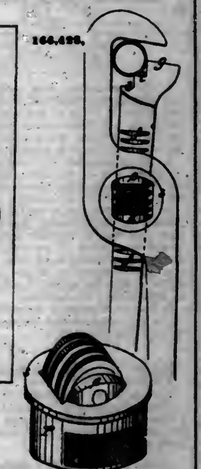


166,426.

166,427. AUTOMATIC ROTARY CARBURETTERS. Thos. Allen Stowbs, San Francisco, Cal. [Filed June 12, 1875.]

Brief.—The driver-wheel is on the same shaft as the combined carbureter and blower-wheel, and is provided with vanes bent at such an angle as to receive and be propelled by the inflowing current of gas.

166,427.

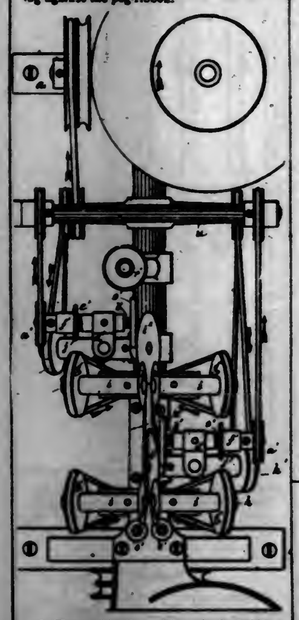


1. The driver E, with its inclined partitions L, and provided with the inlet-passage formed by the vanes V V, standing at different angles, and the air-cylinder C, with its partitions F, mounted upon the same shaft D within the case A, and provided with inlet and exit openings, as shown, the whole constructed to operate substantially as and for the purpose herein described.

2. The carbureting-sheets a—consisting of the continuous fabric J, passing alternately to the circumference and the center of the chambers of the cylinder around the frame K, in combination with the automatic device for regulating the supply of liquid, the same consisting of the float S, with its stem T and valve U, when fitted to rise and fall at the lower end of the supply-pipe, which connects with the chamber A, substantially as herein described.

166,428. PIPE-WRENCHES. Hiram C. Stouffer, Canfield, Ohio, assignor of one-half his right to John Childs, Smith's Ferry, Pa. [Filed May 15, 1875.]

166,428.



1. The combination of the flanged plug, extending through and beyond one side of the main jaw-bar, with the fixed and movable jaws, and in which the plug passes through the main jaw-bar, and the movable jaw-bar passes through the plug outside the main jaw-bar, to key the wrench parts together, substantially as herein set forth.

2. The combination, with the flanged plug and the jaw-bars keyed thereto, as described, of the thumb-screw carried by the plug, for operation as herein set forth.

166,429. Machines for Pointing Ribbon Peg-Wood. Benj. F. Sturtevant, Boston, Mass. (Filed Mar. 27, 1875.)

Brief.—The two corners of one edge of a strip of ribbon peg-wood are beveled or cut away to form a point-forming edge for the strip, and curve for the points of pegs, by means of rests for receiving and holding the strip, and intermediate rotating disk-cutters for forming a sharp edge upon the same, in connection with rotating holding-guides working against the peg-ribbon.

1. The combination, with rests for holding and pointing peg-ribbon, of intermediate cutting-disks *F F*, set at an angle to the path in which the peg-ribbon moves, and adapted to cut the two corners and sharpen the edge of the ribbon or strip, substantially as described.

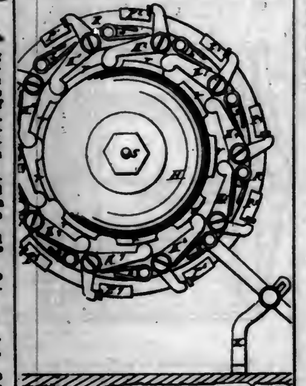
2. The combination, with the rotating holding-guides *f h*, of the disk-cutters *F F*, arranged and operating with relation to each other substantially as described.

3. The combination of the rotating holding-guide *f* and shaft *h* with the sleeve *n* and pawl and ratchet, to allow the guide to be moved in advance of the movement of the sleeve, substantially as set forth.

4. The combination of the shaft *h* and sleeve *n* with the spring *o*² and the plugs *b*² *c*², substantially as described.

5. The combination of the table *g* with the rest *p* and rotating and sliding shaft *o*, substantially as described.

166,430. Machines for Sharpening Scale-Fastenings Within. Benj. F. Sturtevant, Boston, Mass. (Filed Mar. 27, 1875.)



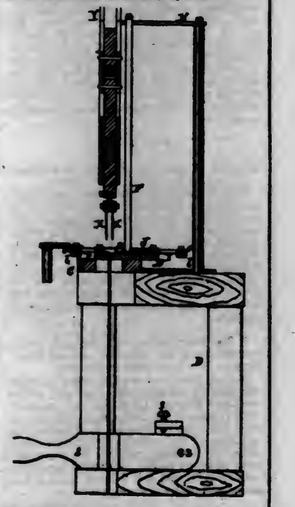
Brief.—The machine is intended to produce a substitute for pegs to be used in fastening the sole to the upper in the manufacture of boots and shoes.

1. The combination of a feeding and holding mechanism, with cutters adapted to operate substantially as shown and described.

2. The combination of two pairs of intermittingly-operated feeding and holding rolls, in which combination one roll at least of each pair is fluted, and in which one roll of each pair is adapted to exert a yielding pressure, as set forth.

3. The combination, with two pairs of feeding and holding rolls, of cutters arranged between the pairs of feed-rolls, and operating substantially as described.

166,431. Electro-Magnetic Engines. Alexander Tittman, Chauncey, assignor to himself and Henry S. Daggett, La Fayette, Ind. (Filed Apr. 16, 1875.)



1. In combination with an unequal number of magnets and armatures, arranged, respectively, on a stationary cylinder and a revolving disk, a stationary ring provided with a series of keys and plates corresponding with the number of magnets, and a revolving disk provided with a series of rosettes corresponding with the number of armatures, substantially as and for the purposes herein set forth.

2. In an electro-magnetic engine, the combination of the ball-crank-shaped keys *b*¹ *b*², &c., plates *F*¹ *F*², &c., springs *r s*, and central disk provided with rounded edge, all arranged to operate as set forth.

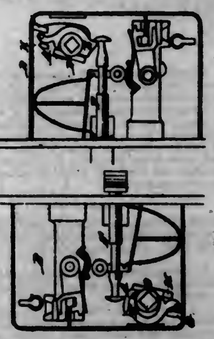
166,432. Machines for Making Ornamental Chains. Gregor Trinks, New York, N. Y. (Filed June 11, 1875.)

Brief.—A reciprocating slide provided at one end with a pusher for pushing the lowermost link from the feeding wire over the die, and at the other end with a needle for opening the ends of the link, which have been bent up at right angles sufficiently to receive the next link. The channel through which the links are pushed is bounded on top by a spring-plate, which will yield in case of irregularities upon the links, and, therefore, prevent the same from being injured.

1. The reciprocating slide *J*, in combination with the pusher *I*, feed-wire *E*, needles *P*, and bed-plate B, composed of divisions, whose edges are cut away to form the chain-eler. Q and needle receiving and guiding holes E E, substantially as and for the purposes specified.

2. The combination, with the reciprocating slide *J*, of the pusher I and needle P attached to said slide, substantially as herein shown and described.

3. The spring-plate S and block U, in combination with the receiving and bed plates A B and pusher I, substantially as shown and described.



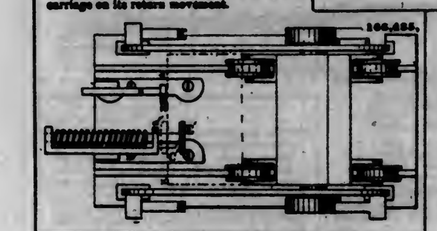
4. The clamp 2, for drawing down the chain, arranged below the bed-plate B, substantially as shown and described.

166,433. Manufacture of Anodes for Nickel-Plating. Edward Weston, New York, N. Y., assignor to Stevens, Roberts & Havell, Newark, N. J. (Filed July 10, 1875.)

A process for forming anodes for electro plating, consisting of mixing particles of metal with a cement when in a plastic state, and then molding, pressing, and baking the mass to form a solid body of the required size and shape, substantially as herein set forth.

166,434. Reversible Latches. Andw. F. Whiting, Crestline, Ohio. (Filed Jan 26, 1875.)

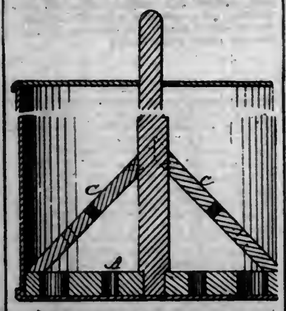
Brief.—A bolt and lever for operating a latch bolt are arranged so as to have a limited sliding motion, sufficient to release the lever from the latch-bolt, and permit the reversal of the latter.



1. The oblong rim A, formed on the interior of the knob-cone B B', and disposed concentrically to the knob-spindle opening, in combination with the knob-spindle bolt and the latch-retracting lever E, substantially as and for the purpose set forth.

2. The projections G H and rim A, formed on the knob-cone B B', bolt D, and lever E, in combination, substantially as and for the purpose set forth.

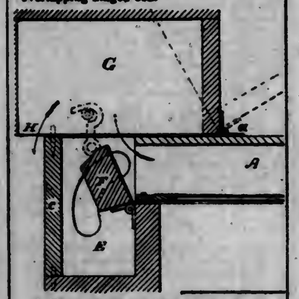
166,435. Buffers for Mule-Carriages. John W. Whitehead, Saco, Me. (Filed May 10, 1875.)



Brief.—The resistance of the spring causes the motion of the carriage to be gradually stopped, while its recoil assists in starting the carriage on its return movement.

1. The adjustable spring-brake D E, combined with a spinning-mule carriage, as and for the purpose described.

2. The combination of the adjustable spring-brake and an adjustable gage-frame H, as and for the purpose described.



166,436. Reciprocating Churn-Dashers. Isaac J. Whitlatch, Lexington, Ind., assignor of one-half his right to A. A. Morrison, same place. (Filed June 26, 1875.)

The within-described churn-dasher, consisting of circular perforated base A, with rod or handle B, and the perforated semicircular wings C C, placed thereon at an angle, substantially as and for the purposes herein set forth.

166,437. Reed-Organs. Henry K. White, Brattleborough, Vt., assignor to J. Estey & Co., same place. (Filed Apr. 7, 1875.)

Brief.—The sound, as it issues from the reed-cell, is diverted upward by a partition fronting it, and is further retarded downward by an overlapping hinged bar.

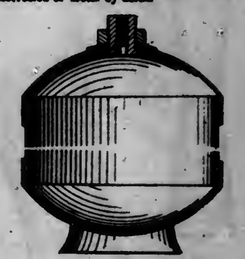
1. The combination of the chamber G, reed-cells A, ports C, and chamber E, when said parts are arranged in substantially the manner described and shown, and for the purposes set forth.

2. The combination of the reed-cells A, reeds C, and chamber E with a resonant chamber, G, arranged to overhang said chamber E and leave a space, B, for the egress of sound from the reeds, substantially as described and shown.

166,438. Tube-Drawing Mandrels. T. Whitehouse, Somerville, assignor to the American Tube-Works, Boston, Mass. (Filed May 27, 1875.)

A tube-drawing mandrel, *A*, provided near its large end only, or near each end, with an annular depression, *f*, having an inclined or rounded shoulder, *h*, substantially as and for the purpose set forth.

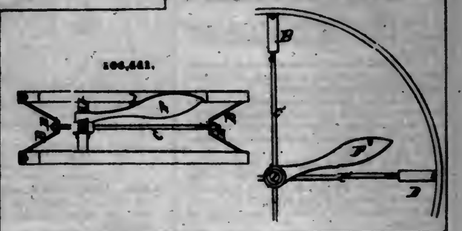
166,439. Umbrellas. John G. Widmann, Yonkers, N. Y. (Filed Apr. 9, 1875.)



1. The combination, with the runner of an umbrella having a notched crown-piece, of a notched disk upon the runner, constructed and arranged to operate substantially as and for the purposes described.

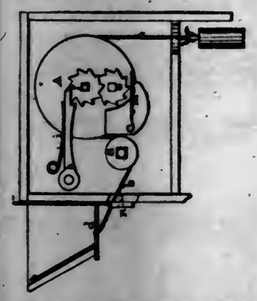
2. The combination, with the runner of an umbrella having a notched head, lateral flange or lip *d*, and a lock or stop, *f*, of the notched disk C, secured between the said flange *d* and the notched head, and having a finger-piece, *e*, and recess *i*, substantially as described.

166,440. Soda-Water Fountains. Fredk. W. Wiesebrock, New York, N. Y., assignor to H. W. Shepard and Robert Seaman. (Filed Jan. 20, 1875.)



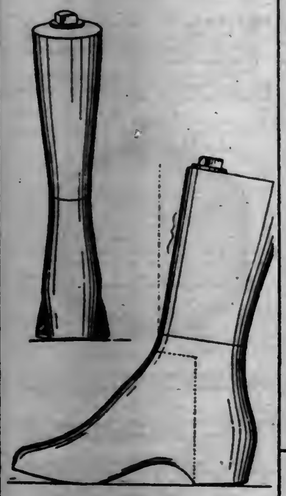
Brief.—Sheet-metal fountain is first tinned and then coated with paraffine, to prevent corrosion of metal by soda.

A sheet-metal fountain tinned and coated with paraffine, as a new article of manufacture.



166,441. Toy Hoops on Treadles. W. W. Wilcox, Middletown, Conn. (Filed July 14, 1875.)

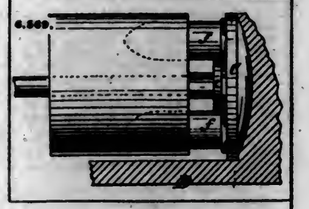
Brief.—The hoop, being double, is adapted to readily stand alone for very young players.



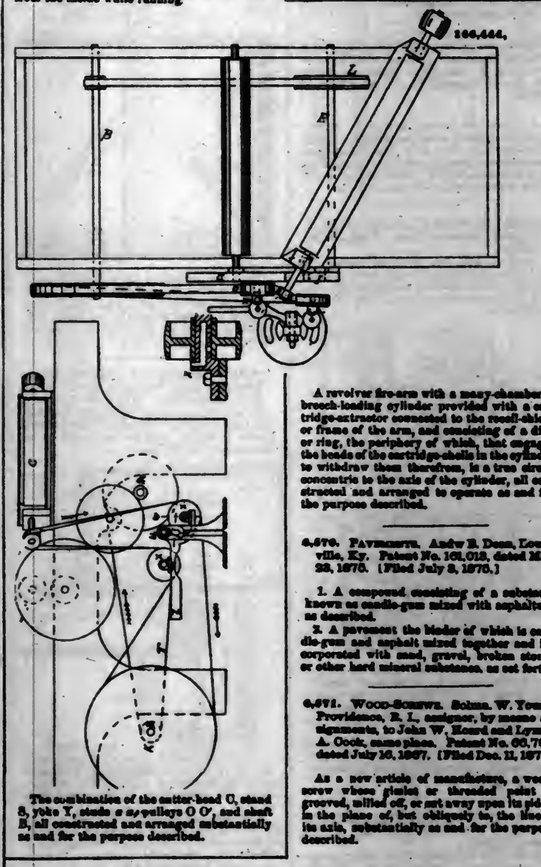
1. The combination of the double hoops A A, brackets B, and radial braces C, constructed and arranged substantially as described.
2. The driver F, in combination with the double hoops A A, brackets B, and radial braces C, substantially as described.

166,643. GRAIN-TALLIES. W. D. Wiley, Oswego, N. Y., assignor of one-half his right to Chas. H. Woodruff, same place. [Filed Feb. 5, 1875.]

The pulley A, carrying ratchet-wheel f and pin h, and held in position by pawl i and spring j, in combination with cord k, passing over pulley A, and under pulley a, one end of said cord being attached to drop d, and the other end provided with a weight.



166,645. LASTS FOR RUBBER-WORKING. Isaac F. Williams, Bristol, R. I. [Filed Dec. 28, 1874.]



1. In a last having a foot and a leg, the receding front leg outline, substantially as described.
2. In a last having a foot and a leg, the concave outline at the rear of the leg, ankle, and heel, substantially as described.
3. In a last having a foot and a leg, the concave outline at the rear of the leg, ankle, and heel, and the concave side lines, with the greatest depth adjacent to the ankle, substantially as described.
4. A last having a leg and a foot, with an outline at the front of the leg, which recedes to the rear from the instep upward, a concave outline at the rear of leg, adjacent to the ankle, and concave side lines, substantially as described.

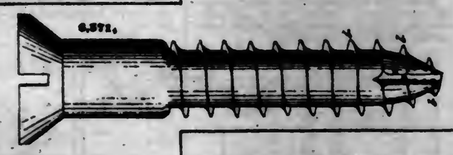
166,644. PLANING-MACHINES. Leander S. Woodbury, Burlington, Vt., assignor of two-thirds his right to B. S. Nichols and F. G. Coggin, same place. [Filed Mar. 29, 1875.]

Brief.—The motion of the driving-shaft, which is parallel with the feed-rolls, can be transmitted to the cutter-head when set at any desired angle other than a right angle, and at the same time admitting of a vertical adjustment of the cutter-head by two carrying or tightening pulleys, running on hollow studs attached to a vertically adjustable and swinging yoke, secured to a laterally-adjustable supporting-stand. The studs can be oiled from the inside while running.

166,644.

The combination of the cutter-head C, stand S, yoke Y, studs *a a*, pulleys O O', and shaft E, all constructed and arranged substantially as and for the purpose described.

A revolver fire-arm with a many-chambered breech-loading cylinder provided with a cartridge-extractor connected to the recoil-shield or frame of the arm, and consisting of a disk or ring, the periphery of which, that engages the heads of the central-pin chain in the cylinder to withdraw them therefrom, is a true circle, concentric to the axis of the cylinder, all constructed and arranged to operate as and for the purpose described.



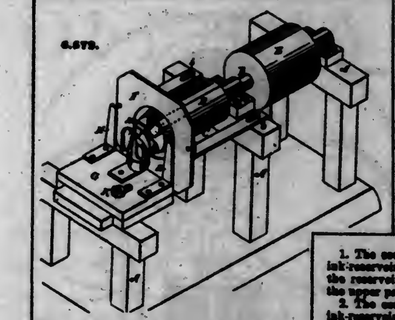
6,570. PAVEMENTS. Andw B. Dunn, Louisville, Ky. Patent No. 161,013, dated Mar. 23, 1870. [Filed July 8, 1875.]

1. A compound consisting of a substance known as candle-gum mixed with asphaltum, as described.
2. A pavement the binder of which is candle-gum and asphalt mixed together and incorporated with sand, gravel, broken stone, or other hard mineral substance, as set forth.

6,571. WOOD-SCREWS. Solma. W. Young, Providence, R. I., assignor, by mesne assignments, to John W. Hoard and Lyman A. Cook, same place. Patent No. 66,700, dated July 16, 1867. [Filed Dec. 11, 1874.]

As a new article of manufacture, a wood-screw whose pinion or threaded point is grooved, milled off, or cut away upon its sides, in the plane of, but obliquely to, the line of its axis, substantially as and for the purpose described.

6,571.



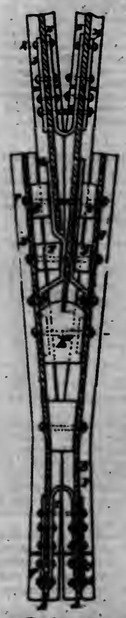
REISSUES.

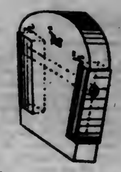
6,568. REVOLVING FIRE-ARMS. Benjamin H. Williams, New York, N. Y. Patent No. 150,120, dated Apr. 21, 1874. [Filed July 8, 1875.]

6,572. MACHINES FOR CARVING AND ORNAMENTING WOOD-WORK. Myron T. Boult, Battle Creek, Mich. Patent No. 91,410, dated June 15, 1869. [Filed July 26, 1875.]

Brief.—Ornamental panels are formed by attaching to one side of the board to be operated upon a former or templet, which is held against a guide-pin opposite the rotating cutter while the latter is shaping the panel.

6,573.

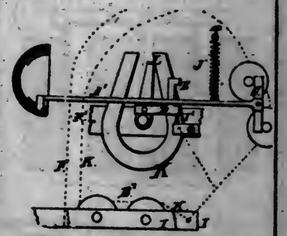




6,574.

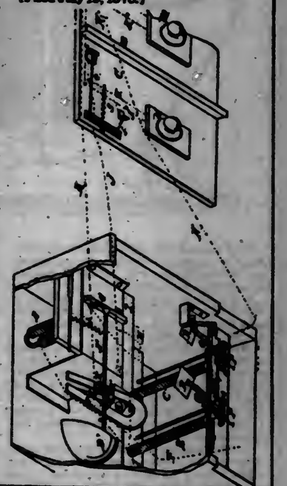
1. The guide l, when used in combination with a molding or running tool, whose axial line is identical with that of the guide, substantially as and for the purposes specified.
2. The arrangement of the cutter-head C, with one or more angular or curved cutters, D, adjustable gage-plate F, and adjustable table G, with its arms H H H, roller I, and spring J, or their equivalents, all constructed substantially as shown and described.

6,575. RAILROAD-FROGS. James Brake, Jersey City, N. J. Patent No. 130,291, dated May 27, 1872. [Filed May 31, 1875.]



1. The brace-bars G, in combination with the point C and guard-rails B of the frog, substantially as herein shown and described.
2. The combination, in a railway-frog, of the metal body W of a "diagblock," and the wooden cushions arranged between the said body and the rail or point of the frog, as and for the purpose described.

6,576. LIFE-PLANES. Samuel Darling, Providence, R. I. Patent No. 111,668, dated Jan. 31, 1871; reissue No. 6,442, dated May 25, 1875. [Filed July 9, 1875.]

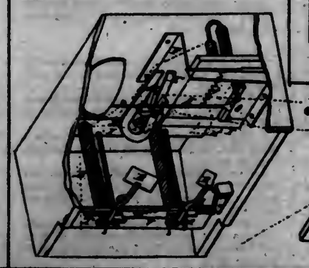


1. The combination, in an inkstand, of an ink-reservoir, an elevated dipping-cup within the reservoir, and an ink-receiving recess in the upper part, substantially as described.
2. The combination, in an inkstand, of an ink-reservoir and a pen-gage, such gage consisting of a cup or chamber, and a deep narrow cavity, leading downward from the bottom of this cup or chamber, the upper end of said cavity, which opens into the cup, being made smaller than the width of an ordinary writing-pen, when the height of the walls surrounding the cup or chamber regulates the amount of ink to be taken upon the pen, substantially as described.
3. The combination, in an inkstand, of an ink-reservoir or central dipping orifice or tube, an ink-receiving recess in the upper part surrounding the dipping-orifice and a central hole, the lower opening of the dipping-orifice being larger than an ordinary writing-pen, and above the ink when in use, substantially as described, and for the purpose herein set forth.
4. The combination, in an inkstand, of an ink-reservoir, a central dipping-orifice, an ink-receiving recess in the upper part of the inkstand, and a deep narrow cavity in the lower part, the upper part of said deep cavity being open in size than the width of an ordinary writing-pen, substantially as described and herein set forth.
5. The combination, in an inkstand, of an ink-reservoir, a central dipping-orifice, an ink-receiving recess in the upper part of the inkstand, a deep narrow cavity in the lower part, said cavity being less in size than the width of an ordinary writing-pen, and an external recess under the bottom surrounding a central leg, which leg contains said deep cavity, substantially as described, and for the purpose herein set forth.
6. The combination, in an inkstand, of an ink-reservoir and an elastic stopper, such stopper having an air-chamber in its upper part or head, and a small air-duct through the lower part, which is located into the inkstand, thus providing a free pressure for air from the chamber in the head of the stopper to the interior of the reservoir, substantially as described.

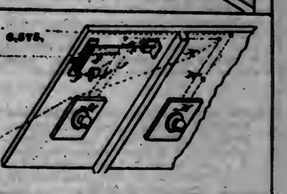
6,577. HOTEL-ANNUNCIATORS AND FIRE-ALARMS. Edward A. Hill, Chicago, Ill. Patent No. 114,007, dated Apr. 25, 1871. [Filed July 19, 1875.]

1. The combination of the magnet A and shunt with the special magnets B' C', when so constructed and arranged that the electric current passes alternately through the magnet and shunt automatically, for the purpose of strengthening the currents to the magnets B' C' when the magnet A is shunted.
2. The permanent magnet K', in combination with the shunt-circuit and the alarm-bell, when constructed and arranged substantially as and for the purposes specified.
3. The combination of the permanent magnet K', the vibrating arms L', E', and A', when constructed and arranged substantially as described, for the purposes of opening and closing the circuit of the shunt.

6,577. HOTEL-ANNUNCIATORS AND FIRE-ALARMS. Edward A. Hill, Chicago, Ill. Patent No. 114,007, dated Apr. 25, 1871. [Filed July 19, 1875.]



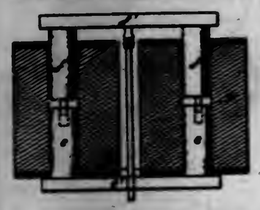
2. The dial S', provided with transparent figures, in combination with the shifting blind, as and for the purpose as specified.
3. The slide-bar V, for restoring the curtain or blind B or the pivoted armature O, as described.



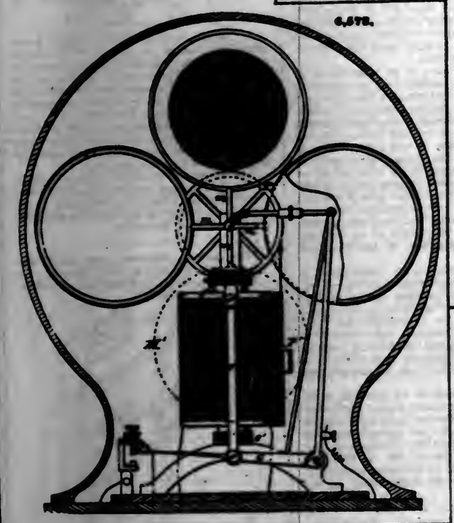
6,578. HOTEL-ANNUNCIATORS AND FIRE-ALARMS. Edward A. Hill, Chicago, Ill. Patent No. 114,007, dated Apr. 25, 1871. [Filed July 19, 1875.]

Brief.—Numbers are supplied on an opaque ground, tilting shields same color as ground normally behind the numbers, practically concealing them until withdrawn by magnet.

1. The combination of the pivoted armature O and tilting blinds or curtains B, when constructed and operating in an annunciator, substantially as and for the purpose specified.



6,579.

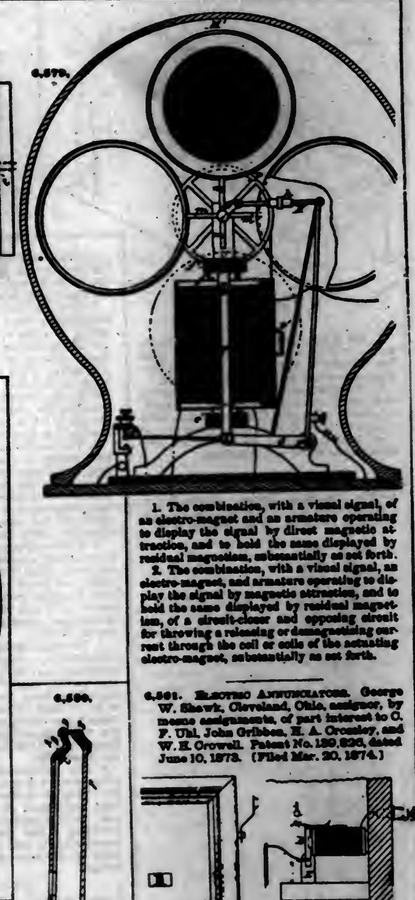


The combination of the thermostat and call-boy or knob in a circuit with an electro-magnetic annunciator, as described

6,572. Electric Signaling Apparatus for Railways. Frank L. Pope, Rimbolt, assignor to himself, Jos. N. Ashley, Greenville, N. J., S. C. Hendrickson, Brooklyn, N. Y., and James D. Lincoln, Greenville, N. J. Patent No. 180,941, dated Aug. 27, 1872. (Filed July 28, 1876.)

6,572.

1. A semaphoric signal constructed with disks or targets of alternate contrasting colors, in combination with an electro-magnet, substantially as specified.

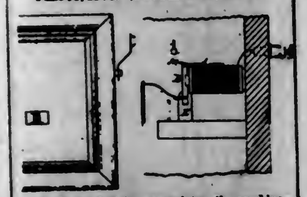


2. An electro-magnet actuated partially or wholly by axial magnetism, in combination with a semaphoric signal, substantially as and for the purpose described.

3. An electro-magnet having an armature so arranged as to be held in contact with its poles by residual magnetism until released by an opposing or demagnetizing current emanating from any suitable apparatus for generating the electricity, in combination with a semaphoric signaling apparatus or an alarm, substantially as specified.

4. The combination of a semaphoric signal operated by electro-magnetism, and a secondary signal actuated or controlled by said semaphoric signal, with a reversing or retarding apparatus so arranged that when the said signals have been set by an operator at one point or station they can only be reversed or released by an operator at another point or station, substantially as herein specified.

6,572. Electric Signaling Apparatus for Railways. Frank L. Pope, Rimbolt, assignor, to himself, Jos. N. Ashley, Greenville, N. J., S. C. Hendrickson, Brooklyn, N. Y., and James D. Lincoln, Greenville, N. J. Patent No. 180,941, dated Aug. 27, 1872. (Filed July 28, 1876.)



6,572.

1. The combination, with a visual signal, of an electro-magnet and an armature operating to display the signal by direct magnetic attraction, and to hold the same displayed by residual magnetism, substantially as set forth.

2. The combination, with a visual signal, an electro-magnet, and armature operating to display the signal by magnetic attraction, and to hold the same displayed by residual magnetism, of a circuit-closer and opposing circuit for throwing a releasing or demagnetizing current through the coil or coils of the actuating electro-magnet, substantially as set forth.

6,580. Electric Annunciators. George W. Shewit, Cleveland, Ohio, assignor, by mesne assignments, of part interest to C. F. Uhl, John Gribben, H. A. Crowley, and W. H. Crowell. Patent No. 180,826, dated June 10, 1873. (Filed Mar. 20, 1874.)

1. In an electric annunciator, the combination of an electro-magnet with an armature, which is actuated by magnetic attraction, and retained in direct contact with the cores of the electro-magnet by residual magnetism, in connection with independent mechanism, substantially as described, whereby the armature is forced from the cores by positive mechanical action, substantially as set forth.

2. In an electric annunciator, the combination of a numbered or lettered plate with the armature of an electro-magnet, the armature adapted to be retained in direct contact with the cores of the magnet by residual magnetism, substantially as described.

3. In an electric annunciator, the combination of a weighted arm with the armature of an electro-magnet, to which a lettered or numbered plate is secured for the purpose of counterbalancing the weight of the said plate, and thereby insure the attraction of the armature to the magnet by a light electric current, substantially as described.

4. In an electric annunciator, the combination of a crank-shaft, having an arm secured thereto, with the armature of an electro-magnet, to which a lettered or numbered plate is secured, for the purpose of releasing the armature from the electro-magnet, and allow the letters or numbers to move away from view, substantially as described.

6,590. Clock-Dials. S. H. Root, Bristol, Conn. Patent No. 28,960, dated May 10, 1860; extended seven years. (Filed July 17, 1876.)

1. The combination of a metallic scalp with a clock-dial, substantially as and for the purpose described.

2. The combination of a metallic scalp and also back with a paper dial, substantially as and for the purpose shown.

3. The combination of a zinc back with a paper dial, substantially as and for the purpose set forth.

4. The combination of metallic back and paper dial with a rim of "struck up" sheet metal, substantially as and for the purpose described.

5. As a new article of manufacture, the combination of a clock-dial, B, metallic back A, and frame C, substantially as and for the purpose set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 6. TUESDAY, AUGUST 10, 1875. PRICE { $5,00 per year—single. $5,00 per year in clubs.

The Official Gazette is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

JAMES HEGINBOTHAM.—*Preliminary reference.*

[*In the matter of the application of James Heginbotham for Letters Patent for* "Improvement in Furnaces for Steam-Boilers."—*Decided July* 22, 1875.]

In certain cases the signature to a petition by an applicant's attorneys may be received. *Voelter's* case, (Commissioner's Decisions, 1870, page 84,) referred to.

In the division of an application the various prerequisites cannot be dispensed with; *ergo*, a new oath must accompany the divisional portion of an application the same as if it were an original application. Case of *Whitely* vs. *Swayne*, (4 Fisher, 117,) referred to.

The dictum that separate independent inventions must be the subjects of separate patents is not a mere Office rule, but is in consonance with the law.

Spear, *Acting Commissioner:*

It is requested on the part of the applicant in this case—

First, that the oath in the original case, which was divided at the request of the Office, be applied to this division, which embraces no matters not contained in the original papers, and covered by the oath annexed thereto.

Second, that the signature of the applicant, by his attorneys, be admitted to the petition.

To the signing of the petition by the attorneys of the applicant I see no objection. As was said in the case of *Voelter*, (Comr. Dec., 1870, p. 84,) the petition is a matter of form merely. There is

nothing in the law that seems directly or by implication to forbid the reception of the petition when signed by attorney, and in the absence of any such statutory prohibition it is believed that a liberal policy in this regard is fully warranted by the analogies that obtain in the general law of principal and agent.

Although this was said in regard to a petition for an extension of a patent under the law of 1870, yet I regard it as equally applicable to the present case.

There are, however, very serious objections to granting the first request of applicant. The division of an application, where more than one distinct invention is claimed, is not required on account alone of classification or the mere convenience of the Office, as contended by applicant; but the Office has always taken the ground that the spirit and policy, if not the letter of the law, require that separate independent inventions should be the subjects of distinct patents, and the courts have invariably acquiesced in that practice.

When, then, several applications are carved out of one, each independent in subject-matter of the other, it is very clear that all the prerequisites of the law in respect to the original application should be observed as to the others.

The oath is a prerequisite to the granting of a patent. It was so held by Judge Story in the very case in which he held the patent valid, notwithstanding the informality of the oath, (*Whittemore* vs. *Cutter*, 1 Gal.,) and other courts have found the same; but, because the courts have sustained patents where some of the prerequisites to their granting have been ignored or dispensed with by the Office, it by no means follows, as contended by the present applicant, that it is a matter discretionary with the Commissioner. On this point the court, in the case of *Crompton* vs. *Belknap Mills*, 3 Fisher, 537, although holding that, whether the oath were taken or not, such an omission would not invalidate the patent nor affect its reissue any more than if the fees required by law had not been paid, yet at the same time observed that both were directory and not to be dispensed with, proceeding on the ground that the patent afforded a conclusive presumption that the requirements of the law were complied with in issuing the patent, but not in the slightest manner justifying the Office in disregarding those requirements.

But the course adopted by the courts in the cases above mentioned has not by any means been uniformly followed by other circuit courts. In the case of *Ransom* vs. *Mayor of New York*, 1 Fisher, 252, it was held that the things specified in section 6 of the act of 1836, were prerequisites to the granting of a patent, and unless these prerequisites were complied with a party sued for infringement of a patent might show that they had not been complied with, and so defeat the action of the supposed inventor. One of the things specified in that section was the oath of precisely the same description as is required by the present law.

In a case still later than any of the others cited (*Whitely* vs. *Swayne*, 4 Fish., 117,) the court, Judge Leavitt, quoted and approved the language in the case last-above named, and held a reissue patent invalid, because an oath attached thereto was not such an oath as the law prescribed, and that it was an excess of authority on the part of the Commissioner to grant a reissued patent upon such an oath. Now, in that case the reissued patent was a division of the original application. The question of division in the matter of reissue is just the same as in the matter of an original application. If an application has gone to patent which includes several separate and distinct parts of an invention, the law provides that the patentee may reissue and have a patent for each of those separate devices. These devices were included in the original application, and must necessarily have been so, or the reissue could not legally be granted. The original oath covered all matters contained in the reissue; why, then, the necessity of additional oath therein?

It is quite clear that if the matter of the present division application were the subject of a reissue application, and the latter should go to patent without the oath attached, the courts, if following the doctrine in *Whitely* vs. *Swayne*, would hold the same invalid; for if an oath informal, in part, was a defect sufficient to invalidate a patent, the omission of the oath entirely would certainly be equally as fatal.

The well-settled doctrine that two patents cannot be legally granted for the same invention would seem to necessitate the requirement that all the prerequisites required by law to the granting of a patent should be possessed by each individually, and that when made in one application they cannot be made to lap over and cover another.

The difficulty of an opposite course is especially illustrated in a case where all the devices which go to make up the invention are originally claimed in combination. The inventor may have made what he considers a legitimate combination of elements, of which he is ready to make oath that he is the first and original discoverer. Yet, considered separately, he may be well aware that he cannot claim to have originated each or several of the distinct parts. In that case, should the Office decide that the combination is not a legitimate one, and require the applicant to divide, and yet allow the oath made to the combination apply to each division, patents would be issued to other than the first and original inventor, in direct violation of law. This consequence might follow in the present case.

For the reasons thus given I am of opinion that it would not be in accordance with law nor sound practice to grant the applicant's first request. The applicant proposes, in conclusion, that if this practice is insisted upon the rule might be observed by filing with the new application a certified copy of the papers accompanying the original case, including the matter now presented and the oath.

Having decided that the division should be treated as an independent application for an invention distinct from that embraced in the original one, the same prerequisites of the statute must be complied with as in all other applications, and the course proposed cannot, therefore, be entertained.

KERNARD KNOTT.—*Interlocutory appeal.*

[*Appeal from the Principal Examiner in the matter of the application of Kernard Knott for* "IMPROVED METHOD OF SLAUGHTERING, &c."—*Decided July* 26, 1875.]

It is the duty of the Office at the outset, in requiring the division of an application, to indicate clearly the nature and extent of the division required.

SPEAR, *Acting Commissioner:*

I have carefully read the specification and examined the drawings in this application with a view of determining how much there might be in the objections raised by the Examiner, and to what extent applicant ought to yield to his requirement of the division of the application.

So far as I see, there should be three applications instead of one. I leave out of question the novelty of the devices, as I have no means of determining this question, and, indeed, am not now called upon to consider the question of patentability on any ground. I think the matter included in the claims, numbered consecutively to the 8th, may be properly included in one application. The claims from the 8th to the 12th, inclusive, relate to the hatchway-elevator and other apparatus on board the vessel, and belong to another and distinct invention. The remaining claims, 13th, 14th, and 15th, contain other and equally distinct subject-matter, and relate to a vessel constructed with a view of keeping the air, or whatever the hold contains, at a low temperature. The applicant should be required to divide his application into these three divisions, and no more.

I cannot permit this case to pass without commenting upon the Examiner's method of treating the application. Applicant doubtless made his application for a patent in the form in which it appears in good faith. He had devised a series of mechanisms all looking to one common object. That object was a remote one indeed, but still it was unquestionably the one object for which all his devices were made. He supposed, as I must believe, when he made his application to this Office for a patent, that he was entitled to claim in one patent all that he had invented. Now, had his application been considered upon its merits, he would have been entitled under the law, if rejected, to the reasons for such rejection, together with such information and references as might be useful in judging of the propriety of changing his specification.

In accordance with the law in such instances the Office invariably points out to the applicant exactly what part of his invention is considered to be new, and what part old. But in the present instance the Examiner wrote to the applicant, as follows:

The applicant claims, separately, many devices belonging to almost as many classes of invention. It is true they are all applied in producing a single ultimate result; but it is as a saw-mill, a planing-machine, and a brick-machine contribute toward the construction of a house, and an engine, a capstan, and a compass to the completion of a steamship. It is considered that there are subjects-matter in this application for many applications, and that it should be divided accordingly, since their connection, to be appreciated, is not a necessity. The method, plan, system, or process which comprehends them all, is not more real than that ginning, spinning, weaving, and bleaching cotton, as carried on in a large establishment, is a single process. (See Office Rules 15 and 16.)

Now the Examiner's illustration throws no light whatever on just that part of the subject which it was necessary for applicant to understand, in order to divide his application in accordance with the views of the Office. As he supposed the invention was a unit, he should have been informed exactly into what parts the Office required a division. To tell him that he must divide, and not to indicate how, was to fail in raising any definite issue, exactly such failure as if the Examiner should reject for lack of novelty, and not inform applicant what part was old, and for what reason he considered it old. Applicant would have complied with the requirement of the Examiner if he had divided the application into two parts; that would have been a division. But it appeared after appeal to the Commissioner that the Examiner considered the application as containing eleven distinct inventions. It would have been the merest guess-work for applicant to attempt a division without particular information as to the Examiner's views; and, indeed, no further words seem necessary to make it clear that it is the duty of the Office at the outset, in requiring the division of an application, to indicate clearly and precisely to the applicant into what parts and how the application should be divided.

I understand this to be the practice of the Office, and certainly no other course is favorable to a speedy and satisfactory transaction of the business. With these remarks the case is returned to the Examiner.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, DISTRICT OF MASSACHUSETTS.

OTIS TUFTS *et al. vs.* THE BOSTON MACHINE COMPANY.

[*In equity.—Before* SHEPLEY, *Cir. J.—January*, 1875.]

The twelfth claim of the patent granted Otis Tufts, August 9, 1859, for Improvement in Elevators and Hoisting Apparatus for Hotels, &c.—viz: "Passing the shipping rods and the cord or rod that operates the friction-brake through the car or platform, for the object and purposes set forth"—if construed broadly as a claim for passing any rod or cord, by means of which the appropriate mechanism is operated to move the car up and down, or hold it at rest, *through the car or platform*, is void for want of novelty.

In view of the prior elevator of Hecker, in which a single chain passing through the car furnished the means for lifting a gravity-brake and operating a friction-clutch, the claim can only be sustained by giving it a construction strictly in accordance with the language used—viz., "passing *the* shipping-rods *and* the cord or rod," &c.

The first claim of the patent granted to Otis Tufts, May 28, 1861, for Improvement in Elevators—viz: "Constructing an elevator or hoisting apparatus with a series of two or more hoisting ropes or chains having independent attachments, and winding simultaneously upon the hoisting-drum for greater safety," &c.—is void for want of novelty.

The second claim of the patent being for "equalizing the strain upon the series of ropes or chains *x x x x* by automatic adjustment," &c., where it appeared that defendants used a different means of automatic adjustment from that described in the patent: *Held*, that, in the absence of proof that the device used by the defendants was, at the date of the patent, a known substitute for the devices described therein, the claim cannot be regarded as infringed.

The claim of a patent held to be anticipated by a clear description in an English provisional specification which had been printed by Eyre & Spottiswoode.

[*James B. Robb*, for complainants.
Causten Browne, for defendants.]

SHEPLEY, *J.:*

This is a bill in equity brought for alleged infringement of letters patent issued to Otis Tufts, dated August 9, 1859, and extended seven years, for improvements in hoisting apparatus, and adapting that apparatus for use as a passenger-elevator for carrying persons to and from the different stories in hotels and other buildings; and also of letters patent dated May 28, 1861, for improvement in the mode of suspending and operating the elevator; also, for infringement of letters patent dated December 11, 1866, for improvements in the mode of adjusting the length and tension of the ropes of an elevator; and of letters patent dated December 11, 1866, for an improvement in elevator-guides. All of these patents were duly assigned to complainants.

The twelfth claim in the patent of August 9, 1859, No. 25,061, is the one on which the infringement is claimed, and is as follows:

I claim passing the shipping-rods and the cord or rod that operates the friction-brake through the car or platform, for the object and purposes set forth.

The shipping-rods are described in the specification as passing up through the car the whole height of the building and operating a shipper, by which the driving-belt is shipped from a fast to a loose pulley when the power is to be thrown off. The cord is also described as passing down through the car or platform, so as to be accessible within the car, which operates to apply a counterpoise-spring, so as to put on a friction-strap brake, its office being to check or perfectly stop the descending motion of the car at the will of any person within the car or on the gallery.

The great advantage (claimed) of running the shipping-rods and the cord or rod up through the car itself is that they are thus rendered accessible to the conductor, or any person within the car, without incurring the danger of protruding the hand or arms beyond the same while in motion.

If the twelfth claim be construed broadly as a claim for passing any rod or cord, by means of which the appropriate mechanism is operated to move the car up and down, or hold it at rest, *through the car or platform*, instead of outside the car or platform, it is void for want of novelty.

George V. Hecker had in his flour-mill in Cherry street, New York, an elevator which was put in twenty years ago, and which has been in successful operation since that time. A chain passed through the roof and floor of the cage or car, which operated upon a friction-clutch and a brake. The conductor or operator within the car could, by means of this chain, operate the shipping apparatus and the brake without incurring the danger of protruding the hand or arms beyond the car while in motion. This chain was connected with a brake in such a manner that the brake could be thrown off by pulling upon the chain, or put on by relaxing the pull upon the chain, a weight then causing the brake to produce friction on the friction-pulley. The pull upon the chain, by raising the weight, first relieved the friction of the brake, and then threw into gear a friction-clutch, and the car ascended by the force of the motor applied through the friction-clutch. When it was desired to stop, the pull upon the chain was relaxed, and the weight threw the clutch out of connection and the cage stopped, held in place by the brake. When it was desired to descend a slight pull was made upon the chain, sufficient to relax the pressure upon the brake, but not to throw the friction-clutch into gear. The car then descended under control of the brake, by force of gravity, at a speed dependent upon

the will of the operator who controlled the brake. Within the car was a lever with one long and two short arms, with a friction-pulley on each of the short arms, which device was for the purpose of making the necessary pulls upon the chain which passed through the inside of the car. The friction-clutch is a well-known substitute for a shaft with a fast and loose pulley, a belt and belt-shipper.

It is manifest, therefore, that, in view of the state of the art, the twelfth claim in the patent can only be sustained by giving to it a much narrower construction than the one claimed for it, and one strictly in accordance with the language of the claim, viz:

Passing *the* shipping-cords *and* the cord or rod that operates the friction-brake through the car and platform, for the objects and purposes set forth.

The defendants do not infringe the twelfth claim thus construed, or any other claim of the patent of August 9, 1859.

Infringement is also alleged of the first and second claims of the patent of May 28, 1861, which are as follows:

1. Constructing an elevator or hoisting apparatus with a series of two or more hoisting ropes or chains having independent attachments, and winding simultaneously upon the hoisting-drum for greater safety, substantially as described.
2. Equalizing the strain upon the series of ropes or chains of my improved elevator or hoisting-machine by automatic adjustment, substantially as described.

To construct "an elevator or hoisting apparatus with a series of two or more hoisting ropes or chains having independent attachments, and winding simultaneously upon the hoisting-drum," was not new at the date of this patent. Letters patent of Great Britain to Frederick Levick and Joseph Fieldhouse, sealed January 13, 1854, describe a hoisting car or carriage with two hoisting-ropes wound around the same spirally-grooved drum. The ends of both of these ropes are attached to a connecting-chain, which passes under a pulley attached to the top of the car. Another chain is attached to the first-described chain in such a manner that the chain surrounds the pulley. If one breaks, the other, with the chain, forms a loop around the pulley, and sustains the car. The second chain converts the attachment into an independent attachment of each rope, and, when one rope breaks, the other rope will continue to sustain the weight of the car. Mr. Renwick, the expert, correctly states that—

The ropes act precisely as if they were attached to the two ends of a horizontal lever whose center, upon which it could turn, was secured to the top of the car.

In the patent of 1861 the patentee, Tufts, says:

I do not confine myself to the precise method herein described of effecting the automatic adjustment of the strain upon the hoisting-ropes, as I sometimes accomplish the same by a rocking lever, when two ropes are used.

It is plain that, in the Levick and Fieldhouse elevator, the two ropes, when intact, have equal strain upon them, and that, if one of the ropes should break, the weight of the car would be supported by the other rope. If the chain should break under the pulley the car would fall, as it would in the form last described of the Tufts elevator, if the attachment to the car at the center of the rocking lever should fail.

It is contended that the purpose of the two ropes in the Levick and Fieldhouse machine was to keep the cage in the center of the shaft, and that, therefore, the Levick and Fieldhouse patent does not anticipate the first claim in the patent of 1861. The answer to this is, first, that whether they were placed there for the purpose of greater safety or not, they effected that result; and, secondly, that the patentees evidently contemplated that as one of the beneficial results to be attained by the use of two ropes instead of one, as there is no conceivable use for the cross-chain before described, except in case of the breakage of one rope, to form a loop around the pulley, thus attaching the surviving rope to the car.

In the elevator which was placed in the mill of the Parsons Paper Company, at Holyoke, Massachusetts, in 1856, there were two hoisting-ropes, having independent attachments to opposite arms of a rocking lever; they jointly and equally took the strain of the weight of the car, and each rope was sufficient to sustain the load put upon the machine. This elevator has been in constant use, and when one rope has broken the elevator has been worked several days with the remaining rope. The ropes in the Holyoke elevator did not, it is true, wind around a drum, but were passed around a series of pulleys, and the free ends of the ropes were attached to counterpoise-weights, but these two means of winding up a rope to which a weight is attached are well-known substitutes for each other.

Without adverting to the other patents which have been introduced in evidence, and relied upon in defense in this branch of the case, enough has been stated to show that the first claim of the patent of 1861 is void for want of novelty.

The second claim in this patent—viz., "equalizing the strain upon the series of ropes or chains of my improved elevator or hoisting-machine by automatic adjustment, substantially as described"—can only be construed as a claim for the described means of performing this function, and for well-known substitutes or equivalents of those described means. The means the patentee describes are three. One of those modes is by means of a rocking lever, or system of rocking levers, to the ends of which the suspensory ropes are attached. The Holyoke elevator and the Levick and Fieldhouse elevator both anticipate this claim. One had a rocking lever, and the other had a device which operated in the same way and produced the same result. If the claim is valid, defendants are not proved to have infringed it, for there is no evidence in the record tending to show that the contrivance used by the defendants—of a series of pistons fitting into a set of cylinders with connecting pipes, the cylinders being filled with an incompressible fluid—were, at the date of the patent, known substitutes for either of the means of adjustment described in the patent.

The patent of December 11, 1866, No. 60,441, so far as the second claim is concerned, which is the one alleged to be infringed, relates to—

Means for manipulating relative adjustment within reasonable limits of the series of ropes or chains, which are independently attached to the winding-drum and to the car of the elevator, so that an equal degree, or very nearly equal degree, of tension can be had upon each rope or chain of the series, by proper attention or manipulation on the part of the party having such elevator in charge.

The patentee states in his specification that considerations of saving in the first cost of construction render it desirable in many instances to substitute for an automatic adjustment of the ropes or chains a means for adjusting them from time to time, as occasion may require; in other words, that the means of manipulatory adjustment in the patent No. 60,441 were intended as a substitute or alternative means for the automatic adjustment described in the patent of May 28, 1861, No. 32,441. The defendants have put into their elevators means of mechanical manipulatory adjustment, but they do not perform the function described by Tufts as a substitute for the automatic adjustment, because the tension on the ropes or chains cannot be varied by any manipulation of the nuts. Owing to the presence of the equalizer, the means of automatic adjustment in the defendant's elevator, the nuts or the stirrups may be screwed up or down to their fullest extent on any rope, without any variation of the tension on that or any other rope. As defendants do not infringe, it is not necessary to consider the question of novelty of this claim.

The patent of December 11, 1866, relates to means by which an elevator is so guided as to prevent the sway thereof, and the noise consequent upon contact with the ways by which the elevator is guided. The claim is as follows:

I claim combining the suspended car of an elevator with the ways or rails which confine it, by means of guides kept by springs constantly in contact with said ways or rails, when said guides are so arranged as to be capable of motion toward and from the rails.

In the provisional specification, filed April 6, 1858, in the office of the Commissioner of Patents for Great Britain, accompanying the petition of Louis Tétar Van Elven for a patent, which did not proceed to the great seal, but which specification was printed by Eyre & Spottiswoode, is a clear and accurate description which contains all the features of this claim. Respondents' Exhibit No. 13 is a model of the device described in the Van Elven specification. It fully anticipates every feature of this claim.

Complainant's bill dismissed.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date August 10, 1875.]

8,560.—Carpet.—JOHN FISHER, New York, N. Y., assignor to E. S. HIGGINS & Co., same place. Application filed July 26, 1875. Term of patent 3½ years.

8,561.—Carpet.—THOMAS J. STEARNS, Boston, Mass., assignor to ROXBURY CARPET COMPANY, same place. Application filed July 29, 1875. Term of patent 3½ years.

8,562.—Bird-Cage and Hanging-Basket Hook.—FRANCIS T. FRACKER, New Britain, Conn., assignor to P. & F. CORBIN, same place. Application filed June 26, 1875. Term of patent 7 years.

Auger, hollow, A. A. Wood	29	166,673
Auger, hollow, A. A. Wood	29	166,674
Awning, F. C. Lueenhop	162	166,618
Bale tie, H. B. Jones	7	166,614
Bale tie, A. A. Szabo	7	166,658
Bale tie clamp, H. Z. Young	7	166,491
Baling hay, cotton, &c., J. M. Seymour	7	166,640
Bed bottom, T. L. Odell	62	166,545
Bed bottom, C. V. B. Reeder	62	166,634
Bedstead, sofa, S. Squires	62	166,566
Belt coupling, J. Hare	81	166,457
Belt shifter, J. D. Isaacs	87	166,464
Bilge water valve for ships, J. W. Hughes	137	166,526
Bird cage, A. L. Edwards	170	166,385

	Class No.	No. of Patent.
Bird cage, A. L. Edwards	176	166,596
Boot and shoe, Meyer and Freiburg	16	166,621
Boot and shoe heel, A. A. Danforth	16	166,507
Boot and shoe inner sole, A. Van Wagenen	16	166,664
Boot and shoe leather tip, A. Van Wagenen	16	166 658
Boot and shoe strape, protector for, H. P. Osbourne	16	166,547
Boot and shoe, wooden sole, M. J. S. Falcon	16	166,517
Boot, rubber, I. F. Williams	84	166,669
Boot tree, Case and Rankin	16	166,499
Boots and shoes, machine for sewing on the soles of, T. J. and M. C. Denne	16	166,509
Box scraper, G. Meyer	29	166,540
Brake pipe coupling, vacuum, G. Westinghouse, Jr	122	166,489
Brick machine, A. Morand	20	166,544
Bridle bit, L. F. Judd	72	166 615
Brush, S. A. Miles	22	166,542
Brush, M. E. Hawkins	22	166,607
Burner, gas, P. F. Jonté	64	166,531
Burner, lamp, A. Barker	90	166,493
Burner, lamp, S. R. Wilmot	90	166,670
Burner, refuse, Smith and Walker	149	166,650
Button, sleeve, J. G. Misselmer	86	166,543
Can, milk, Hawley and Mead	45	166,525
Can seaming machine, L. C. Beardsley, (reissue)	136	6,582
Can, sheet metal, L. C. Beardsley, (reissue)	136	6,583
Can traveling, A. A. Gervais	154	166 520
Candlestick, T. Swann	90	166,651
Car axle lubricator, C. D. Flynt	123	166,600
Car coupling, H. C. Hunt	122	166,463
Car coupling, J. M. Marlin	122	166 537
Car coupling, B. Mickle	122	166 622
Car coupling, J. Singer	122	166,563
Car coupling, street, H. Kruger, Jr	122	166,533
Car seats, head rest for, T. Edwards	121	166,435
Carburetor, E. J. Daschbach	27	166,508
Carbureting apparatus, C. M. Gearing	27	166,602
Card cylinders, machine for cleaning, H. Spaulding	28	166,565
Carding engine, wool, A. H. Woodbury	28	166,578
Carding machines, condensing mechanism for, M. A. Furbush	28	166,601
Carriage, R. L. Ogden	31	166,546
Chain links, machine for welding, B. Hershey, (reissue)	60	6,589
Chair, H. Reupke	62	166,555
Chair seat, nursery, S. S. Newton	62	166,474
Chair, ship's, D. Parks	62	166,628
Cheese press, Dolph and Smith	45	166 512
Chuck and centerer, J. R. Mason	100	166,538
Cigar box, M. Lichtenstein	166	166,534
Cigar bundling machine, N. Du Brul	160	166,591
Cigar mold press, J. Simpson	160	166 643
Clamp for pressing leaves, C. W. Holbrook	54	166,608
Clasp for holding currency, &c., spring, B. W. James	23	166,613
Clocks, device for winding, E. Farcot	76	166,518
Cloth dyeing frame, E. Brierley	11	166,450
Clothes line reel, E. D. Richardson	91	166,478
Clothes pounder, A. J. Harmon	91	166 458
Clothes washer, H. E. Smith	91	166 646
Coal, apparatus for drying, L. Jacobi	48	166,612
Cock, stop, J. Mallinson	167	166,472
Coffee, compound for polishing and coating, J. H. Siegman	57	166,641
Confectionery, cream dropping machine for, G. Smith, Sr	155	166,644
Cork, W. King	1	166,467
Cornice tool, W. P. Walter	4	166,666
Cotton chopper, W. D. Evans	43	166,597
Cultivator, A. Schrader	43	166,636
Currency, &c., spring clasp for holding, B. W. James	23	166,613
Curtain fixture, H. Seebausen	69	166,561
Cylinder for cotton presses, steam, J. F. Taylor	150	166,653
Desk, combined reading and writing, L. G. Fairbank	62	166,516
Ditching machine, H. and K. Olsen	51	166,626
Drill sharpening machine, W. H. Eddy	100	166,515
Drilling machine, rock, C. C. Creeger	124	166,590
Egg tester, W. W. Wilson	116	166,671
Electroplating glass, china, &c., E. Hansen	113	166,606
Elevator, W. H. Brown	79	166,496
Elevator, water, J. Chandler	79	166,500
Engine, electro-magnetic, C. A. Hussey	50	166,527
Engine, oscillating, J. Wolf	150	166,672
Engine piston, steam, W. T. Duvall	151	166,592
Engine, portable steam, McKaig and Muncaster	94	166,541
Equalizer, draft, H. Sensenbaugh	31	166,639
Evaporating pan, J. M. Trumbo	155	166,656
Fan sticks, machine for cutting, J. W. White	174	166,751
Fare box, S. W. Francis	42	166,598
Faucet, E. W. Barnes	167	166,581
Faucet, D. C. Stillson	167	166,482
Faucet, self-closing, D. C. Stillson	167	166,483
Faucet, vent, C. H. Rauert	167	166,554
Fire extinguisher, automatic, Brown and Foskett	35	166,451
Fire extinguisher, automatic, Brown and Foskett	35	166,452
Floor, fire-proof, J. D. Pierce	30	166,552
Furnace grate, W. Tinkham	149	166,487
Gas apparatus, C. M. Gearing	66	166,603
Gas, apparatus for the manufacture of illuminating, Smith and Goldthorp	66	166,645
Gas carburetor, A. W. Porter	27	166,476
Grain meter, W. Colwell	132	166,593
Grain shocks, machine for compressing, S. C. Minear	74	166,624
Gun barrels, covering for, H. A. Silver	55	166,642
Harrow, I. W. Hutchin	73	166,528
Harvester, Gordon, Myers, Telford, and Hubbard	74	166,605
Harvester, corn, C. D. Reed	75	166,633
Hay gatherer, P. Russell	77	166,560
Hoisting tongs, W. C. Frederick	79	166,599
Hook, hat and coat, C. H. Winton	24	166,576
Hoop fastening, W. Spalding	40	166,564
Horn and hoof, manufacturing articles from, W. F. Niles	176	166,475
Horseshoe, J. H. Dorgan	60	166,513
Hose nozzle, W. Thomson	167	166,654
Hose spanner and key, A. J. Barnard	167	166,492
Hose, water proof, S. W. Baker	81	166,580
Hydrants, &c., stuffing box and valve mechanism for, J. P. Hyde	167	166 611
Ice cream, &c., vessel for measuring, F. Watkins	88	166,667
Ice creeper, A. J. R. Phillips	16	166,630
Indicator, station, L. V. Adams	121	166,445
Indicator, station, S. M. Dewey	121	166,510
Induction coil, J. C. Vetter	50	166,488
Iron and steel, manufacture of, A. G. Cook	85	166,454
Ironing apparatus, H. E. Smith	91	166,647
Ironing apparatus, H. E. Smith	91	166,648
Knit fabrics, machine for drying tubular, Greene and Pawling, (reissue)	37	6,587
Knit fabrics, machine for drying tubular, Greene and Pawling, (reissue)	37	6,588
Lamp, G. A. Beidler	90	166,582
Lantern, C. J. Sykes	90	166,484
Lathes, shell cutter for metal turning, A. Hoyle	100	166,462
Lathing, metallic, I. V. Holmes, (reissue)	4	6,590
Leaves, clamp for pressing, C. W. Holbrook	54	166,608
Letter box and milk receptacle, combined, E. E. Miller	146	166,623
Life preserving jacket, T. Richards	138	166,477
Liquids, &c., apparatus for measuring, E. E. P. Clausolles	42	166,502
Lock for doors, J. G. L. Martin	93	166,620
Lock for doors, &c., J. G. L. Martin	93	166,619
Lock for sliding doors, F. Corbin	93	166,505
Lock for sliding doors, Lyon and Parker	93	166,470
Lock, time, O. E. Pillard	93	166,632
Loom shuttle binder, T. Blake	95	166,494
Marking wheel, W. H. Bell	117	166,583
Match box, T. Robertson	90	166,480
Measuring liquids &c., apparatus for, E. E. P. Clausolles	42	166,502
Medical composition, C. C. Troutman	98	166,655
Mill, J. Kaiser	59	166,466
Millstone dressing machine, diamond, O. G. Vanderhoof	133	166,570
Motors, governor for electric, A. MacConnel	50	166,471
Mowing machine knives, &c., machine for sharpening, G. V. Phelps	70	166,629
Nail plates, machine for rolling, H. Woods	125	166 577
Needle wrapper, A. K. Phillips	104	166,550
Nozzle, exhaust, T. Shaw	150	166,562
Nut tapping machine, S. L. Wonsley	14	166,490
Oil tanks, manhole for, W. H. Anderson	51	166,446
Organ attachment, reed, A. Schoenhut	106	166,635
Oil wells, torpedo for, R. S. Orsburn	124	166,627
Paper pulp engine, A. Gardner	108	166,519
Paper pulp, machine for molding, B. F. Barker	108	166,447
Pavement, concrete, Thormann and Brumshagen	110	166,486
Pin, safety, A. Shedlock	86	166,481
Pinchers, wire barb, Dobbs and Booth	170	166,511
Pipe coupling, vacuum brake, G. Westinghouse, Jr	122	166,489
Pipe, machine for welding and finishing, M. Blakey	163	166,449
Pipes, pressure regulator for water, F. Steele	167	166,567
Piping for buildings, system of steam and water, J. H. Mills, (reissue)	147	6,591
Planking clamp, J. Hastings	29	166,524
Plow, T. M. Brous	114	166,586
Plow, gang, D. A. Mannel	114	166,536
Press, cigar mold, J. Simpson	160	166,643
Presses, steam cylinder for cotton, J. F. Taylor	150	166,653
Printing press, Cook and Foskett	117	166,675
Propeller, screw, L. C. and G. F. Cary	139	166,498
Pump, T. Butler	118	166,497
Railway signal, electric, D. Rousseau	50	166,557
Railway signal, electric, D. Rousseau	50	166,559
Railway signals, circuit closer for, D. Rousseau	50	166,558
Railway switch, Gill and Beisel	129	166,604
Railway switch, street, A. L. Johnson	129	166,530
Railway tanks, raising water into, T. Rodes	118	166,556
Railways, apparatus for lubricating, O'Sullivan and Murphy	129	166,546
Railways, permanent way for, R. E. Nichols	130	166,625
Refrigerator, R. Loud	38	166,469
Sash cord fastener, J. F. Collins	24	166,503
Sash fastener, J. Thornan	24	166,485
Saw setting device, L. A. Greely	131	166,522
Sawing machine, Frey and Eichholtz, (reissue)	130	6,586
Scales, letter, A. Turnbull	132	166 569
Scales, weighing, H. C. Wingate	132	166,575
Seed dropper, bean and pumpkin, E. Sears	133	166,638
Separator, grain, A. W. Gray	159	166,456
Separator, grain, A. W. Kendrick	159	166,538

	Class No.	No. of Patent.
Sewed or stitched, trimming the edges of material while being, W. A. Springer, (reissue)	134	6,593
Sewing machine quilting attachments, holder for, N. Barnum	134	166,448
Sewing machines, trimming and cutting attachment for, W. A. Springer, (reissue)	134	6,592
Shawl holder, P. Meinberg	38	166,473
Sheet metal shearing machine, Clark and Kittredge	119	166,588
Ships, bilge water valve for, J. W. Hughes	137	166,526
Ships' chair, D. Parks	62	166,628
Shirt bosom, J. C. Coombs	38	166,589
Shoe fastenings, nail strip for, A. Van Wagenen	16	166,661
Shoe fastenings, nail strip for, A. Van Wagenen	16	166,662
Shoe tip, A. Van Wagenen	16	166,660
Slate frame, J. Haggerty	146	166,523
Sleigh bell, G. W. Goff	72	166,521
Smoke flue and heating drum, L. T. Houghton	154	166,461
Snow plow, A. J. Smith	122	166,649
Soap, Hoge and Schultz	26	166,609
Sole fastenings, nail for, A. Van Wagenen	16	166,663
Sole fastenings, nail strip for, A. Van Wagenen	16	166,659
Steam whistle, J. Rieppel	148	166,479
Stench trap, J. D. Pierce	8	166,551
Stone crusher, J. Comly	3	166,504
Stove, cooking, Crowley and Chamberlain	154	166,594
Straw cutter, W. R. Bowman	50	166,585
Telegraph, electric train, Keyes and Clark	50	166,616
Tools, die for forming the eyes of, J. R. Thomas	29	166,568
Torpedo for oil wells, R. S. Orsburn	124	166,627
Truss, J. G. Jado	156	166,529
Tubing, machine for welding, G. H. White	163	166,668
Toyeres, F. H. Lloyd	12	166,617
Type setting machine, W. D. C. Pattyson	117	166,549
Type writers, scale for, W. C. Johnson	117	166,465
Vault cover, J. M. Willbur	4	166,572
Vault cover, J. M. Willbur	4	166,574
Vault light, J. M. Willbur	4	166,573
Vehicle end gate, F. C. Brooke	31	166,495
Vehicle top support, R. Hunt	31	166,610
Vise, hand, L. L. Pollard	100	166,553
Washing machine, W. Atwood	91	166,579
Washing machine, D. and D. F. Born	91	166,584
Washing machine, J. Hollingsworth	91	166,460
Washing machine, McQuillan and Knepper	91	166,539
Watch case, C. K. Colby, (reissue,) (design)		6,585
Water, &c., apparatus for drawing or raising, Vabe and Guan	118	166,657
Water closets, &c., apparatus for emptying, R. Boekelen, (reissue)	8	6 584
Water wheel, J. Atkins	168	166,676
Weather strip, T. Clark	30	166,453
Weeding implement, C. Crofut	114	166,506
Whistle, steam, J. Rieppel	148	166,479
Windlass, W. H. King	79	166,468
Windmill, J. D. Christie	118	166,501
Window blind, metallic, W. S. Mackrell	30	166 535
Wire barb pinchers, Dobbs and Booth	170	166,511
Wrench, M. E. Campfield	100	166,587
Wrench, T. F. Dunn	100	166,514
Wrench, L. O. Veber	100	166,665
Wringer, C. E. Haynes	91	166,459

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED AUGUST 10, 1875.

	Patent No.
Adams, L. V., Station indicator	166,445
American Screw Company, assignee	166,490
Anderson, W. H., Man hole for oil tanks	166,446
Atchison, T. A., assignee	166,556
Atkins, J., Water wheel	166,676
Atwood, W., Washing machine	166,579
Baker, S. W., Water proof hose	166,580
Baldwin, F. A., assignee	166,611
Barker, A., Lamp burner	166,493
Barker, B. F., Machine for molding paper pulp	166,447
Barker, J., & Bros., assignees	166,447
Barnard, A. J., Hose spanner and key	166,492
Barnes, E. W., Faucet	166,581
Barnum, N., Holder for sewing machine quilting attachments	166,448
Battles, R. S., assignee	166,587
Beardsley, L. C., Can seaming machine, (reissue)	6,582
Beardsley, L. C., Sheet metal can, (reissue)	6,583
Beidler, G. A. Lamp	166,582
Beisel and Gill	166,604
Bell, W. H., Marking wheel	166,583
Blake, T., Loom shuttle binder	166,494
Blakey, M., Machine for welding and finishing pipe	166,449
Boeklen, R., Apparatus for emptying water closets, &c., (reissue)	6,584
Booth and Dobbs	166,511
Born, D. and D. F., Washing machine	166,584
Bowman, W. R., Straw cutter	166,585
Brierley, E., Frame for dyeing cloth	166,450
Bridgeport Brass Company, assignee	166,670
Brooke, F. C., Vehicle end gate	166,495
Brous, T. M., Plow	166,586
Brown, J. R., and W. A. Foskett, Automatic fire extinguisher	166,451
Brown, J. R., and W. A. Foskett, Automatic fire extinguisher	166,452
Brown, W. H., Elevator	166,496
Brumshagen and Thormann	166,486
Buckley, M., assignee	166,506
Butler, T., Pump	166,497
Campfield, M. E., Wrench	166,587
Cary, L. C. and G. F., Screw propeller	166,498
Cass, H. C., and G. R. Rankin, Boot tree	166,499
Chamberlain and Crowley	166,594
Chandler, J., Water elevator	166,500
Christie, J. D., Windmill	166,501
Clark and Keyes	166,616
Clark, T., Weather strip	166,453
Clark, W. H. and W. J., and A. O. Kittredge, Sheet metal shearing machine	166,588
Clausolles, E. E. P., Apparatus for measuring liquids, &c	166,502
Colby, C. K., Watch case, (reissue)	6,585
Collins, J. F., Sash cord fastener	166,503
Colwell, W., Grain meter	166,593
Comly, J., Stone crusher	166,504
Cook, A. G., Manufacture of iron and steel	166,454
Cook, J., and W. Foskett, Printing press	166,675
Coombs, J. C., Shirt bosom	166,589
Cooper, J., assignee, (reissue)	6,590
Corbin, F., Lock for sliding doors	166,505
Corbin, P. and F., assignees	166,505
Creeger, C. C., Rock drilling machine	166,590
Crofut, C., Weeding implement	166,506
Crowley, J. B., and A. E. Chamberlain, Cooking stove	166,594
Cuan and Vabe	166,657
Curtis, V. G., assignee	166,592
Danforth, A. A., Boot and shoe heel	166,507
Daschback, E. J., Carbureter	166,508
Denne, T. J. and M. C., Machine for sewing on the soles of boots and shoes	166,509
Detrick, W., assignee, (reissue)	6,586
Dewey, S. M., Station indicator	166 510
Differential Gearing Company, assignee	166,605
Dobbs, J., and B. F. Booth, Wire barb pincers	166,511
Dolph, G. C., and F. J. Smith, Cheese press	166,512
Dorgan, J. H., Horseshoe	166,513
Draper, O. D., assignee	166,649
Du Brul, N., Cigar bundling machine	166 591
Dunn, T. F., Wrench	166,514
Duvall, W. T., Piston for steam engines	166,592
East Hampton Bell Company, assignee	166,521
Eddy, W. H., Drill sharpening machine	166,515
Edwards, A. L., Bird cage	166,595
Edwards, A. L., Bird cage	166,596
Edwards, T., Head rest for car seats	166,455
Eichholtz and Frey, (reissue)	6,586
Evans, W. D., Cotton chopper	166,597
Fairbank, L. G., Combined reading and writing desk	166,516
Falcon, M. J. S., Wooden sole boot and shoe	166,517
Farcot, E., Device for winding clocks	166,518
Flynt, C. D., Car axle lubricator	166,600
Foskett and Cook	166,675
Foskett and Brown	166,451, 166,452
Francis, S. W., Fare box	166,598
Franke, J., assignee	166,540
Frederick, W. C., Hoisting tongs	166,599
Freiburg and Meyer	166,621
Frey, J., and J. M. Eichholtz, Sawing machine, (reissue)	6,586
Furbush, M. A., Condensing mechanism for carding machines	166,601
Gardner, A., Paper pulp engine	166,519
Gearing, C. M., Carbureting apparatus	166 602
Gearing, C. M., Gas apparatus	166,603
Gervais, A., & Co., assignees	166,520
Gervais, A. A., Traveling can	166,599
Gill, G., and F. V. Beisel, Railway switch	166,604
Goff, G. W., Sleigh bell	166,521
Goldthorp and Smith	166,645
Gordon, A., J. H. Myers, G. Telford, and M. G. Hubbard, Harvester	166,605
Gray, A. W., Grain separator	166,456
Greely, L. A., Saw setting device	166,522
Greene, W. K., Jr., and W. M. Pawling, Machine for drying tubular knit fabrics, (reissue)	6,587
Greene, W. K., Jr., and W. M. Pawling, Machine for drying tubular knit fabrics, (reissue)	6,588
Haggerty, J., Slate frame	166,523
Hansen, E., Electroplating glass, china, &c	166,606
Hare, J., Belt coupling	166,457
Harmon, A. J., Clothes pounder	166,458
Hastings, J., Planking clamp	166,524
Hawkins, M. E., Brush	166,607
Hawley, S. F., and H. A. Mead, Milk can	166,525
Haynes, C. E., Wringer	166,459

TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED AUG 10, 1875

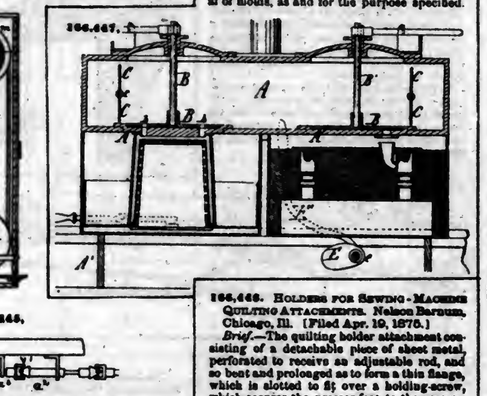
166,445. STATION-INDICATORS. Lewis V. Adams, Rock Island, Ill. [Filed Feb. 23, 1875.]

1. The roller *m*, shaft *n*, and spring *r*, in combination with the roller *i*, ribbon D, and cord *k*, and suitable driving devices, substantially as and for the purposes specified.

2. The shaft A, consisting of the parts *a* a^1 a^2 and shaft B, in combination with shaft *n*, roller *m*, spring *r*, roller *i*, ribbon D, and cord *k*, in a station-indicator for cars, all as and for the purpose specified.

166,446. MAN-HOLES FOR OIL-TANKS. W. H. Anderson, Brooklyn, E. D., N. Y., assignor of one-half his right to A. J. Pouch, same place. [Filed Nov. 27, 1874.]

Brief.—The springs successively add to the repellent force which closes the hinged cover when pulled upward by escaping vapors.



The oil-tank constructed with the external system of independent springs *b d*, arranged above and behind the usual man-hole plate or cover C, and operating in succession to automatically close the said plate when the same has been thrown open by explosion, the elastic force applied to them return the plate being thereby proportioned to the force with which it is thrown open, substantially as herein described.

166,447. MACHINES FOR MOLDING PAPER-PULP. Benjamin F. Barker, Curtisville, assignor to himself and J. Barker & Brothers, Pittsfield, Mass., and G. W. Williams, Hartford, Conn. [Filed June 20, 1874.]

Brief.—The pulp is let into a vat, where it is kept in constant agitation, and from this vat runs into molds, which are lifted into close contact by means of cam-levers.

1. In combination with the chest A, valves B, framing A^3 A^4, and molds M F, the means R, substantially as described, for bringing the molds into tight contact with the chest, and releasing them therefrom, as herein specified.

2. The chest A, having the connection *c*, in combination with the agitator C and series of valves to allow the application and removal of molds, as and for the purpose specified.

166,448. HOLDERS FOR SEWING-MACHINE QUILTING ATTACHMENTS. Nelson Barnum, Chicago, Ill. [Filed Apr. 19, 1875.]

Brief.—The quilting holder attachment consisting of a detachable piece of sheet metal, perforated to receive an adjustable rod, and so bent and prolonged as to form a thin flange, which is slotted to fit over a holding-screw, which secures the presser-foot to the presser bar.

1. The sheet-metal holder E, made with the parts *b d*, pierced to receive the rod D, the part *b* being prolonged into the flange *c*, and the part *d* being prolonged and bent to form the spring *g*, substantially as specified.

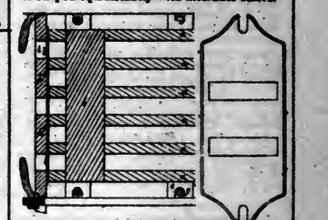
2. The combination and arrangement of the holder E, having the thin sheet-metal flange *c*, with the presser-bar A, presser-foot B, and screw F, substantially as specified.

166,449. MACHINES FOR WELDING AND FINISHING PIPE. Mildred Blakey, Etna, Pa., assignor of one-third his right to J. L. Robertson, same place. [Filed July 8, 1875.]

Brief.—Two or more concave-faced rolls in a revolving stock, angular to the line of feed, and acting circumferentially on the pipe, grooved feed-rolls, tubular bearing-shaft, and mandrel.

166,449.

1. For welding or finishing pipe, a series of two or more concave-faced rolls arranged in a rotating head or stock angularly to the line of feed, and when in operation revolving on their axes, and also acting circumferentially on the pipe either by the revolution of the pipe inside the rolls or by the revolution of the rolls around the pipe, substantially as set forth.



2. A series of two or more rolls, D, arranged, and operating as set forth, in combination with grooved feed-rolls A A, for the purposes substantially as described.

3. Two or more rolls, D, arranged to act circumferentially on the pipe or skelp, in combination with a tubular bearing, axle or shaft through which the skelp or pipe is fed and delivered, substantially as set forth.

4. A mandrel, c, in combination with revolving circumferentially-bearing rolls D, substantially as described.

166,450. FRAMES FOR DYEING CLOTH. E. Brierley, Milton Mills, N. H. [Filed June 1, 1875.]

Brief.—There are first clamped onto the dyeing-frame end frames, which have vertical bars three times the width of the spaces between them. By dipping in the vat the spaces between the bars take the stripe color. Then substitute other end frames having a slot opening against the center of the broad ground-color space of the cloth, between the stripes already made. Dip again in other color, and the cloth is striped equidistantly with alternate colors.

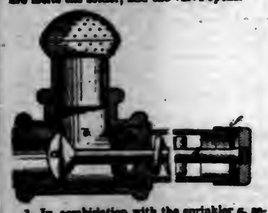
In the above-described dye-frame, the end frames D, having bars which severally lap on and cover two next adjacent bars and the space between them of each of the sectional frames, all being to enable the cloth to be dyed with stripes of different colors, as set forth.

166,451. AUTOMATIC FIRE-EXTINGUISHERS. Joseph R. Brown and William A. Foskett, New Haven, Conn. [Filed Jan. 4, 1875.]

Brief.—Within the water-pipe, and between the distributing-nozzle and the water, is placed a metal disk, secured within the pipe by fusible solder, and covered with wax or equivalent material, to keep the water from the disk, and allow the heat to act more quickly upon the solder. A core of some poor conductor of heat is placed in front of the disk. The pipe has a pocket at its end to receive the disk, which is forced therein by the action of the water when the solder securing it has melted.

166,451.

1. The disk *f*, secured within the pipe A by fusible solder, and covered with paraffine, wax, or their equivalent, substantially as and for the purpose specified.

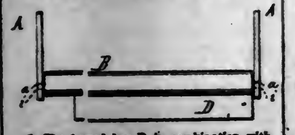


2. The core G, consisting of fusible material, when placed between the water and the disk, secured by solder to be fused by the heat of the fire, substantially as and for the purpose described.

3. The combination of the core G, the disk *f*, and the pocket K for receiving the core and disk, and allowing a free passage for the water, substantially as herein described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

166,452. AUTOMATIC FIRE-EXTINGUISHERS. Joseph R. Brown and William A. Foskett, New Haven, Conn. [Filed Jan. 30, 1875.]



Brief.—To a T-pipe is attached, to the side part, a sprinkler; to one end an end of water-pipe, having a valve-seat formed upon it; to the other end a plug containing a valve, valve-stem, projecting arms, and cap, (the two latter joined by a fusible solder.) The increased temperature from the outbreak of a fire melts the solder, and the valve opens.

1. In combination with the sprinkler *a*, secured to a branch of the T-piece *b*, as described, the valve C, the stem projecting horizontally beyond the T-piece, and the cap *f*, secured either to the valve-stem or to the projecting arms *g g*, by fusible solder substantially as and for the purpose described.

2. The combination of the T-piece *b*, having the valve C placed within the same, the valve-stem *d*, cap *f*, projecting arms *g g*, and the spring H, arranged to open the valve as soon as the solder is melted, substantially as and for the purpose herein described.

166,453. WEATHER-STRIPS. Thos. Clark, Akron, Ohio. [Filed May 27, 1875.]

1. The bowed bar B, in combination with the cams *i* and rubber D, substantially as specified.

2. The bowed bar B, in combination with the cams *i*, rubber D, bearings A, and boss *c*, substantially as and for the purpose set forth.

166,454. MANUFACTURE OF IRON AND STEEL. A. G. Cook, Burlington, Vt. [Filed May 13, 1875.]

Brief.—Six hundred pounds No. 1 iron, five hundred to eight hundred pounds No. 6 iron, two hundred pounds finetch iron, one hundred pounds steel, and fifty pounds wrought-iron are mixed and melted in the cupola, and then drawn off into a refiner.

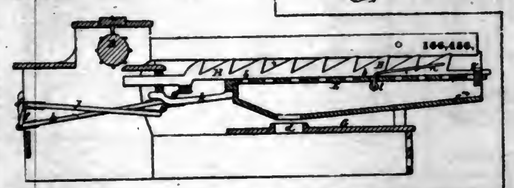
A metal composed of gray or No. 1 iron, white or No. 6 iron, finetch iron, steel, and wrought iron combined, in about the proportions and substantially as described.

166,455. HEAD-RESTS FOR CAR-SEATS. Tryon Edwards, Hagerstown, Md. [Filed Nov. 3, 1873.]

A car-seat back provided with the loose portion B, having its face adapted to form a part of the face of the seat, and also capable of use upon either edge of the back, as described.

166,456. GRAIN-SEPARATORS. Albert W. Gray, Middletown, Vt., assignor to himself, Leonidas Gray, and Albert T. Gray, same place. [Filed Mar. 6, 1875.]

Brief.—Serrated bars and screen reciprocated in opposite directions at different speed by unequal double crank. Lifting-fingers, with center of oscillation in the screen, operate in connection with the serrated bars, to detain the straw from moving backward during the backward movement of the bars.

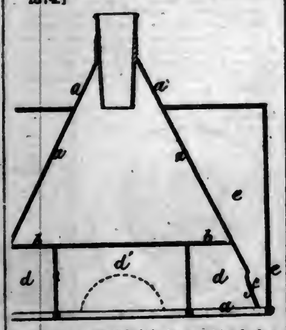


1. The combination of the single shaft *c*, with its long and short cranks *f g*, arranged opposite to each other, the pitmen *h i*, the serrated bars or straw-pushers H, and the shaker or screen E, for moving said pusher and screen simultaneously in contrary directions, the former faster and farther than the latter, as and for the purpose described.

2. In combination with the serrated straw pusher and the screen, moving in contrary directions, the former faster and farther than the latter, the vibrating fingers *n*, operated, in connection therewith, as and for the purpose described.

166,459.

166,456.

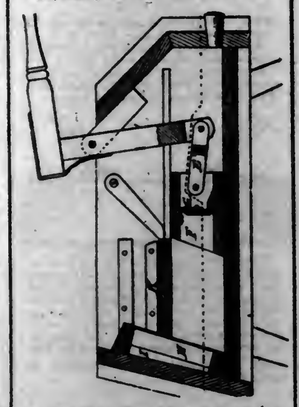


166,457. BELT-COUPLINGS. James Hare, Providence, R. I., assignor to J. A. Whitman, same place. [Filed June 21, 1875.]

1. An elastic belt-coupling, A, made of triangular wire, the internal spaces of which form screw-threads, as and for the purpose described.

2. An elastic belt-coupling formed by the combination of the two parts A A, having the internal screw-threads thereon, and the internal part or male screw B, having external screw-threads, substantially as described.

166,458. CLOTHES-POUNDERS. Ambrose J. Harmon, Boston, Mass. [Filed Nov. 26, 1874.]

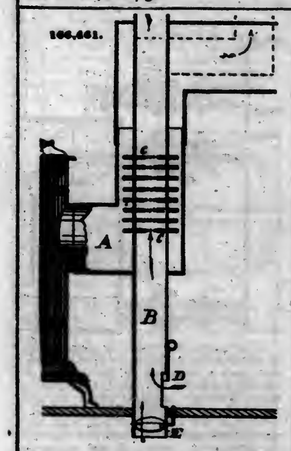


The conical body *c*, having partition *b*, ring *c*, and annular chamber *d*, in combination with radial air-chambers *eeee*, closed at their tops, but having openings ////into said annular chamber, substantially as and for the purpose set forth.

166,459. WEBFOOTS. Cornelius B. Haynes, Boston, Mass., assignor to Augustus Page, same place. [Filed Mar. 4, 1875.]

The beat spring, formed as described, with a bearing for the upper roll in its free end, in combination with the standard formed with a bearing for the lower roll, and a seat upon which the spring is fixed and held, substantially as shown and set forth.

166,460. WASHING-MACHINES. Jos. Hollingsworth, Jonesborough, Ind., assignor of one-half his right to Elihu W. Pemberton, same place. [Filed July 15, 1875.]



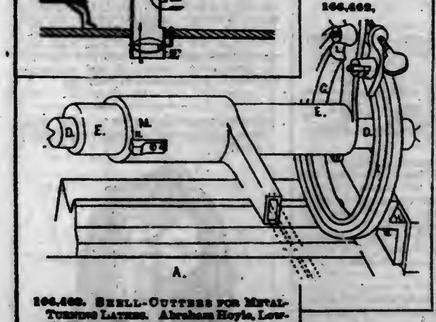
1. The combination of the tubular plunger F, furnished with the valve G and the rods or bars H and water-chamber I, substantially as set forth.

2. In combination, the valved plunger, the bars and water-chamber, and the adjustable partition K, substantially as set forth.

166,461. SMOKE-FLUES AND HEATING-DRUMS. L. T. Houghton, Worcester, Mass. [Filed Apr. 5, 1875.]

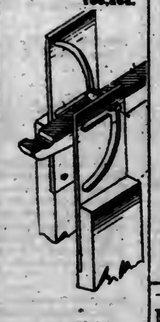
The combination of the smoke-flue A with the air-heating pipe B, the external air-inlet E, the interior air-inlet D, and the radiators C, substantially as described.

166,461.



1. In a coupling for cars, the spring-clutch composed of the jaws *j* and *f* and springs *s s*, in combination with the transverse sliding plate P', so as to be self-adjusting by the action of the springs *s s* when the link is removed, substantially as shown and described.

2. The transverse sliding plate P', in combination with the chain *c*, (or its equivalent,) and the spring-clutch composed of the springs *s* and the jaws *j* and *f*, substantially as and for the purposes shown and described.



166,462. BELT-SHIFTERS. John D. Isaacs, Wilmington, Del. [Filed Jan. 26, 1875.]

Brief.—Sliding and parallel in a frame are two bars, each having a pair of holding-pins, for the shifting of belts successively off and on the tight central drum and outer loose ones by means of a lever having a pin projecting from both sides, and working each bar longitudinally by a slot formed of a curve and a right angle

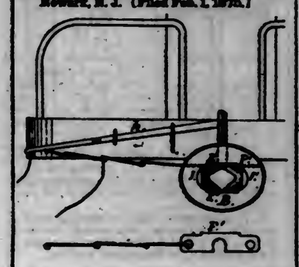
166,462.

166,462.

The combination, in a belt-shifter, of two plates, each having a curved slot, substantially as shown in the accompanying drawings, with a pin or its equivalent, either the plate or the pin moving in a curved path, substantially as described, and for the purpose above specified.

166,463. SHELL-CUTTERS FOR METAL-TURNING LATHES. Abraham Hoyle, Lowell, Mass. [Filed Mar. 24, 1875.]

Brief.—The shell-arbor, bored eccentrically, surrounds a solid arbor, which is supported either concentrically or eccentrically by the lathe-spindle. A ring fixed to the tail-stock and a screw bolt and nut serve to fix the shell-arbor in position, and an adjustable gage-screw is used to adjust the arm of the shell-arbor. The shell-cutter arbor surrounds the shell-arbor, and is held from turning by an extension of its arm being inserted in the tool-post.



1. The combination of the arm F on the shell-arbor B, the grooved circle G, the screw K, and nut L, as and for the purpose herein described.

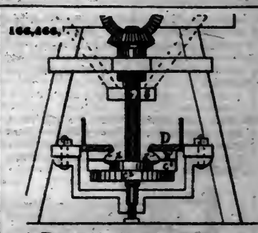
2. The combination, with the shell M and tool H, of the slot W and the bar X, fixed in the tool-post of a lathe, as and for the purpose herein described.

3. The combination of the eccentric shell-arbor B with the eccentric solid arbor D', as and for the purpose herein described.

4. The combination of the eccentric shell-arbor B, the shell M, and the tool H, as and for the purpose herein described.

166,464. GEAR-COUPLINGS. Henry C. Hull, Newark, N. J. [Filed Feb. 1, 1875.]

166,465. SCALES FOR TYPE-WRITERS. W. C. Johnson, Newburyport, Mass. [Filed Feb. 20, 1875.]

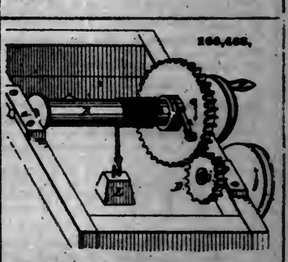


A type-writer scale upon which divisions are marked, as shown and numbered, each of said divisions corresponding with the space occupied by a letter made by the type-writer, as and for the purpose specified.

166,466. MILLS. Jacob Kaiser, York Township, York County, Canada. [Filed Sept. 30, 1874.]

166,466.

1. The combination, with the upper horizontal stationary metal grinder D', of the receiving-cylinder D, fixed upon its upper surface, the central opening in each coinciding, and the grinder flaring inwardly from its upper surface, all as shown and described.

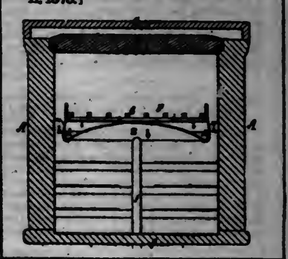


2. The upper metallic grinder, (shown in Fig. 3,) having the slopes *o o* thereon cut into the circular portion of the center, and the supplemental grooves *f* between their outer grooves and the furrows, the slopes *o* being, some of them, cross-cut, in combination with the lower metallic grinder, (shown in Fig. 5,) having the groups of undercut grooves *r* cutting the straight but non-radial furrows *g*.

166,467. CORKS. William King, Perth Amboy, N. J., assignor to William King & Co., New York, N. Y. [Filed May 10, 1875.]

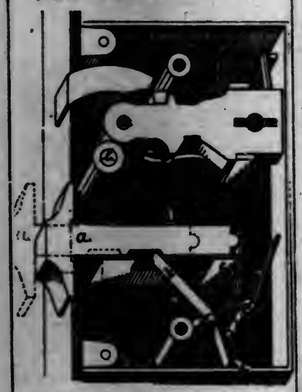
Brief.—The stopper is cut from a blank composed of two or more layers of previously-prepared cork-wood, joined together by suitable cement, and firmly united by being subjected to heavy pressure, for the purpose of saving cork-wood by making large-sized corks from thin layers of bark.

As a new article of manufacture, a stopper cut from a slab or piece of cork composed of two or more layers, first joined together by cement and pressure, substantially as described.



166,468.

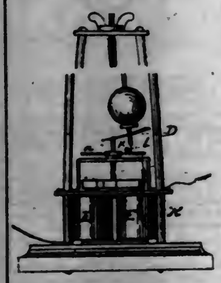
166,468. WINDLASSES. W. Hadnell King, Somerville, assignor of one-half his right to John W. Lukens, Springfield, Mass. [Filed June 12, 1875.]



An improved elevator, having the combination of the shaft b, nut l, drum B, clutch G, bar H, tooth-wheel C, and strap *s*, in connection with or without the platen D, substantially as and for the purpose described.

166,469. REFRIGERATORS. Richard Loud, South Weymouth, Mass., assignor to Reuben Loud & Son, same place. [Filed May 11, 1875.]

In combination with the unperforated box A and the water-diffusing pan F containing the grid G, the pan S, having the domed and cold-conducting bottom, operating as described to cool the air beneath it, all substantially as specified.

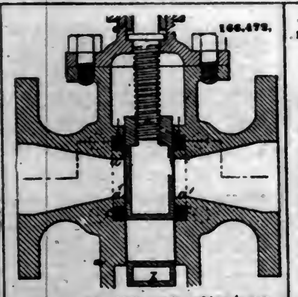


166,470. LOCKS FOR SLIDING DOORS. Thos. Lyon, Hartford, and Emery Parker, New Britain, assignors to Russell & Erwin Manufacturing Company, New Britain, Conn. [Filed June 29, 1875.]

1. In combination with lock-cases for sliding flush doors, an extensible draw-bar, *c*, having its head projected beyond the front plate to form a thumb-piece, by which it can be extended, but arranged to be sheathed within the case when the edges of the sliding doors are brought into contact, substantially as described.

2. The combination, with an extensible draw-bar, *c*, as described, of a friction-stop spring, *b*, substantially as specified.

166,471. GOVERNORS FOR ELECTRIC MOTORS. Augustus Mac Connel, Cambridge, Mass. [Filed Apr. 15, 1875.]

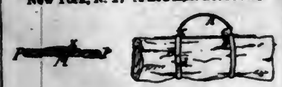


The combination of the rotatory electro-magnetic engine, the circuit-closer K having projecting arms *a a*, the slotted arm D upon the shaft h of the motor, and the conical pendulum E, constructed and operating substantially as and for the purpose set forth.

166,472. STOP-COCKS. James Mallinson, Welwyn, Hertford. [Filed July 6, 1875.]

1. The cock or valve shell, constructed substantially as hereinbefore set forth, with a fluid-way or passage therethrough, a plug-seat therein, and packing cavities around the fluid-way or passage.

2. The combination, substantially as hereinbefore set forth, of the shell having a plug-seat and fluid-passage, the lips on the shell, the cavities provided with packing, and the plug



166,472.

surrounded by said lips and working in contact with the packing.

3. The combination, substantially as hereinbefore set forth, of the shell having a way or passage for the fluid, and a plug-seat, the plug, the packing, and the removable covers securing the packing in place.

166,472. SHAWL-HOLDERS. F. Meinberg, New York, N. Y. [Filed Apr. 26, 1875.]

In a shawl-strap, the core M, having its edge bound with the gutter-shaped metal binding P, and with or without the leather covering X, and adapted for use in connection with the handle A and straps D D, substantially as and for the purpose specified.

In testimony whereof I have hereunto set my hand this 27th day of April, 1875, in the presence of two subscribing witnesses.

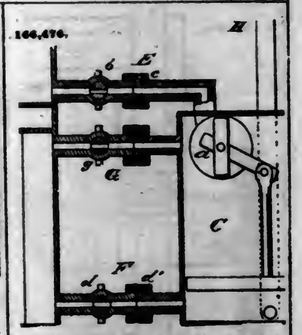
166,474. NURSERY-CHAIR SEATS. Stephen S. Newton, Binghamton, N. Y. [Filed Jan. 18, 1875.]

Brief.—The combination and arrangement of a guard with the chair-seat and vessel in such a manner that said guard shall prevent the saturation of the seat by careless use.

166,474.

The combination and arrangement of the chair-seat A, having a slot, *a*, and recess *b*, semicircular guards B, and vessel C, all constructed substantially as herein described, for the purpose set forth.

166,475. PROCESSES OF MANUFACTURING ARTICLES FROM HORN AND HOOF. William F. Niles, Leominster, Mass. [Filed Feb. 20, 1875.]



1. The herein-described improved mode or process of making or forming articles from horn or hoof and bone-black, which consists in reducing the horn or hoof to powder by grinding, mixing with the same bone-black, as described, boiling or sifting said mixture slightly moistened, as described, and then pressing the boiled or sifted product in heated files or molds of the configuration required for the article to be produced.

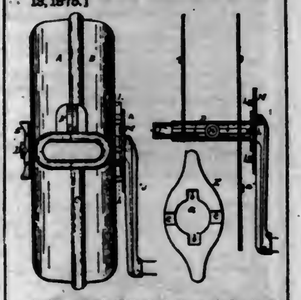
2. Articles made from ground hoof or horn and bone-black, combined together substantially in the manner described.

166,476. GAS-CARBURETERS. A. W. Porter, New York, N. Y. [Filed July 14, 1875.]

Brief.—The float operating the cock in the supply-pipe is placed in a box by itself, and the box is joined by pipes to the oil-supply tank and carburetor. An air-chamber is formed between the oil-tank and carburetor.

166,476.

1. In combination with a carburetor which is subdivided by partitions *a' d'*, and the central space or apartment K, the reservoir A and an automatic feed-box, C, containing a valve, *c*, which is actuated by the rise and fall of a float, C', substantially as described.



2. Pipes E F G, provided with cocks and union-couplings, in combination with reservoir A, carbureting-chamber B, and automatic feed-box C, substantially as described.

166,477. LIFE-PRESERVING JACKETS. Thos. Richards, Cleveland, Ohio. [Filed May 1, 1874.]

A life-preserving jacket provided with an intermediate piece of fabric, to which is attached the sections of cork, substantially as and for the purposes described.

166,478. CLOTHES-LINE REELS. Ephraim D. Richardson, Chardon, Ohio. [Filed July 13, 1875.]

1. The wheels H I, shaft D, crank J, wheel M, studs A, and click L, in combination with the case, consisting of the two sections A B, substantially in the manner as and for the purpose set forth.

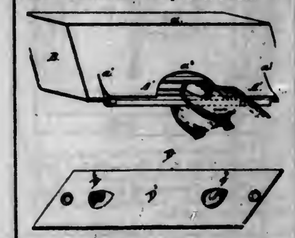
2. In combination with the shaft D, pin *d*, and case, constructed substantially as described, the button B, provided with notches *b* and groove *c*, for the purpose specified.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

166,479. STEAM-WHISTLES. John Rieppel, Renovo, Pa. [Filed June 26, 1875.]

Brief.—The bell of the whistle is constructed at its mouth, so that the steam from the bowl strikes it at an angle. The opening between the bell-mouth and the bowl is automatically adjusted by means of a spring.

166,479.



1. A steam-whistle bell constructed with a contracted mouth, combined with a steam-jet less in diameter than the body of said bell.

2. The bell D, with the contracted mouth *a*, combined with the conical jet *d e*, as set forth.

3. The bell D, constructed with the hub *f*, fitted to the cylindrical stem *g*, as described, and combined with an adjusting-nut, *i*, and a seat-spring, E, to hold said bell against said adjusting-nut, as and for the purpose set forth.

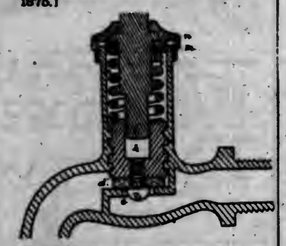
166,480. MATCH-BOXES. Thos. Robertson, Toronto, Canada. [Filed Jan. 28, 1875.]

Brief.—A box in which matches are packed, and which is arranged for the removal of one match at a time, provided with apertures to receive buttons or a wall-plate or holder.

1. A match-box constructed of some suitable material, having its bottom inclined forward, as shown, and its front and bottom slitted at *a'*, forming the spring-surfaces A' A², and provided with the finger-way *a²*, as and for the purpose specified.

2. A match-box constructed substantially as herein shown, and having the openings *a²* in the back, in combination with the plate D', having the studs D², as and for the purposes set forth.

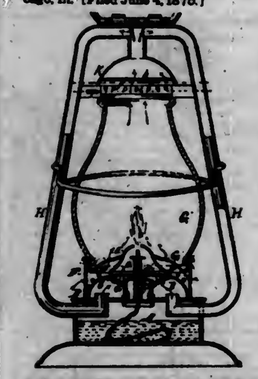
166,481. SAFETY-PINS. Alfred Shedlock, New York, N. Y. [Filed June 16, 1874.]



As a new article of manufacture, the safety-pin formed from a single piece of wire with the spring *b*, and helical shield *a*, the axis of which is in line with the pin proper, substantially as described and for the purpose set forth.

166,482. FAUCETS. Dani. C. Stillson, Boston, Mass. [Filed July 3, 1875.]

Brief.—When the key is rotated, both ends of the bar impinge against the sides of the arms of the rocker-levers, and, moving the former horizontally, cause the levers to be moved vertically, and, by their impingement against the upper walls of their slots, raise the valve.

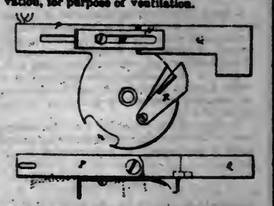


The combination, with the valve-chamber b and valve B, of the screw-ring *f*, provided with a bar, *g*, the rocker-levers h h', spring *e*, and the key D, provided with the actuating-bar *m*, the whole being arranged and operating together, substantially as set forth.

166,482. SELF-CLOSING FAUCETS. Daniel C. Stillson, Boston, Mass. [Filed July 3, 1875.]

In a self-closing faucet, the valve *d*, having a screw-thread cut on its outer surface, and provided with a socket, A, into which the angular end of the valve-key *i* is fitted, said key having a fixed disk or washer, *l*, and a loose washer, *n*, with a packing, *o*, interposed between the two, a spring, *e*, enveloping the said key, and resting at one end against the washer *n*, and at its other end upon the superior end of the valve *d*, the whole being arranged and operating together as described, and for the purpose specified

166,484. LANTERNS. Charles J. Sykes, Chicago, Ill. [Filed June 4, 1875.]



1. In combination with the curbs H H, arranged to pass into the oil-pot and upward through the cover, the conveyed cap C, forming chamber D, the latter communicating with the interior of the case through the perforated plate *b'*, as specified.

2. In combination with the removable perforated rim F, the plate G, arranged to receive the lower end of the globe, and to form chamber D', the latter communicating with the interior of the globe through the distributing perforations in the plate, as specified.

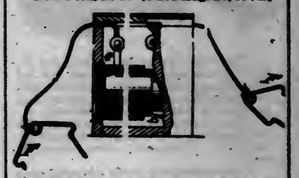
3. The hinged perforated ring I, in combination with hood K and perforated diaphragm *h*, as specified.

166,485. SASH-FASTENERS. J. Thorman, Terre Haute, Ind. [Filed May 31, 1875.]

Brief.—A notched disk, carrying a jointed tangential arm, is secured to the window-casing in such manner that the jointed arm, when extended out, overlaps the corner of the inside meeting-rail, and by the use of a sliding plate locks the sash. A check or serrated catch pivoted on the disk holds the sash, when partially raised, in desired position, and a suitable pin, playing in a notch on the edge of the disk, prevents it from rotating too far, and likewise locks the device at a slight elevation, for purpose of ventilation.

A window-sash lock consisting of the center or disk O, having notch *n*, the tangential slotted arm P, slide N, movable arm Q, and check K, in combination with the pin *m*, substantially as described, and for the purpose set forth.

166,486. CONCRETE PAVEMENTS. John H. Thormann and Friedrich Brauenhagen, Baltimore, Md. [Filed July 22, 1875.]



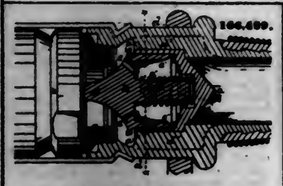
A pavement or floor composed of concrete slags or blocks, separated by interposed layers of white lead, substantially as and for the purpose specified.

166,487. FURNACE-GRATES. W. Tinkham, Providence, R. I. [Filed Dec. 28, 1874.]

In a furnace-grate, the combination of the series of bars A, having flat sides, and provided with the coincident and engaging conical projections B and sockets C, and the lower row of points D, all as shown and described, whereby the bars are locked together and made mutually supporting, as shown and described.

166,488. INDUCTION-COILS. Jos. C. Vetter, New York, N. Y. [Filed Aug. 27, 1874.]

1. The handles E E', constructed to telescope and to pass over the exterior of the induction-coil through an opening in the box, substantially as herein set forth.



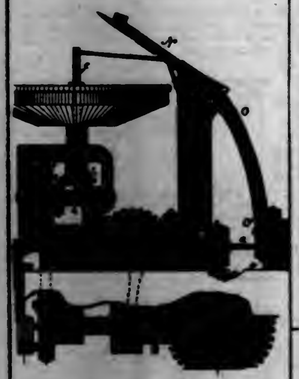
2. The elastic ball-like attachments F F, in combination with the handles E E' and conductors, substantially and as for the purpose specified.

166,489. VACUUM BRAKE-PIPE COUPLINGS. George Westinghouse, Jr., Pittsburg, Pa. [Filed Mar. 10, 1875.]

Brief.—Improves upon applicant's Patent No. 158,397, March 4, 1875, by supporting the cylindrical valve-case by radial ribs projecting inwardly from the outer shell. Secures closure of the valve against atmospheric pressure, in part by balancing the valve, and in part by a spring.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

166,489.



1. In a pipe-coupling, the valve or piston case *a* as a carrier and guide for the valve, arranged in the axial line of the coupling by means of radial ribs *b* projecting inwardly from the outer shell, substantially as set forth.

2. In a pipe-coupling, the combination of valve *c*, piston extension *d*, case *a*, and spring *e*, arranged substantially as and for the purposes set forth.

3. The annular projection *i* on the seating part of the valve, in combination with port or ports *o*, and spring *e*, substantially as set forth.

166,490. MACHINES FOR TAPPING NUTS. Samuel L. Worsley, Providence, R. I., assignor to the American Screw Company, same place. [Filed June 7, 1875.]

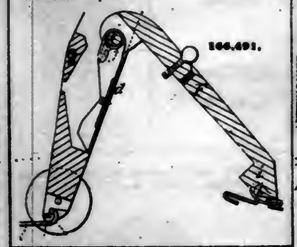
Brief.—The column of blanks in the receiving-chute is supported by the nut when at work. When the tap has passed through the blank it comes in contact with an arm attached to a ball-crank lever, forces it back, and thereby causes the stop to be withdrawn from the mouth of the chute, to allow the previously-tapped blank to fall. When the tap is withdrawn, a spring forces the stop back to its normal position.

1. The combination of the revolving dish M', for containing nut-blanks in a mass, and the vibrating separator N, when the latter is constructed with a shovel end, *m*, a mortise, *n*, and guard *o*, substantially as described.

2. The combination of the vibrating mentioned separator N with a stationary receiving-stock and a spring-shank, substantially as described.

3. The combination of the threading-tap *a* with the devices, substantially as described, for discharging the nuts one by one.

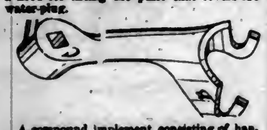
4. The combination and arrangement of the threading-tap *a* with the stock O and holder O' for the nut-blanks, whereby the said tap, while threading the blank in the column of blanks next above the last threaded blank, shall support the whole column of blanks above the tap while the underlying nut is being discharged, substantially as specified.



166,491. BALE-TIE CLAMPS. H. S. Young, Vicksburg, Miss. [Filed Jan. 9, 1875.]

1. In a bale-tie clamp or stretcher, the vibrating arm F, combined with the main lever D, its pivot-pin *f* being arranged in slots *g* of the said lever, substantially as and for the purpose specified.

2. The combination, with lever D and the arm F, endwise movable with relation thereto, of the trigger G, arranged within the said lever, and adjustable pin *p* on arms F, substantially as specified.



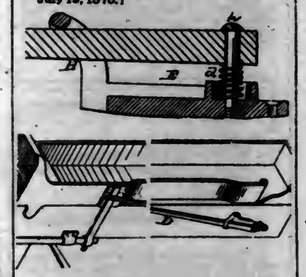
3. In a bale-tie clamp, the trigger G, consisting of parts *j j*, hinged together and adapted to flex downwardly, as and for the purpose specified.

166,491.

166,492. HOSE-SPANNERS AND KEYS. A. J. Barnard, Camden, N. J. [Filed May 1, 1875.]

Brief.—A hose-spanner having on the end of its handle a key for turning the plug, and a hook for lifting the plate that covers the water-plug.

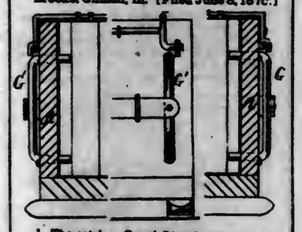
A compound implement consisting of handle A, having recessed prongs B B at one end, and key C, as well as tapering pin D, at the other, as and for the purpose specified.



166,493. LAMP-BURNERS. Abel Barker, Wyoming, Pa. [Filed Nov. 30, 1874.]

Brief.—The object of the collars upon the ratchet-shaft is to prevent "traveling" of the oil on said shaft.

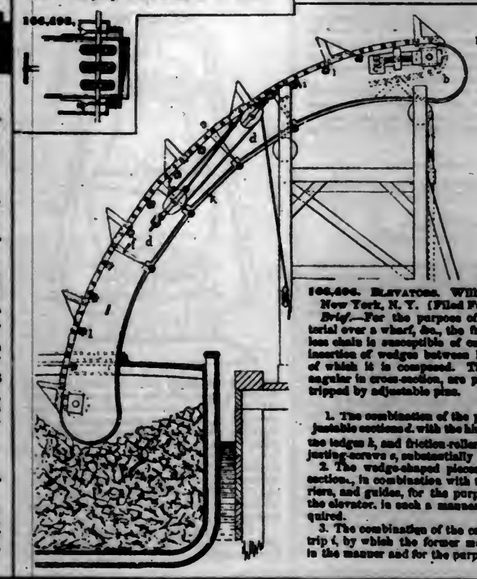
The collars B B, in combination with and moving with the ratchet-shaft and cup or chamber inclosing the wick-tube, substantially as and for the purpose set forth.



166,493.

166,494. LOOM-SHUTTLE BINDERS. Theophilus Blake, Fisherville, N. H. [Filed July 10, 1875.]

In combination with a protecting-rod and shuttle-binder, the metal piece E, with loops H, the arm or lever D, spring *d*, and screw *h*, constructed and arranged to operate substantially as and for the purposes herein set forth.



166,495. VEHICLE END-GATES. Fitzhen C. Brooks, Gilman, Ill. [Filed June 8, 1875.]

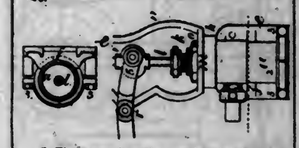
1. The catches G and G' and springs *i* and *i'*, in combination with the backboard B and wagon-box A, substantially as described.

2. The rod C and spring *f*, in combination with the backboard B and wagon-box A, substantially as described.

166,496.

166,496. ELEVATORS. William H. Brown, New York, N. Y. [Filed Feb. 8, 1875.]

Brief.—For the purpose of elevating material over a wharf, &c., the frame of an endless chain is susceptible of curvature by the insertion of wedge between hinged sections of which it is composed. The buckets, triangular in cross-section, are pivoted, and are tripped by adjustable pins.

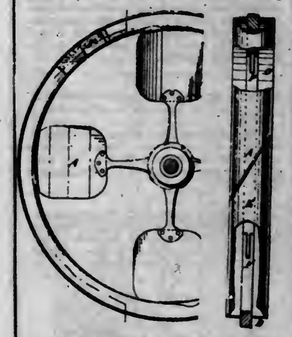


1. The combination of the portable and adjustable sections *d*, with the hinges and chains, the ledges *k*, and friction-rollers *l*, and the adjusting-screws *e*, substantially as described.

2. The wedge-shaped pieces *o* between the sections, in combination with the chains, carriers, and guides, for the purpose of carving the elevator, in such a manner as may be required.

3. The combination of the carriers with the trip *i*, by which the former may be reversed, in the manner and for the purposes described.

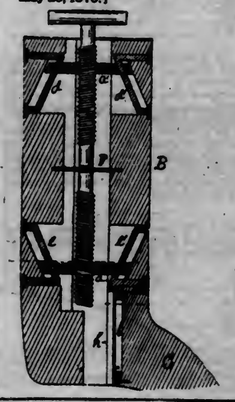
166,497. PUMPS. Theodore Butler, Melrose, N. Y. [Filed July 12, 1875.]



Brief.—The swiveled frame and the pump-barrel fastening allow the handle and discharge-nozzle to be turned in a semicircular arc.

1. The pump-barrel *a*, resting in the segmental bearings of the frame *c*, in combination with the segmental strap *i*, bolts 3, and rings 2 upon the pump-barrel, for the purposes and as set forth.

2. The frame *n*, attached to the cylinder-head by the nut *o* around the stuffing-box, and forming a guide for the upper end of the piston-rod *l*, in combination with the lever *c*, that is attached to such frame by the fulcrum-pin *r*, and is formed with a fork at the end, passing at both sides of the frame and of the cross-piece upon the piston-rod, for the purposes and as set forth.



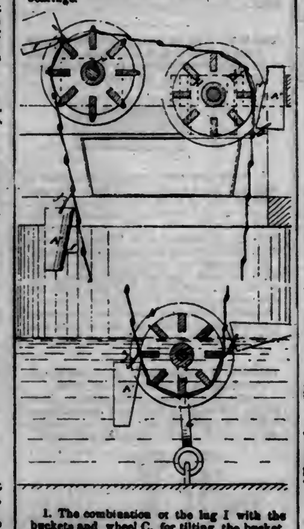
166,498. SCREW-PROPELLERS. Lewis O. Cary and George F. Cary, Portland, Me. [Filed May 1, 1875.]

1. The combination of a hollow water-tight protecting-rim with the blades of a propeller, substantially as specified.

2. The protecting-rim, constructed of the flat band D, oval or half-round band E, and the stiffening-rim F, substantially as specified.

166,499. BOOT-TREES. Henry Clay Cass and Geo. Read Rankin, Alma, Colo. [Filed May 26, 1875.]

1. In a boot-tree, the rod D, provided with a right-and-left-hand screw, in combination with the movable plates *a a'*, and the fixed plate F, as shown and described.



2. The laterally-adjustable parts A and B, provided with the keepers *d d'* and *c c'*, in combination with the movable foot C, substantially as before shown and described.

3. In a boot-tree, the movable foot C, provided with an elongated slot, *b*, in combination with the screw *c*, substantially as shown and described.

4. The keepers *c c'* and *d d'*, in combination with the plates *a a'* and F, rod D, and foot C, and parts A B.

166,500. WATER-ELEVATORS. Jesse Chandler, Barry, Ill. [Filed July 3, 1875.]

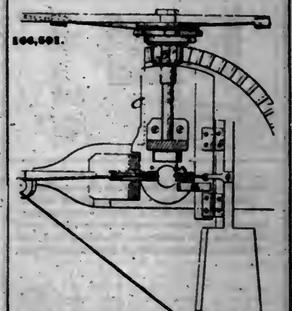
Brief.—The buckets are attached to the chain by bails, so that they strike the water bottom down, allowing air to escape as water enters. The lug on the under side allows the bucket to be easily tilted. The second wheel is in a lower plane, and has lateral play in its bearings.

1. The combination of the lug I with the buckets and wheel C, for tilting the bucket, in the manner described.

2. The wheel D, arranged in a lower plane than wheel C, and in combination with the chain and buckets, to incline the buckets down, in the manner described.

3. The wheel D, having lateral play in its axle-bearings, in combination with chain A and wheel C, substantially as specified.

4. The buckets connected to the chain by a ball, allowing them to strike the water bottom downward, substantially as specified.



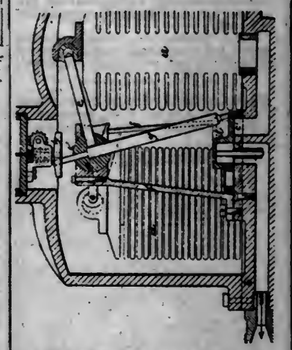
166,501. WINDMILLS. Jacob D. Christie, Schrallenburg, N. J. [Filed June 26, 1875.]

Brief.—The combination of an independently-swinging and adjustable wheel-shaft, provided with loose pinion and supplementary vane, with a quadrantal toothed turn-table, governed by the main vane, for securing position of wheel to any desired angle toward the direction of the wind.

1. The combination of the independently-swinging and adjustable wheel-shaft, provided with loose pinion and supplementary vane, with a quadrantal toothed turn-table, governed by the main vane, for securing position of wheel to any desired angle toward the direction of the wind, substantially as and for the purpose set forth.

2. The combination of the weighted and swinging wheel-supporting frame with a hinged supplementary vane for throwing wheel out of the wind on relaxing weight,

166,501.



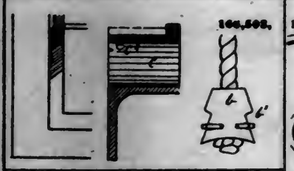
and throwing vane in horizontal position, substantially as described.

3. The combination of the revolving wheel, having adjustable and centrifugally-working brake mechanism, with the disk-pinion and quadrantal turn-table, to produce uniform speed of wheel at varying velocity of wind, substantially as set forth.

166,502. APPARATUS FOR MEASURING LIQUIDS, &c. Emile E. F. Clascelles, Barcelona, Spain. [Filed Apr. 26, 1875.]

Brief.—Three or more bellows consisting of plates of thin metal soldered at their edges, or of other material, operate together a compound L-lever by means of ball-and-socket joints, the central spindle of which lever revolves a rotary valve, which supplies and exhausts the bellows. Said spindle, prolonged through the center ball, actuates the registering mechanism.

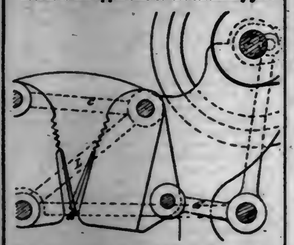
1. The bellows *a*, constructed of thin disks of metal, connected at their edges by solder or otherwise, substantially as described.



2. The combination, with the valve *d*, of the spindle *g*, central ball-and-socket joint *s'*, lever *s*, and the bellows *a*, as and for the purpose specified.

166,503. SASH-CORD FASTENERS. James F. Collins, Washington, D. C. [Filed Mar. 23, 1875.]

Brief.—A hollow shell or holder, having a wedge-shaped recess, is let into the window-casing, and in this shell a wedge-shaped block, which is pierced for and carries the knotted end of the sash-cord, is closely fitted. On the sides of this block are springs engaging with notches in the holder, and when these springs are pressed in, the cord-carrying block may be readily lifted out of place, thus detaching the sash.

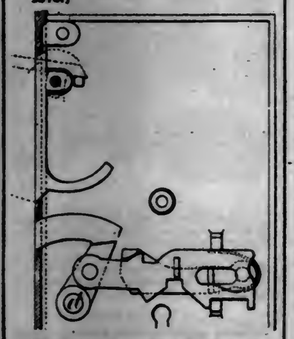


The sash-cord fastening and shifting device, composed of the block *b*, having the notches or grooves *b'*, mortise *b''*, and springs *b'*, and the shell or holder *c*, constructed as described, when arranged and operating substantially as and for the purposes set forth.

166,502.

166,504. STONE-CRUSHERS. Joshua Comly, Philadelphia, Pa. [Filed June 26, 1875.]

Brief.—The vibrating jaw of a stone-crusher is caused to have a motion in the direction of its length by having its vibrating end connected to the upper side of the stationary jaw.

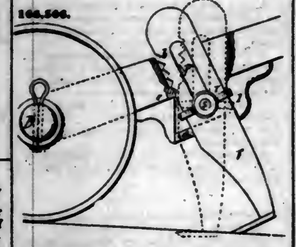


1. The combination of the rocker F and toggle-bar G with the crank-shaft and movable jaw, and the connecting-bars L, substantially as specified.

2. The vibrating end of the movable jaw, coupled to the stationary jaw by the rod L, and pivoted in bearings allowing it to have lengthwise motion, in combination with the rocker F and connecting-rod E, substantially as specified.

3. The vibrating jaw, having lengthwise motion, and being coupled to the trunnions of the stationary jaw, substantially as specified.

166,505. LOCKS FOR SLIDING DOORS. Frank Curtis, New Britain, Conn., assignor to F. & F. Curtis, same place. [Filed June 11, 1875.]



The combination, with a door-lock, of a swinging pull pivoted to the back of the face-plate, and provided with the tail-piece c, stopping against the block c upon the inside of the lock-case, for the purposes and as set forth.

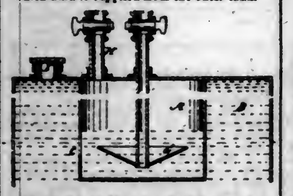
166,506. WEEDING IMPLEMENTS. Charles Crofut, Weston, Conn., assignor of one-half his right to M. Buckley and Wm. E. Crofut, same place. [Filed May 11, 1875.]

Brief.—A single push-handle is mounted upon two small trunk-wheels. The upper end of the handle has a cross-piece for the hands of the operator. An adjustable cutter or tooth has its standard passing through the handle-bar, and by means of a double set of grooves and notches, and a set-screw, the tooth can be set at any desired height or angle.

166,506.

In a weeding-machine, the combination of the shank F, constructed with vertical grooves d and transverse notches b, and the slot B, the notches c, and projections e in the socket, and the clamping-bolt, substantially as set forth.

166,507. HEELS FOR BOOTS AND SHOES. Ariel A. Danforth, Lynn, Mass., assignor to himself and Melville C. Kimball, same place. [Filed Jan. 27, 1876.]

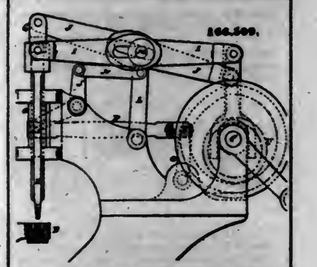


1. As an improved manufacture, a boot or shoe heel having each of its inner lifts composed of two or more pieces, *c d*, scarfed and lapped on each other, and next, or while applied to the outer lift or lifts *a b*, subjected to powerful pressure, so as to firmly and closely set together the scarfed edges, all as set forth.

2. The described mode or process of making a heel—viz., by scarfing and lapping pieces of material together to form each inner lift, and subsequently, or while applied to the outer lift or lifts, subjecting the whole to powerful pressure, so as to force the lapped parts into close or intimate contact, all as set forth.

166,508. CARBURETERS. E. J. Deschbach, Pittsburg, Pa. [Filed June 26, 1875.]

Brief.—The carburator-chamber is placed within the gasoline-tank, and communicates with it by a passage near its bottom, through which fluid is supplied from the outer tank.

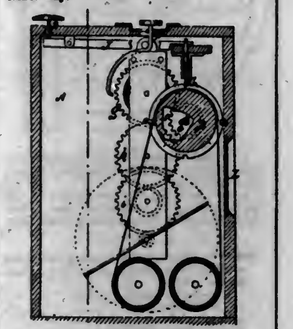


The fluid-tank B, having inlet I, combined with inclosed carburetor A, having hole C and corked pipes D H, as and for the purpose specified.

166,509. MACHINES FOR SEWING ON THE SOLES OF BOOTS AND SHOES. Thomas J. Deane, Croydon, and Mark G. Deane, New Cross, England. [Filed May 24, 1875.]

Brief.—The frame which supports the needle-actuating mechanism is pivoted to the base-plate of the machine in such a manner as to admit of being revolved around an axis thereon coincident with the axis of the needle-bar. The stroke of the needle and the position of the presser-foot are automatically regulated, to adapt them to different thicknesses of material, by means of a sliding fulcrum, which is operated by the material itself, through suitable connecting devices. The needle is arranged eccentrically to the axis of the needle-bar, which has a rotary reciprocating motion imparted to it by a cam, so that the needle, after passing through the work, is caused to move around in a circular groove formed in the top of a stationary horn, to carry the hook across the thread, so that the taking of the same at every stitch is insured.

166,509.

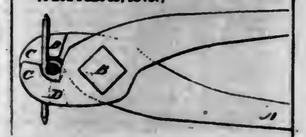


1. The combination of the needle-bar G, arranged to receive a needle, T, set eccentrically therein, as shown, the slotted sleeve O, stud O', arm P, pin or roller E, and cam E, with a horn, B, perforated to receive a sewing-thread, and provided with an annular groove around said thread-hole, substantially in the manner shown, and for the purpose specified.

2. The combination of the adjusting-bar S, bell-crank and link K K' N, rock-lever L, fulcrum-pin M, slotted beam l, cam D, and presser-foot H, all constructed substantially as shown, and arranged to operate as set forth.

3. The combination of a needle-bar, G, having the needle T arranged eccentrically therein, and adapted to be rotated back and forth, as described, with a horn, B, having an opening for the passage of the thread, and an annular groove or channel around said thread-hole for the travel of the needle, as and for the purposes specified.

166,510. STATION-INDICATORS. Stanley M. Dewey, New York, N. Y. [Filed Jan. 7, 1875.]

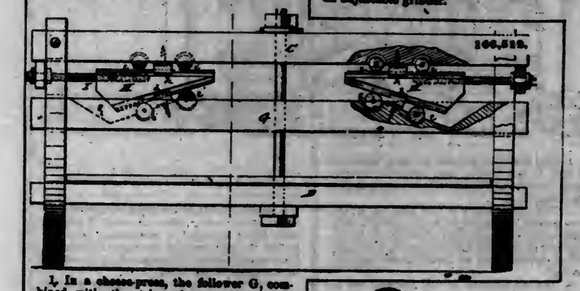


Brief.—Belt carrying names of stations is moved by clock-work when the main wheel is released by depressing a button. The train of gearing can be adjusted to drive the belt either way.

1. In a station-indicator having winding-drums revolving in opposite directions, the combination of the main roller E, gearing *g h i*, combined lever and pawl F, and dogging-plate G, arranged and operating substantially as shown and described.

2. In a station-indicator, the combination of a train of wheels with a detaining pawl or stop, with which the wheels may be dogged when the main roller is being changed, so that it may revolve in a given direction, substantially as described.

166,511. WIRE-EARS FOR FISCHERS. John Dobbs and Benj. F. Booth, Victor, Iowa. [Filed June 10, 1875.]



The pinchers made with the curved and notched jaws C, and provided with the projections D upon the inner sides of said jaws, to adapt it for use in applying barbs to fence-wires, substantially as herein shown and described.

166,512. CHEESE-PRESSES. Geo. C. Dolph and Frank J. Smith, West Andover Township, Ashtabula County, Ohio. [Filed July 10, 1875.]

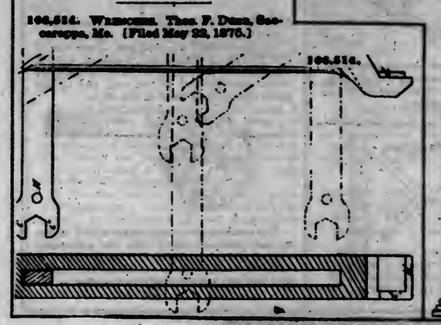
Brief.—The pressor-beam is depressed by wedges and friction-rollers forced inward by the rotation of screws.

166,512.

1. In a cheese-press, the follower G, combined with the triangular recesses *e* and rollers *i*, in combination with the wedge H, stationary beam C, and beams D, all constructed and arranged substantially as and for the purpose specified.

2. The combination of the wedge H, screw I, clamps *h*, and friction-rollers *i* with the stationary top beam C and follower G, substantially as and for the purposes herein set forth.

166,513. HORSESHOES. Joseph H. Dorgan, Plattsburg, N. Y. [Filed Mar. 13, 1875.]

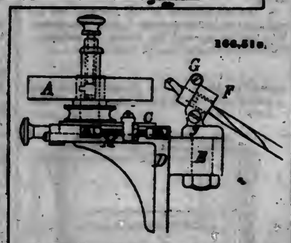


Brief.—A clasp of sheet metal spans the front of the heel, its ends overlapping and adjustably attached to two other side strips, which have lugs on their rear ends, to sustain the rear ends of the shoe, which is attached in front by a screw-bolt passing up through the clasp.

1. The combination of band B, having its flexible end portions provided with a series of holes, G, the longitudinal adjustable pieces E, and bolts F, as shown and described.

2. The bolt H and lugs I, in combination with the band B and shoe C, for the purposes described.

166,514. WRENCHES. Thos. F. Dunn, Geocreque, Mo. [Filed May 22, 1875.]



The wrench provided with a lengthwise slot, S, in its body or handle portion, for the purpose of adapting it to be applied to another wrench, in the manner specified.

166,515. DRILL-SHARPENING MACHINES. Wm. H. Daly, Worcester, Mass. [Filed Jan. 18, 1876.]

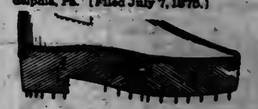
Brief.—A drill-holder consisting of three parts—viz., a spring-clasp with gage-lugs to regulate the changing of the drill, a jointed socket or holder, and a support eccentrically pivoted in a bracket attached to the frame of an adjustable grinder.

166,516.

1. The hinged holder F, arranged eccentrically on the oscillating fixture E, to bring the end of the drill past the grinding-surface, in combination with the grinding-wheel A, when constructed and operating substantially as described.

2. The griping-collar G, having a shoulder fitted on the holder F, in combination with the holder F, arranged eccentrically on the oscillating fixture E, as described, and the grinding-wheel A, when constructed and operating as and for the purposes described.

166,516. COMBINED READING AND WRITING DESKS. Lemuel G. Fairbank, Chicago, Ill. [Filed Apr. 13, 1875.]

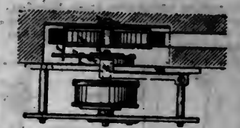


In a combined reading and writing desk, the ends A and A', legs B and B', feet C and C', drawer D, cover D', foot-rest E, and the receptacle F, all constructed, combined, and arranged to operate substantially as and for the purpose specified and described.

166,516.

166,516.

166,517. WOODEN-SOLED BOOTS AND SHOES. Manuel J. Silver Falcon, Philadelphia, Pa. [Filed July 7, 1875.]

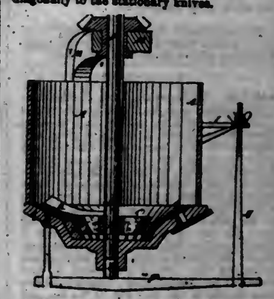


1. The hinge-jointed wood sole constructed with a cavity, and with both front and side abutments, substantially as and for the purpose described.

2. The wood sole for boots and shoes having its hinge C arranged in a cavity, which forms front and side abutments, and which is packed with the box-shaped rubber, substantially as and for the purpose described.

3. The jointed wood sole constructed with a cavity, *a a*, and provided with an abutment-block, E, which is rounded and beveled as described, substantially as and for the purpose described.

4. The hinge-jointed wood sole constructed with a cavity, *a a*, provided with an abutment-block, E, and with an india-rubber insole, A, which covers the cavity and block and the joint between the side and intermediate abutments, substantially as and for the purpose described.

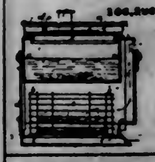


166,518. DEVICES FOR WINDING CLOCKS. Eugene Farcot, Paris, France. [Filed Apr. 20, 1876.]

In combination with the mainspring-barrel of a clock-movement, a second spring-barrel, in connection with the mainspring-barrel by means of a pawl and ratchet, and a cord or ribbon on said second barrel, substantially as described, so that drawing upon the said cord simultaneously winds the spring in both barrels, the mainspring to drive the clock-movement and the second to rewind the cord.

166,519. PAPER-PULP ENGINES. Alvin Gardner, Windsor, Canada. [Filed June 12, 1876.]

Brief.—The knives on grinding-ring are set diagonally to the stationary knives.



1. The combination, with box A, having tapered wall at the bottom, of inclined knives *b' c'*, held, respectively, in beveled ring and wheel, open inside the rim, as and for the purpose specified.

2. The combination of the damper K with the polygonal box A, the tapering knife-ring B, and the beveled knife-wheel C, open inside the rim, substantially as herein shown and described.

166,520. TRAVELING-CARS. A. A. Gervais, Paris, France, assignor to A. Gervais & Co., same place. [Filed July 6, 1875.]

The combination, with the body of the traveling-can, of the cover A, having neck *p*, the hinged bar *f*, the braces *x*, and the set screws *o*, as and for the purpose specified.

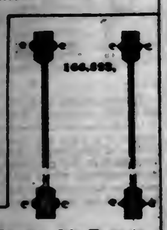
166,580.

166,581.

166,581. SLEIGH-BELLS. George W. Goff, East Hampton, Conn., assignor to the East Hampton Bell Company, same place. [Filed July 13, 1875.]

Brief.—As an article of manufacture, the herein described sleigh-bell, consisting of the two parts A B formed from sheet metal, and their meeting edges soldered as the only means for securing the said two parts together.

166,582. SAW-SETTING DEVICES. Lewis A. Grosly, Huron, Ohio. [Filed May 22, 1875.]



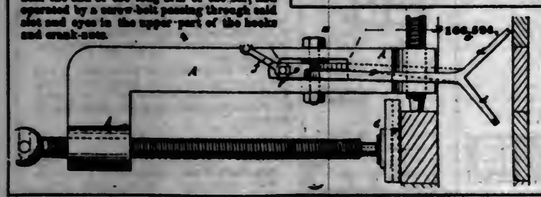
Brief.—Screw for regulating amount of set, fulcrum ob which the foot of the tooth rests, and face against which the tooth is bent by any appropriate means, the whole device being held in the head, against the saw, while it is in a clamp.

The gage for setting saws, herein described, comprising the block A, having f projecting face, B, fulcrum C, and set-screw D, as and for the purposes set forth.

166,583.

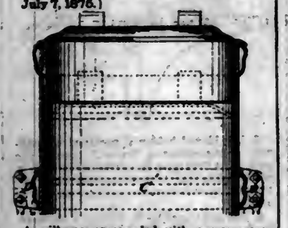
166,583.

166,583. SLATE-FRAMES. John Haggerty, Corry, Pa., assignor of one-half his right to V. G. Curtis, same place. [Filed May 26, 1875.]



Brief.—The projecting bead forms part of the felt or other frame-cover.

The slate-frame having a covering, C, of felt or similar material, provided with a bead, *c*, substantially as shown and described.



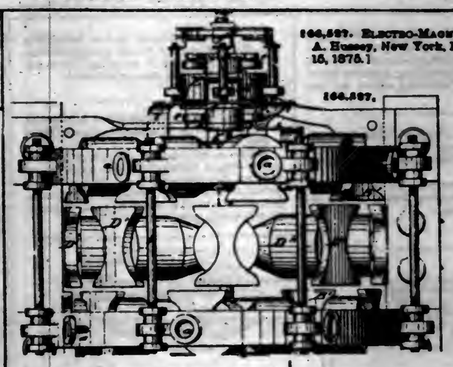
166,584. PLANKING-CLAMPS. J. Hastings, Elizabethport, N. J. [Filed June 5, 1875.]

Brief.—In planking vessels, the planks are forced to their places by means of a bar bent edgewise at right angles near one end, and provided at its ends with internally screw-threaded sockets, to receive the clamping-screws, which operate simultaneously upon the edge and side of the plank, in connection with a dovetail-shaped cross-head, pivoted to the forward end of the screw operating upon the side of plank, and upon which is placed a sliding bar, with its inner face serrated. The clamp is secured in position and locked on the ribs of the vessel by two bracketed hooks pivoted in a longitudinal slot near the end of the long arm of the bar, and operated by a screw-bolt passing through said slot and eyes in the upper part of the hooks and crank-arm.

166,584.

166,585. MILK-CANS. Samuel F. Hawley and Henry A. Mead, Cuba, N. Y. [Filed July 7, 1875.]

A milk-can surrounded with one or more bands, formed of stripe, with a raised bead running longitudinally with the stripe, drawn tightly around the can by the joints formed of the dampers, sockets, and screws, and soldered to the body of the can.



166,586. BILGE-WATER VALVES FOR SHIPS. Joseph W. Hughes, Newburyport, Mass. [Filed May 26, 1875.]

The combination of a self-closing stop-valve, F, with the ribs A and planking E C of a ship, to retain the bilge-water in the middle of the ship, substantially as specified.

166,587. ELECTRO-MAGNETIC ENGINES. C. A. Hussey, New York, N. Y. [Filed May 15, 1875.]

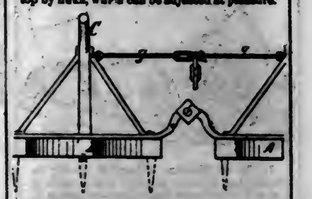
166,587.

1. The hooks D, pivoted to each other by a bolt, E, and having their lower or prosged ends branched, substantially as herein shown and described.

2. The combination of the bent bar A, the two screws B C, arranged at right angles with each other, the branched hooks D, the pivoting-bolt E, and the locking-bolt F, with each other, substantially as herein shown and described.

3. The combination of the grooved bar H and the pivoted cross-head G with the screws B C, the bar A, and the hooks D, substantially as herein shown and described.

1. In electro-magnetic engines, the stationary magnets having radial arms with T-shaped ends, being arranged in alternating position, so that the pole ends of one face the intermediate space between the pole ends of the other, for the purpose set forth.

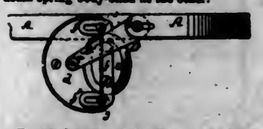


2. The outer stationary magnets having widening pole ends of T shape at right angles to the arms, substantially as described.

3. The central revolving magnet provided with widening pole ends of double T shape at right angles to the radial arms of the same, as set forth.

4. The stationary and revolving magnets having radial arms and widening pole ends whose face-width is somewhat larger than the distance between two adjoining pole extremities, so as to lap on the pole ends across the intermediate space, substantially as described.

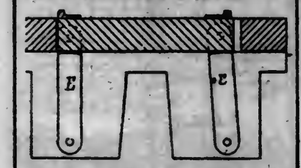
166,588. HARROWS. Isaac W. Hutchin, Clinton, Ill. [Filed Apr. 17, 1875.]



Brief.—Two triangular harrow-frames are hinged together in front and rear by raised hinges, so as to pass on each side, or straddle the row of corn. The handles are rigidly fixed to the frames, and connected near the top by links, which can be adjusted at pleasure.

In a sectional harrow, the raised hinges *e e*, in combination with sections A B, fixed handles C C, and adjustable connecting-chains *g g*, as specified.

166,589. TROUSERS. Joseph G. Jodo, Montmorenci, Pa. [Filed June 26, 1875.]



Brief.—A small pressure-pad, at one side of a large crescent-shaped pad, is pressed against the rupture by means of a link, which is fixed to the crescent-pad at one end, and to the usual spring body-band at the other.

The combination of the strap A, link D, pin *c*, and crescent-pad *d* with the adjustable slotted plate *f* and ball-pad *e*, all arranged so that the link D acts as a lever on the plate *f* and ball-pad, substantially as specified.

166,590. STREET-RAILWAY SWITCHES. A. L. Johnson, New Orleans, La. [Filed May 27, 1874.]

Brief.—A street-railway switch having its movable portion laid on a platform which is supported upon vertical toggles, so as to be shifted with great facility by the action of the draft-animal, when guided to the right or left after the car has entered the platform.

The combination of the swinging switch-rails C and C' with the supporting-toggles E E, arranged substantially as described, and for the purpose set forth.

166,591. GAS-BURNERS. Pierre F. Joute, Cincinnati, Ohio. [Filed May 6, 1875.]

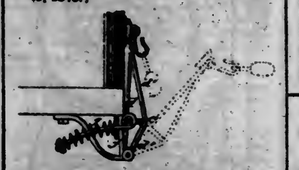
Brief.—The plate B is placed at the side of the flame-orifices, and serves to spread the flame.

The burner A, having perforations *a*, in combination with the flange B, provided with the corrugations *b*, substantially as and for the purpose hereinbefore described and set forth.

166,592. GRAIN-SEPARATORS. Andrew W. Kendrick, Brooklyn, N. Y. [Filed July 3, 1875.]

Brief.—Device for running the separator, either independently of, or in connection with, the fan, as desired. Elbow-crank actuates the lower end of the shoe through connecting-rod, adjustable to suit the height of the lever and of the shoe, which is suspended by adjustable straps. Knocking-lever adjustable to suit height of shoe. Device for regulating the flow of grain from the hopper.

166,592.



1. The combination, with driving-wheel E and crank-pulley J, operating the shoe F, of the plates H' and pulley H, rigidly secured together, and detachably secured to the fan-shaft B, for the purpose of allowing the separator to be used at will, either with or without the blast, substantially as set forth.

2. The combination of pulley J, having the cam-projection *j*, with the adjustable jarring-lever I and adjustably inclined separator or shoe F, substantially as set forth.

3. The combination of adjustably inclined shoe F, slotted bracket K', inclined connecting-rod *d*, provided at one end with screw-thread and adjusting-nuts *e*, and lever K', substantially as set forth.

4. The combination of slides B', having delivery-orifices in its lower edge, pivoted slats or gates C, and adjusting-bar D, to which said slats are pivotally connected, substantially as and for the purposes set forth.

166,593. STREET-CAR COUPLINGS. Heinrich Krueger, Jr., New York, N. Y. [Filed June 19, 1875.]

1. A spring-retracted lever, fulcrumed at *a*, and having pivoted hook at upper end, to serve on horse-cars as a draw-bar that will automatically be taken out of the way of the horses' feet as soon as a stoppage is made.

2. The combination of the braced and pivoted lever with rear-extending and spring-acted arm pivoted thereto, and a perforated retaining guard-plate of the car-bottom frame, substantially as shown and specified.

3. The swinging and spring-acted lever, having broad contact-plate at upper end to rest against dash-board, substantially as described.

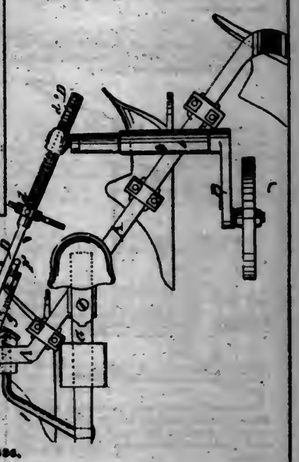
166,594. CIGAR-BOXES. M. Lichtenstein, New York, N. Y., assignor to Lichtenstein Brothers & Co., same place. [Filed June 4, 1875.]

Brief.—The box is covered with foil gummed thereon. Paper binding or border on all the edges covers the edges of the foil, and prevents soiling or rolling.

A cigar-box rendered air-tight by a complete covering of tin-foil, *a*, which is attached to the wood of the box by gum, and whose edges are covered with paper binding *b*, substantially as and for the purpose specified.

166,595. METALLIC WINDOW-BLINDS. W. S. Mackrell, Evanston, Tex., assignor to himself, W. R. Wilson, and Curtis T. Ball, same place. [Filed June 1, 1875.]

The fire-proof window-blind consisting of horizontal leaves or sections A, vertical cleats B, and locking-arm C, all arranged substantially as and for the purpose described.

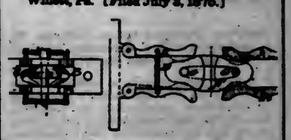


166,595.

166,596. GANG-PLOWS. David A. Manuel, Napa, Cal. [Filed May 8, 1875.]

Brief.—Plow-beam and wheels placed obliquely. The crank-axle arms connected to either end of an oblique horizontal shaft, and actuated by a lever and connecting mechanism to raise the wheels, and by a swiveled screw to set the depth of the plows. Draft-beam and tongue adjustable to allow the plows more or less land.

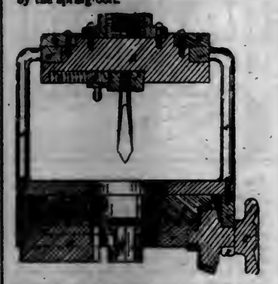
166,596.



1. The combination of the main beam A and crank-axle E swinging thereon with the governing rear shaft D, fulcrumed hand-lever F, and rack and treadle mechanism for raising and lowering wheels and regulating depth of plows, substantially as set forth.

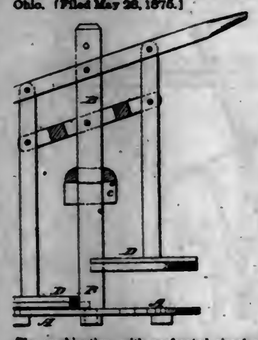
2. The combination of the rear crank-axle and shaft B', having swiveled nut *c*, with the receiving screw-sleeve 2, of rear shaft D, for setting plows to exact depth required, as specified.

3. The main beam A, in combination with pivoted draft-beam G, having socket *n* with tongue pivoted therein, and adjustable side brace I to throw draft-beam out of line of draft and plows to or from the land, as set forth.



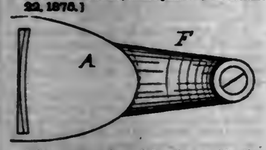
166,597. CAR-COUPLINGS. John M. Martin, Willett, Pa. [Filed July 3, 1875.]

An automatic car-coupling composed of stationary top and bottom guide-bars, pivoted and spring-connected side bars, with grooved front jaws, with coupling-pin resting thereon, and of a centrally-widening link, all constructed substantially as specified.



166,536. CHUCKS AND CENTERERS. John R. Macoy, Wilmington, Del. [Filed June 22, 1875.]

Brief.—Sliding plate carries two tools, either of which may be locked in a central position by the spring-bolt.

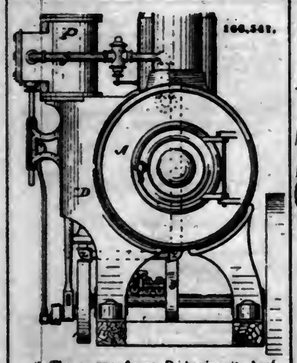


The combination of arm-plate F, face-plate G, lock-plate H, ring M, and sliding plate I, adapted for the use of two tools, J and K, with the scroll-check, all as and for the purpose specified.

166,539. WASHING-MACHINES. John W. McQuillin and John A. Knepper, Delta, Ohio. [Filed May 28, 1875.]

The combination, with perforated circular grate A, having central post B, of the pounders D D, recessed and sliding on said post as a guide, in the manner shown and described.

166,540. BOX-SCRAPERS. Gustavus Meyer, Quincy, Ill., assignor of one-half his right to Julius Franke, same place. [Filed June 22, 1875.]



A box-scraper formed by the combination of the plane-rest A, handles F, shoulder B, and adjustable piece D, substantially as shown and described.

166,541. PORTABLE STEAM-ENGINES. M. McEaig and W. J. Muncaster, Cumberland, Md. [Filed May 26, 1875.]

1. The combination, in a portable steam-engine, of the horizontal boiler A and frame D, constructed substantially as described, whereby the said frame supports the cylinder above, and the crank-shaft with its balance-wheel below, the boiler, as set forth.

2. In combination with the horizontal boiler A, the engine-frame D, having its back fitted to the boiler, and its upper end adapted to receive the engine-cylinder, substantially as shown and described.

166,542.

3. The engine-frame D, having its back adapted to fit upon and support the end of the horizontal boiler, and its lower and provided with bearings for the main shaft, in combination with the vertical cylinder P, substantially as set forth.

4. The frame D, having its back made concave to fit upon and support the boiler, with bearings for the cross-head in its interior, the bearings or guides *g* for the valve-stem, and the boxes or bearings at its lower end for the main shaft, substantially as shown and described.

5. The pump H, secured to the boiler underneath the same, in combination with its operating-wheel *q* and main shaft G, all being arranged to operate as set forth.

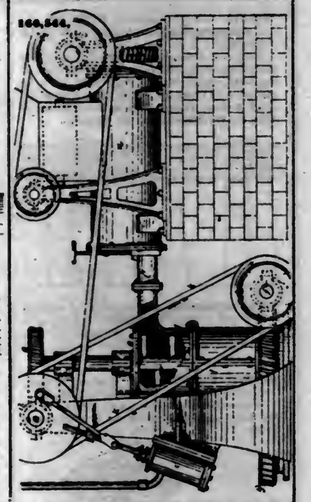
166,542. BRUSHES. Saml. A. Miles, Rochester, N. Y. [Filed May 24, 1875.]

Brief.—The head is grooved, and leading to this is a narrow throat at the bottom of two converging sides, by means of which a sponge can be rammed into the groove through the throat, and held thereby without other fastening.

The grooved head or holder A, constructed with the narrow throat *c* and expanding sides *b b*, forming the angular groove *f* for the easy insertion of the sponge, as herein shown and described.

166,543. SLEEVE-BUTTONS. J. C. Miesmer, Trenton, N. J. [Filed June 19, 1875.]

Brief.—A perforated bar is adapted to slide in a groove on the bottom of the foot, and a spring-catch which is secured to the top of the foot engages with the bar, and locks the button to the article on which it is used.



A button having the face-plate or head A and the shank B, with the single foot *b'* at a right angle to it, in combination with the spring-catch D and perforated slide-bar C, substantially as and for the purpose specified.

166,544. BRICK-MACHINES. A. Conrad, Germantown, Pa. [Filed Nov. 27, 1874.]

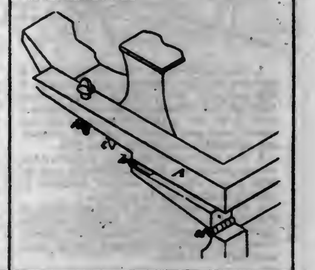
Brief.—The clay is tempered in a horizontal cylinder by a pair of rollers of differing velocities. It thence passes into a closed vertical pug-mill at a point just below the uppermost blade. Worm-gearing throughout, with belting at both ends of each shaft.

166,544.

1. The combination of the worm-wheels *e* and *g*, worm-shafts *a*, *d*, and *f*, double or balanced pulleys B B and A A, and the belts *h h*, when constructed and arranged to operate together, substantially in the manner shown, and for the purposes specified.

2. The combination of a brick-pressing machine, constructed substantially as shown, and provided with a vertical receiver, *i*, for tempered clay, and a horizontal clay-tempering machine, n, connected together by a conduit, C, and a suitable arrangement of pulleys and belts driven from the same motor-shaft, so that the speed of one may be always proportionate to that of the other, substantially in the manner shown, and for the purposes set forth.

166,545. BED-BOTTOMS. Thomas L. Odell, Iowa Falls, Iowa. [Filed Nov. 19, 1874.]



Brief.—The edges of the slats are stiffened by the wires, and the slats are supported by the staples which rest in the grooves of the transverse slat.

In combination with the grooved slats B, the slats A provided with the metallic springs or wires *a a*, the staples C and eyes *d*, all constructed substantially as and for the purpose set forth.

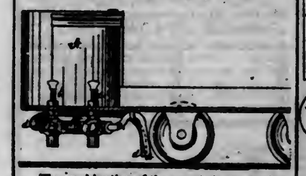
166,546. CARRIAGES. Richard L. Ogden, San Francisco, Cal. [Filed June 22, 1875.]

Brief.—To allow the bows to be folded back of the driver's seat.

1. The rest *c*, hinged to the carriage-body at *d*, and having the part A hinged to it at *b*, so that the top may be folded back of the seat, substantially as herein described.

2. In combination with the parts A and *c* of a carriage-rest, hinged together as shown, the extension *e* and the folding-cover *h*, for securing and steadying the rest in vertical position, substantially as herein described.

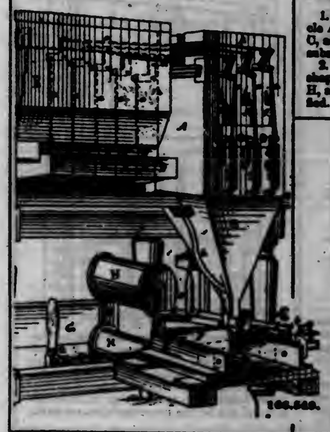
166,547. PROTECTORS FOR BOOT AND SHOE STRAPS. Horace P. Osbourne, Milwaukee, Wis. [Filed Dec. 21, 1874.]



Brief.—The webbing or fabric encircling the strap is passed through a slotted piece of leather and stitched to it.

The protector B, in combination with the fabric composing the strap of a boot or shoe, for the purpose specified.

166,548. APPARATUS FOR LUBRICATING RAILWAYS. Cornelius B. O'Sullivan and Patrick Murphy, New Orleans, La. [Filed Feb. 20, 1875.]



Brief.—Waters both tracks, or either, with streams regulated in quantity by valves.

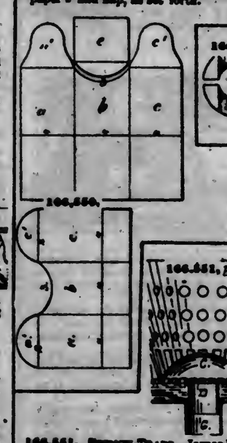
The combination of the reservoir A, supply-pipe *a*, valves B and C, and discharge-pipes *d* and *e*, as and for the purpose set forth.

166,549. TYPE-SETTING MACHINES. William D. C. Pattyson, Sherbrooke, Canada. [Filed Jan. 12, 1875.]

Brief.—The types stand out on end in separate tubes. By touching the proper key the lower type in any tube is released, falls through a funnel, and drops on the end of a liberatory lever in the composing-stick. As this lever is tripped it completes the circuit, so that a magnet is brought into action. This actuates a pusher, which slides the type along in its line, making place for the next letter. When the line is full it is drawn back in the stick by a lever moved by hand.

166,549.

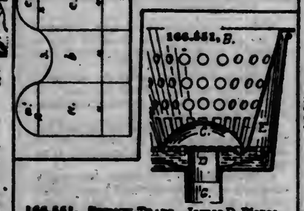
1. The combination of the keys D, arranged and located in case E, the spring-valves *d*, arms *g*, and tubes *a* in case A, together with the rods *c* and levers for connecting the keys with the valves and arms, so that the former shall operate the latter, all constructed and operating in the manner specified.



2. The combination of the block K, lever J, armature I, and electro-magnets H H, in the manner and for the purpose stated.

3. The combination of the liberating-lever N, poles L M, magnets H H, lever J, and block K, in the manner and for the purpose specified.

166,550. NEEDLE-WRAPPERS. Augustus K. Phillips, New York, N. Y. [Filed Jan. 19, 1875.]



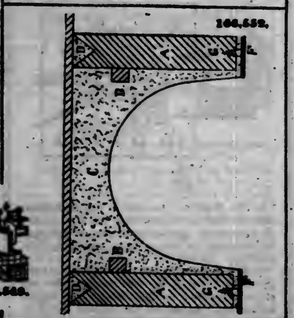
1. The needle-wrapper, made of one piece of paper, folded to form the sections *a b c*, and with the end flaps *a' c'* to cover the opening at 3, as and for the purposes set forth.

2. The needle-wrapper, made of one piece of paper, folded to form the sections *a b c*, and provided with the opening at 3 for the tack or flap, in combination with the separate paper *e* and flap, as set forth.

166,550.

166,551.

166,551. B.



166,551. STENCH-TRAPS. James D. Pierce, Milwaukee, Wis., assignor of one-half his right to John B. Smith, same place. [Filed June 26, 1875.]

Brief.—The trap has a perforated strainer with crown-shaped bottom. Below this is a disk attached to a removable pipe. The posts being easily removed, the trap can be kept clean, and also free from effects of frost.

1. A steam-trap constructed with receptacle A, strainer B, with crown-shaped bottom C, and removable pipe D, all in combination substantially as set forth.

2. Receptacle A, strainer B, with crown-shaped bottom C, removable pipe D, and disk H, all in combination substantially as specified.

166,552.

166,552.

166,552. FIRE-PROOF FLOORS. James D. Pierce, Milwaukee, Wis., assignor of one-half his right to John B. Smith, same place. [Filed Dec. 16, 1874.]

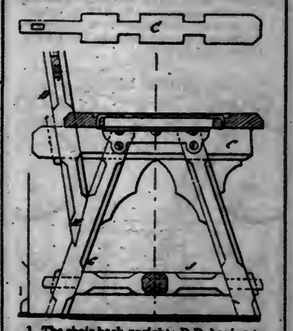
Brief.—A fire-proof floor consisting of a cement arch supported by iron plates secured to the bottom of the joists. The joists are recessed on top to receive cement, and are provided with side strips, which assist in holding the cement arch in place.

1. A fire-proof floor constructed with joist A, cement arch C, and plates F, substantially as specified.

2. A fire-proof floor constructed with joist A, side plates E, cement arches C, hollow D, filled with cement, and plates F, substantially as specified.

166,553. HAND-VISES. Leonard L. Pollard, Worcester, Mass. [Filed May 25, 1875.]

Brief.—A portion of the screw-shank is smooth, and fits in a corresponding socket in the upper end of the handle, to protect the screw-thread from dirt or filings.



The hand-vise herein described, consisting of the pivoted jaws A A, springs *a a*, and screw-shank B, the upper part thereof formed smooth, to fit with a close joint into a recess, E, in the handle C, said handle having a conical end, *d*, for operating the jaws, substantially as and for the purpose set forth.

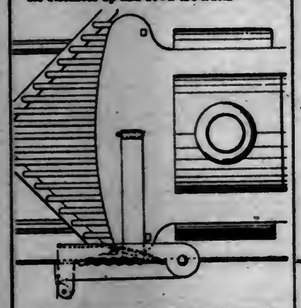
166,554. VENT-FAUCETS. Chas. H. Bassett, Buffalo, N. Y. [Filed July 6, 1875.]

The return-duct E K, arranged upon the faucet-body A, whereby cold air is drawn from an ice-box or refrigerator through one of the ducts E, and, passing through the channel F in the plug B, returns through the adjacent duct into the ice-box, to vent the cask containing the liquor to be drawn, substantially in a manner as described.

166,555. CHAIRS. Henry Rempka, Chicago, Ill., assignor to himself and F. W. Krause, same place. [Filed Apr. 10, 1875.]

Brief.—The several parts of the chairs are united by mortises and tenons, which are secured by keys.

1. The chair-back uprights D D, having tenons H resting in notch of legs G, and a mortise through which the seat-rails C are passed, and secured by keys, all substantially as and for the purpose described.



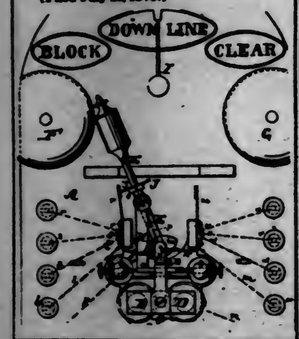
2. The connected chair-stretchers J J, passing through front and rear legs of chair, and secured by keys, substantially as and for the purpose set forth.

3. The seat-rails C, having gains N, combined with front and rear legs, slotted, as and for the purpose specified.

4. The head S, having bar Q and cross-bar R, combined with back pieces D, slotted and mortised, as and for the purpose described.

166,556. Means for Raising Water into Railroad-Tanks. Tyree Roden, Wales Station, Tenn., assignor to himself and T. A. Atchison, same place. (Filed Apr. 3, 1875.)

Brief.—A clamping-jaw attached to the locomotive, and capable of being swung over to either side, by which a rope is seized which connects with pumping machinery, and enables the locomotive to raise its own water into a tank. The clamp is disengaged by the lever thereof striking posts located at suitable distances up and down the track.



1. As an improved device for raising water into railway-tanks by the action of the locomotive without interfering with the running of the trains, a swinging and adjustable grappling attachment to the locomotive, in combination with a wire-rope running-gear, parallel to the track at both sides of the tank, and with detaching-posts near each end of running-gear, all being arranged and operated substantially as and for the purpose set forth.

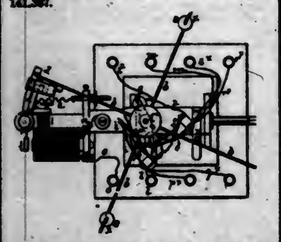
2. The grappling attachment to locomotives for raising water into the tank, composed of hinged main arm with lateral supporting jaw-piece, pivoted and spring-acted clamping jaw-piece, and eccentric locking-lever, substantially as described.

3. The combination of swinging grappling attachment, hinged centrally to cow-catcher beam of locomotive, with supporting legs or rests at each side of the same, for the purpose specified.

166,557. Electric Railway-Signals. David Rousseau, New York, N. Y., assignor, by mesne assignments, to William F. Smith and Samuel Samuels, same place. (Filed July 21, 1875.)

1. The combination of the tube H, formed on the circuit-closer, with the inner rings or plates h i, and with the sliding sleeve or plate l, substantially as described.

2. The rod I, placed within the cushion C, and through the rings i h, and combined with the sleeve l and plate E, substantially as and for the purpose specified.



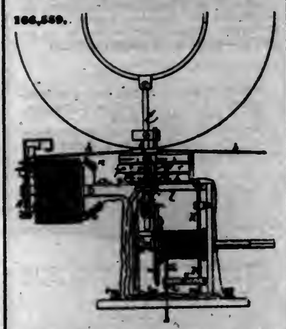
3. The cushion C, flanged on top and bottom, and combined with the plates B and D, and screw-rings E and G, substantially as set forth.

4. The conductor F', carrying the plate q, combined with the conductor F", carrying the plate p, and with the cushion r and screw s, substantially as and for the purpose specified.

5. The combination of the upper and lower movable plate h i with the intermediate plate or sleeve l, which is capable of motion, all arranged to constitute a circuit-closer, substantially as specified.

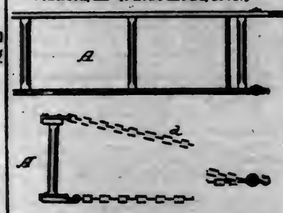
166,558. Electric Railway-Signals. David Rousseau, New York, N. Y., assignor, by mesne assignments, to William F. Smith and Samuel Samuels, same place. (Filed July 21, 1875.)

Brief.—Improvement on his Patent No. 141,367.



1. The trigger f, pivoted to the armature-lever F, and combined with the leg d, that protects from said armature-lever, substantially as and for the purposes shown and described.

2. The projecting hook w, attached to the armature-lever F, in combination with the projecting step s on the arm b of the signal, substantially as and for the purpose specified.



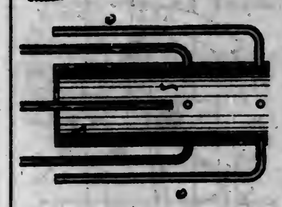
3. The friction-rollers e e, combined with the projecting arms g h of the signal-shaft, and with the springs p' q' r' r", &c., substantially as and for the purpose described.

166,559.

4. The slide H, carrying the slotted arm y, and combined with the rope E, which has the knot z, for the purpose of raising said slide, as specified.

166,560. Hay-Gatherers. Perry Russell, Jefferson, Ill. (Filed June 24, 1875.)

The frame A, consisting of two or more longitudinal bars, suitably connected together, in combination with chains d e at each end, all constructed and operating substantially as and for the purpose specified.

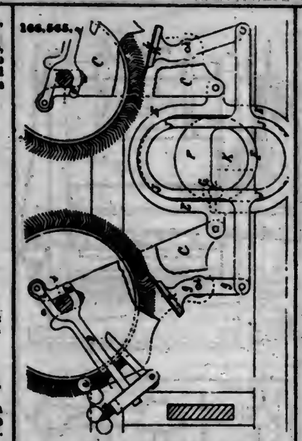


166,561. Curtain-Fixtures. Herman Beshausen, Memphis, Tenn., assignor of one-half his right to George E. G. Jones, same place. (Filed July 7, 1875.)

In combination with a curtain and its curtain roller, with cylinder at one end, the cord c attached at one end to the curtain, and passing around the pulley b, and ceiling at the other end upon the roller, the frame D having pulley b and slot a, and the pins f, all substantially as and for the purposes herein set forth.

166,562. Exhaust-Nozzles. Thos. Shaw, Philadelphia, Pa. (Filed May 17, 1875.)

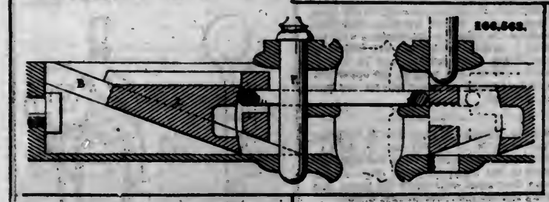
Brief.—The steam is exhausted into a pipe, in which a cushion is formed, and thence into the atmosphere through a series of small pipes, thus preventing the shooting of the steam.



The combination of the steam-chamber a with the tubes c and the exhaust-pipe e, as described, and for the purpose set forth.

166,563. Car-Couplings. Jacob Singer, Harrisburg, Pa. (Filed Oct. 16, 1874.)

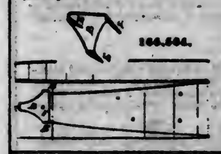
Brief.—Two gravitating-blocks sliding upon inclined shelves within the draw-head. The first block slides under the pin-hole, and supports the pin when uncoupled; when coupling, the thrust of the link pushes it back, and allows the pin to fall. The second block receives the end of the link, and prevents shock when the bumpers come violently together.



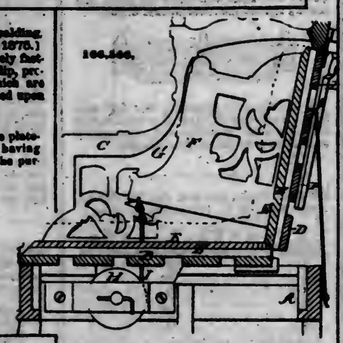
1. A triangular shelf, No. 1, slotted at D, in combination with the inclined way E, and a yielding auxiliary device beyond to receive the link in case of violent shocks, as and for the purpose described.

2. The block-follower No. 2, in combination with the shelf-follower and inclined seat, as and for the purpose set forth.

1. The steel comb or cleaner I, in combination with the frames C C H g g, eccentric F, cam K on shaft G, and eccentric frames J E, whereby the comb is adapted to be moved in a circle concentric with the periphery of the cylinder to be cleaned, substantially as and for the purpose specified.



2. The combination, with the frames C C, slotted at a a, whereby they are adapted to hang on shaft b, of the slotted lever-arms or bents D e e, the set-screws o o, and straps d d, for adjusting the cleaner toward or away from the cylinder, substantially as specified.



166,564. Hoop-Fastenings. W. Spalding, Petersburg, Mich. (Filed May 14, 1875.)

Brief.—The end of a hoop is securely fastened by a triangular-shaped metal clip, provided at its corners with prongs, which are passed through the hoop, and clinched upon the inside.

As a new article of manufacture, the plate-clip B, of a triangular shape, and having prongs B at its corners, as and for the purpose specified.

166,565.

166,566. Machine for Cleaning Card-Cylinders. Harvey Spaulding, Springville, N. Y. (Filed June 28, 1875.)

Brief.—The frames which carry the comb or cleaner are hung on the shaft of the cylinder to be cleaned, and are vibrated by the eccentric and its frame, the teeth of the comb, at the end of each stroke, being thrown downward away from the card by the cam and its frame, so that the comb, in moving back, may not strike the card-teeth. By lowering the screws the lever-arms are raised or depressed, and the cylinder moved away from or toward the comb, so that it may be cleaned to a greater or less depth.

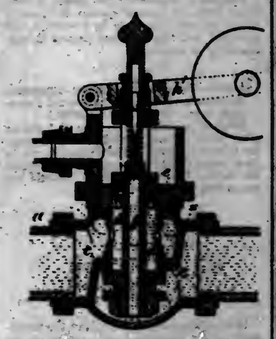
166,567. Sofa-Bedsteads. Sidney Squires, Boston, Mass. (Filed Nov. 6, 1874.)

Brief.—The ends of the swinging back fall into recesses in the ends of the stationary frame, the folding and extension of the parts being assisted by a cord attached upon a spring-drum. An ornamental strip is hinged to the back, and turned down to support it where the bed is made. It is also provided with legs folding in a longitudinal direction upon the solid back, and held in position by the tension of a cord, which is strained by raising the back.

1. In a sofa-bedstead, the combination of the swinging back D, with the arms F F arranged to slide into the rabbets G G in the arms O C, so as to be concealed from view, substantially as and for the purposes described.

2. The combination of the springs H, fixed within the sofa-frame and under the sofa-seat, arms F F, and swinging back D, as and for the purposes set forth.

3. The combination of the swinging back D with the legs P P, constructed as described, to be folded toward or away from said swinging back, in a direction lengthwise with it, as and for the purposes set forth.



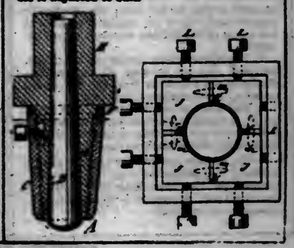
4. The combination of the swinging back D, frame A, legs P, cord Q, and staples or pulleys R, as and for the purpose set forth.

5. The combination of the swinging back D and hinged top S, as and for the purpose set forth.

6. The combination of the swinging back D, hinged top S, frame A, cord V, bar U, and spring W, as and for the purpose set forth.

166,567. Pressure-Regulators for Water-Pipes. Ferdinand Steele, Brooklyn, N. Y. (Filed May 31, 1875.)

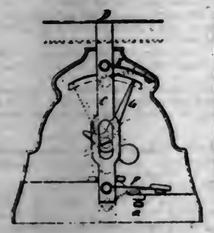
Brief.—When the pressure is lowered in the delivery-pipe, the weight opens the valve to again admit water. If the pressure becomes too great, a small relief-valve is opened.



1. The removable cylinder d, containing the sliding piston e, and forming a seat at its end for the valve g, in combination with the piston e, valve g, stem f, lever h', and inlet water-way a', opening into the cylinder d between the piston e and valve g, substantially as set forth.

2. In a pressure-regulator, the piston and valve upon one stem, between which the incoming pressure is balanced, in combination with a valve adjusted to open by an excess of pressure in the delivery-pipe, substantially as set forth.

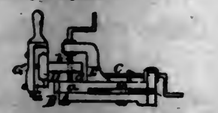
166,568. Dies for Forming the Eyes of Tools. John R. Thomas, Hamilton, Ohio. (Filed May 10, 1875.)



Brief.—The conical shell is adjusted on the part A, and held thus adjusted by washers, this lengthening of the punch causing it to enter farther into the eye, and, by virtue of its conical shape, further distend it. The lower die is adjusted to suit.

1. The combination, with the tapered and slitted die-stock A, of the correspondingly-shaped nut C, and pin B, and a collar or ring, F, as and for the purpose specified.

2. The combination of the adjustable punch with a die constructed substantially as described.



166,569. LETTER-SCALES. Andrew Turnbull, New Britain, Conn., assignor to Landers, Frary & Clark, same place. [Filed Mar. 18, 1874.]

The post C, supporting the platen D, combined with the parallel springs E F, one of which is made adjustable by a screw, *a*, and provided with the weighted pointer G, substantially as specified.

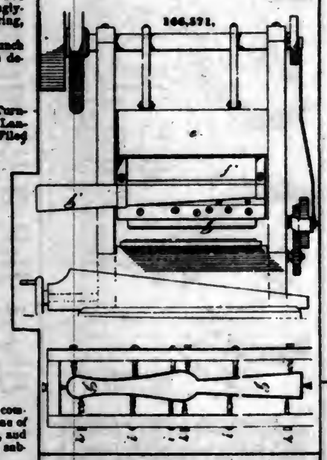
166,570. DIAMOND MILLSTONE-DRESSING MACHINES. Orsem G. Vanderhoof, Knoxville, Tenn. [Filed July 13, 1875.]

Brief.—The bracket-arms on the sliding plate have vertical screws passing through the projecting arms of the adjustable bar, to be adjusted up and down as desired, to make the sliding diamond-holder on the said bar cut as deep as required.

In a millstone-dressing machine, the combination of the bed-plate A, with guides *a a*, the sliding plate B, with brackets E E, the adjustable bar D, with arms *d d*, and the adjusting-screws C and *b b*, all substantially as and for the purposes herein set forth.

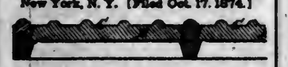
166,571. MACHINES FOR CUTTING FAN-STICKS. Joseph W. White, Weymouth, Mass. [Filed June 24, 1875.]

Brief.—Fan-sticks are cut by means of a reciprocating cutter-carrier provided with an endless flexible and laterally-adjustable cutter of suitable form, in connection with a vertically-adjustable bed, feed-rollers, and loose support actuated by the feed, and adapted to support and present the material to the cutter. The upper portion of the cutter-carrier is inclined, for the purpose of delivering the sticks, as they are discharged from the cutter, through an opening in the carrier, in line with the cutter, into a receiver or guide attached to the side of the carrier.



1. In a fan-stick-cutting machine, the combination of the reciprocating cutter-carrier, cutter *g*, and bed with feed-rollers and loose support, moved by the feed, and adapted to support and present the fan-stick material to the action of the cutters, substantially as described.

2. The reciprocating carrier for the cutter, provided with an opening, *f'*, for the discharge of the fan-sticks from the top of the cutter *g*, substantially as described.



3. The cutter-carrier *e*, provided with opening *f'*, in combination with the fan-stick guide *f* to receive the fan-sticks as discharged from the holder, substantially as described.

4. The endless and flexible cutter *g*, and its holder *f*, in combination with the adjusting-screws *h* and *i* for controlling the opening in the cutter and its position in the holder, substantially as described.

166,571.

166,572. VAULT-COVERS. Jos. M. Willbur, New York, N. Y. [Filed Oct. 17, 1874.]

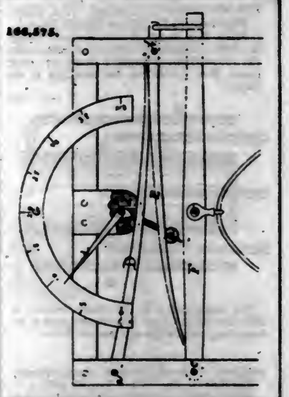
The frame or sash A, composed of the parts or sections *a a'*, having openings in the form, in cross-section, of two frustums of a cone, one above the other, in combination with the lights C, adapted to rest on the projecting edges of the lower section, and to be held in place by the inclined walls of the upper section, substantially as described, for the purpose specified.

166,573. VAULT-LIGHTS. Jos. M. Willbur, New York, N. Y. [Filed Oct. 17, 1874.]

Brief.—A vault-light in which the lenses are secured in the frame by metal rings shrunk around their small ends below the frame, and bearing against the lower surface thereof.

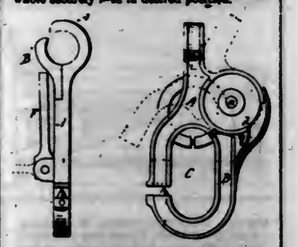
A cork-shaped or tapering lens for vault-lights, secured to its frame by a metallic ring shrunk around its smaller end, substantially as described, for the purpose specified.

166,574. VAULT-COVERS. Jos. M. Willbur, New York, N. Y. [Filed Oct. 17, 1874.]



The solid reversible vault-cover, provided with projections B, substantially as shown, for the purposes set forth.

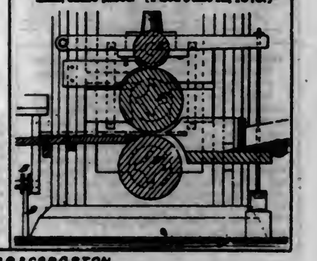
166,575. WRENCHES-SCALES. Henry C. Wingate, New Orleans, La. [Filed Jan. 18, 1875.]



The pivoted levers D E F, formed and secured as shown, cam *f*, shaft *e*, index-finger *d*, weighted crank *g*, and dial-plate G, the whole being combined and arranged to operate substantially as described.

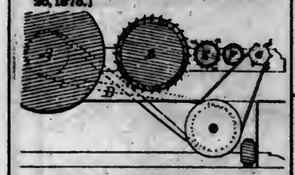
166,575.

166,576. HAT AND COAT HOOKS. Charles H. Winton, Danbury, Conn. [Filed June 26, 1875.]



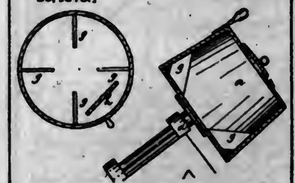
Brief.—To the base or body of a portable detachable hook is hinged a supplementary arm, the two parts opening and closing on a pivot, there being on the one part a suitable pawl, and on the other a segmental ratchet, also a detached key to operate the same. There are also a pair of jaws hinged to the main device, which open out nearly at right angles, and in that position may be attached to any ordinary hook or the like, the construction being such that when the main device is locked these jaws are also locked, and the whole securely held in desired position.

1. The combination of the two parts A B, hinged together, and constructed to form the recess C, with the locking-pawl *f* on one part, and the corresponding notch *d* on the other part, and the jaws A' B' on their respective parts, substantially as set forth.



2. The combination of the two parts A B, hinged together and constructed to form the recess C, with the locking-pawl *f* on one part and the corresponding notch *d* on the other part, and the hinged jaws F F' constructed to form the recess G, substantially as described.

166,577. MACHINES FOR ROLLING NAIL-PLATES. Hiram Woods, Newcastle, Pa., assignor to himself and William P. Merriman, same place. [Filed June 12, 1875.]



The combination of a movable feed-table, A, with the drawer-over roll E and a pair of nail-plate rolls, substantially as specified.

166,578. WOOL-CARDING ENGINES. A. H. Woodbury, Ashuelot, N. H. [Filed Mar. 26, 1875.]

In combination with the serrated stripping-roll E and auxiliary roll F, the beating-roll C, substantially as and for the purposes stated.

166,579. WASHING-MACHINES. William Atwood, Cape Elizabeth, Me. [Filed May 26, 1875.]

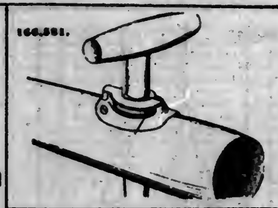
The vessel *a*, constructed to rotate upon the inclined axis *b*, having the wings *g*, grating A, and discharge-plug *i*, as shown and described.

166,580. WATER-PROOF HOSE. Seth W. Baker, Providence, R. I. [Filed Mar. 24, 1875.]

1. The hydraulic hose, consisting of the thick woven fabric and water-proof lining, united into tubular form by the seam D, having the packing and covering, substantially as shown and described.

2. In hydraulic hose, the combination, with a seam or joint constructed as described, of an outside covering or shield, applied to the same substantially as and for the purpose specified.

3. The combination of the webbing or handle G with the ridged part of the hose, substantially as shown and described.



4. The combination of the external ribs H with the body of the hose, substantially in the manner and for the purpose specified.

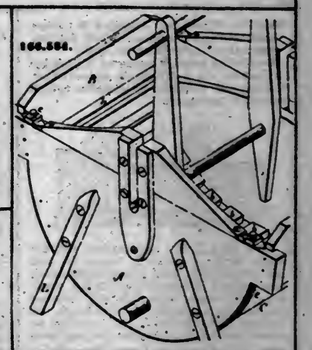
5. The herein-described hydraulic hose, consisting of the thick woven fabric, the water-proof lining, the seam D having the packing and covering, and the external ribs H, the several parts being constructed, combined, and arranged substantially as and for the purpose described.

166,581. FAUCETS. Edward W. Barnes, Syracuse, N. Y. [Filed July 28, 1875.]

The metallic disk or plate adapted to fit and and be secured upon a faucet over the spigot-recess, being provided with an aperture for the insertion of the spigot, and carrying a semicircular bridge adapted to engage over a lug, pin, or projection on the spigot, and confine the same in place, substantially as described.

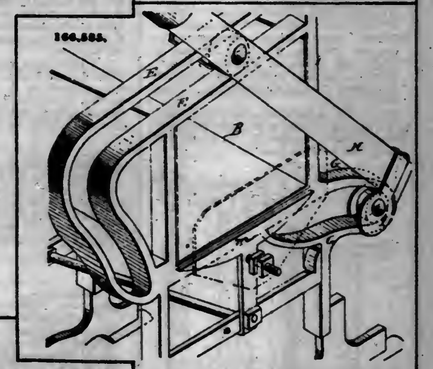
166,581.

166,582. LAMPS. George A. Soldier, Philadelphia, Pa. [Filed June 18, 1875.]



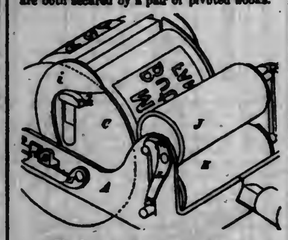
2. The combination of the double tube A B, sliding tube C, with aperture *h*, and vent-tube *i*, as and for the purposes herein set forth.

3. The combination of the double tube A B, sliding tube C, collar *d*, with hole *p*, and drip-cup D, all substantially as and for the purposes herein set forth.



166,582.

166,584.



166,585.

166,583. MARKING-WHEELS. Wm. H. Bell, San Francisco, Cal. [Filed June 20, 1875.]

Brief.—The marking-belt is tightened by a cross-bar held by hooks, and the inking-rolls are both secured by a pair of pivoted hooks.

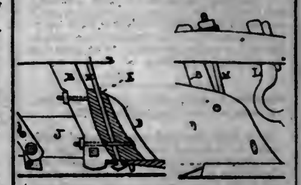
1. The frame A, having the slots D to receive the ends of the axle, in combination with the plates E, with their hooks *f f* to accommodate different sizes of rollers, substantially as herein described.

2. The band or belt H, and bar A, in combination with the type-roller C, provided with the depression *g* and cam-hooks *i*, substantially as and for the purpose set forth.

3. The pivoted plates L, with their hooks *m* and ends *n*, in combination with the frame A, when said plates are so attached as to either secure or release the two rollers J and K at one operation, substantially as herein described.

166,584. WASHING-MACHINES. David Born and David F. Born, Fulton, Ohio. [Filed Mar. 6, 1875.]

The combination of the case C, having bars *h* at each end unattached to the side pieces, cross-pieces B B, binding-straps *a*, sides A, and pinking-strips *c*, substantially as and for the purpose described.



166,585. STRAW-CUTTERS. W. R. Bowman, Danville, Ky., assignor to Lucy C. Bowman, same place. [Filed Dec. 16, 1874.]

Brief.—The particular shape of the guide-ways in which the knife works gives the desired draw-cut, and permits the knife to be thrown back out of the way of the material with ease and convenience.

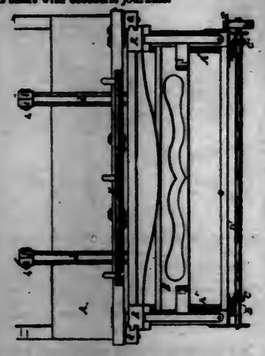
In combination with the frame A and box B, the angular bars E E, having curves *s s*, the bars G G, and the knife H, having straps O and roller J at its upper part and roller I at its lower part, and connected thereby to the bars E and G, respectively, all substantially as set forth.

166,586. PLOWS. T. Miles Brose, Philadelphia, Pa. [Filed Nov. 13, 1872.]

Brief.—The plow is formed with a solid block for the standard, and which is of one piece with the mold-board. An iron bolt passes up through the standard and beam, thus securing the parts firmly together.

The mold-board D, formed with a solid back, E, extending from top to bottom of the board, in combination with the fastening-rod H, passed through the back E, the plate J, fitted to said back, and the standard B, bolted to the same solid back E, all as herein set forth.

166,587. WRENCHES. Matthew B. Campfield, Girard, Pa., assignor to R. S. Bettler, same place. [Filed Apr. 13, 1875.]



Brief.—The ferrule is supported in place by a cylindrical nut on the shank, against which it abuts, and which nut is accessible by the removal of the handle.

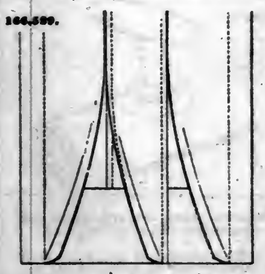
In a wrench, the combination, with the shank C, of the socket B, having the oval and cylindrical portions fitting corresponding parts of said shank, the outer flange a embracing the end of the handle, and the inner flange extending beyond the outer flange, and bearing upon the nut E, all combined as shown and described, for the purpose specified.

166,588. SHEET-METAL-SHEARING MACHINES. William H. Clark, William J. Clark, and Abner C. Eldredge, Salem, Ohio, assignors to Eldredge Cornice and Ornament Company, same place. [Filed June 7, 1875.]

Brief.—The cutter-bearing frame is provided with a gage in addition to that upon the table. The metal clamp is operated by a handle and a shaft with eccentric journals.

1. In combination with the herein-described squaring-shears, the adjusting-screws A' A', miter-gear B', gear C', shaft D', hand-wheel E', gage F, and frame G, substantially in the manner as and for the purpose specified.

2. The rails d of the clamps F, when sunk in the surface of the table A, so that said rails shall be level or flush therewith, clamps f f fitted to said rails, so that the lower part of the clamp shall be below the surface of the table, and secured to the rails by bolts h, to admit of their being adjusted on said rails for the purpose specified, in combination with the squaring-shears herein described, in the manner substantially as set forth.



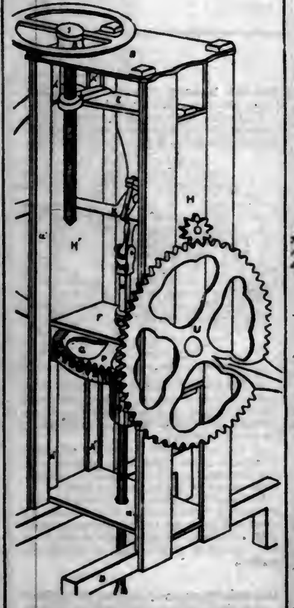
3. The shaft D, having eccentric journals e and handle K, in combination with the bar G connected therewith by the yokes J and hangers H, operating and co-operating in combination with a squaring-shear, P, as set forth and for the purpose specified.

166,589. SHIRT-BOSOMS. John C. Coombs, Boston, Mass. [Filed Apr. 8, 1875.]

1. A shirt front or bosom having strengthening or stiffening pieces O O arranged and connected with its plaits at or about the middles of the back folds thereof, as shown at *f* and *e*, Fig. 2, and with the parts next to or in rear thereof, all substantially as described.

2. A white or dyed front shirt-bosom, having the middle or central plait O' attached at or near one of its side edges only to its backing, or part in rear of said plait, as at *b'*, and the other edge attached through and through or fixed, as at *f'*.

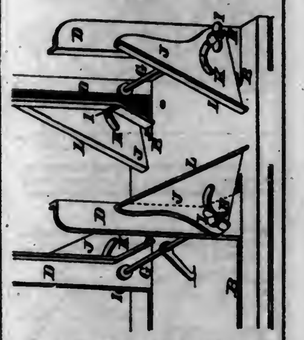
166,590.



3. A shirt front or bosom having the middle or central plait O' attached at or near one edge only to the part or parts in rear of said plait, and also having its other plaits connected at or near their middles, or those of their back folds, by stay-pieces C C, to the parts in rear of them, all being substantially as represented and described.

4. A shirt-bosom constructed essentially as above described and claimed, and being, besides, thinned out at its lower part, or from its lower edge upward for a part of its length, substantially in the manner described and shown, and for the purpose set forth.

166,590. ROCK-DRILLING MACHINES. C. C. Creager, Tiffin, Ohio. [Filed Jan. 21, 1875.]

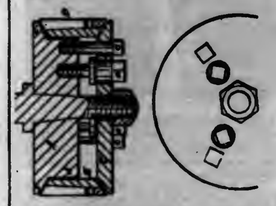


Brief.—In an upright frame the drill is in the center of a horizontal tooth-wheel, rotated by a winch-wheel, which latter gears also with another wheel, the shaft of which, by a connecting-rod, reciprocates the tool.

The combination of the swivel M and movable arm L, the crank on the main shaft K, raising and lowering the drill, the rotating mechanism U, X, and F, weight G, feeding-screw I, sliding frame H H' E F G, frame A A A' A' E, and standards D D, substantially as and for the purposes herein described.

166,591. CIGAR-BUNDLING MACHINES. Napoleon Du Breil, Cincinnati, Ohio. [Filed Dec. 19, 1874.]

Brief.—The adjustable standards have feet that are connected and slide in a horizontal slot in the base. Each standard carries a side plate, that can be adjusted to different angles, as desired, for packages of different shapes.



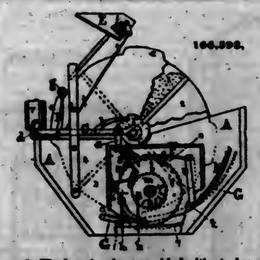
1. The standards D, having flanges E, the rods G H, the angle-plates J K, and nuts I, in combination with the barbed base A B C, as and for the purposes set forth.

2. The paired adjustable standards D, having the feet F, the base A having barb C, as and for the purpose set forth.

3. In combination with the base A and standards D, the adjustable angle plates J K, for the purpose designated.

166,592. PISTONS FOR STEAM-ENGINES. William T. Duvall, Georgetown, D. C., assignor to himself and Joseph L. Simms, same place. [Filed Aug. 4, 1875.]

Brief.—The body and follower are provided with two annular recesses and corresponding shoulder, that fit each other, which prevent the spring from twisting, which form a hub, each of which has tapered flanges. The packing-rings are slotted on their periphery, and tapered to fit the flanges of the hub and follower.



1. The construction of the rings D E, slotted alternately from either edge, as and for the purpose described.

2. The follower C, constructed with a cylindrical collar, *a*, to encircle the hub A of the piston, in combination with said hub and with the slotted rings D and E, for the purpose set forth.

166,593. GRAIN-MEASURES. William Colwell, Chillicothe, Ill. [Filed Mar. 31, 1875.]

Brief.—An automatic grain-weigher consisting of a revolving drum having legs on the circumference, also partitions dividing the drum off into equal parts. This drum is placed on a lever which is weighed to weigh a certain amount. When this amount is placed in one of these partitions, the lever is tilted, the drum revolves, and the grain is thrown against the diaphragm, which is attached to a frame, is thrown down by the weight, and by a pawl moves a register. Attached to this frame is a cross-bar, which engages with the legs on the drum. This, together with the others which are attached to a frame on the lever, and a pawl, also attached to the same, prevents the drum from turning except in one direction.

166,593.

1. The box A, when provided with steelyard C C, pivots *a a*, standards *b b*, and spout E, provided with valve *f* and with trap or levers G G, having a connecting board or diaphragm, *g*, said levers pivoted by axles *i i* in the sides of said box in such a manner as to receive the impact of the dumped grain and transfer the motion to the register-pawl *q*, substantially as and for the purpose described.

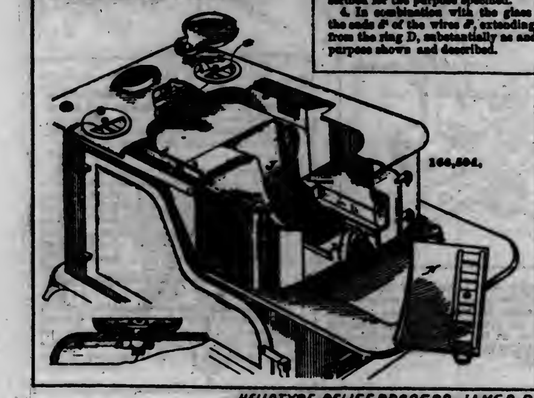
2. The combination, with the box A, of the pivots *a a*, levers C C, with pivoted arms D D *d d*, provided with friction-rollers *g g g g*, substantially as described, together with the standards *b b*.

3. The combination, with the box A, of the pivoted levers G G, united by diaphragm *g* and cross-bar *s*, and provided with an arm, *e*, on the axle *i*, terminating in the registering-pawl *q*.

4. The combination, with the legs *o*, of the rotary grain-receiver B, projecting beyond its circle, the cross-bar *s* of the levers G G, as described.

5. The combination of the floor-pocket receiver B, ratchet-wheel *r*, and pawl *h* of lever C, as described.

6. The receiver B, in combination with and operated simultaneously by the legs *o*, ratchet *r*, pawl *h*, steelyard C, provided with vertical arms *d* D, with rollers *g g*, and the rod *s* of the levers G in the box A, as described.



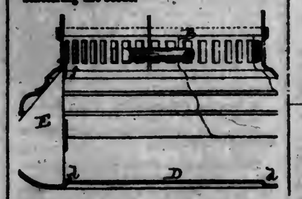
166,594. COOKING-STOVES. John B. Crowley and Addis B. Chamberlain, Cincinnati, Ohio. [Filed June 26, 1875.]

Brief.—Air may be admitted through the registers to the fires supplying the fire-pot, or to the top sheet-flue. The nipple and washer obviate friction of the bolt.

1. In a cooking-stove, the combination of the flues G J E, arranged substantially as described.

2. In a cooking-stove, the combination of the flues G H, arranged substantially as and for the purposes specified.

3. The register or registers, in combination with the induction and exit flues, and constructed to regulate the supply of air for combustion by turning a part or all into the induction-flues, or shutting off all supply from the fire, and turning currents of cold air into the escape-flue of stove, to entirely check the draft, substantially as described.



166,594.

4. A nipple cast or attached to a flat surface, passing entirely through the handle or portion of the article to be swung, to a washer resting on the head of said nipple, and held in place by bolt and nut, substantially as described.

5. A lid-holder with a perforated neck or arm to receive the nipple and bolt, with a flange encircling its entire edge, and connected to the pivot-bolt at a point on the bottom of the lid-holder inside said flange, in combination with the nipple-bolt and washer, substantially as and for the purposes set forth.

166,595. BIRD-CAGES. Albert L. Edwards, Syracuse, N. Y. [Filed July 1, 1875.]

Brief.—The base containing the feed-cup is contracted at its top to prevent the bird from scattering the seeds.

1. The combination, with the base of a bird-cage, of a ring or band, C, enlarged or expanded outward and downward, as shown and described, for the purpose specified.

2. The combination of the feed-cup E, provided with the hook *f*, with the cage or ventilating-ring B, and the floor D, provided with the rib, ledge, or shoulder *d*, as shown and described, for the purpose specified.

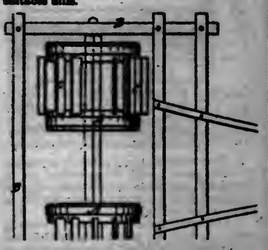
166,596. BIRD-CAGES. Albert L. Edwards, Syracuse, N. Y. [Filed Feb. 2, 1875.]

Brief.—To the base of the cage is attached a ventilating-caution, composed of two horizontal rings, through which pass vertical wires, the upper ends of which extend above the upper ring, to hold in place a glass dome-shaped open-top section, inside of which are three or more suspending rods or wires, passing through the glass at its upper end, and connected to a ring-bolt.

1. In a bird-cage, constructed of the base A, metallic open ring or hoop D, glass body F, having an open top, and resting upon and supported by the ring or hoop, and a ventilating-cap, G, arranged on the top of the glass body over its open top, all substantially as described.

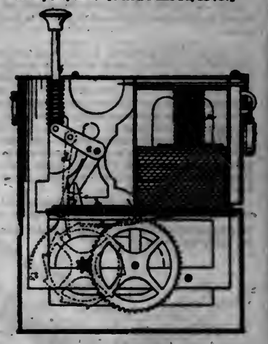
2. The combination of the ring or hoop D, the suspension-wires H, glass body F, top or cap G, and bolt K, substantially as and for the purpose shown and described.

3. The combination, with the suspension-wires H, of the spreader I, as shown and described for the purpose specified.



4. In combination with the glass body F, the ends *g*' of the wires *g*, extending upward from the ring D, substantially as and for the purpose shown and described.

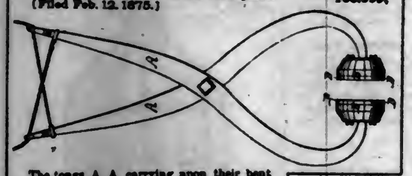
166,596.



166,597. COTTON-CHOPPERS. W. D. Ryder, Society Hill, S. C. [Filed July 1, 1875.]

Brief.—One or more pairs of wheels upon a shaft, with transverse knives upon their circumference. The knives are set at a reverse angle from those designed to spade the earth, and have openings at intervals, being designed to run upon the rows of cotton and chop it to suitable hills.

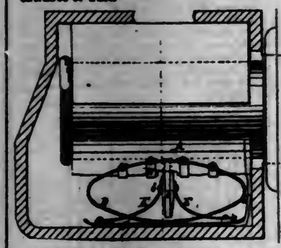
In a cotton-chopper, the drums A A and irregularly-spaced transverse cutting-blades C reversely inclined to the center, combined as and for the purpose specified.



166,598. FARM-BOXES. Saml. W. Francis, Newport, R. I. [Filed June 14, 1875.]

1. The combination of the pusher, the slotted ticket or check receptacle, and the gate or stop, normally closing the discharge-slot in said receptacle, and directly operated to open the same by the advancing pusher, substantially as shown and described.

2. The combination of the hooking-cam, its cover, the vertical slide depressed by said cover, and the key-hole shield for joint operation, as shown and set forth.



166,599. Hoisting-Tongs. Wm. C. Frederick, Medford, Mass., assignor to Wm. H. Hooper and Wm. A. Willard, same place. [Filed Feb. 12, 1875.]

The tongs A A, carrying upon their bent prongs balls *c*, in combination with the clamps B B, having sockets to receive the balls *c*, filling D, of soft metal or equivalent material, and flange E, the whole constructed as shown and described, for the purpose specified.

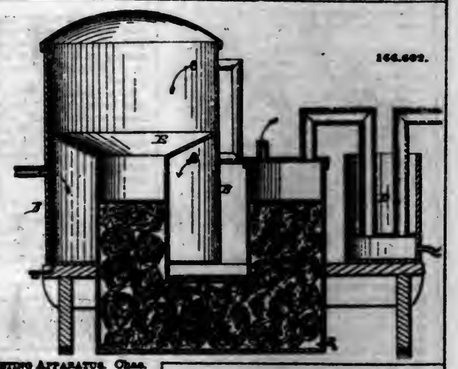
166,600. Car-Axle Lubricators. Chester D. Flynn, Brooklyn, N. Y. [Filed June 30, 1875.]

Brief.—The roller carries up the lubricant to distributing-pad. Curtain G extends downward from distributing-pad, and prevents the entrance of dust.

1. The combination of a roller, F, supported by elastic arms E, with the absorbent pad A, frames B C, and their connecting-springs D, all constructed and operating substantially as shown and described.

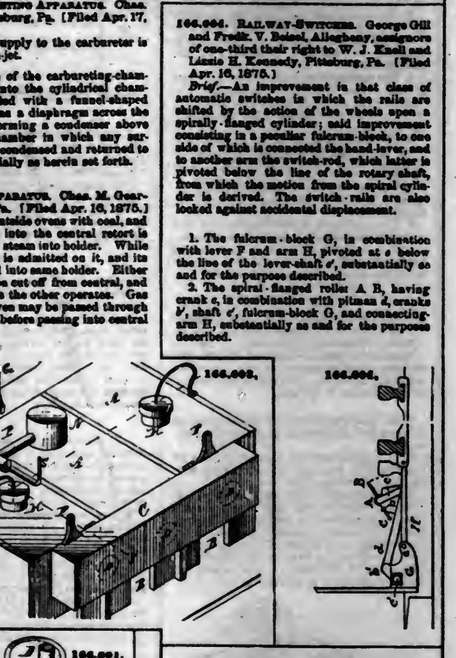
2. The combination of a dust-protecting apron, G, with the pad A, frames B C, and their connecting-spring, D, substantially as and for the purpose set forth.

166,601. Condensing Mechanism for Carding-Machines. Merrill A. Furbush, Philadelphia, Pa., assignor to himself and Charles A. Furbush, same place. [Filed May 21, 1875.]



Brief.—To enable the rolls to be readily attached to, detached from, and adjusted in the frame.

1. In a carding-engine, a series of upper condensing-cylinders, each of which is supported and adapted to slide at one end in the self-adjusting hub of a driving-wheel, and is confined at the opposite end, by a ball-and-socket joint, to a reciprocating bearing, all substantially as set forth.

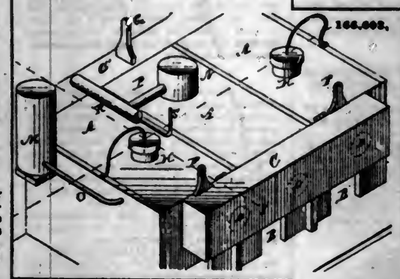


2. The combination of the hanger I and the spindle and driving-wheel of a condensing-cylinder with the bar or frame A, screw *i*, nut *j*, and nut-screws *k k*, all substantially as set forth.

3. The combination of the reciprocating and adjustable hanger E, its socket, and screw *e* with the spindle of a condensing-cylinder having spherical ends.

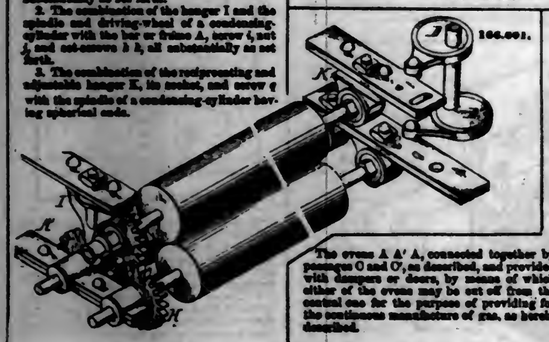
166,599.

166,602.



166,602. Carbureting Apparatus. Chas. M. Gearing, Pittsburg, Pa. [Filed Apr. 17, 1875.]

Brief.—The air-supply to the carburetor is induced by a steam-jet.



The combination of the carbureting-chamber A, extending into the cylindrical chamber B, and provided with a funnel-shaped mouth, E, serving as a diaphragm across the chamber B, and forming a condenser above the carbureting-chamber in which any surplus vapor will be condensed and returned to the same, substantially as herein set forth.

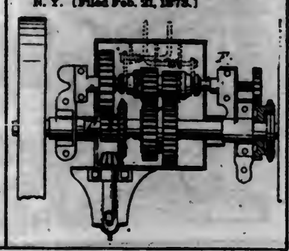
166,603. Gas Apparatus. Chas. M. Gearing, Pittsburg, Pa. [Filed Apr. 16, 1875.]

Brief.—Charge outside ovens with coal, and gas having passed into the central retort is extracted by jet of steam into holder. While coke is yet hot, oil is admitted on it, and its gas likewise passed into same holder. Either outside oven may be cut off from central, and charged anew while the other operates. Gas from one outside oven may be passed through other outside oven before passing into central oven.

166,602.

166,603.

The ovens A A' A, connected together by passages O and O', as described, and provided with dampers or doors, by means of which either of the ovens may be cut off from the central one for the purpose of providing for the continuous manufacture of gas, as herein described.



166,604. Railway-Switches. George Gill and Fredk. V. Reisel, Allegheny, assignors of one-third their right to W. J. Knell and Lizzie H. Kennedy, Pittsburg, Pa. [Filed Apr. 16, 1875.]

Brief.—An improvement in that class of automatic switches in which the rails are shifted by the action of the wheels upon a spirally-flanged cylinder; said improvement consisting in a peculiar fulcrum-block, to one side of which is connected the hand-lever, and to another arm the switch-rod, which latter is pivoted below the line of the rotary shaft, from which the motion from the spiral cylinder is derived. The switch-rails are also locked against accidental displacement.

1. The fulcrum-block G, in combination with lever F and arm H, pivoted at *e* below the line of the lever-shaft *e'*, substantially as and for the purpose described.

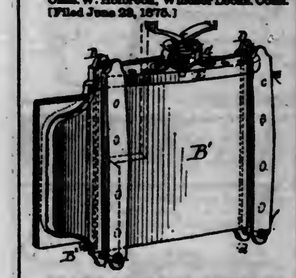
2. The spiral-flanged roller A B, having crank *c*, in combination with pitman *d*, cranks *b'*, shaft *c'*, fulcrum-block G, and connecting-arm H, substantially as and for the purposes described.

166,605. Harvesters. Alexander Gordon, Jacob H. Myers, Geo. Telford, and Moses G. Hubbard, Rochester, assignors to the Differential-Gearing Company, Syracuse, N. Y. [Filed Feb. 21, 1873.]

The combination of the wheel or pulley which drives the reel or rake with the differentially-geared shaft from which motion is communicated to the cutters, and through which the speed of the cutters is changed, as described, whereby any change in the speed of vibration of the cutters will be accompanied by a corresponding change in the speed of the reel or rake, for the purpose and substantially as specified.

166,606. Electroplating Glass, China, &c. Ellev Hansen, Copenhagen, Denmark. [Filed Jan. 9, 1875.]

The herein-described process of forming a metallic covering on glass and like substances, consisting in first painting the surface with a solution containing sulphur, then baking or burning the article to drive off the sulphur and other volatiles, and to fix the metallic base thereon, and finally making a deposit by the electro-chemical process, all substantially as specified.



166,607. Brushes. Marcus R. Hawkins, Lansingburg, N. Y. [Filed May 24, 1874.]

Brief.—The entire head is of malleable iron, and the jaws are V-shaped, with an enlarged opening at their meeting-point, in which is a rod, over which the brush material is placed. The jaws are pressed upon this material and held by their rigidity.

The brush-head, formed as described, of malleable cast-iron, with V-shaped jaws with an enlarged opening at the angle, in combination with a binding-wire D, for holding the body of the brush in place without screws or other fastening devices, substantially as herein described and set forth.

166,608. Clamps for Pressing Leaves. Chas. W. Holbrook, Windsor Locks, Conn. [Filed June 29, 1875.]

The clamp or press composed of the boards B' B', bars D D, cord or cords C, windlass J, bridge-piece G, and hand E, substantially as and for the purpose herein described.

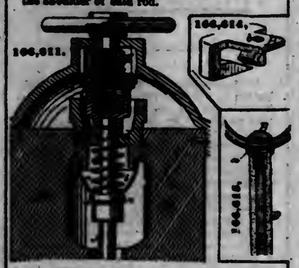
166,609. Soaps. John T. Hoge and Robert D. Schultz, Zanesville, Ohio. [Filed May 21, 1875.]

1. The process, substantially as described, of making bar-soap of a green, blue, or other color, consisting in the addition or compounding of indigo with the common ingredients employed in making yellow, white, or other colored soaps, whereby the blue color of the indigo, uniting with the color of the soap, gives a product having a third or resultant color.

2. A soap and indigo compound, substantially as and for the purposes herein described, having the inherent property upon exposure and oxidation of changing its color to a color that is the resultant of the combination of the blue color of the indigo and the color of the soap before the compounding of indigo therewith.

166,610. Vehicle-Top Supports. Reuben Hunt, Albion, Mich. [Filed June 17, 1875.]

Brief.—The spring rests upon the back of the seat when the top is lowered.



166,610.

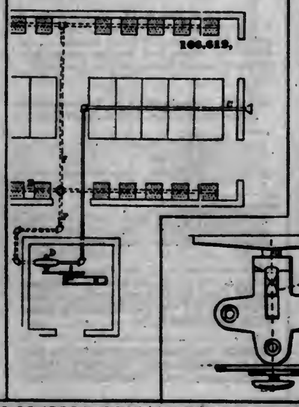
The combination, with the bow A of a carriage-top, of the metallic plate B, secured by the clamp *a*, and provided with the spring C, all constructed and arranged substantially as described and shown.

166,611. Stuffing-Box and Valve Mechanism for Hydrants, &c. Jas. P. Hyde, New York, N. Y., assignor to F. A. Baldwin, same place. [Filed May 10, 1875.]

Brief.—A flexible stuffing-box consisting of an annular diaphragm attached at either end, as shown. The diaphragm is moved by the hydrant-rod, the spring pressing it firmly upon the shoulder of said rod.

166,611.

166,614.



166,615.

In combination with the reciprocating rod A, having the shoulder *c*, and with the annular flexible diaphragm C, which rests on said shoulder, the spring *b*, which keeps the diaphragm in contact with the shoulder *c*, substantially as herein shown and described.

166,612. Apparatus for Drying Coal. Louis Jacobi, Baltimore, Md., assignor of one-half his right to Miron A. Ward, New York, N. Y. [Filed June 17, 1875.]

Brief.—The induction-pipe supplying air to the blower passes through the brick-work of the retort-furnace, or near to it, whereby the air is heated previous to being blown through the coal for drying it.

The supply and discharge pipes C and F and blower D, in combination with the pits G and perforated plates H, substantially as and for the purpose set forth.

166,612.

166,613. Spring-Clasps for Holding Overshoot, &c. Bushrod W. James, Philadelphia, Pa. [Filed May 26, 1875.]

166,613.

A spring-catch for tackets, overshoot, &c., consisting of a strip of steel or other elastic material, bent and corrugated as described, and presenting elastic arms, corrugations on one arm coinciding with those of the adjoining arm, all substantially as set forth.

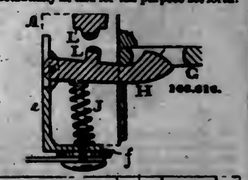
166,614. Bale-Ties. Henry B. Jones, Burton, assignor of one-half his right to Yerd & Sullivan, Galveston, Tex. [Filed June 29, 1875.]

Brief.—The oblique slot between the horns or catches facilitates the insertion of the notched end of the hoop.

As a new article of manufacture, the bale-tie herein described, consisting of the base or bar B, having a perforated projecting tongue, D', a short projection or catch, C, curved and beveled, as described, and a long projection or catch, C', bent at right angles and beveled on its under surface, substantially as and for the purpose specified.

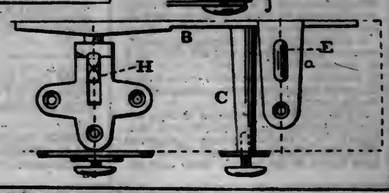
166,615. Bridle-Bits. Loria F. Judd, New Britain, Conn., assignor to the North & Judd Manufacturing Company, same place. [Filed Apr. 8, 1875.]

The combination of the bit-rod C, tubular rubber covering D, and the projecting rims *a a* of the heads B B, which rims encircle the ends of the rubber covering, all substantially as and for the purpose described.



166,616. Electric Train-Telegraphs. H. C. Keyes and J. P. Clark, Philadelphia, Pa. [Filed June 9, 1875.]

1. In an electric signal apparatus for railway-trains consisting of an open metallic circuit, two wires and an interrupting bell-magnet, the plate B, with post C, in combination with the arm *a* and link E, and with the eye F of the insulating-cord, substantially as and for the purpose set forth.

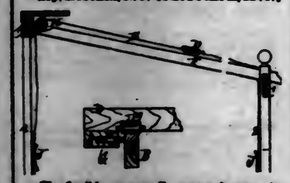


2. In an electric signal apparatus for railway-trains consisting of an open metallic circuit, two wires and an interrupting bell-magnet, the hinged arm H and spring J, in combination with the plate *f e*, and with the eye G of the insulating-cord.

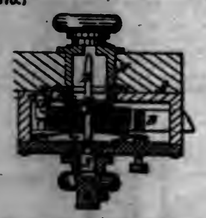
3. In an electric signal apparatus for railway-trains having an open metallic circuit, which, when the train is restored, will be closed, the hinged arm H, with point I, in combination with the plate B with point I', substantially as and for the purpose set forth.

4. The eye F of the insulating-cord *a*, in combination with the link E and spring *b*, substantially as and for the purpose set forth.

166,616.



166,617. Tuyeres. Francis Henry Lloyd, Wednesbury, England. [Filed July 27, 1875.]

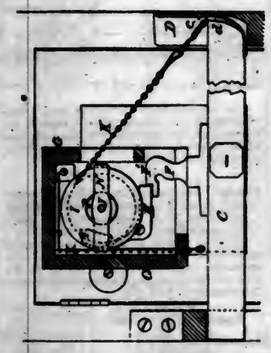


The combination, with a tuyere open at its back or rear end, as described, of a water-delivery pipe or system of pipes placed between the inner and outer tubes of the said open tuyere, and perforated for the passage of water under pressure in the form of small jets or spray, substantially as and for the purpose set forth.

166,618. Awnings. Ferdinand C. Lemmerhop, Hoboken, N. J. [Filed June 11, 1875.]

The flexible awning B, arranged upon the roller H, in combination with the stretcher D and the anti-friction rollers F and G, constructed and applied to the stretcher at right angles to each other, substantially as shown, whereby the said anti-friction rollers are caused to bear upon the top and the side surfaces of the supporting-bars B of the awning-frame, as set forth.

166,619. Locks for Doors, &c. James G. L. Martin, Eufaula, Ala. [Filed July 6, 1875.]



1. The combination of the rotating and endwise-movable tumbler H, having rack-teeth J, with the rack-bolt B K, fixed arbor D, and a suitable device for unlocking the tumbler from said arbor, substantially as herein described.

2. In combination with the rotating and endwise-movable tumbler H, and the rack-bolt B K, operated thereby, the pull and turn knob Q, connected with said tumbler by the rods R R passing through the slots r, and used as and for the purpose set forth.

3. The combination, with the rotating and endwise-movable tumbler and its fixed locking-arbor D, of the locking bent or projection O and the cushion or recesses P P', substantially as and for the purpose herein set forth.

166,620. Locks for Doors, &c. James G. L. Martin, Eufaula, Ala. [Filed Dec. 17, 1874.]

1. The combination, with the pivoted locking-bar C, provided with the hook F F', of the lever E and the cam-pulley I T, connected with said bar C by the chain K, whereby the bar C is both unlocked and turned by the direct action of said pulley, as set forth.

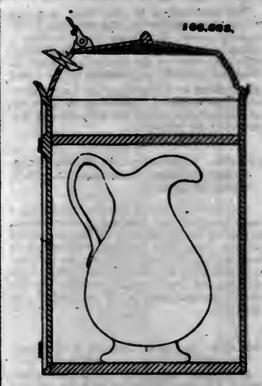
2. In combination with the fastening-bar C and grooved pulley I, the connecting-chain K and the spring catch-plate d on the end of the fastening-bar C, substantially as and for the purpose herein set forth.

3. The combination of the pulley I, having a rotating and sliding movement upon its spindle, with the angular boss L on the arbor J, the spring N, and the angular socket in the pulley I, whereby the pulley is released from the locking-boss and rotated to raise the bar, as herein set forth.

4. The convex bearing-plates P Q, in combination with the revolving pulley I, the spring N, and the lock-case G, substantially as and for the purpose specified.

5. The lock-case G, provided with reversely-running seats or recesses O, in combination with the pressure-spring N and pulley I, substantially as and for the purpose herein described.

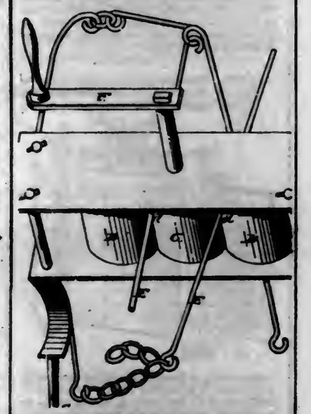
166,621. Boots and Shoes. Wm. Meyer and Henry Freiburg, Quincy, Ill. [Filed June 22, 1875.]



A shoe having the wooden heel and shank B B, with attached continuous insole A A, having flaps A' bent over and secured to the under side of the said wooden shank, substantially as and for the purpose described.

166,622. Car-Couplings. Bolton Mickle, Holly Springs, Miss. [Filed June 14, 1875.]

The combination of the gravity-catch B, having a slot, a, with the transverse support-lug-pin b and the draw-bar, having a central longitudinal slot with side recesses c c, as and for the purpose set forth.



166,623. Combined Letter-Boxes and Mail-Receptacles. Charles H. Miller, Indianapolis, Ind. [Filed June 17, 1875.]

A receptacle formed of two apartments, one below to receive bread, milk-vessels, &c., and the one above to receive letters and newspapers, constructed substantially as and for the purpose herein before set forth.

166,624. Machines for Compressing Grain-Sheaves. Solomon C. Minear, Chillicothe, Ohio. [Filed Apr. 28, 1876.]

Brief.—The machine being placed in position, with the chains around the sheaf, by turning the crank the rods are drawn in opposite directions, tightening the chains and compressing the sheaf.

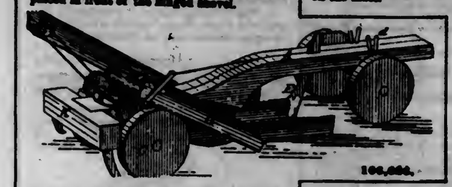
1. The combination of the rollers C and B B, provided with circumferential grooves d, and the rods E E, provided with connecting-links b b, substantially as and for the purpose herein set forth.

2. The combination of the frame A, legs or pendants g, grooved rollers C and B B, crank F, rods E, and connecting-links b, all substantially as and for the purpose herein set forth.

166,625. Permanent Ways for Railroads. Reuben H. Nichols, Philadelphia, Pa. [Filed July 10, 1875.]

1. A permanent way, consisting of sleepers and sills of channel-iron, connected together and placed for the reception of a filling of broken stones or rubble, all substantially as set forth.

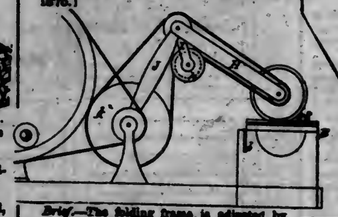
2. The channel-iron sleeper A, from two sides of which lips a are formed for attachment to the sides of the channel-iron sill B as specified.



166,626.

2. The channel-iron sill B, with sides bent inward, and flanges a, and with upturned edges for the reception of the rail, as described.

166,627. Devices-Machines. Halver Olsen and Knud Olsen, Tobin Creek P. O Wis. [Filed July 21, 1876.]

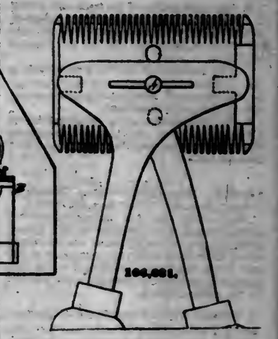


Brief.—A central draft-beam and shovel, with diverging fixed elevators having pulleys, operating endless bands with bentiron. The draft-beam is slotted for an adjustable cutter placed in front of the hinged shovel.

1. In combination with a central draft-beam, A, and shovel D, the diverging fixed elevators G G, having pulleys i, operating endless bands, substantially as and for the purpose herein shown and specified.

2. The combination of the slotted draft-beam A, adjustable cutter B, hinged shovel D, and diverging fixed elevators G G, all arranged and operating substantially as and for the purpose herein shown and specified.

166,628. Machines for Sharpening Mowing-Machine Knives, &c. G. V. Phelps, Newark, Ohio, assignor to himself and G. W. Ingraham, same place. [Filed July 6, 1876.]



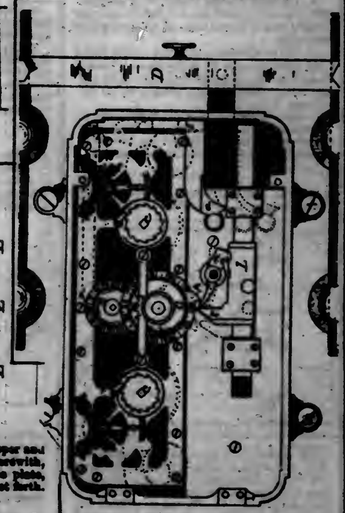
Brief.—The folding frame is adjusted by means of pulleys, and the double-faced grinder is governed by a pin which travels in a guide on the table.

1. The described combination, with a double-faced grinder, F, of a traveling pin, d, in its median front, and a guide, D, on table, to operate upon both edges of a harvester-knife, in the manner set forth.

2. The combination, with grinder F, of folding frame H I J, having pulleys g g' h h', to enable the grinder to be actuated, in the manner specified.

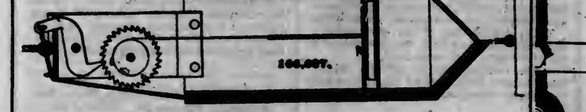
166,629. Ice-Creepers. Albert J. B. Phillips, Philadelphia, Pa., assignor to Samuel B. Phillips, C. L. Phillips, and A. J. B. Phillips, same place. [Filed June 9, 1876.]

166,630.



1. In a clipping-machine, a fixed handle, having a head which serves as a case or cover to the clipper, and a fixed bearing-plate for the movable cutter, substantially as shown and set forth.

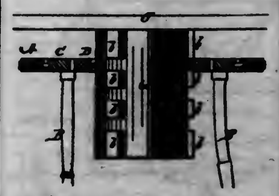
2. The combination of the fixed cutter, the movable cutter, the movable handle, the fixed handle provided with a head which serves as a case or cover to the clipper, and a bearing-plate for the movable cutter, and the spring or springs interposed between the movable cutter and the fixed head, and covered and protected by said heads, said parts being arranged and held together as shown and set forth.



3. The combination, with the handles, of the fixed and movable cutters provided with cutting-teeth on their front and back longitudinal edges, and constructed and arranged, substantially as described, so as to be reversible, in order to bring either set of cutting-teeth to the front of the clipper at pleasure.

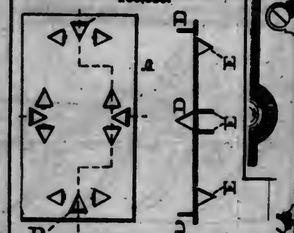
166,631. Tees-Locks. O. B. Filkerd, New Britain, Conn., assignor to F. E. North, same place. [Filed July 26, 1876.]

1. The combination of the gate F, one or more corresponding movements, and a tripping-bar, K or L, constructed to engage with the gate and hold it up until withdrawn by the movement or movements, when the gate falls, substantially as described, and for the purpose set forth.



166,632.

1. The combination, with the torpedo of the cap-wire, winding mechanism, rubber, dog, and weight, arranged and operating substantially as described.



2. The combination, with a torpedo in which the discharge is effected through the agency of clock-work mechanism, of a weight controlling the action of the same, substantially as described.

166,633. Skirt Clasps. Dana Parks, Boston, Mass., assignor of one-half his right to F. P. Sawyer, Georgetown, D. C. [Filed July 26, 1875.]

The combination of the annular frame A, concentric rings C D, pivoted on diametrical lines at right angles to each other, and the inner ring D, provided with slots a a, and the cylindrical cam-support G, provided with lugs b b, substantially as and for the purpose herein set forth.

166,634.

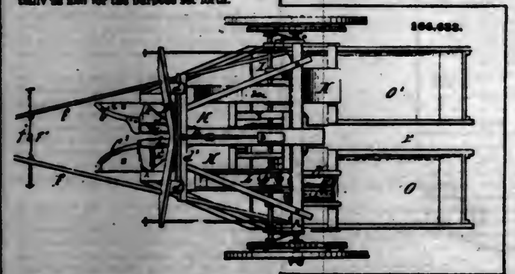
The two cross-plate A, having upper and lower spars D E, which are integral therewith, and formed within the confines of the plate, substantially as and for the purpose set forth.

166,635. Animal-Clippers. Thomas L. Filgate, Birmingham, England. [Filed July 6, 1875.]

Brief.—The head of the fixed handle serves as a cover to protect the springs and working parts. The cutters are so arranged that they can be reversed in order to bring either set of cutters to the front.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON

2. The combination of the train-bolt C C D E, gate F, two independent tripping devices, K and L, with a chronometer movement, substantially as described, and for the purpose set forth.



3. The combination of the time-indicating dial H, the crank or cam on its shaft, the bar K, and the gate F, substantially as described, and for the purpose set forth.

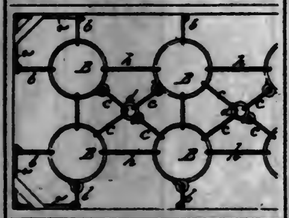
4. The combination of the unlocking-dial G g, dog n, horizontal tripping-bar L r, and gate F, substantially as described, and for the purpose set forth.

166,626. Corn-Harvesters. Charles D. Reed, Pain, Ill. [Filed Apr. 26, 1875.]

Brief.—The ears are stripped from the stalks, husked, and carried by inclined planes to receptacles at the bottom of the elevators, which carry them to the compartments at the rear of the machine. The frame of the machine is constructed so as to allow free passage for the stalks under it.

1. The arch or yoke F, connecting the tongue-bars F F at their forward ends, and provided with the ring *f'* for the cross-reins, substantially as and for the purposes set forth.

166,626.

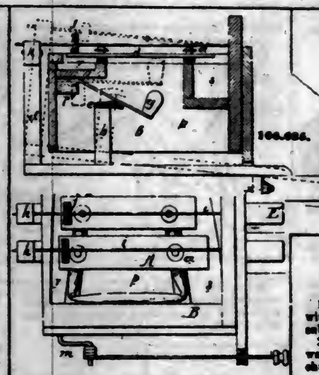


2. The combination, with the upright open frame *b b'*, of the inverted V-shaped bracing-yoke D, through the lower intended ends of which the clevis rods or chains B pass, substantially as described.

3. The open upright frame *b b'*, in combination with the lever-frame *d d'*, and the pivoted tongue-bars F F, and lever G, all arranged as described.

4. The combination, with the rollers *h* and *i* and the receptacle K, of the inclined planes H, for receiving the ears from the rollers and conducting them to said receptacle, as described.

5. The compartments O O', constructed as described, and separated longitudinally by the central space at *P*, for permitting the constructed passage of the stalks, as described.

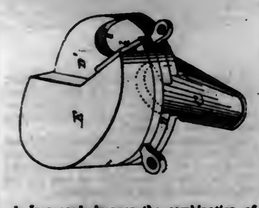


166,627. Bee-Hives. C. V. B. Reeder, San Jose, Cal. [Filed Feb. 26, 1874.]

166,627.

The frames A A', provided with the springs B B, connected at their lower ends by longitudinal and transverse wires *c c*, in combination with the corner-braces *a a*, attached to both frames and to the upper ends of the springs B by wires *b*, the wires *b b a a*, and rings *d*, the whole being arranged and constructed in the manner and for the purpose set forth.

166,628. Bird-Cherry Attachments. A. Schoenhut, Philadelphia, Pa. [Filed June 10, 1875.]



166,628.

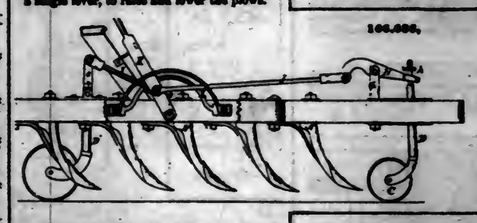
1. The swinging hopper I, in combination with a branch chute, E, and main chute A, substantially as described.

2. The swinging hopper I, arranged in the wall of a house, in combination with the main chute A, substantially as described.

166,629. Bean and Pumpkin-Seed Droppers. Ephraim Sears, Kimbolton, Ohio. [Filed June 10, 1875.]

166,629.

1. In a seed-dropper, the combination of the disks D D', pivoted centrally one on top of the other, and provided with the apertures *c c'*, respectively, and operated simultaneously in opposite directions, substantially as and for the purposes herein set forth.



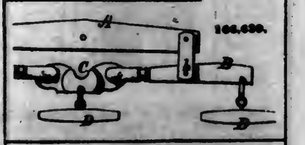
2. The combination of the hammers *g* with the pivoted block F, and mechanism for operating the same, all substantially as set forth.

3. The combination of the spring-rods *i* and their dampers *j* with the projections *d* and their loops A, all as set forth.

4. The sounding-box B, with its central open chamber *p* and box-like chambers *r* and *s*, arranged as set forth, for the purposes specified.

166,630. Cultivators. Ander Schrader, Walla Walla, Wash. [Filed June 7, 1875.]

Brief.—Swiveled caster-wheels at front and rear are connected by rods, and operated by a single lever, to raise and lower the plows.



166,630.

The combination, with sliding rod D and swiveled rods D', holding front and rear wheels, of the rock-shaft E having arm *e*, the lever H having oblong slot *h*, the rods I J, and the lever K, all arranged in connection with frame A, as and for the purposes described.

166,631. Ash-Chutes. J. P. Schweibert, New York, N. Y. [Filed June 2, 1875.]

Brief.—A swinging hopper is arranged in connection with a main chute and a branch chute of a well, for the reception of ashes, &c., so as to control the opening to prevent dust, whether the hopper is closed or open.

166,630.

166,632. Processes of Baling Hay, Cotton, &c. James M. Seymour, Newark, N. J. [Filed June 10, 1875.]

166,633.

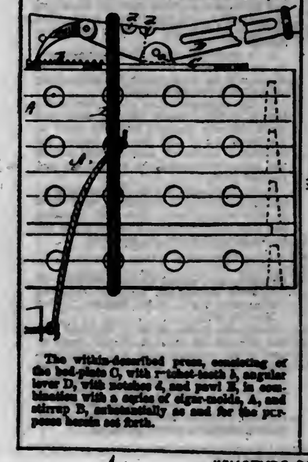
166,633.

2. The process hereinbefore described of applying flexible bands to materials to be baled, and which consists in lapping the ends of the band, after it has been passed around the bale, over upon each other, and then, by any suitable device, linking up the sheet of the band by folding a part of the band over upon a contiguous part thereof, and otherwise securing the fold thus formed in any efficient manner.

166,634. Compounds for Polishing and Coating Copper. John H. Simpson, Baltimore, Md. [Filed Mar. 17, 1875.]

A compound consisting of rice or wheat flour combined with gum-arabic and water, substantially as described, and for the purpose set forth.

166,635. Coverings for Gun-Barrels. Hugh Adams Silver, Cornhill, London, England. [Filed Dec. 19, 1874.]

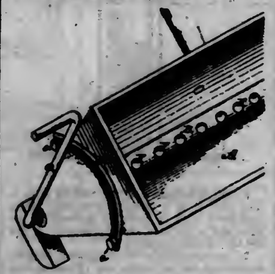


166,635.

1. A non-conducting shield for gun-barrels, of ebonite or its equivalent, surrounding the barrel, and secured thereto by its under portion being firmly clamped between said barrel and the stock, substantially as set forth.

2. A fastener, substantially as described, for the purpose specified, consisting of the upper side plate, and the under side plate, when secured in place by being clamped between the barrel *f* and the stock, substantially as described, and shown in Fig. 1 of the drawings.

166,636. Chair-Mold Fillers. Jos. Simpson, Newark, Ohio. [Filed Mar. 26, 1875.]

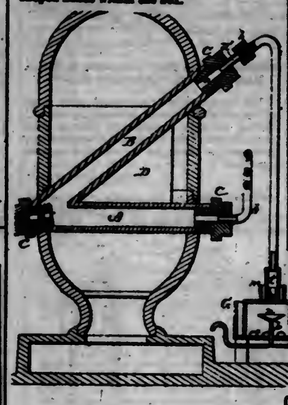


166,636.

The within-described press, consisting of the bed-plate C, with rack-teeth *h*, angular lever D, with notches *d*, and pawl E, in combination with a series of cigar-molds, A, and stirrup B, substantially as and for the purpose herein set forth.

166,637. Organ-Dropping Machines for Confectionery. George Smith and Elizabeth Smith, Cleveland, Ohio, administratrix of George Smith, Sr., deceased. [Filed Mar. 17, 1875.]

Brief.—The semi-fluid material is placed in a hopper having perforations in its bottom. A similarly perforated cylinder is at the bottom of the hopper. The material falls through the holes, any desired quantity being cut off by partly revolving the cylinder.



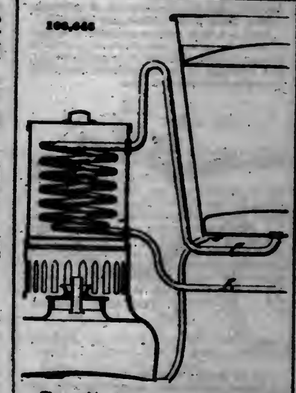
166,637.

In a cream-dropping machine, the box A, provided with a perforated bottom, in combination with the perforated roller B, crank C, gage-plate D, and set-screws *a a*, provided with nuts at their ends, substantially as described, and for the purpose set forth.

166,638. Apparatus for the Manufacture of Illuminating-Gas. Roland H. Smith and Joshua Goldsmith, Pittsburg, Pa. [Filed July 10, 1875.]

Brief.—The two legs of the angular retort are united by a strengthening-web, and the ends of the retort are closed by screw-plugs. The water-seal house, by which the gas-pipes are united to the purifier, are provided with overflow dip-pipes. The crossbar dip-pipes extending from the purifier-box have cup-shaped heads within the box.

166,638.

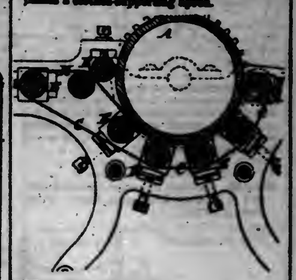


1. A retort composed of two tubes, A B, connected at an angle, and provided with the strengthening-web D and hollow screw-plugs C, substantially as and for the purposes herein set forth.

2. The dip-tubes *i*, in combination with the seals *n* of the washer G, substantially for the purposes herein set forth.

3. The tubes *p*, provided with capped heads *s* in the bottom of the washer G, substantially as and for the purposes herein set forth.

166,639. Clothes-Washers. H. H. Smith, New York, N. Y. [Filed Feb. 24, 1875.]

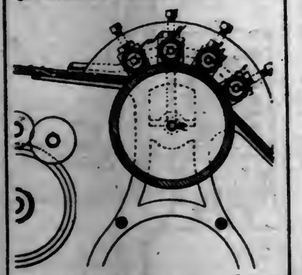


166,639.

The combination, in an apparatus for washing clothes or other articles, of a tank having an open mouth and a false bottom for supporting the articles to be washed, with an air-forcing apparatus and an air-hosing pipe, one end of which communicates with the tank at its bottom below the false bottom, while the other end communicates with the air-forcing apparatus, substantially as described, whereby the articles to be washed, after the same have been soaked in water, can be exposed to a current of atmospheric air, as set forth.

166,640. Ironing Apparatus. H. H. Smith, New York, N. Y. [Filed Jan. 20, 1875.]

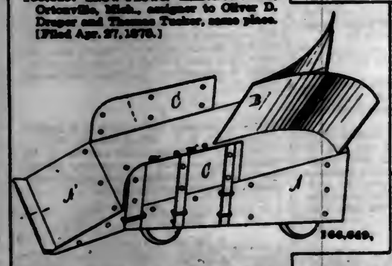
Brief.—A polishing-roller adapted to be heated, with a series of supporting-rollers having a different surface-speed, around which passes a clothes-supporting apron.



166,640.

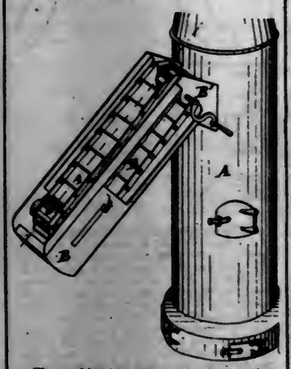
1. The combination, in an ironing-machine, of a polishing-roller, A, constructed with an opening for receiving heat-generating agents, two or more supporting-rollers, B, geared with the polishing-roller, to revolve at a different speed, and a clothes-supporting apron, C, arranged around the supporting-rollers, substantially as and for the purpose described.

2. The combination, with a polishing-roller, A, constructed to be heated, and the rollers B, provided with the apron C, for supporting the clothes, of the rollers F F, arranged in the same horizontal plane, and over which the clothes-supporting apron passes, for producing a level portion, E, and the guide-roller G, arranged above the apron for conducting the clothes to the polishing-roller, all substantially as described.



166,648. INCURED APPARATUS. H. B. Smith, New York, N. Y. [Filed Jan. 20, 1875.]

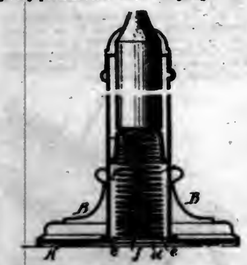
Brief.—A large cloth-wound roller that may be inwardly heated, over which are a series of pressing-rollers, that may be heated inwardly, and arranged to run at different speeds by gear-wheels of different sizes.



In an ironing-machine, the combination of a heated cloth-wound supporting-roller with a series of pressing-rollers, constructed to rotate at different speeds, substantially as herein shown and described.

166,649. SNOW-PLOWS. Almon J. Smith, Ortonville, Mich., assignor to Oliver D. Dragoo and Thomas Tasker, same place. [Filed Apr. 27, 1875.]

The combination of the longitudinally-adjustable mold-board B E and the detachable side plates C C with the inclined apron A A', mounted on wheels, the several parts being constructed and arranged substantially as and for the purpose set forth.

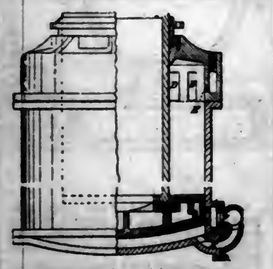


166,650. BROOM-SUPPORTS. Ira C. Smith and F. Walker, Muskegon, Mich. [Filed June 3, 1875.]

The combination, with a return-bearing furnace, A, of the elevator-leg B D', extending from the said furnace to the mill where the rotors is manufactured, and provided with the wheels C D, endless chain E, and plate e, substantially as described and shown.

166,651. CANDLESTICKS. Thomas Sweet, Philadelphia, Pa. [Filed June 26, 1875.]

Brief.—The candle-holding tube extends through the base to the bottom plate. The plate *f* permits removal of the spring.

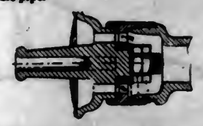


1. The combination of the tubular stem A and base B of a spring candlestick with a cast-metal ring or plate, H, secured to the base and to the tube, all substantially as and for the purpose set forth.

2. The combination of the plate *f*, forming a bearing for the lower end of the spring, with the central opening *d* of the ring H and its recesses *e e*.

166,652. BALE-TIES. Alexander A. Smith, Houston, Texas. [Filed July 12, 1875.]

The improved bale-tie block A, with laterally-open slot B *b* and cramping-grooves C, having the hole D, extending from a point near one end of slot B laterally or transversely through the block, as and for the purpose specified.

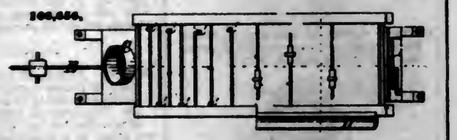


166,653. STEAM-CYLINDERS FOR COTTON-PRESSES. John F. Taylor, Charleston, S. C. [Filed June 24, 1875.]

The combination, in a single-acting steam-cylinder for operating the toggle-arms of a press, of the upwalking-rocarer D with the holes B, said recesses being located upon the inner periphery of the cylinder, near the end of the stroke, and the holes in the same plane with the same, so that the piston covers the holes when it passes upon the recesses, substantially as and for the purpose described.

166,654. HOSE-NOZZLES. Walter Thomson, Detroit, Mich. [Filed May 4, 1875.]

Brief.—The nozzle is pivoted to a double-flanged diaphragm, which is screwed upon the nozzle-pipe.



In a hose-nozzle, substantially as described, the combination of the rose and jet head with the double-flanged diaphragm, pivoted thereto, and an intervening packing-leather, covered provided with the ports and passages, substantially as described, for the purposes specified.

166,655. MEDICAL COMPOSITIONS. Columbus C. Trowbridge, Nelson Furnace, Ky. [Filed Aug. 12, 1874.]

The within-described medicinal composition, consisting of bitter-root, (silk-weed root,) mandrake-root, and prickly-ash bark, in the proportions described, steeped in diluted alcohol, substantially as and for the purpose herein specified.

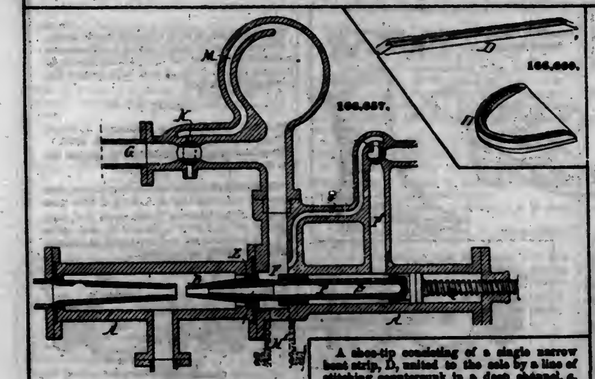
166,656.

166,657.

166,658. EVAPORATING-PANS. John M. Trowbo, Metropolis City, Ill. [Filed May 3, 1875.]

Brief.—The pan is pivoted at one end, and the other rests upon a lever, by raising which the pan may be tipped. A trough is arranged at one side to receive the steam. The partitions are placed so as to divide the pan into a series of regularly-decreasing spaces, and have openings between their ends and the sides of the pan alternately upon opposite sides.

1. In combination with the furnace B, pivoted at its front end upon the support D, the lever E, pivoted upon the support D to engage with the rear end of said furnace, and the slotted post F, embracing the outer end of said lever, and provided with the horizontal openings *f' f'* and pin G, said parts being combined substantially as and for the purpose specified.



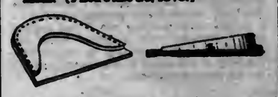
2. In combination with the evaporating-pan A, the high central partition A", the reduced side *a*, and the steam-trough H, substantially as and for the purpose shown.

3. The cross-partitions A' A' within the pan A, forming spaces between each pair, which decrease regularly from the upper to the lower end of said pan, and having the openings *a'* alternately upon opposite sides of the latter, substantially as and for the purpose set forth.

4. In combination with the partition A', having the opening *a'*, the gate *a''*, constructed to slide longitudinally upon said partition, and to close said opening, substantially as and for the purpose shown and described.

166,657. APPARATUS FOR DRAWING OR RAISING WATER, &c. Philibert Vabo and Hippolyte Cuau, Paris, France. [Filed May 31, 1875.]

Brief.—By means of an L two-cock and side passages, the steam is allowed direct access to the water-chamber and supply-pipe, and by first blowing through the same and then condensing, vacuum is produced, and a priming of the injector; then, by allowing access of air to the elevated water-chamber at the same time that steam is let onto the nozzle, the injector is started promptly.

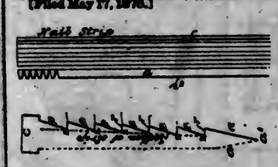


166,656.

166,657.

1. A perforated hollow plate, P, communicating with the steam-pipe T, and forming a water-regulator, with the containing-tube D of an injector, in combination with the water-passage communicating, through the cock K, with the steam-pipe, all substantially as set forth.

2. The combination of the vessel I, its air-passage M, and the cock K with the water-pipe G and water-chamber F, communicating with the steam-pipe, all substantially as described.

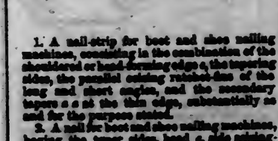


166,658. LEATHER TIPS FOR BOOTS AND SHOES. Albert Van Wagenen, Boston, Mass. [Filed June 26, 1875.]

1. As a new article of manufacture, a leather shoe-tip composed of two pieces of leather, united at or near their edges by stitches going through the whole or part of the two thicknesses of leather, one of these pieces of leather being raised from a horizontal position to any angle desired, thereby forming a tip to protect the upper.

2. The mode of constructing tips for boots and shoes, consisting in first uniting two pieces of leather by a line of stitches, and afterward raising and fixing the upper piece to the required angle to form a protector, substantially in the manner and for the purpose specified.

166,659. NAIL-STRIPS FOR SOLE-FASTENINGS. Albt. Van Wagenen, Boston, Mass. [Filed May 17, 1875.]

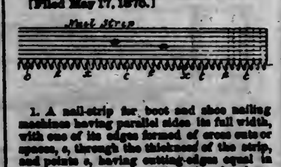


1. A metallic nail-strip or blank having a thin or taper clinch-forming edge, with one side *a* thereof concave from the strip-edge *r* to the ridge *s*, which bounds the clinch-forming edge, substantially as and for the purpose set forth.

2. The combination, in a metallic nail-strip or blank, of a shouldered or head-forming edge, *a*, side cutting ratchet-line *c*, and a clinch-forming tapered edge with one of its sides made concave the full width of the clinch-forming edge, substantially as and for the purpose herein set forth.

3. The combination, in a nail-strip having a clinch-forming edge, of the bevel side *b*, the concave side *a*, and the penetrating point *r* extending from one straight side of the nail to the other, substantially as herein set forth.

4. A nail for boots and shoes having a clinch-forming point formed by the bevel *b* on one side a concave, *r*, on the other, and a penetrating point the width of the nail, as shown and described.

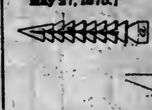


166,660. NAIL-STRIPS FOR SOLE-FASTENINGS. Albt. Van Wagenen, Boston, Mass. [Filed May 17, 1875.]

1. A nail-strip for boot and shoe nailing machines, consisting in the combination of the shouldered or head-forming edge *a*, the tapering sides, the parallel cutting ratchet-line of the long and short angles, and the secondary tapers *a a* at the thin edge, substantially as and for the purpose stated.

2. A nail for boot and shoe nailing machines, having the taper sides, head *a*, side cutting-line of long and short angles, *c r*, and secondary tapers *a a* at the thin edge, as shown and described.

166,661. NAIL-STRIPS FOR SOLE-FASTENINGS. Albt. Van Wagenen, Boston, Mass. [Filed May 17, 1875.]



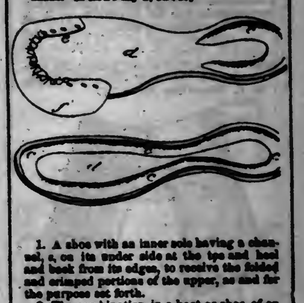
1. A nail-strip for boot and shoe nailing machines having parallel sides its full width, with one of its edges formed of cross cuts or spaces, *a*, through the thickness of the strip, and points *s*, having cutting-edges equal in width to the thickness of the strip, whereby to space and determine the clinching of the nail-point in the line of the nails when cut and driven, substantially as herein described.

2. A nail-strip with parallel sides and cross division-points, having one of the inner or tapering sides of each point made with a recess, *s*, as and for the purpose stated.

3. A nail-strip having parallel sides and edge shoulder, side lines, and points formed by cross-spaces, with sharp edges, equal in width to the thickness of the strip, as a new article of manufacture.

4. A nail for boot and shoe nailing machines, having parallel sides from head to point, side cutting-line, wedge-point, and a cross-recess in one of the sides of each point, as shown and described.

166,662. NAILS FOR SOLE-FASTENINGS. Albt. Van Wagenen, Boston, Mass. [Filed May 27, 1875.]

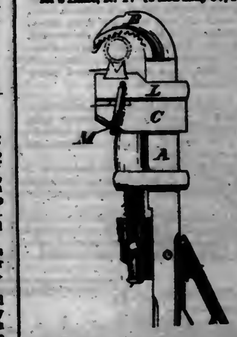


1. A shoe-nail, consisting of a head, a clinching-point, a rank of cones, and the side grooves, made substantially as described.

2. In a shoe-nail, the combination of side grooves or channels *s* with a rank of cones, said channels intersecting said cones in the manner and for the purpose described.

3. In a shoe-nail having the combination of side grooves or channels *s* with a rank of cones, as described, the said side grooves extending from near the clinching-point and terminating short of the head, to preserve the head intact for the important purposes stated.

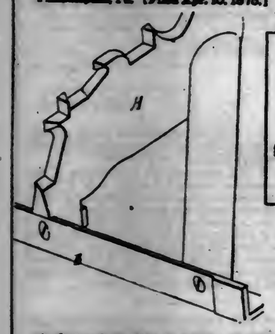
166,664. INNER SOLES FOR BOOTS AND SHOES. Albert Van Wagenen, Boston, Mass. [Filed July 8, 1875.]



1. A shoe with an inner sole having a channel, *c*, on its under side at the toe and heel and back from its edges, to receive the folded and crimped portions of the upper, as and for the purpose set forth.

2. The combination, in a boot or shoe, of an inner sole, *d*, having an under surface groove or depression, *s*, partially or all the way round it, with the upper *f* lasted in said groove, and the outer sole *l* secured thereon.

3. As a new manufacture, an inner sole having a channel, *c*, on its under side at the toe back from its edges and lessening in depth, as described, and for the purpose set forth.



4. As a new manufacture, an inner sole having a channel, *c*, of varying depth on its under surface, and beveled edges on its upper surface, substantially as and for the purpose herein set forth.

166,665. WRENCHES. L. C. Velser, Schuyler's Lake, N. Y. [Filed May 27, 1875.]

A wrench consisting of a main arm, A, upper jaw B, lower jaw C, and intermediate jaw L, adapted to be coupled to either the upper or lower jaw by means of a link, M, said lower and intermediate jaws sliding upon the arm A, as set forth.

166,666. CORNER-TOOLS. WM. P. Walter, Philadelphia, Pa. [Filed Apr. 10, 1875.]

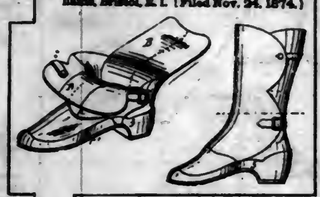
A plasterer's molding instrument in which a detachable molding-plate, A, and handle D are combined with the angular frame B, as and for the purpose set forth.

166,667. VESSELS FOR MEASURING ICE-CREAM, &c. Frank Watchie, New York, N. Y. [Filed Mar. 20, 1875.]

As an article of manufacture, a vessel for measuring ice-cream, longitudinally divided into equal sections, A¹ A², hinged together at their bottom and provided with fastening devices at their top for securing the sections together, the whole being combined substantially as and for the purpose described.

166,668. MACHINES FOR WELDING TUBES. George H. White, Cleveland, Ohio. [Filed Apr. 17, 1875.]

Brief.—A long furnace with a narrow slit in its covering-plate, through which the flames pass to the lapped edges of the skelp; a concave roller-anvil in front of the furnace, on which to effect the welding, and a welding-roller attached to one end of a horizontal lever, around which roll and over the skelp passes as it is gradually fed forward from the furnace, the lever being moved, to force the roll down upon the lapped edges lying and moving upon the anvil-roller, by a wedge inserted under the other end of the lever.



1. In a machine for making lap-weld tubes, the furnace A, provided with a narrow opening, E, in combination with the feed-roller G, welder I, and lever H, all substantially as and for the purpose described.

2. The combination, with the feed-roller G and the lever H, of the wedge K, and hand-wheel M, substantially as and for the purpose described.

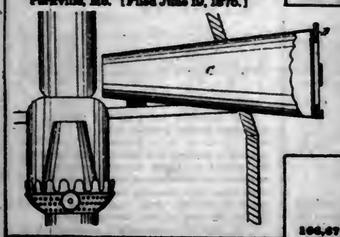
3. The combination of the lever H, provided with welding-roller I, fulcrum H, and standard N', with the bed-plate O and shoes P, substantially as and for the purpose described.

166,669. RUBBER BOOTS. Isaac F. Williams, Bristol, R. I. [Filed Nov. 24, 1874.]

1. The improved boot composed of textile fabric and rubber, having an inner upper cut to fit the last or foot, and an outer upper cut larger than the inner upper, with the surplus portion thereof overlapped, substantially as described.

2. The improved boot, having an open overlapping leg-section and the overlapping ankle-section, provided with the bellows-flap, formed of continuations of the front and rear uppers, substantially as described.

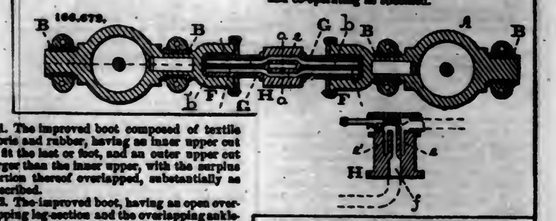
3. In a boot, the overlapping leg and ankle section, provided with the recess D at the edge between the said sections, substantially as described.



166,670. LAMP-BURNERS. S. R. Wilmot, Bridgeport, Conn., assignor to Bridgeport Brass Company, same place. [Filed July 24, 1875.]

Brief.—Air is admitted to the vent-tube through the holes.

A lamp-burner provided with a gas or vent-tube extending from or near the bottom of the burner to or near to the top of the wick-tube, and having one or more air openings or vents intermediately between its top and bottom, substantially as and for the purpose herein set forth.

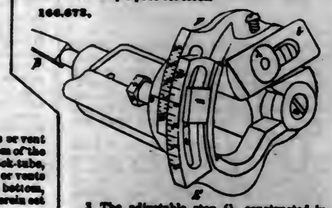


166,671. HOG-TROUGH. Wm. W. Wilson, Parkville, Mo. [Filed June 10, 1875.]

166,672. OSCILLATING ENGINES. J. Wolf, Philadelphia, Pa. [Filed June 10, 1875.]

Brief.—A single valve serves to operate the two engines.

The herein-described oscillating engine, composed of the cylinders A A, formed with trunnions B B' and bosses F, the ports *d d'*, passages *c c'* and *b' b''*, pipes G G, and valve H *e f g*, constructed and arranged as shown, and co-operating as specified.



166,673. HOLLOW AUGERS. A. A. Wood, Manlius, N. Y. [Filed July 31, 1875.]

Brief.—The cutter is secured to one of a pair of jaws, the other acting as a gage to determine the size of the tenon formed by the tool.

1. The adjusting-wedge *c* and its screw *d*, in combination with the jaw F, cutter I, and its adjusting and holding screws *e'* and *h*, substantially as and for the purpose specified.

2. The cutter-carrying jaw F and gaging-jaw B, provided with graduated scales and holding devices, as shown, in combination the body A and shank B, substantially as and for the purpose set forth.

166,673.

3. The adjustable step G, constructed in two pieces, clamped to each other and to the body A by the screw *p*, as and for the purpose specified.

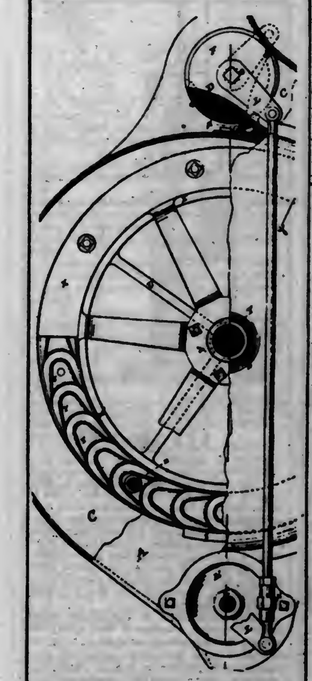
166,674. HOLLOW AUGERS. Abel A. Wood, Syracuse, N. Y. [Filed Dec. 17, 1874.]

Brief.—The cutter is attached to the body of the auger, and adjustable, as desired, by means of a pivoted clamp, having a slot at its outer end, and provided upon its inner face with a recess to receive the body of the cutter.

The combination of the body A of a hollow auger with the cutting-knife K and clamp B, provided with the slot O, all constructed to operate as shown and described, and for the purpose specified.

166,675.

166,676. PRINTING-PRESSES. James Cook and William Foster, Meriden, Conn.; said Foster assignor to said Cook. [Filed Apr. 13, 1875.]



Brief.—The rest is pivoted to the stand, the face of which is inclined, so that when it is turned outward it is elevated above the ink-plate.

In a printing-press, the combination of the ink-plate, the inclined bearing *d*, and the rest R, substantially as described.

166,677. WATER-WHEELS. Joseph Attlee, Washington, D. C. [Filed Mar. 26, 1875.]

Brief.—The buckets are semi-cylindrical in form, and the rear portion of each is so formed with reference to the one next to it as, with it, to form a semi-annular channel, which the water from the chute enters and leaves in a tangential direction, or nearly so. These semi-annular channels have an aggregate sectional area twice that of the chutes. Each gate consists of a segment of a cylinder connected to its ends, and having a partial revolution upon its axis, a water-pressure packing being introduced in the wall of the chute to bear against its face. The two gates are adjusted to open and close simultaneously. The wheel is so attached to the shaft by the central collar of the former and the shoulder on the latter that the wheel can be raised without raising the shaft.

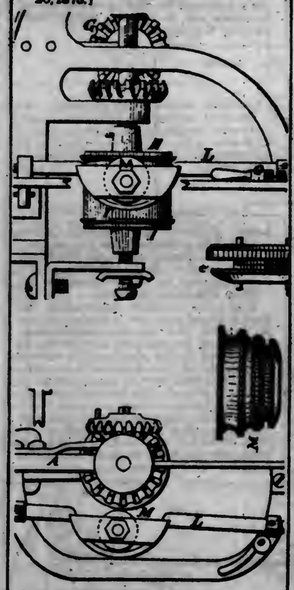
1. In combination with the chute C, the buckets Y, of the form shown and described, having circular passages of uniform width, the sectional area of which in the aggregate is double that of the chutes in the aggregate, substantially as described.

2. The buckets Y, constructed with flanges *y'*, and in combination therewith the flanges *y''*, raised upon the edges of the disks X.

3. The gate D, constructed with the disks F, the periphery of the gate having a less diameter than the openings which they occupy in the trunk, and a longer radius than the periphery of the disk F, for the purposes set forth.

4. The detachable gate-cap E, combined with the gate D and trunk A.

5. The self-adjusting packing H, with water-passages J behind it, combined with the water-gate of a hydraulic motor.



6. The self-adjusting packing-rings F' and F'', substantially as set forth.

7. The self-adjusting box V, substantially as set forth.

8. In combination with the flange F' of the shaft T, the flattened hub A' of the wheel, resting upon said flange, and secured thereto by bolts, whereby the wheel may be raised from the shaft without disturbing the same, substantially as described.

REISSUES.

6,568. GAS-REGULATING MACHINES. Lester G. Beardsley, Cleveland, Ohio. Patent No. 156,012, dated Oct. 20, 1874. [Filed Feb. 26, 1875.]

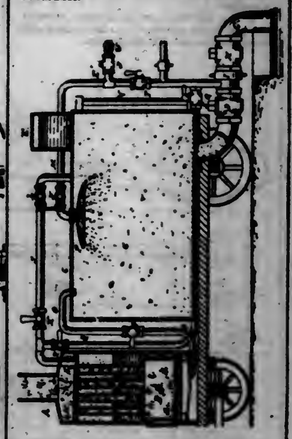
1. The gas-ensuring machine consisting of the two disks or chokes H I, with mechanism for causing the same to revolve, in combination with the pivoted ensuring-roller M, having the described groove *g* and *i*, and mechanism for forcing the said roller down around the edge of the one, all substantially as and for the purpose described.

2. The lever L, bearing or journal *a*, and sleeve *a'*, in combination with the roller M, cam O, and disks H I, in the manner as and for the purpose described.

3. The ensuring-roller M, for forming a double seam, having the rectangular groove *g*, *i*, and *f*, beveled groove *i*, and with or without the curved wiring-groove *k*, substantially as and for the purpose described.

4. In combination with the roller M, the rectangular groove *g* and adjustable plate *r*, substantially as and for the purpose described.

6,569. SEAMS-METAL CANS. L. G. Beardsley, Cleveland, Ohio. Patent No. 156,013, dated Oct. 20, 1874. [Filed Feb. 26, 1875.]

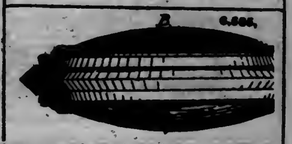


1. In combination with the double tubular or beaded seam, the filling C of white lead, substantially as and for the purpose set forth.

2. The process of uniting a top to a can by a tubular or beaded seam and of filling the band with white lead, consisting, first, of placing a film of white lead on the flange *c*; second, of pressing the overlapping flange *b* upon the same and crimping it over the edge of the flange *c*; and third, of carving the combined flanges downward and pressing the edge against the side of the can, substantially as and for the purpose set forth.

6,570. APPARATUS FOR EMPTYING WATER-CLOSETS, &c. Reinhold Boekius, Brooklyn, N. Y. Patent No. 142,200, dated Aug. 26, 1873. [Filed July 27, 1875.]

Brief.—Fills tank and hose with steam, and makes vacuum in both by water. Washes fecal matter from hose by steam, and afterward cleanses by water. Burns escaping gases in furnace.



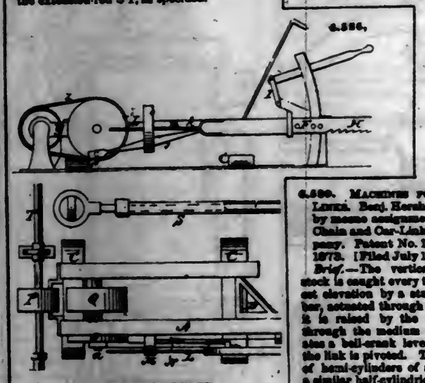
1. The method of removing night-soil, sewage, or the like material from its receptacle, which consists in filling with steam both an air-tight tank and an air-tight conduit from the tank into the material to be removed, and, by injected water, condensing the steam in the tank and in the conduit down to the material, in order to obtain a continuous vacuum, through the tank and the conduit, above the material, for the purpose set forth.

2. The combination of the tank C and hose G and water-supply pipe M with a stop-cock, F, to condense the steam in both the hose G and the tank C, substantially as herein set forth.

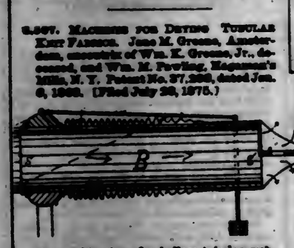
3. The combination of pipes M and J, stop-cocks K L F, with vessel C and boiler A, substantially as and for the purpose set forth.

4. The combination herein described of boiler A, vessel C, and pipes J, Q, O, F', and M, for the purpose set forth.

6,571.



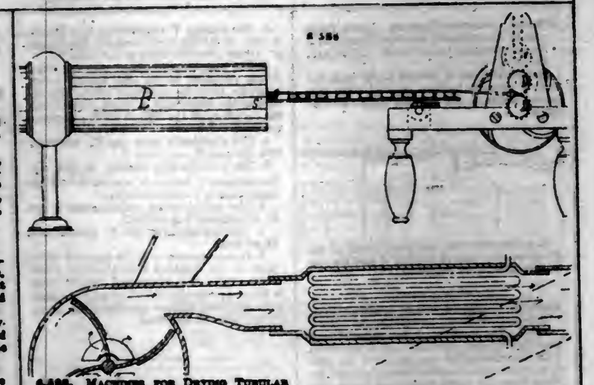
6,586. WATCH-CASE. Caleb K. Colby, New York, N. Y. Design No. 6,201, dated Oct. 16, 1872. [Filed July 29, 1875.]



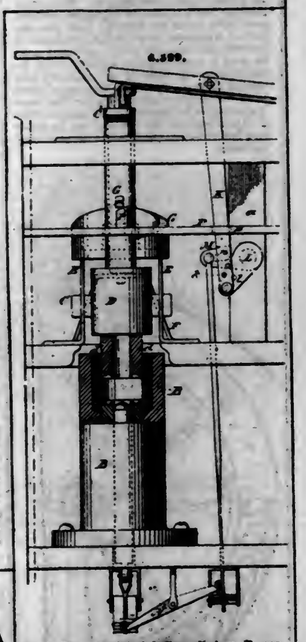
1. The design for the watch-case proper, A, having the V edge, as shown.
2. The design for a watch-case lid, B, having an inclined band, b, raised above a central portion, d, to form the step c, substantially as shown.
3. The design for a watch-case as a whole, having the V-edged case A and the ornamental lids B B, the ornamentation on the lids consisting of the band c, then the band b, then the step c, down to the central portion d, substantially as shown.

6,587. SEWING-MACHINES. John Frey, Canajoharie, and John M. Hobbelein, Canton, Ohio, assignors to Wm. Detrick. Patent No. 61,266, dated Aug. 29, 1866. [Filed Nov. 26, 1873.]

Brief.—A telescopic shaft is used for driving the saw, which allows it to be moved along the leg, instead of moving the leg to the saw.

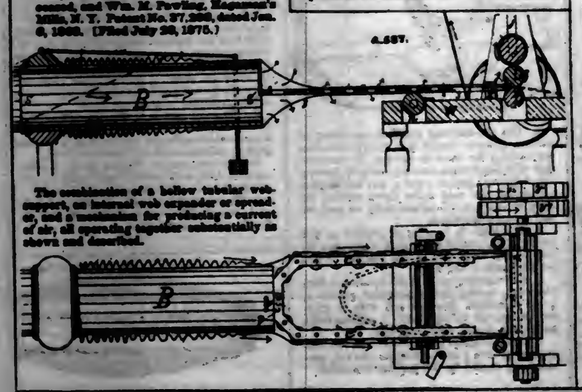


1. The extension-rod S T, composed of the tube S, with journals s, and shaft t T T, when used in combination with the auxiliary pulley F of a sewing-machine, said pulley being maintained in its relative position to the machine by means of the arms Y Y, the extended ends of which form the bearer of the auxiliary pulley F, substantially as and for the purpose specified.
2. The movable sewing-machine, substantially as herein described, in combination with the extension-rod S T, as specified.



6,588. MACHINES FOR DRIVING TUBULAR KNIT FABRICS. Jane M. Greene, Amsterdam, executrix of Wm. K. Greene, Jr., deceased, and Wm. M. Fowling, Hagaman's Mills, N. Y. Patent No. 37,266, dated Jan. 6, 1863. [Filed July 26, 1875.]

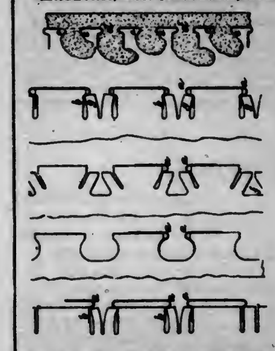
The combination of a hollow tubular web-support, an internal web expander or spreader, and a mechanism for drawing off and closing the tubular web, all operating together substantially as shown and described.



6,589. MACHINES FOR WELDING CHAIN-LINKS. Benj. Hershey, Erie, Pa., assignor, by mesne assignments, to the Pittsburgh Chain and Car-Link Manufacturing Company. Patent No. 139,151, dated May 20, 1873. [Filed July 12, 1875.]

Brief.—The vertically-reciprocating die-stock is caught every time it reaches its highest elevation by a stab on a movable crosshead, actuated through the link by the trap as it is raised by the stock, and is released through the medium of a treadle that operates a bell-crank lever, to one arm of which the link is pivoted. The dies are in the ends of semi-cylinders of steel, and move within a similar half-cylindrical inclosure; and a cylindrical mandrel lying in the cavity of the lower die-stock is movable upward, by a foot-lever, into the upper stock, to prevent the spread of the link inward.

6,590. MACHINES FOR DRIVING TUBULAR KNIT FABRICS. Jane M. Greene, Amsterdam, executrix of Wm. K. Greene, Jr., deceased, and Wm. M. Fowling, Hagaman's Mills, N. Y. Patent No. 37,266, dated Jan. 6, 1863. [Filed July 26, 1875.]

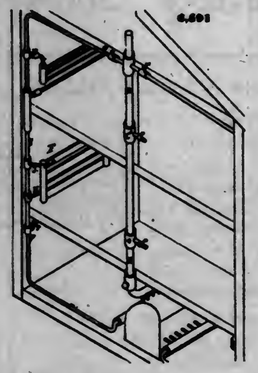


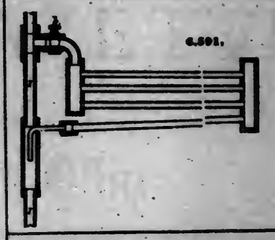
The combination of a hollow tubular web-support, an internal web expander or spreader, and a mechanism for producing a current of air, all operating together substantially as shown and described.

1. The cylindrical hollow die-box B, constructed as shown, a stationary die, b, and a traveling-die, d, the same being combined and arranged to operate substantially as described.
2. The combination of the detachable dies b d, die-block B, plunger C, collar D, and camwheel G, operating substantially as described.
3. The die-box B having a detachable steel packing, B', when the latter is secured so as to operate in connection with dies b d, substantially as described.
4. The combination of the hinged lever-board H, having a torsion or other spring attached, and so relatively arranged as to act in connection with the upper section of the plunger, as stated, pivoted arm K, crank-arm I, and axle L, the same operating substantially as described, and for the purpose specified.
5. The combination of sliding bar P, having a slot, p, and stop-pin P', arm K, lever-board H, and plunger C, the same being so arranged that as it is plunger is elevated the sliding bar shall be so moved as to arrest its motion at the proper time, substantially as described.

6. The combination of the sliding step-bar P, arm K, lever-board H, axle L, crank-arms I M, and treadle M', operating substantially as described.
7. In a link-welding machine, a stationary die, b, a traveling die, d, and the traveling tongue or frog O, the whole being constructed, combined, and arranged to operate substantially as described.
8. The combination of the double treadle N N', pivoted connecting-arm N², tongue-bearing pin O, rod M', axle L, arm K, bed-piece H, and plunger C, operating substantially as described.
9. The combination of the double treadle N N', pivoted connecting-arm N², tongue-bearing pin O, rod M', axle L, arm K, bed-piece H, and plunger C, operating substantially as described.

6,590. METALLIC LATHING. I. V. Hobson, Mount Vernon, Ohio, assignor of one-half interest to J. Cooper. Patent No. 64,881, dated Dec. 18, 1866. [Filed Oct. 18, 1874.]



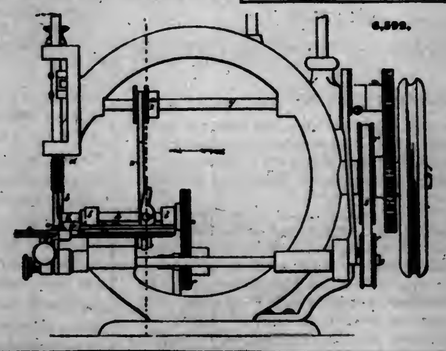


1. A sheet-metal lath having its edges bent or curved back in a manner substantially as the twofold purpose of stiffening the lathe and affording a broad bearing for the plaster-key.
2. A perforated sheet-metal strip-lath, stiffened by having its edges bent or curved back.
3. The metallic sheet-lath described, when provided with rectangular openings, made by slitting the lath and bending back the edges a a, substantially as and for the purpose described.
4. Lathing composed of studs provided with recesses, and laths supported in said recesses, substantially as and for the purpose specified.
5. The combination of a metallic stud and a metallic lath, constructed and secured together by bending one over or upon the other.
6. A lath, when constructed of sheet metal, with its edges bent back, so as to present rounded corners a a a a, and applied substantially as and for the purpose described.
7. The construction of the described metallic sheet-lath, when made with a tapered form at one end, with a view to splicing or jointing, substantially as described.
8. The metallic plates, slitted as described, when used for studs or supports for metallic sheet-laths, substantially as shown, and for the purpose described.

6,591. SYSTEMS OF STEAM AND WATER PIPES FOR BUILDINGS. John H. Hills, Boston, Mass. Patent No. 140,003, dated Dec. 30, 1873. [Filed June 10, 1875.]

Brief.—The steam is first carried to the top of the building to be heated; then, in its downward course, is distributed to radiating coils, which discharge into the same pipe from which they receive steam.

1. The herein-described system of steam-heating, the same consisting in the combination of one or more main pipes, conveying the steam without distribution to a point above the radiators, with branch piping, conveying the steam downward, and serving at one and the same time to supply steam to and conduct the water of condensation from the radiators, the steam, water, and air moving together in one direction toward the boiler, as shown.
2. In a system of steam-heating, comprising an overhead supply, the combination of the radiators or coils with the branch or return piping entering below the water-line of the boiler, as shown and described.
3. The combination, with a system of steam-piping and radiators connected therewith and operating as described, of an air vent or valve located on the branch or return piping at a point below the first or lowest radiator, but above the water-line of the boiler, as shown and described.



6,592. MACHINES FOR THREADING AND CUTTING ATTACHMENTS FOR SEWING-MACHINES. William A. Springer, Marlborough, Mass. Patent No. 147,441, dated Feb. 10, 1874; reissue No. 6,088, dated Oct. 13, 1874. [Filed Mar. 18, 1875.]

1. In combination with a stitch-forming and feed mechanism of a sewing-machine, a positively-rotated, but intermittingly-acting trimming-cutter, for the purposes stated.
2. In combination with a stitch-forming and feed mechanism, a positively-rotated cutter, having a vertically-reciprocating movement, substantially as and for the purposes set forth.
3. In combination with the plate a, the slide h, and herform the slot or groove f, substantially as shown and described.
4. The hinged bearing-plate m, carrying a cutter, and having a spring to force it upward, combined with an eccentric, e, and link or intermediate arm w, to force it downward, substantially as shown and described.
5. The eccentric e, link or intermediate arm w, lever v, arm s, cam-lever t, and plate m, combined and operating substantially as shown and described.
6. In combination with the hinged plate for supporting the cutter, the rear block *s*, arranged *s*, substantially as shown and described.

6,593. SYSTEMS OF STEAM AND WATER PIPES FOR BUILDINGS. John H. Hills, Boston, Mass. Patent No. 140,003, dated Dec. 30, 1873. [Filed June 10, 1875.]

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 7. TUESDAY, AUGUST 17, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

ORCUTT & SON.—*Label.*

[*Appeal from the Examiner of Trade-Marks in the matter of the application of* D. ORCUTT & SON *for registration of a label.—Decided August* 5, 1875.]

The superscription being in its main elements a *label*, the fact that it contains matter which, taken separately, might constitute a *trade-mark* is not fatal to its registration. (Case of *A. Godillot*, OFFICIAL GAZETTE, Vol. VI, p. 641, commented on.)

SPEAR, *Acting Commissioner:*

The subject-matter which applicant seeks to register as a label is a printed slip having at the top a monogram composed of the initial letters of the firm, below which are the words "Orcutt's Salt-Rheum Cure." This is followed by an enumeration of the diseases for which this cure is intended, the price of the article, fac-simile of the signature of the firm, and the place of manufacture. In all its essential, and by far the larger parts of the slip, it is unquestionably a label. The Examiner refuses registration on the ground that the monogram and the fac-simile, if taken from the label, might constitute a trade-mark, and, therefore, make the whole slip a trade-mark, and exclude it from registration by the terms of the law.

The Examiner, in considering this application, and in refusing the registration prayed for, may have been influenced by the decision of the Acting Commissioner in the case of *Godillot*, OFFICIAL GAZETTE, Vol. VI, p. 641; and I refer to that decision to correct what I believe to be unguarded language, which is capable of construction broad enough to exclude the present application from registration.

The matter under consideration in that case was, in all its essential characteristics, a trade-mark; and it was not intended to exclude from registration as labels matters which were essentially labels, although having elements which might be selected, rearranged, and used as trade-marks.

In the present instance the slip of paper indicates the contents of the bottle or package to which it is to be applied, the purpose of the contents, the price, the manufacturers, and place of manufacture. The rest is merely incidental, and it would be manifestly a hardship to refuse registration of what is so plainly a label, by reason of some added ornamentation.

The decision of the Examiner is, therefore, reversed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, NORTHERN DISTRICT OF NEW YORK.

THE GOULDS MANUFACTURING COMPANY *vs.* JOHN P. COWING *et al.*

[*In equity.—Before Mr. Justice* HUNT.—*July*, 1874.]

The rule is settled that when the patent is for an improvement upon a machine the damages for the infringement of such patent are confined to the profits made by the use of the improvement only, and not by the manufacture of the whole instrument.

The complainants, at the accounting, proved the expenses of making and selling the infringing pumps; that they were prepared and ready to fill the orders taken by the defendants, and the prices at which the pumps were sold by the defendants, and the master took the difference between such expenses and such prices (being $47.71 on each pump) as the measure of damages: *Held*, that as the patented invention was merely an *improvement* in pumps, being only a special construction of the side chamber, whereby the same is adapted to use with the valve-casings bolted on the outside, and constituting but a small part

of the aggregate mechanism, this rule was erroneous, and that the damages could not exceed the profits upon such improvement.

The burden of proof, to show the amount of damages or profits, is upon the plaintiff. Where he fails to show the profits or damages arising from the use of the patented improvement, as distinguished from the profits on the entire machine, nominal damages only can be recovered.

[This was a suit in equity brought upon letters patent for an "improvement in gas-pumps," granted to the complainants on the 8th day of August, 1871, as the assignees of William H. Pollard, the inventor. The case came up on exceptions to the master's report, to whom under a previous decree it had been sent for an accounting.]

[*J. B. Perkins*, for complainants.
Elisha Foote, for defendants.]

HUNT, *Justice:*

Upon the hearing of this case upon the merits it was adjudged by the court that the patent to the plaintiffs, dated August 8, 1871, was a valid patent, and that the defendants were infringing in respect to all the pumps manufactured and sold by them subsequent to that date. It was referred to a master to ascertain and report the complainants' damages. The master reported that the complainants should recover damages on two hundred and ninety eight pumps manufactured, to the amount of $47.71 per pump. To this report the defendants filed exceptions, and the case now comes before the court on the hearing of such exceptions.

The principal question arises upon the third exception, and regards the rule for the measure of damages adopted by the master. The complainants proved the expenses of making and selling the pumps in question, that they were prepared and ready to fill the orders taken by the defendants, and the prices at which the pumps were sold by the defendants. The master found the damages to be the difference between such expenses and such prices, and reported accordingly.

If the plaintiffs had been the inventor and patentee of pumps, or of double-acting pumps, the argument would have been strong in favor of the rule adopted; but the invention patented and infringed was of an improvement upon pumps merely. Such was the decree, which did not restrain the defendants from making pumps, or even the pumps in question, but only certain devices, forming a part of them, and which devices the court adjudged to be an improvement belonging to the plaintiffs, which had been infringed by the defendants. The decree adjudges that the letters patent in question, "for an improvement in gas-pumps, dated August 8, 1871, and more particularly set forth in the complaint, were and are valid in law, and that the defendants infringe on the rights secured thereby;" and the defendants are restrained "from making, using, or vending the device or improvement secured thereby." In making the report the master says:

While admitting, of course, the doctrine that, in some cases, the profits resulting from the mere improvement must be separated from those of the entire machine, and allowed to the plaintiff as the sole measure of damages, I am unable to see how, upon any correct principle, this separation can be made in the present case. I have said, in the opinion accompanying this report, that, as it appears to me, the comparison must be made between the machine as it stands, with its patented improvements, and what would be left of the same machine if these improvements were taken away, and not between this machine, with its patented improvements, and any other one having the same general character, not patented, and used in the business, and sold in the market. If this criterion is the correct one—and, for the purposes of this decision, I hold it to be so—it is very plain that, if the patented improvements on this gas-pump are removed, there is nothing left which can be called a machine, and in respect of which any profits can be predicated. I distinctly hold, then, in order that the question may be distinctly presented—although it seems to me to be a matter of law, a sort of construing the machine in the same way that a court construes a writing—that the profits resulting from the patented portion of this pump cannot be separated from those resulting from any other part of it.

In concluding his report, he says:

In conclusion, I find and report that the plaintiffs are entitled to recover, as "damages" sustained by them by the sale of the aforesaid two hundred and ninety-eight pumps by the defendants, as aforesaid, at the rate of $47.71 for each pump so sold by the defendants, that being the whole profit which, as appears from the evidence, the plaintiffs would have made from the sale of each entire pump.

Pumps have been in use since the earliest ages of the world. Double-acting pumps, like the one in question, have long been in use. Double-acting pumps, having a cast side chamber to allow the medium to follow the action of the plunger, have long been in use; and, in this patent, it is expressly stated that this is not claimed as an invention by the plaintiffs. The base, the cylinder, the top, the piston, are the same, in general arrangement, as are used in ordinary double-acting pumps. These things are not claimed by the plaintiffs to be within their improvement. Their use is free to the defendants. Only a special construction of the side chamber is claimed, whereby the same is adapted to use with the valve-casings bolted on the outside. Valves must exist in every pump, and they must open on the outside. They are located in hollow casings; but this the inventor in his patent says that he does not claim. A valve-box or valve-case—that is, the portion of the passages to and from the cylinder that contains the valves cut off from the rest, for the convenience of fitting the valves, and then bolted on again to the outside of the cylinder—is a valuable device forming a part of this machine, but it is not claimed to belong to the plaintiffs, although the specification is said to have been drawn with reference to it. I do not pursue the analysis of the patent so carefully carried out by the defendants' counsel, showing all the parts which were in use before the alleged improvement, and showing specifically what the patent claims. Enough has been said to present the main question in the case—viz., whether the patentees can recover the profits for the manufacture of the entire pump, or whether their claim is limited to the profits upon the improvement embraced within the patent. The master concedes the latter to be the rule in some cases; but, if I understand his reasoning, above quoted, he takes this case out of it on a ground that, I think, cannot be sustained. The comparison is to be made, he says, "between the machine as it stands, with its patented improvements," (the plaintiffs' improvements, I assume,) "and what would be left of the same machine if these improvements were taken away, and not between this machine, with its patented improvements, and any other one having the same general character, not patented, and used in the business, and sold in the market." The portion of the pump in question which belongs to or is included in the improvement of the plaintiffs is very small, and a machine constructed upon other known principles and devices applicable to pumps, omitting the plaintiffs' improvement, would include nearly everything useful that is to be found in the present machine. A different view of this matter of fact is the basis of the master's opinion. I

judge that the master holds the plaintiffs' improvement to be more extensive than it is.

The proposition is simply this: The patentee takes the well-known portions of a pump used in pumping gas oil, with passages, valves, piston, chambers, openings, &c., as ordinarily made and used, and adds a chamber of an important construction, as it is alleged, and a combination with certain other parts described. Now, if this addition is not a new and useful improvement, no damages can be claimed for its use. If it is such an improvement, the improvement, in its nature and by law, is and must be capable of being described and pointed out, and must be described and pointed out. Every skilful mechanic must be able to learn, from the patent itself, precisely what the monopoly covers. (Act of July 8, 1870, sec. 26, 16 U. S. Stat. at Large, 201.) If this alleged improvement is so confounded with portions of the machine which are the subjects of other patents, or which, from long-continued use, are open to the public, that it cannot be separated from them, or if, when so separated, it has no value, it is not a patentable invention, and no damages are due for its use. The decree in this case has adjudged the patent to be valid. In its nature, therefore, it is, and must be, capable of separation and distinction from other portions of the machine. The ruling of the master, that the profits arising from the improvement of the plaintiffs cannot be separated from the profits of the machine generally, seems to be based upon the idea that the improvement of the plaintiffs is all that is valuable in the machine. I cannot but consider this a great mistake, as I have already shown.

I understand the rule to be settled that, when the patent is for an improvement upon a machine, the damages for the infringement of such patent are confined to the profits made by the use of the improvement only, and not by the manufacture of the whole instrument. What profit or advantage did the defendants obtain by the use of the plaintiffs' improvement? What advantage did they have that they would not have had, if they had built their machines without the improvement? In *Philp* vs. *Nock*, (17 Wall., 460,) although the case did not, perhaps, require an adjudication of the point, the rule is thus laid down, by Swayne, J.:

Where the infringement is confined to a part of the thing sold, the recovery must be limited accordingly. It cannot be as if the entire thing were covered by the patent; or, where that is the case, as if the infringement were as large as the monopoly. * * The plaintiff must show his damages by evidence. They must not be left to conjecture by the jury.

In *Mowry* vs. *Whitney*, (14 Wall., 620, 649,) the precise point before us was in question. The defendant was charged by the master with $91,000, as the profits arising from the use of the plaintiffs' patent, in manufacturing car-wheels, which was the profit obtained from the manufacture of the entire wheel. In delivering the opinion of the court, Strong, J., says:

It is clear that Whitney is not entitled to recover more than the profits actually made in consequence of the use of his process in the manufacture of the 19,819 wheels. It is the additional advantage the defendant derived from the process—advantage beyond what he had without it—for which he must account; * * but the master charged the profit obtained from the entire wheel, instead of that resulting from the use of Whitney's invention in a part of the manufacture. * * * It is as true of a process invented as an improvement in a manufacture, as it is of an improvement in a machine, that an infringer is not liable to the extent of his entire profits in the manufacture. The question is, What advantage did the defendant derive from using the complainant's invention, over what he had in using other processes then open to the public and adequate to enable him to obtain an equally beneficial result? The fruits of that advantage are his profits. They are all the benefits he derived from the existence of the Whitney invention.

The burden of proof rested upon the complainants. The damages to the plaintiffs or the profits to the defendants (they are the same thing) must be proved like the other points in the case. For all the profits or advantages with which they have been charged, except that precise advantage derived from using the plaintiffs' improvement, the defendants may still be liable to other inventors, or they may have already paid for them to those inventors. Upon no principle can the plaintiffs assume that they belong to themselves, and call upon the defendants to disprove this assumption. It is not necessary further to examine the cases on this point. The Supreme Court has decided it explicitly, and, if there are cases found to the contrary, they must be considered as overruled. The master should have decided that, as the plaintiffs had failed to show the profits or damages arising from the use of the improvement, nominal damages only could be recovered.

The third exception is allowed, and, as it goes to the basis of the entire recovery, it is not necessary to consider the other exceptions in the case.

SUPREME COURT OF THE DISTRICT OF COLUMBIA.

[*In general term.*]

FREDERICK G. AND WILLIAM F. NIEDRINGHAUS.—*Appeal.*

[*In the matter of the application of Frederick G. and William F. Niedringhaus for a patent for a* "DESIGN FOR ORNAMENT FOR ENAMELED IRON-WARE," *filed June 3, 1874.—Appeal from the decision of the Commissioner of Patents.*]

A beautiful appearance is not of itself entitled to a design patent. The design must also be new and original, and the result of invention and genius.

Mere exhibition of skill on the part of workers in enamel, in giving beautiful forms and colors to their productions, when they are the common efforts of persons ordinarily skilled in the art, is not the invention which is protected by the law.

The use of an old design is clearly excluded from patent by the statute, and mere change or "double use" cannot receive its protection.

The same degree of originality is required in both design and functional patents—that is, the claim must not comprehend what is already in existence.

A design consisting in a mere mottled appearance to be given to enameled iron-ware is not patentable.

[*Charles D. Moody*, for appellant.
Wm. H. Doolittle, for the Commissioner.]

Mr. Justice MAC ARTHUR delivered the opinion of the court:

This is an appeal from the decision of the Commissioner of Patents refusing a design patent in enameled iron-ware to Frederick G. Niedringhaus and William F. Niedringhaus. The statute in regard to design patents reads as follows:

Any person who, by his own industry, genius, efforts, and expense, has *invented and produced* any *new and original* design for a manufacture, bust, statue, alto-relievo, or bas-relief; any *new*

and original design for the printing of woolen, silk, cotton, or other fabrics; any *new and original* impression, ornament, pattern, print, or picture to be printed, painted, cast, or otherwise placed on or worked into any article of manufacture; or any new, useful, and original shape or configuration of any article of manufacture, *the same not having been known or used by others before his invention or production thereof, or patented or described in any printed publication*, may, upon payment of the fee prescribed, and other due proceedings had the same as in cases of inventions and discoveries, obtain a patent therefor. (Sec. 4929 United States Revised Statutes.)

In their specification, the applicants claim to have invented and produced a new and original design of ornament or pattern, to be printed, painted, or otherwise placed on, or marked into the various articles of enameled iron-ware which they make and sell. A photograph is annexed to illustrate the outline. They also say that—

the article itself, however, when completed, presents to the eye a beautifully-mottled appearance, resembling granite in color, which the illustration fails to exhibit. It is this peculiar mottled appearance which constitutes the chief merit of our design, and it is on this we place most importance.

The Primary Examiner, the Examiners-in-Chief, and the Commissioner have all concurred in refusing the application for the patent. The Commissioner, in his decision, says:

I concur in the opinion of the Examiners-in-Chief, so far as want of patentability in the general subject-matter embraced by the application is concerned. The so-called design is effected by printing, painting, or in any other way placing upon iron-ware a peculiarly-mixed color. The enameling of iron-ware in various colors is an art well known. If applicant has achieved anything new, it is to be found in the mixing of colors, by which he produces a mottled appearance having the effect of granite coloring. If he has in this way obtained a new paint, it may or may not be patentable; but the application of such a paint in an ordinary way does not constitute the subject-matter of a design patent, even under the most liberal construction of the statute.

The court are unanimously of the opinion that the decision of the Commissioner ought to be affirmed. The art of enameling has been practiced for many centuries, and the different kinds of enamel have been produced in every variety of shade and color. The materials used for the purpose of coloring, and the process by which they are fused have been known so long that to change them requires only the taste and skill of one engaged in the business. The appellants, of course, do not mean to claim any exclusive title to what is so well known. But their specification certainly seems to suggest that the change of color "resembling granite," imparts great value to their invention. They say "the mottled appearance which constitutes the chief merit of our design, and it is on this we place the most importance." The specimen of enameled iron-ware exhibited by counsel on the argument was of a color resembling granite, and was marked by spots of different shades darker than granite. The enamel and coloring substances are manifestly liquefied by intense heat, such as enamelers use, until they are completely fused, and they are laid upon the iron-ware while in this condition. The spots are then formed at random, in larger and smaller patches, without regard to regularity or design of any kind. No two of the articles are alike, except in color and general appearance. It is undoubtedly ornamental to the article, and has a pleasing effect on the eye. This is equally true of the hundreds of objects upon which this art is employed. Ornamental work in great variety, and paintings that never lose their freshness, are executed in enamel. Indeed, the primary object of this art is to impart greater luster and beauty to every article of luxury or utility to which it is applied. A beautiful appearance is not in itself patentable. The design must be new and original, and the work of invention and genius. The ingenuity and taste of workers in enamel are quite wonderful to all but those employed in it; but no one would imagine that these exhibitions of skill in giving beautiful forms or colors to their productions was the kind of invention to be protected by the law. They are the common efforts of persons ordinarily skilled in the art. The appellants contend in their brief that—

it matters not if the design has been previously used, if now combined with an "object" with which it has not been hitherto combined; and if, as a result of such association, a new and distinctive aspect is given to such object, the law is complied with—

and refers to former decisions by the Commissioner of Patents as cases in point. We cannot concur in this view. The thing provided for in the law is in express language, "any new and original design for a manufacture;" "any new and original design for printing;" "any new and original impression;" "any new, useful, and original shape;" "the same not having been known or used by others before his invention or production thereof." The use of an old design upon an old object is clearly excluded by the statute, and mere changes or "double use" cannot receive its protection.

Besides, it is now well understood that the same degree of originality is required in both design and functional patents. That is, the claim must not be for a copy or imitation of what is already in existence. If, for instance, the applicants should manufacture their iron-ware with a figure of the statue of the Three Graces, it might improve the appearance of the article, but would scarcely entitle them to the benefits of a patent. To manufacture it with enamel is a change of the same kind, for the same thing has been performed on metals from time immemorial. To give the enamel any particular color is a matter of ordinary skill and taste. The coloring substances have always been fused with the enamel in the heat of the furnace. We can, therefore, observe nothing in the present specification to which the term invention can be applied.

I am aware that the Supreme Court of the United States, in *Gorham Company* vs. *White*, 14 Wall., 524, have said in regard to design patents that—

they contemplate not so much utility as appearance, and that not an abstract impression but an aspect given to those objects mentioned in the arts.

That was an action brought for the infringement of a design patent for the handles of table-spoons and forks. The design consisted in the configuration of the spoon and the ornamentation of the handle. The outline and all the details of the design were new, and invariable in each spoon alike. No question was discussed as to the originality of the patent, for it had never been known before, and the court decided that the article manufactured and sold by the defendant did not differ substantially from plaintiff's, and that it was therefore an infringement. But the whole tenor of the decision is to the effect that the appearance or aspect of the object must be of a design that is new and original. Indeed no other view is admissible, for such is the express requirement of the law.

The decision of the Commissioner is affirmed.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date August 17, 1875.]

8,563.—Heating-Stove.—WILLIAM C. DAVIS, Cincinnati, Ohio, assignor to WILLIAM C. DAVIS & Co., same place. Application filed August 7, 1875. Term of patent 7 years.

8,564 to 8,566, inclusive.—Carpet.—ALFRED HEALD, Philadelphia, Pa.—Cases B', C', and D'. Applications filed August 7, 1875. Term of patents 3½ years.

8,567.—Fire-Place Heater.—PHILIP ROLLHAUS, Jr., Brooklyn, N. Y. Application filed August 6, 1875. Term of patent 7 years.

8,568.—Ranges.—WILLIAM S. WHITMAN, Bangor, Me. Application filed July 24, 1875. Term of patent 7 years.

8,569.—Clock-Case Doors.—LUTHER E. JEROME, New Haven, Conn., assignor to THE NEW HAVEN CLOCK COMPANY, same place. Application filed August 9, 1875. Term of patent 7 years.

8,570.—Handles for Cans, &c.—HERMAN MILLER, New York, N. Y., assignor to THE DEVOE MANUFACTURING COMPANY, same place. Application filed August 2, 1875. Term of patent 7 years.

8,571.—Handles of Forks and Spoons.—LE ROY S. WHITE, Waterbury, Conn., assignor to BROWN & BROTHERS, same place. Application filed July 10, 1875. Term of patent 14 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date August 17, 1875.]

2,826.—Salicylic Acid.—SAMUEL W. CANFIELD, Piermont, N. Y. Application filed June 19, 1875.

"the compound word 'MILK-SALICYLIC.'"

2,827.—Medicine.—JOHN A. CRAIG, Philadelphia, Pa. Application filed June 19, 1875.

"'GOLDEN TONIC.'"

2,828.—Medicine.—WM. B. DOUGLASS & Co., Washington, D. C. (Re-registration.) Application filed June 20, 1872.

"a map or topographical outline of Lake Superior, with the words 'Lake Superior' arranged above the figure, and the word 'Vis' beneath it."

2,829.—Flour.—WILLIAM M. GALT, Washington, D. C. (Re-registration.) Application filed July 28, 1871.

"words 'GOLDEN HILL.'"

2,830.—Spectacles and Spectacle-Frames.—ANDREW L. SMITH, Geneva, N. Y. Application filed December 22, 1874.

"the letter 'C' and the words 'Crystal Spectacles,' arranged in an ornamental border."

2,831.—Shirts.—JOSEPH WHEELOCK, Jr., Troy, N. Y. Application filed March 2, 1875.

"figure of a heart."

2,832.—Beverages.—EDWARD J. WILLIAMSON, St. Louis, Mo. (Re-registration.) Application filed June 6, 1871.

"word 'Melaroma.'"

LABELS REGISTERED DURING THE WEEK.

[Each certificate bearing date August 17, 1875.]

302.—Title: "**Bonham's Recipes.**"—J. S. BONHAM, Jacksborough, Tenn. Application filed July 16, 1875.

303.—Title: "**Dr. Heilen's Healing Oil.**"—F. HOLLEN, Wilsonburg, Ill. Application filed June 10, 1875.

304.—Title: "**Kinder Supper Extract.**"—SIVARTH & SCHLEUSSNER, Brooklyn, N. Y. Application filed August 12, 1875.

305.—Title: "**Business Envelope.**"—JAMES W. TURNER, Boston, Mass. Application filed May 17, 1875.

306.—Title: "**Mrs. Reader's Candy.**"—JOSEPH WHITE, Lancaster, Pa. Application filed August 2, 1875.

BOUND VOLUMES OF PATENTS.

The bound volumes of patents, containing the specifications and drawings of patents in full from May 30, 1871, to within a few months of date, may be consulted at the following places:

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

INDEX OF INVENTIONS PATENTED AUGUST 17, 1875.

	Class No.	No. of Patent.
Acid, apparatus for the manufacture of salicylic, W. E. Graf	35	166,862
Acid, producing salicylic, W. E. Graf	35	166,863

Carriages, shifting rail for, E. P. Stedman	31	166,728
Casting, mold for, B. Harris	33	166,773
Casting pulleys, J. Murdock	33	166,799
Chair, folding rocking, A. W. Stewart	62	166,726
Chair, folding rocking, G. E. Vail	62	166,733
Chairs, attachment for stand rocking, C. H. Hildreth	62	166,698
Chimney top and ventilator, P. H. Shine	4	166,725
Chinch bugs, implement for destroying, H. F. Rice	63	166,730
Churn, J. Butler	45	166,745
Churn, W. Redheffer	45	166,893
Claw bar, A. Shaw	29	166,818
Coal hod, J. Cochran	154	166,851
Compass, mariner's, E. S. Ritchie	50	166,812
Corn sheller, Creekmore and McMillin	59	166,751
Corn sheller, Hall and Yingst	59	166,771
Corn sheller, S. Williams	59	166,832
Coverlets, fabric for, H. Shadewald	95	166,896
Cryptography, A. L. Flamm	146	166,761
Cushion cleaning machine, J. R. Barry	62	166,841
Dental cement, M. T. Labbé	46	166,878
Dental engine, electro-magnetic, J. Bishop	46	166,843
Dental plugger, T. Crossett	46	166,752
Dental plugger, automatic, G. W. Levin	46	166,709
Dental plugger, automatic, G. W. Levin	46	166,710
Drill holes, apparatus for charging, R. G. Baldwin	124	166,840
Eaves trough hanger, H. K. and T. F. Stobler	126	166,905
Electric light, S. A. Kosloff	50	166,877
Elevators, internal gearing of, E. Schlenker	79	166,729
Engine cylinders, port for steam, W. C. Church	150	166,849
Engine hydrant, steam fire, R. T. H. Stileman	167	166,904
Engine, reciprocating, G. B. Dixwell	150	166,688
Engine, steam, E. D. Leavitt, Jr.	150	166,706
Excavator, T. Z. Cole	51	166,852
Explosive compound, R. Cahuc, (reissue)	71	6,601
Fabric for coverlets, H. Schadewald	95	166,896
Fare box, W. C. McGill	42	166,794
Fare register, D. Eldridge	42	166,864
Faucet, E. Wilson	167	166,833
Feed rack, M. Ralph	144	166,719
Felting machine, Hooper and Crane	76	166,699
Fence, portable, T. L. Davidson	52	166,687
File, J. Haptonstall	53	166,868
Flanges on boiler heads, machine for turning, R. C. Nugent	125	166,715
Flour bolting machine, W. F. Cochrane, (reissue)	57	6,594
Flour bolting machine, W. F. Cochrane, (reissue)	57	6,595
Fork, horse hay, J. P. Fricst	77	166,694
Fuel, apparatus for economizing, L. C. E. Carré	61	166,846
Furnace for brick kilns, W. S. Colwell	20	166,749
Furnace for burning edgings, sawdust, &c., L. O. Smith, (reissue)	154	6,600
Furnace for melting metals, W. E. C. Eustis	85	166,757
Game board, A. Hersog	143	166,776
Garden trellis, I. Goodspeed	63	166,766
Gas apparatus, A. Glachet	66	166,867
Gate, automatic, Ferris and Lewis	52	166,866
Gear cutting attachment, W. Kratzsch	100	166,705
Generator, steam, J. Goulding	148	166,768
Glass cutter, steel, H. H. Clark	63	166,684
Grain drill, W. Aldrich	133	166,739
Grain drill tooth, G. L. Ives	133	166,779
Grain drills, force feed apparatus for, W. Aldrich	133	166,678
Hair picker, C. A. Teal	62	166,924
Hame fastener, S. Spicer	72	166,902
Harness saddle tree, A. Teas	72	166,907
Harness snap, E. Kempshall	72	166,783
Harness trace carrier, E. A. Cooper	72	166,685
Harrow, L. Francisco	73	166,763
Hat stiffening machine, G. B. Fuller	76	166,764
Hatchway guard, J. C. Foster	30	166,692
Heating and ventilating device, A. H. Thorp	147	166,825
Heel attaching and trimming machine, McKay, Fairfield, and Glidden	16	166,795
Heeling machine, Elliott, Fellows, and Simmons	16	166,756
Hoisting apparatus, J. Hoffman, (reissue)	79	6,597
Hoisting machine or elevator, E. Schlenker	79	166,730
Hook, hat and coat, C. Schoenbein	24	166,815
Horseshoe, A. C. Snowden	60	166,820
Hose nozzle, C. Oyston	167	166,803
Hosiery seams, machine for sewing, W. Pearson	134	166,805
Hub boring machine, J. Lee	31	166,788
Hydrant, steam fire engine, R. T. H. Stileman	167	166,904
Ice, apparatus for the manufacture of, Negley and Cunningham	83	166,713
Ice breaker, J. T. Martin	137	166,793
Ingot mold, J. Illingsworth	33	166,700
Inhaler, C. R. Sykes	156	166,729
Injector, S. Fowden	148	166,702
Ironing board, O. S. Pride	91	166,809
Knitting machine, weft thread, N. W. Westcott	89	166,831
Ladder, A. S. Miller	30	166,883
Lamp, nursery, C. I. Gorham	65	166,767
Latch, locking, G. J. Dickson	93	166,856
Latch, locking, A. Worster	93	166,834
Lathes, tool holding attachment for metal, W. Krutsch	100	166,787
Leather board, &c., machine for stripping, E. Andrews	92	166,837
Leather, water-proofing compound for, J. Clunan	92	166,748
Letter box, E. S. Newcomer	146	166,800
Locks, adjustable face plate for, E. M. and J. E. Mix	93	166,797
Locomotives, steam brake for, L. B. Salisbury	122	166,895
Loom for weaving hair cloth, J. Turpie	95	166,732
Loom stopping mechanism, A. S. Wynn	95	166,737
Meat chopper, W. L. Fallis	25	166,865
Mechanical movement, P. Broadbooks	67	166,844
Mechanical movement, P. Broadbooks	98	166,853
Medical composition, L. Corfman	95	166,739
Medical composition, N. Sullivan	98	166,823
Metal punching machine, J. R. Lindsay	119	166,707
Milling machine, W. Krutzsch	100	166,704
Millstone, counter balancing, H. Klinkermann	57	166,785
Mirrors, producing amalgamated silvering for, J. J. E. Lenoir	113	166,790
Molding machine, variety, J. Sears	173	166,817
Mop head, J. K. Clark	22	166,850
Motion, traverse, C. L. Noe	67	166,801
Nail forging machines, feeding device for, L. A. Dodge	60	166,857
Nails, manufacture of cut, G. Stacy	103	166,821
Nozzle, exhaust, White and Levy	148	166,910
Numbering machine, consecutive, T. S. Bowman	42	166,681
Nursing bottle, J. J. Christie	156	166,747
Ore crusher, wet and dry, H. Bolthoff	3	166,743
Packing-box, H. N. Harr	88	166,774
Padlock, W. H. Andrews	93	166,838
Paper stock grinder, O. Abell	109	166,835
Paper weight, J. T. Adams	146	166,836
Pavement, brick, S. Strong	110	166,822
Photographs, machine for washing, J. L. Caylor	111	166,847
Pins to brooches, attaching, C. B. Duesbury	23	166,754
Pipes, connecting steam, gas, or water, C. C. Walworth	167	166,735
Plow, W. S. Wadsworth	114	166,734
Propelling mechanism for boats, W. Ascough	139	166,839
Pump, A. and M. Knecht	118	166,786
Punches, holding conductors', T. B. Doolittle	42	166,858
Punching machine, metal, J. R. Lindsay	119	166,707
Purifier, middlings, R. W. Gunter	57	166,770
Radiator, steam, W. B. Snow	147	166,901
Railway frog, J. Cumming	120	166,855
Railway rail joint fastening, J. Corson	120	166,750
Rake, horse hay, C. E. Lipe	77	166,708
Refrigerator, beer, J. N. Bohart	58	166,742
Rope halter, L. C. Chase	144	166,683
Rope stretcher, C. C. Curtis	127	166,753
Sash fastener, B. A. Berryman	24	166,842
Sash holder, S. M. Pratt	24	166,808
Saw, cylinder, Peirce and Kinsman	130	166,718
Saw gumming machine, J. M. Smith	131	166,727
Sawing barrel heads, machine for, E. and B. Holmes	40	166,873
Sawing machine, A. T. Nichols	130	166,887
Scaffold clamp, W. C. Fellows	30	166,759
Scraper, J. Megill	51	166,882
Screw cutting die, R. C. Nugent	14	166,716
Separator, grain, W. R. Torley	159	166,826
Separator, sand and gravel, N. J. Keller, (reissue)	3	6,598
Sewing hosiery seams, machine for, W. Pearson	134	166,805
Sewing machine, T. J. Harper	134	166,869
Sewing machine, C. Hodgkins, (reissue)	134	6,596

	Class No.	No. of Patent.
Sewing machine button hole attachment, W. Randel	134	166,810
Sewing machine corder, W. Wilson, (reissue)	134	6,603
Sewing machine treadle, R. F. Willcox, (reissue)	134	6,602
Shade holder, T. Moran	90	166,884
Sharpening machine, A. S. Weaver	70	166,830
Sheep shears, P. Harlow	144	166,772
Sheet metal, mallet for smoothing, Kittredge and Clark	60	166,703
Shingle machine, J. J. Kendall	174	166,784
Shirt, J. W. Hutchinson	38	166,777
Shoe tip or protector, C. T. Grilley	16	166,769
Shot charger for shot pouches, J. S. Long	55	166,791
Shutter fastener, J. Shedd	24	166,819
Sieve, O. Bond	170	166,680
Skylight, Querner and Burke	126	166,890
Soap slabbing machine, J. C. Ralston	26	166,891
Spader, rotary, W. C. B. Richardson	43	166,721
Spark arrester, D. Hawkesworth	94	166,870
Spindles, bearing surfaces for, E. D. Murfey	142	166,885
Spindles, preparation for bearing surfaces for, E. D. Murfey	142	166,886
Spinning frames, ring for, J. W. Wattles	142	166,909
Stand for water coolers, C. B. Porter	62	166,889
Stave jointing machine, E. and B. Holmes	40	166,872
Stereotype plate holder, Kellogg and Shock	117	166,702
Stone crushing machine, C. H. Scheermesser	3	166,897
Stove, lamp, M. F. Rathbun	65	166,892
Stove, oil, H. Allen	65	166,740
Stove, oil, A. Q. Allis	65	166,738
Sugar cooling and draining apparatus, J. H. Hynson	155	166,778
Table, adjustable folding, C. S. Hood	62	166,674
Table, extension, J. W. Bent	62	166,679
Table, ironing, E. C. McClain	91	166,881
Telegraph key, compound, M. L. M. Hussey	50	166,876
Telegraph, printing, A. Wirsching	158	166,911
Telegraph transmitter, H. Middleton	158	166,712
Telegraphy, chemical, T. A. Edison	50	166,859
Telegraphy, chemical, T. A. Edison	50	166,860
Telegraphy, chemical, T. A. Edison	50	166,861
Thill coupling, S. A. Hathaway	31	166,997
Toy store, E. Durlach	143	166,755
Tram stick, J. R. Byer	57	166,746
Trap, animal, E. Oliver	143	166,802
Valve, balanced, W. C. Church	152	166,848
Valve, rotary balanced, C. M. Farrar	152	166,758
Vehicle fifth wheel, P. B. Cunningham	31	166,854
Vehicle king bolt, E. Freeman	31	166,693
Vehicle lubricating axle, A. Schirck	31	166,898
Vehicle spring, H. Jeffrey	31	166,780
Vehicle top, J. F. Heger	31	166,775
Vernier, A. Young	157	166,912
Vise, bench, A. Vellieux	109	166,828
Wagon jack, C. T. Drake	79	166,689
Walls, construction of, G. H. Field	4	166,760
Warming apparatus, J. F. Reilly	154	166,894
Washing machine, G. W. Holmes	91	166,871
Washing machine, J. H. Mudgett	91	166,714
Washing machine, Palmer and Briggs	91	166,988
Washing machine, O. S. Thayer	91	166,731
Washing machine boiler, Everson and Cramer	91	166,691
Watches, safety center pinion for, Bacon and Brown	36	166,741
Watches, stem winding and setting device for, L. Kahn	36	166,781
Water cooler, L. B. Woolfolk	58	166,736
Water cooler stand, C. B. Porter	62	166,889
Water wheel, Campbell and Johnson	168	166,682
Waterproofing compound for leather, J. Clunan	92	166,748
Welding compound, J., Jr., and A. S. Scott	35	166,816
Whalebone, machine for splitting and dressing, F. E. Merriman	176	166,711
Whip socket clasp, E. W. Scott	31	166,724
Wind wheel, H. J. Brimhall, Jr.	118	166,744
Window frame, J. F. Ebert	30	166,690
Wrench, P. Samuel	100	166,814

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED AUGUST 17, 1875.

	Patent No.
Abell, O., Paper stock grinder	166,835
Abernethy, W. P., assignee	166,783
Adams, J. T., Paper weight	166,836
Albertson, J. M., Bale tie	166,677
Aldrich, W., Force feed apparatus for grain drills	166,678
Aldrich, W., Grain drill	166,739
Allen, H., Oil stove	166,740
Allis, A. Q., Oil stove	166,738
Andrews, E., Machine for stripping leather board, &c.	166,837
Andrews, W. H., Padlock	166,838
Armstrong, J. A., assignee	166,747
Ascough, W., Propelling mechanism for boats	166,839
Bacon, C. R., and L. C. Brown, Safety center pinion for watches	166,741
Baldwin, R. G., Apparatus for charging drill holes	166,840
Barker, G. W., assignee	166,676
Barry, J. R., Cushion cleaning machine	166,841
Bent, J. W., Extension table	166,679
Berryman, B. A., Sash fastener	166,842
Bishop, J., Electro-magnetic dental engine	166,843
Bohart, J. N., Beer refrigerator	166,742
Bolthoff, H., Wet and dry ore crusher	166,743
Bond, O., Sieve	166,680
Bowman, T. S., Consecutive numbering machine	166,681
Briggs and Palmer	166,988
Brimhall, H. J., Jr., Wind wheel	166,744
Broadbooks, P., Mechanical movement	166,844
Brooks, J. W., assignee	166,756, 166,765, 166,795
Brower, J. Y. and R., assignees	166,836
Brown and Bacon	166,741
Burke and Querner	166,890
Butler, J., Churn	166,745
Byer, J. R., Tram stick	166,746
Cahuc, R., Explosive compound, (reissue)	6,601
Caldwell, R. W., Baby jumper	166,845
Campbell, H. W., and J. H. Johnson, Water wheel	166,682
Canfield, S. W., assignee	166,862, 166,863
Carré, L. C. E., Apparatus for economizing fuel	166,846
Caylor, J. L., Machine for washing photographs	166,847
Chase, L. C., Rope halter	166,683
Chick, W. H., and J. S., assignees	166,893
Christie, J. J., Nursing bottle	166,747
Church, W. C., Balanced valve	166,848
Church, W. C., Port for steam engine cylinders	166,849
Clark, H. H., Steel glass cutter	166,684
Clark, J. K., Mop head	166,850
Clark and Kittredge	166,703
Clunam, J., Water proofing compound for leather	166,748
Cochran, J., Coal hod	166,851
Cochrane, W. F., Machine for bolting flour, (reissue)	6,594
Cochrane, W. F., Machine for bolting flour, (reissue)	6,595
Cole, T. Z., Excavator	166,852
Colwell, W. S., Furnace for brick kilns	166,749
Cooper, E. A., Trace carrier for harness	166,685
Corfman, L., Medical composition	166,853
Cornell Watch Company, assignee	166,741
Corson, J., Railroad rail joint fastening	166,750
Cramer and Everson	166,691
Crane and Hooper	166,699
Creekmore, H. C., and J. W. McMillin, Corn sheller	166,751
Crossett, T., Dental plugger	166,752
Cummins, J., Railway frog	166,855
Cunningham, P. B., Vehicle fifth wheel	166,854
Cunningham and Negley	166,713
Curtis, C. C., Rope stretcher	166,753
Daniels, T. E., Breast cup for females	166,686
Davidson, T. L., Portable fence	166,687
Dayton Machine Company, assignee	166,678, 166,739
Dickson, G. J., Locking latch	166,856
Divine, J. F., assignee	166,792
Dixwell, G. B., Reciprocating engine	166,688
Dodge, L. A., Feed device for nail forging machines	166,857
Doolittle, T. B., Means for holding conductors' punches	166,858
Drake, C. T., Wagon jack	166,689
Driscoll and Schuster	166,723
Duesbury, C. B., attaching pins to brooches	166,754
Durlach, E., Toy store	166,755
Eaton, Cole, and Burnham Company, assignee	166,901
Ebert, J. F., Window frame	166,690
Edison, T. A., Chemical telegraphy	166,859
Edison, T. A., Chemical telegraphy	166,860
Edison, T. A., Chemical telegraphy	166,861
Eldridge, D., Fare register	166,864
Elliott, A. D., G. E. Fellows, and S. A. Simmons, Heeling machine	166,756
Ettinger, W., assignee	166,876
Eustis, W. E. C., Furnace for melting metals	166,757
Everson, C. R., and L. L. Cramer, Boiler washing machine	166,691
Fairfield, Gliddon, and McKay	166,795
Fallis, W. L., Meat chopper	166,865
Farrar, C. M., Rotary balanced valve	166,758
Faulkner, E. H., assignee	166,732
Fellows, Simmons and Elliott	166,756
Fellows, W. C., Scaffold clamp	166,759
Ferris, H. L., and C. Lewis, Automatic gate	166,866
Field, G. H., Construction of walls	166,760
Firth, A., executor, (reissue)	6,599
Fish, A. H., assignee	166,746
Flamm, A. L., Cryptography	166,761
Force, C. G., Jr., Canal lock	166,695
Foster, J. C., Hatchway guard	166,692
Foster, S. E., assignee	166,744
Fowden, S., Injector	166,702
Francisco, L., Harrow	166,763
Freeman, E., Vehicle king bolt	166,693
Friest, J. P., Horse hay fork	166,694
Fuller, G. B., Machine for stiffening hats	166,764
Glachet, A., Gas apparatus	166,867
Glidden, C. W., and S. A. Simmons, Boot and shoe heel trimmer	166,765
Glidden, McKay, and Fairfield	166,795
Goodspeed, I., Garden trellis	166,766
Gorham, C. I., Nursery lamp	166,767
Goulding, J., Steam generator	166,768
Graf, W. E., Apparatus for the manufacture of salicylic acid	166,862
Graf, W. E., Producing salicylic acid	166,863
Grilley, C. T., Shoe tip or protector	166,769
Gunter, R. W., Middlings purifier	166,770
Hall, W. H., and C. S. Yingst, Corn sheller	166,771
Hand, E., Burglar alarm	166,696
Haptonstall, J., File	166,868
Harlow, P., Sheep shears	166,772
Harper, T. J., Sewing machine	166,869

	Patent No.
Harrington, G., assignee	166,859, 166,860, 166,861
Harris, B., Mold for casting	166,773
Hart, H. N., Packing box	166,774
Hathaway, S. A., Thill coupling	166,697
Hawkesworth, D., Spark arrester	166,870
Heger, J. F., Vehicle top	166,775
Hendrick, H. H., assignee	166,715
Hendrie, C. F., assignee	166,743
Herzog, A., Game board	166,776
Hildreth, C. H., Attachment for stand rocking chairs	166,698
Hodgkins, C., Sewing machine, (reissue)	6,596
Hoffman, J., Hoisting apparatus, (reissue)	6,597
Hoglen, G. W., assignee	166,704, 166,705, 166,716, 166,787
Holmes, E. and B., Stave jointing machine	166,872
Holmes, E. and B., Machine for sawing barrel heads	166,873
Holmes, E. T., assignee, (reissue)	6,599
Holmes, G. W., Washing machine	166,871
Hood, C. S., Adjustable folding table	166,874
Hooper, N. R., and T. S. Crane, Felting machine	166,699
Horton, N. N., Railway car seat	166,875
Howard, R. L. and G. F., assignee	166,722, 166,730
Hussey, M. L. M., Compound telegraph key	166,876
Hutchinson, J. W., Shirt	166,777
Hynson, J. H., Sugar cooling and draining apparatus	166,778
Illingworth, J., Ingot mold	166,700
Ingersoll, E. C., assignee	167,822
Ives, G. L., Grain drill teeth	166,779
Jeffrey, H., Vehicle spring	166,780
Jerome, W. R., assignee	166,841
Johnson, J., Spring bed	166,701
Johnson and Campbell	166,622
Jones, B. C., assignee	166,725
Kahn, L., Stem winding and setting device for watches	166,781
Keith, H. L., assignee	166,779
Keller, N. J., Sand and gravel separator, (reissue)	6,598
Kellogg, A. N., and J. J. Shock, Stereotype plate holder	166,702

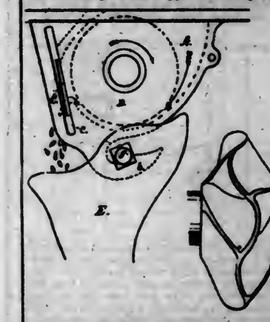
TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED AUG. 17, 1875.

166,677. BALE-TIES. James M. Albertson, New London, Conn. [Filed Dec. 10, 1874.]



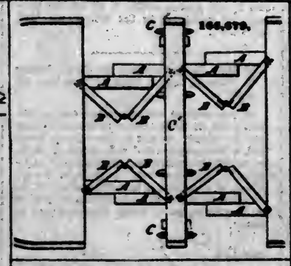
1. A bale-tie formed by a single piece or blank of metal, having top and bottom parts a b, and provided with two similar grooves extending entirely around it, for the reception of the ends of the bands, these grooves being at an angle with each other, and crossing upon opposite sides of the tie, substantially as herein shown and described.

2. A bale-tie having grooves which cross or intersect each other at a common point, C, said grooves being of a greater depth at the point C than at any other portion of the same, so as to better contain the two wires crossing each other at this point, substantially as described.

3. A bale-tie formed with two intersecting grooves, and provided with a spur, D, substantially as and for the purpose specified.

166,678. FORCE-FEED APPARATUS FOR GRAIN-DRILLS. Wales Aldrich, Dayton, Ohio, assignor of one-half his right to the Dayton Manufacturing Company, same place. [Filed June 8, 1875.]

Brief.—Within the hopper is journaled a seed-wheel, the periphery of which forms a zigzag line, and the irregular-shaped recesses diminish in capacity from the circumference to the center. On the lower part of the hopper is formed a hook for the reception of a spout, clamped together by a bolt, which also serves as a pivot-like support for the spout.



1. The herein-described feed-wheel, whose periphery forms a zigzag curved line, and whose sides are irregularly-shaped inclining recesses, diminishing in capacity from the circumference to the center, substantially as set forth.

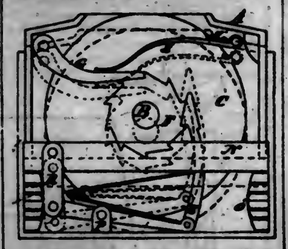
2. The chamber A, constructed as described, and provided with the hook b and guide-plate c.

3. The receiving-spout B, clamped by the bolt or rivet g, in combination with the hook b of the chamber A, for forming the connection between the two parts, in the manner and for the purpose specified.

166,679. ROTARY-PUMP. John W. Bent, Chicago, Ill. [Filed June 7, 1875.]

The combination, in connection with a table of the sliding extensions A A, folding rails B B, and central support C C, the parts A A being supported by the central support, and the parts B B by the parts A A, substantially as specified, for the purposes set forth.

166,680. SEWER. Oliver Bond, Milwaukee, Wis. [Filed Feb. 8, 1875.]



Brief.—The apparatus is made dust-tight around the journals and cover.

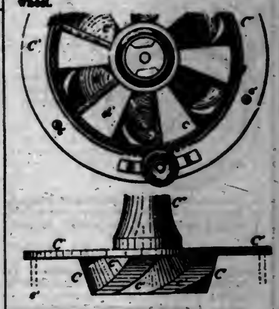
The box A, provided with removable caps K and rubber cap I, in combination with the removable cam B, provided with stove C, shaft G, rigid bearers F, and dust-tight cover D, constructed and arranged as shown and described.

166,681. COMBINATION-NUMBERING MACHINES. Thos. S. Bowman, St. Louis, Mo. [Filed Oct. 24, 1874.]

Brief.—An outer case has a movable ledge resting on springs, which support, at a little above type-height, an inner case provided with consecutive-numbering wheels. The ledge is connected to a pivoted lever carrying an upright pawl, which, at each sinking of the inner case under the impression, engages with a ratchet on the unit-wheel. A pivoted pawl on the unit-wheel, on the completion of each revolution, engages with a ratchet on the adjoining wheel, and moves it one notch, the succeeding wheels being similarly actuated. The part bearing the 0 slides in a slot in the wheel, and rides on a fixed cam, so that it may be cleared from the impression till the revolution of its wheel raises it.

1. The combination of the outer case M, the ledge N, springs O O', and the inner case A, containing a series of numeral-bearing wheels, substantially as described.

2. The wheel O', ratchet P, provided with the offset e, the pawl d, and dog H, provided with the point I, combined and operating substantially as described.



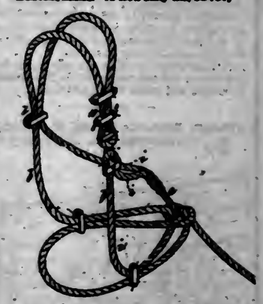
3. The combination of the numeral-wheel O', post J, stud K, cam L, and shaft B, substantially as described.

4. The combination of the outer case M, ledge N, springs O O', hook S, spring U, arm Q, post P, inner case A, wheel C, and its ratchet, substantially as described and shown.

5. The combination of the outer case M, ledge N, springs O O', hooks S, spring U, arm Q, post P, case A, wheel C, and its ratchet, dog H, pawl D, wheel O', and its ratchet, substantially as described.

166,682. WATER-WHEELS. H. W. Campbell and Joseph H. Johnson, Paducah, Ky. [Filed July 8, 1874.]

Brief.—The combination in a turbine water-wheel of a stationary hub, having inclined spiral chutes, and buckets constructed to have a greater area between them at inner ends than at the issues at the periphery of the wheel.



1. In a turbine water-wheel, the stationary center core C, projecting downward from plate O', and having the inclined spiral chutes c', as and for the purposes described.

2. The combination, in a turbine water-wheel, of the stationary core C, having inclined spiral chutes c', and the wheel A, having the buckets d, constructed to have a greater area between them at their inner ends than at the issues at the periphery of the wheel, as and for the purposes described.

3. The inclined discharge-openings f f through the bottom of wheel A, as and for the purposes described.

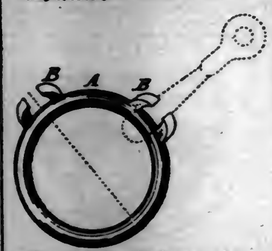
166,683. BOOT HEELING. Lorin C. Chase, Boston, Mass. [Filed May 22, 1875.]

1. A lifter made of one continuous piece of wire, as arranged and connected at various points so as to form all of the parts common to a five-ring lifter, substantially as described.

2. The combination of looped throat-latch and cheek-piece i h, looped head-piece e d, and connecting-hook n, substantially as and for the purposes set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

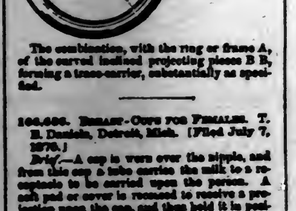
166,084. STEEL GLASS-CUTTERS. Henry H. Clark, Washington, D. C. [Filed June 30, 1875.]



1. The guide-roller B, made of any suitable material, and inserted near the end of the cutter-frame, and above the steel cutter, as herein described, and for the purposes set forth.

2. The flanged conical wheel-cutter A, operating as herein described, and for the purposes set forth.

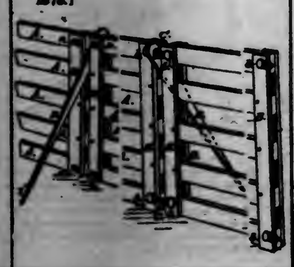
3. The combination of the guide-roller B and flanged conical wheel-cutter A with the handle C, as herein described, and for the purposes set forth.



166,085. TRACE-CARRIERS FOR HARNESS. Edwd. A. Cooper, Lancaster, N. Y. [Filed July 8, 1875.]

The combination, with the ring or frame A, of the curved inclined projecting pieces B B, forming a trace-carrier, substantially as specified.

166,086. BREAST-CUPS FOR FEMALES. T. B. Daniels, Detroit, Mich. [Filed July 7, 1875.]

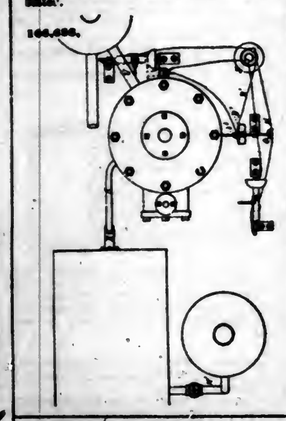


Brief.—A cup is worn over the nipple, and from this cup a tube carries the milk to a receptacle to be carried upon the person. A soft pad or cover is recessed to receive a projection upon the cup, and then hold it in position.

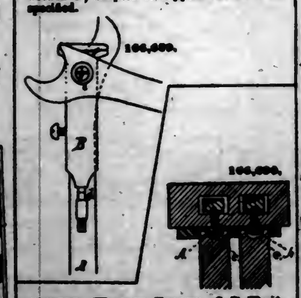
1. A device to be worn upon the person under the clothing for the purpose of receiving and retaining the fluid involuntarily discharged from the breast, consisting of a flattened nipple-cup, A, and the receptacle B, connected thereto by the small flexible tube, of suitable length to extend from the breast to the pocket, or other suitable part of the clothing, substantially as shown.

2. In combination with the cup A, having the tube a, the soft pad or shield B, recessed to receive and retain the cup, as shown.

166,087. PORTABLE FENCES. T. L. Davidson, Worth County, Mo. [Filed June 18, 1875.]



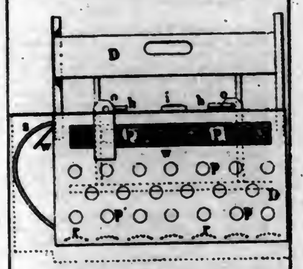
A portable fence consisting of a series of panels formed of bars A, united by uprights B, held together by the bolts b and nuts n, said panels being united by the chains C, attached on alternate sides of the panels, as shown, and supported at top by the props D, projecting on the side opposite to that on which the chain is attached, and fixed at bottom by the ground-hooks E, all for the purposes set forth, and in the manner specified and shown.



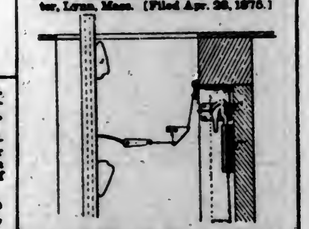
166,088. RECIPROCATING ENGINES. George B. Dixwell, Boston, Mass. [Filed May 22, 1876.]

In combination with the steam-engine cylinder, and its hot-air jacket or means of heating the cylinder, as and for the purpose specified, a thermometer and the electrical alarm apparatus or apparatuses, substantially as described, applied thereto, to indicate the extremes of temperature to be maintained in the cylinder to prevent the formation of mist in said cylinder, as or under circumstances as stated.

166,089.



166,090.



166,091. BOILER WASHING-MACHINES. G. B. Everson and L. L. Cramer, Macedon, N. Y. [Filed Apr. 17, 1874.]

Brief.—The attachment is intended to be placed in a wash-boiler, and has perforated sides, and springs at the ends, and a hand-dasher that moves in grooves at the ends within the attachment.

The herein-described wash-boiler attachment, having concave bottom *b*, convex protector *d* open at each end, and provided with triangular-shaped openings *s*, springs *s*, wings *w*, and sides *o o*, provided with hooks *h h*, dasher D, operating in vertical grooves *g*, apertures P and P', when the several parts are combined to operate substantially as and for the purpose set forth.

166,092. HATCHWAY-GUARDS. John C. Foster, Lynn, Mass. [Filed Apr. 26, 1875.]

In combination with brackets attached to the frame of an elevator, a series of levers, substantially such as are herein described, a spring for returning said levers to their original positions after they have been operated upon by the brackets, a spring, D', for holding an automatically-falling bar in position, and the bar A, the parts being connected and arranged to operate substantially as and for the purpose set forth.

166,093. KING-BOLTS FOR VEHICLES. Elisha Freeman, Mass. N. Y. [Filed May 27, 1875.]

The slip *f*, about the front axle of a wagon, having a double-jointed attachment to it, the upper part being a bolt, *a*, from the bolster A, with its ball-head *c* in a cavity in the upper part of the slip, and the lower part of the joint being made by the projection *l* on the slip-bar *g*, substantially as set forth.

166,094. WAGON-JACKS. Chester T. Drake, Evanston, Ill., assignor, by mesne assignment, to Seth A. Mathews, Washington, D. C. [Filed Aug. 7, 1875.]

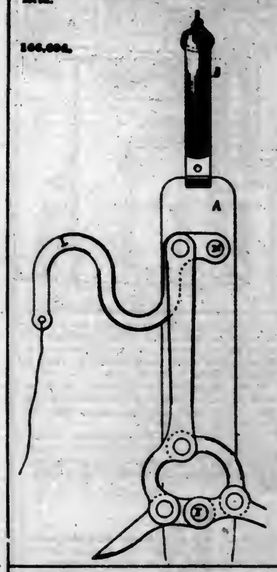
Brief.—A wrench-receptacle, with tool therein, has a lug on each side passing into a lever as fulcrums thereon. The head of the wrench forms the wagon-bearing. The levers are of different lengths.

1. In combination with the hollow receptacle B, provided with the lugs *a a*, the levers A A', provided with the sliding catches *d d*, all operating as specified.

2. In combination with the hollow receptacle B and levers A A', arranged as described, the wrench D, adapted to support the axle, as specified.

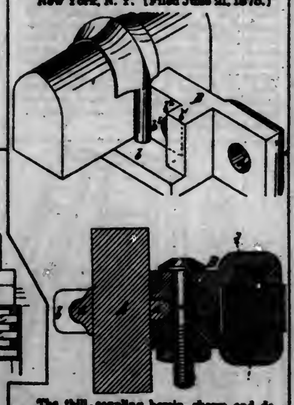
166,095. WINDOW-FRAMES. J. F. Hoyt, Dayton, Ohio. [Filed Jan. 30, 1875.]

Brief.—A metallic ornamental strip in a window-frame, to conceal the sash-cords and reduce the friction of the sash.



In a window-frame, the combination of the strip A, plate C, drop *h*, rubber *g*, and grooved sashes, substantially as described, and for the purpose specified.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO BOSTON



166,096. HORSE HAY-FORKS. J. P. Frizzi, Chillicothe, Mo. [Filed Dec. 6, 1874.]

The serpentine lever I, arranged to enter the eyes A and ring B, substantially as set forth.

166,096.

166,097. TRILL-COUPLINGS. Samuel A. Hathaway, Norwalk, Conn., assignor of one-half his right to George H. Stedwell, New York, N. Y. [Filed June 21, 1875.]

The trill-coupling herein shown and described, consisting of the stationary shoe-plate B attached to the axle-tree, and formed with shoulder *b'*, jaw *b''*, and socket *d*, and the removable shoe-plate C, provided with shoulder *c*, jaw *c'*, socket *d'*, said shoe-plates being secured together by the bolt J, in combination with the thill-strap or eye-plate G and pivot E, arranged and operating substantially in the manner and for the purpose herein set forth.

166,098. DUMPLAR-ALARMS. Heinz Hendl, Rochester, N. Y., assignor of one-half his right to Clark D. Page, same place. [Filed Oct. 9, 1874.]

1. The combination, with the hammer D and rod G, connected with the spindle of the door-knob, of the sliding pawl E pivoted to the end of the rod, and provided with the hook *d* and cam *f* for alternately engaging with and disengaging from the ring of the hammer, as herein shown and described.

2. The combination, with the knob-spindle K, of the crank-arm I and rod G, the latter connecting with the hammer-lever, and having a pin, *i*, and stop *o*, the whole constructed to operate, substantially as described, whereby the knob sounds the alarm in the initial movement, but is stopped before withdrawing the latch-bolt from its keeper, as set forth.

166,099. ANTAGONISTS FOR SHAFT ROCKING-CHAIRS. Chas. H. Hildreth, Chicago, Ill. [Filed Dec. 31, 1874.]

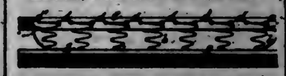
1. The plates A and F, attached to the sides of the rocker B and stand G, in combination with the two diverging springs C C, as and for the purpose set forth.

2. The plate A, provided with the hooks E; and the springs C, provided with the loops *i* D, in combination with the rods *h*, nuts *b'* *b''*, loops *i* and *i*, rocker B, and stand G, substantially as described and shown.

166,100. PRINTING-MACHINES. Nicholas B. Hooper, Brooklyn, N. Y., and T. S. Crane, Newark, N. J. [Filed June 2, 1875.]

Brief.—The belts, between which the hat-body is placed, have a reciprocating motion in opposite directions, imparted to them by means of a slide, receiving motion from a rotating crank-shaft, and straps connected to opposite ends of said slide, passing beneath and around in an opposite direction to each other, and secured to the elongated journal of the roll to which the belts are attached.

The crank G, connection E, lever D, and tightening apparatus *g g* and *f f*, arranged and operated under a table, B, in combination with the tablet C and straps *d d*, working above the table, and connected with the reciprocating mechanism over the rolls *e e*, in the manner and for the purpose described.

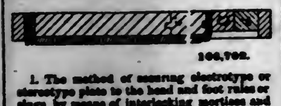


166,100. MOLDS FOR INGOTS. John Illingworth, Newark, N. J. [Filed Apr. 12, 1875.]

Brief.—Two covers are provided, one fast-hand and the other removed. The mold is first filled with the fast-hand cover applied; the removed cover is then substituted, and other metal poured in to fill the space.

In a mold for casting ingots of combined iron and steel, the covers A' and A'', as and for the purpose specified and shown.

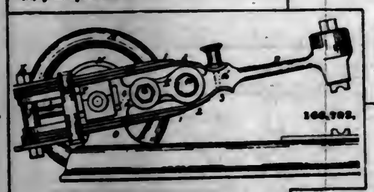
166,101. SPRING-BEDS. John Johnson, Hartford, Conn. [Filed Dec. 7, 1874.]



In a bed-bottom constructed as described, the connecting-links *f*, arranged between the intermediate springs of the outer rows and the surrounding frame *i*, and attached to the lower ends of the springs and to the frame, in the manner and for the purpose set forth.

166,102. SEPARATOR-PLATE HOLDERS. Ansel M. Kellogg and James J. Babcock, Chicago, Ill. [Filed Nov. 11, 1874.]

Brief.—The rods have square-shouldered grooves, to interlock both with the plate and bed-block at top and bottom.



HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO BOSTON

166,702.

1. The method of securing electrotype or stereotype plate to the head and foot rules or slugs by means of interlocking mortises and tenons having horizontal surfaces, substantially as set forth.

2. The rule or slug, constructed to interlock with the electrotype or stereotype plate, and to interact with the bed-block, in combination with such plate and bed-block, substantially as specified.

166,702.

166,703. MALLETS FOR SMOOTHING SHEET METAL. Ansen C. Eldredge, William H. Clark, and William J. Clark, Salem, Ohio, assignors to Eldredge Cornice and Ornament Company, same place. [Filed June 7, 1875.]

Brief.—Improvements on Patent No. 133,663, to Clark, Eldredge, and Clark, August 4, 1874. The mallet-handle is jointed to the vibratory beam, and is embraced by springs fixed upon said beam.

1. The handle D, jointed to the vibratory beam E, in combination with the springs G', substantially in the manner as described, and for the purpose set forth.

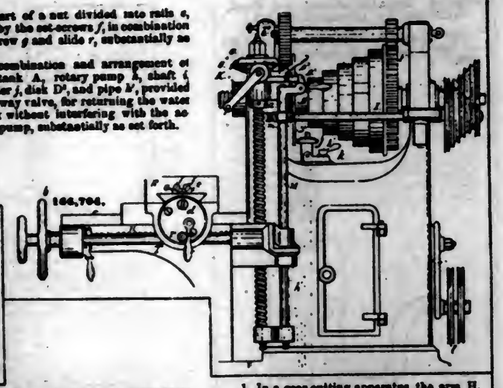
2. The yoke H, bar I, sleeve J, keys I I, and bolt K, in combination with the springs G and vibrating beam E, in the manner substantially as described, and for the purpose specified.

3. The oil-cup Q and oil-hole *o'* in the handle D, in combination with the springs G' and said handle D, whereby both upper and lower springs are oiled at once, as herein set forth.

166,704. MILLING-MACHINE. William Krutzsch, Dayton, Ohio, assignor to O. W. Hogien and Charles H. Pease, same place. [Filed Apr. 10, 1875.]

Brief.—A vertical shaft, carrying a worm-wheel at its upper end, is connected, by bevel-gearing, with a horizontal shaft, which connects by the same means with a short shaft situated under the cutter, for traversing the T-slotted slide across the table. All of the shafts carry spur-wheels, which can be made to connect with those upon the cutter-shafts by conveniently-placed spur-gears. A right- and left worm upon a sliding shaft is to traverse into gear with the worm-wheel when it is desirable to have the slides operated by the machine. For convenience in taking up backlash, the half of the nut carried by the T-slotted slide, in which the operating-screw works, is made in longitudinal sections, which can be adjusted by set-screws.

1. The elastic collar J, slotted longitudinally upon its outer surface, and operated longitudinally, as described, in combination with the nut *y* and spindle K, substantially as set forth.



2. The shaft I, keyed, but arranged to slide in the shaft carrying in the pivoted bearing F, and provided with the right and left worm, for imparting motion to the cutter-shaft H, substantially as described, and for the purpose specified.

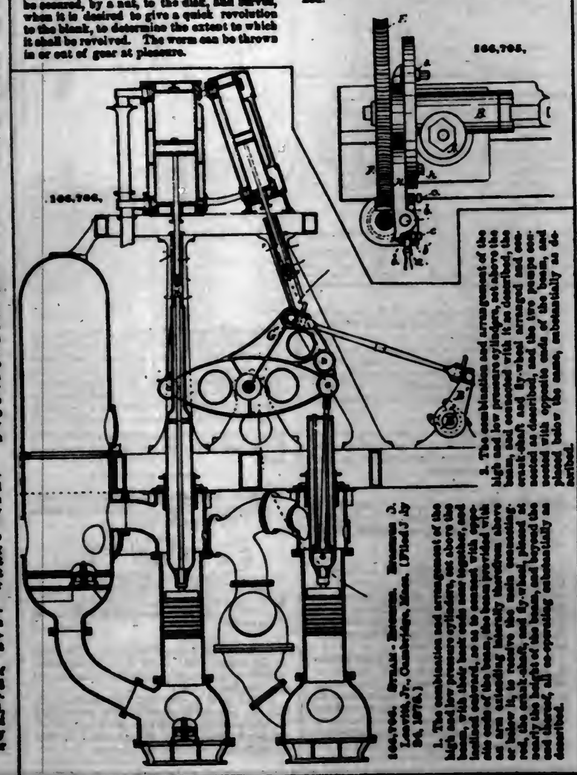
3. The centrically-pivoted link *c*, provided with the block *b*, in connection with the nut *d*, and the right and left worms upon the pivoted shaft I, substantially as set forth.

4. The combination and arrangement of the pivoted shafts O and M, T and U, *d* and *f*, each pair connected by the centrically-pivoted spur-wheels *g*, arranged as described, and also by the sliding bevel-gearing *i* and *s*, whereby the operator is enabled to set any or all of the shafts in motion from any one or all of the three cloud-points mentioned.

5. The part *d* of a nut divided into rails *c*, adjustable by the set-screws *f*, in combination with the screw *g* and slide *r*, substantially as set forth.

6. The combination and arrangement of the water-tank A, rotary pump B, shaft *i*, friction-roller *j*, disk D', and pipe *h'*, provided with a two-way valve, for returning the water to the tank without interfering with the action of the pump, substantially as set forth.

166,704.



166,705. GEAR-CUTTING ATTACHMENTS. Wm. Krutzsch, Dayton, Ohio, assignor to Geo. W. Hogien and Chas. H. Pease, same place. [Filed Apr. 15, 1875.]

Brief.—The worm for revolving the worm-wheel is journaled in a box, which is pivoted to an arm clasped loosely upon the spindle. The crank which operates the worm is provided with a pointer, which indicates, by means of a scale upon an index-plate, the extent to which the checked blank shall be revolved. A bolt, which points toward an index upon the periphery of a slotted disk, can be secured, by a nut, to the disk, and serves, when it is desired to give a quick revolution to the blank, to determine the extent to which it shall be revolved. The worm can be thrown in or out of gear at pleasure.

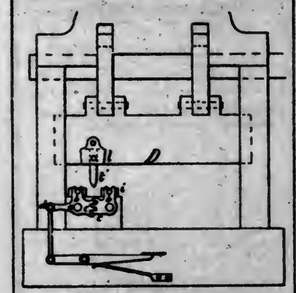
1. In a gear-cutting apparatus, the arm H, arranged as described, to which is pivoted the worm and its bearings, in combination with a fixed slotted disk, G, and indicating-bolt *e*, substantially as herein set forth.

2. The adjustable pivoted plate b, provided with the set-screw *c*, in combination with the arm H and latch *a*, in the manner and for the purpose specified.

3. The combination of the standard A, bearing E, disk G, spindle T, arm H, worm-wheel F, and worm M, the whole arranged substantially as described, and for the purpose specified.

166,705.

166,706.



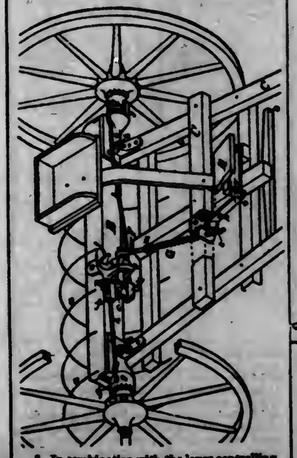
166,706. SPRING-BEDSTEAD. Thomas J. Lewis, Jr., Owensville, Ohio. [Filed July 24, 1875.]

1. The combination and arrangement of the bed, with low pressure cylinders, as above set forth, with tube connecting the cylinders, and bellows-chamber, as and for the purpose specified.

2. The combination and arrangement of the bed, with low pressure cylinders, as above set forth, with tube connecting the cylinders, and the steam-chamber and fly-wheel arranged and operated as described, and the two pumps connected with opposite ends of the bed, substantially as described.

166,707. METAL-PUNCHING MACHINE. Jas. B. Lindsay, Newark, N. J. [Filed June 26, 1875.]

Brief.—The bar to be punched is held in position by a pair of centering-jaws. One of the punches is carried in an adjustable slide, and can, consequently, be set at any desired distance from the other.



1. The self-centering clamp for holding bars, constructed with jaws *f f*, in combination with cranks or arms *b b*, gears *c c*, and treadle or lever, substantially as herein shown and described.

2. The combination, with the cross-head D, of the adjustable slide *l* and punches *i f*, substantially as herein shown and described.

3. The combination of the reciprocating cross-head, adjustable slide, punches, clamping devices, and lever, substantially as herein shown and described.

166,708. HORSE HAY-RAKER. C. B. Lipe, Syracuse, N. Y. [Filed Nov. 14, 1874.]

Brief.—Clutches on the rake-head, thrown into operation by a foot-board and pawller intermediate mechanism, engage with the supporting-wheels, whereby the teeth are lifted and the load discharged.

1. In combination with the lever connecting the movements of the clutch mechanism, the thrust-rod F, spring G, and moving rake-head E, whereby the rod and spring are adapted, by the movement of the rake-head, to retain the lever in connection with the clutch mechanism, substantially as described.

2. In combination with the connecting-lever connecting the movements of the clutch mechanism, the moving rake-head, the thrust-rod, and spring, automatic mechanism *f*, substantially as described, for releasing the thrust-rod when the rake-head is fully thrown-off, substantially as described.

2. The combination of the foot-board H, the pulling-bar *p*, the connecting-thrust-rod F, and the retaining-lever E, substantially as described.

4. The combination of the T-shaped bell-crank lever with the rods connecting the same to the clutch mechanism and the thrust-rod, the parts being relatively so arranged that the direct action of the thrust-rod is exerted upon the lever at right angles thereto, substantially as described.

5. The casting D, having the stud *e*, guard-bar *d*, segment with notches *e e'*, and arm *f*, as described.

166,709. AUTOMATIC DENTAL PLUGGER. George W. Lovis, Chicago, Ill., assignor of one-half his right to John S. Swartley, same place. [Filed Jan. 19, 1876.]

Brief.—Toggle-levers carry at their jointed upper ends a mallet, and a thumb-lever operates the levers, to throw down the mallet against the end of the tool, which is secured in a holder made up of a recessed plate, a band, and set-screw, whereby tools of different sizes are held.

1. The combination of the lever M, case A, connecting-pieces O O', the levers H, pieces J J, and mallet L, substantially as described.

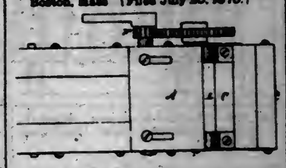
2. The combination of the lever M, case A, and spring B, for restoring the mallet to position, as described.

3. The holder A, the recess-piece B, band C, with the screw D, and thumb-nut P, substantially as and for the purpose specified.

166,710. AUTOMATIC DENTAL PLUGGER. George W. Lovis, Chicago, Ill., assignor of one-half his right to John S. Swartley, same place. [Filed June 14, 1876.]

Brief.—Toggle-levers carrying a rotating mallet, with faces of different materials, are operated by forcing the plugging-tool against the filling of the tooth. A ring and spring-pin convert the plugger into an ordinary one, without the sliding motion and stroke of mallet.

1. The stock A, the tool-holder B, the cross H, the pivoted levers J J, pivoted cross I, and mallet M, as specified.



2. The pin W, ring T, tool-holder B, and stock A, substantially as described.

3. The mallet M, provided with the striking-surfaces S, of different material, and hung upon bearings, as and for the purpose described.

166,709.

166,710.

166,711. MACHINES FOR SPLITTING OR DRESSING WHALEBONE. F. H. Merriman, Boston, Mass. [Filed July 20, 1875.]

In the described machine for splitting or dressing whalebone, the combination of the gage L, the vibrator C, and the eccentric D, all being arranged as shown, and applied to the knife A and its supporting-frame B, substantially and to operate as specified.

166,712. TELEGRAPH-TRANSMITTERS. S. Middleton, Charleston, S. C. [Filed June 10, 1875.]

1. The finger-springs *a'*, in combination with the finger-keys K and K' and insulated cores *s'*, substantially as and for the purpose described.

2. The finger-keys K and K', having springs *g* applied thereto, as shown, in combination with the metallic letters V', substantially as and for the purpose described.

3. The bar Q, with its supports T and T' and adjusting-screws *x*, in combination with the metallic letters V', substantially as and for the purpose described.

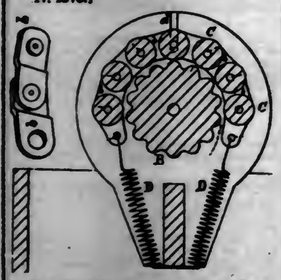
166,712.

166,713. APPARATUS FOR THE MANUFACTURE OF ICE. Edward C. Negley, Robert H. Negley, and J. T. Cunningham, Pittsburg, Pa. [Filed July 15, 1875.]

Brief.—The vessel for water to be frozen has corrugated sides and bottom, to offset greater surface for contact of the air, which is the freezing agent. Outward pressure on the vessel is relieved by a hollow tube fixed on the vessel, or supported by a bridge resting on the refrigerator.

1. A vessel for the manufacture of ice, having corrugated sides and a ribbed or corrugated bottom, substantially as shown and described, and for the purposes mentioned.

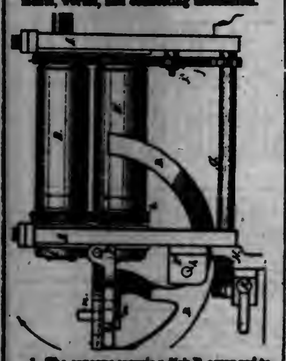
2. The central tube B, concentrically as shown and described, and for the purpose mentioned.



3. The combination of the parts B and feet C, or bridge F, substantially as shown and described, and for the purpose mentioned.

4. The combination of the corrugated vessel A, the central tube B, the supporting-bridge F, or the feet C, substantially as shown and described, and for the purposes mentioned.

166,713.



166,714. WASHING-MACHINES. Joseph E. Medgett, Canandaba, Iowa. [Filed July 17, 1875.]

In combination with the central roller B and small rollers C and springs D, the adjustable bearings b, each constructed in a separate part, and all connected together by loose joints, as described, to render each one of the small rollers separately adjustable, substantially as and for the purpose set forth.

166,715. MACHINES FOR TURNING FLANGES ON BOILER-HEADS. Richard C. Nugent, Dayton, Ohio, assignor of two-thirds his right to Wm. R. Spickler and H. H. Hendrick, same place. [Filed June 30, 1875.]

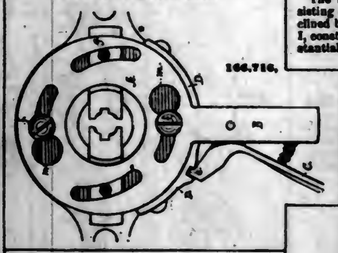
Brief.—The head is fixed upon the face-plate, with aperture on central pin, and edge to be turned up extending between the rolls. As the rolls are rotated the head upon the disk is fed up gradually by means of the segments, worms, and connecting mechanism.

1. The concave carrying-disk P, arranged to revolve upon the adjustable pivot n, in combination with the sliding-table R, and the ends of a pair of rolls, B B', substantially as and for the purposes specified.

2. The pivoted sliding-table R, provided with the adjustable bearing l, in combination with the segments D and worms E, substantially as described.

3. The segments D, in combination with the worm-shafts G, connection K, levers I, bearings F, and rolls B B', when the respective parts are arranged to operate in the manner and for the purposes specified.

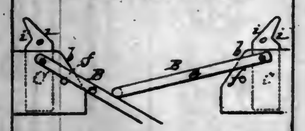
4. The combination and arrangement of the rolls B B', disk P, bed-plate R, segments D, bearings F, worms E, levers I, connection K, shafts G, and connecting-gearing f f, the whole substantially as described.



166,716. SCREW-CUTTING DIES. Richard C. Nugent, Dayton, Ohio, assignor of one-half his right to Geo. W. Hoglen and C. E. Pence, same place. [Filed Apr. 2, 1875.]

Brief.—A circularly-shaped body having opposite radial slots for the reception of the dies, which dies are provided with projections to work in the eccentric grooves in the face-plate. The body is also provided with an adjustable stop-plate, for regulating the inward throw of the dies through the medium of the handle of the face-plate and its attached spring-latch.

1. The face-plate A, provided with the circumferential slots and circular openings *m*, handle B, and spring-lever C, substantially as described.

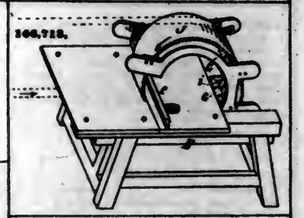


2. The adjustable plate D, provided with a transverse slot, in combination with the body E, spring-lever C, handle B, and face-plate A, substantially as described, and for the purpose specified.

3. The improved screw-cutting device, constructed substantially as set forth, and consisting of the body E, screws f, face-plate A, handle B, spring-lever C, and adjustable plate D, as and for the purpose specified.

166,716.

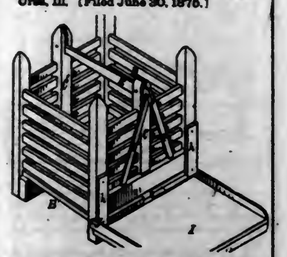
166,717. CAR-COUPLINGS. Geo. R. Owen, Cortland, N. Y. [Filed May 1, 1875.]



1. The combination of a vertically-vibrating coupling-ball, B, adapted to be held in an inactive position by means of stop f, the draw-bar A having beveled front edge *i* and coupling-pin O, having inclined front edge *i*, for forming a continuous backward inclination or summit, whereby ball B of the other draw-bar is directed upward to an engagement with pin O, substantially as specified.

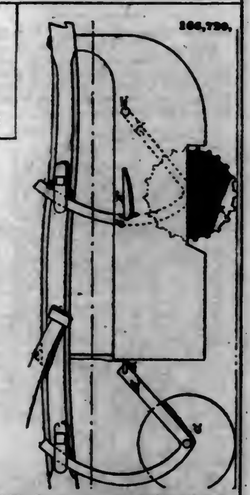
2. The coupling-pin O, having slot *d* and projecting head *c*, with inclined edge *i* and central edge f', adapted for use substantially as specified.

166,718. OUTLINE-SAWS. Jos. M. Pabco and Frank M. Kinnman, Fitchburg, Mass. [Filed May 12, 1875.]



Brief.—The saw is provided with an internal groove, which receives a projecting rib upon the supporting-rails, thus enabling them to guide the saw.

The drum-saw J, provided with the interior groove K, in combination with the rollers G G, provided with the lenses *i*, fitting in the groove K, and the rollers I, journaled on the inner face of the channel A, all constructed to operate substantially as and for the purpose set forth.

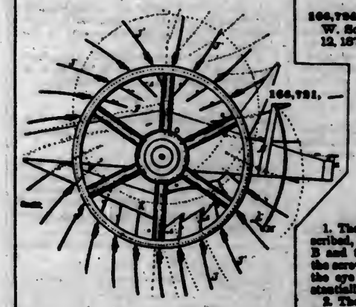


166,718.

166,719. FEED-RACKS. Matthias Ralph Urea, Ill. [Filed June 30, 1875.]

The improved feeding-crib described, consisting of the body A, provided with the inclined bottom B, gate F G, and hinged table I, constructed and arranged to operate substantially as and for the purpose specified.

166,720.



166,720. IMPLEMENTS FOR DISBUDDING CHEESE-HOOPS. H. F. Hess, Allen County, Kans. [Filed Mar. 6, 1875.]

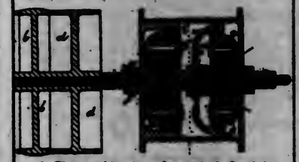
Brief.—A bent-like diamond dag is provided at suitable point with an adjustable toothed wheel, which crushes the bugs into the bottom of the furrow. At the stern is another adjustable wheel, with a concave face or bead, which covers the insects crushed down by the toothed wheel. The machine is drawn repeatedly around the field to be protected.

A machine or implement so hereinbefore described, consisting of the body A, wings F F, and beam K, in combination with the toothed wheel H and covering-wheel G, adjusted and arranged as specified, and operated in herein-before described, for the purpose of effecting the destruction of the insect known as the chinch-bug.

HELIOTYPE. RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON

166,721.

166,721. ROTARY SPADERS. William C. B. Richardson, Cleveland, Ohio. [Filed Jan. 11, 1875.]



Brief.—A rotary spader with hinged teeth provided with a shaker and scraper.

1. In combination with the hinged spades J J', the scraper, consisting of the pivoted frame M and bent b', arranged to operate substantially as described, and for the purpose specified.

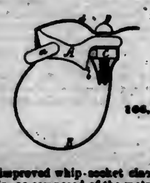
2. The shaker K, as arranged in relation to, and in combination with, the spades J', as and for the purpose specified.

166,722. INTERNAL GEARINGS OF ELEVATORS. Erhard Schlenker, Buffalo, N. Y., assignor of one-half his right to Burke L. Howard and Gilbert F. Howard, same place. [Filed Feb. 23, 1875.]

Brief.—The gearing is within the winding-drum to be operated—the whole on bearings, which revolve on a shaft made hollow for lubrication. A pinion fixed to the shaft operates, through others, gearing on the inside of a ring, which, at its hub, has another pinion, working, in a similar way, inner peripheral gearing on the drum.

1. The combination of the shaft O, pinion K, and gears l l, gear *n*, and pinion *o* with gears *p p* and gear *i*, the latter secured to, and all arranged within, the drum S, substantially as and for the purposes specified.

2. The bearing-frames f f', secured to the stationary frame of the machine, and arranged so as to form bearings for the shafts O, P, and p' p'', wheel *n*, and drum S, substantially as specified.



166,723. PAINT-BRUSHES. G. A. Schuster and J. L. Driscoll, Oakland, Cal., assignors to G. A. Schuster, same place. [Filed May 20, 1875.]

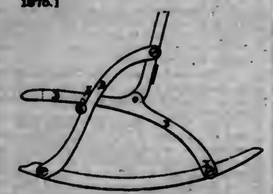
Brief.—The handle is attached to a clamp, in which the head of a brush is inserted, and as the clamp is drawn into a drip-cup its sides are made to grasp the brush.

The combination and arrangement of the drip-cup B, having the fastened sides I, with the brush-holder or devices A, B, F, and G, when arranged and operated substantially as and for the purposes set forth.

166,724. WHIP-SOCKET CLASPS. Erastus W. Scott, Wauregan, Conn. [Filed Jan. 12, 1875.]

166,724.

1. The improved whip-socket clasp, as described, viz., as composed of the metallic band B and the screw-nut C, in combination with the screw D and the saddle A, provided with the eye *a*, all arranged and to operate substantially as set forth.



2. The band B, arranged with or to clasp the nut C on two opposite sides thereof, and having lips *b b* to embrace the nut on its other two opposite sides, all as set forth.

166,725. CEMENT TOPS AND VENTILATORS. Patrick H. Shinn, Chicago, Ill., assignor of two-thirds his right to Benj. C. Jones and S. J. Stebbins. [Filed Mar. 16, 1875.]

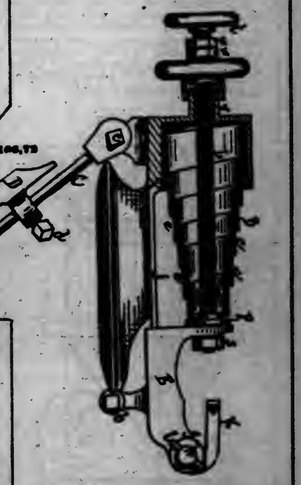
The combination of the stationary pipe D, the curved rotary pipe A, and vane *l*, the pipe B, the funnel C, spindle F, cross-pieces H and G, and bearing E, as specified.

166,726. FOLDING ROCKING-CHAIRS. Alex. W. Stewart, Boston, Mass. [Filed May 10, 1875.]

The curved pieces B B, forming rear legs and sides of the seat, the right braces D D, forming the front legs and supporting the back frame, and the bar R, provided with spurs or pegs K to hold the seat in position, in combination with the rockers *a* of a rocking-chair, substantially as described, and for the purposes set forth.

166,727. SAW-GUMMING MACHINES. Jos. H. Smith, Rochester, N. Y. [Filed July 28, 1875.]

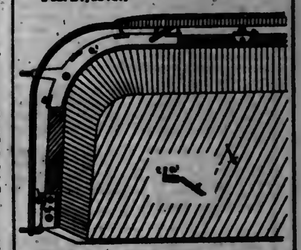
Brief.—A vibrate spring adapted to be compressed to vary the range of motion or the feeding pressure; a rest sliding upon a rod, and adjustable thereon to grasp the blade, and a gage resting against the point of the tooth to determine the cut of the burr.



1. The combination, with the carriage E and screw L, of the coiled spring B, resting at one end against a shoulder of the main frame, and connected at the other with the screw, by means of a nut adjustable up or down on said screw, whereby the spring may be compressed a greater or less degree, to vary the range of motion or the feeding pressure of the milling-head, as herein described.

2. The combination, with the screw L and spring B, of the nut *p*, made adjustable upon the screw for the purpose of compressing the spring, and the hand-wheel *a*, for rotating the said pressure, as shown and described.

3. The combination, with the screw L and spring B, of the clamp-nuts *p a*, hand-wheels *t u*, and adjusting-nuts *v w*, arranged to operate in the manner and for the purpose specified.



4. The combination with the rod C, pivoted to the main frame and adjustable to different positions on the pivot, of the rest D, provided with the slit a', to receive the saw, and adjustable vertically upon the rod by means of the set-screw *d*, as and for the purpose specified.

5. The combination, with the carriage E and burr or milling-tool G, of the gage K, projecting backward over the burr, and resting against the point of the tooth, to form a gage to the cut of the burr, as herein shown and described.

166,727

166,728. SHIPPING-RACKS FOR CARRIAGES. Miles P. Stedman, Ravenna, Ohio. [Filed Feb. 27, 1875.]

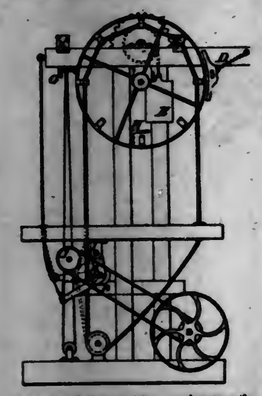
1. The sections *a' a' a' a'*, in combination with the cant-flange, substantially as and for the purpose set forth.

2. The sections *a' a'* and cant-flange, in combination with the supports *c c* of the bed-frame A, substantially as and for the purpose herein set forth.

HELIOTYPE. RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON

166,729. INHALERS. Chas. R. Sykes, Chicago, Ill. [Filed Jan. 27, 1875.]

Brief.—An outer and inner tube unite near one end, and carry a nasal ping. The inner tube does not extend entirely to the bottom of the outer, which has a closed lower end, as well as a lateral opening for entrance of air. An enlarged part of outer tube catches sediment.



1. The combination of the outer cylindrical case A, the central or inner tube C, and lateral opening B in the single outer tube near its open end, substantially as described and shown.

2. The cylinder A, nozzle B, conduit-pipe C, bulb D, the neck F, and enlarged part E, as and for the purpose set forth.

166,730. HOISTING-MACHINES OR ELEVATORS. Richard Sicklenbon, Buffalo, N. Y., assignor of one-half his right to Rufus L. Howard and Gibson F. Howard, same place. [Filed Aug. 4, 1874.]

Brief.—Worked ordinarily by a hand-rope passing over a large wheel above and a small one below, or by a pulley rotating by friction from belting being pressed against the rope. A brake is operated by a lever struck by the platform or the top of its ascent, or by the longitudinal movement of a shaft, offseted by its rotation, and working in a nut.

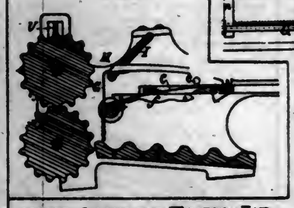
1. In a hoisting-machine or elevator, the rope A and the wheel B, with shaft and gearing for operating the winding-drum X, arranged with relation to the cord O, lever n, and grooved wheels a and K, operated by mechanical power, as that either manual or mechanical power, or both together may be used at the will of the operator, and without special adjustment or alteration of any of the parts of the machine, substantially as and for the purpose specified.

2. The automatic safety-brake lever W, whereby the brake-shoe is operated by the tumbler H and the counter-weight R, substantially as described, and for the purposes set forth.

3. The brake-rod B, having the nut Y and spring S, in combination with the brake-shoe lever 4, pulley O, and rope F, and with the lever W, operating substantially as and for the purpose specified.

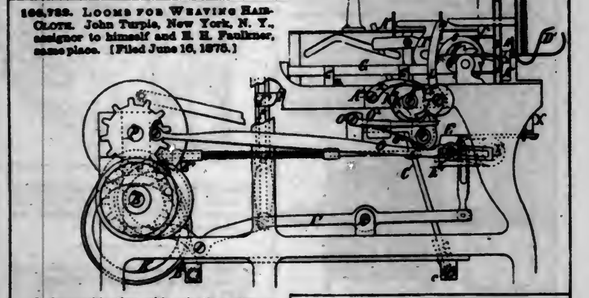
166,731. WASHING-MACHINE. Olney S. Thayer, Worcester, Mass., assignor of one-half his right to Charles W. Thayer, same place. [Filed June 30, 1875.]

1. In a washing-machine, substantially such as described, the corrugated rollers E F, ratchet O P Q, rod H and cam M, combined to operate substantially as set forth.



2. In a washing-machine, substantially such as described, the rollers E T, rubber *g*, rails *f*, and reciprocating stock B, provided with the spring C, and flange F, combined to operate substantially as set forth and specified.

3. In a washing-machine, substantially such as described, the bar D, provided with the spring C, in combination with the pitman H, crank I, stock B, rails *f*, and spring C, substantially as set forth.



4. In a washing-machine, substantially such as described, the cup V, in combination with the stock B, substantially as set forth and specified.

166,731.

166,732. LOOMS FOR WEAVING HAIR-CLOTH. John Turpin, New York, N. Y., assignor to himself and H. H. Faulkner, same place. [Filed June 16, 1875.]

1. In combination with selecting-nippers and a pendulous hair-holder, the adjustable weight D', adapted to graduate the force with which the hair resists the plunge of the selector, as herein specified.

2. The slowly-rotating cam F' and bearer J', in combination with a hair-holder capable of being gradually changed in position thereby, as herein specified.

3. The vertical hinge or turning joint V and the selector N N', in combination with mechanism, substantially as described, for moving the selector vertically as it is carried across the path of the hook, as herein specified.

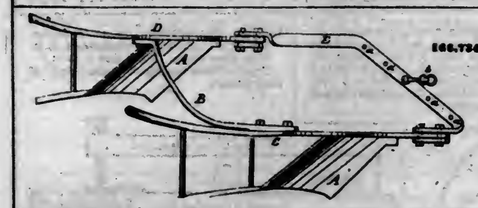
4. The horizontal hinge or turning joint W and the selector N N', in combination with mechanism, substantially as described, for moving the selector toward and partially into the shed, as described, so as to allow of liberating the hair therein, as and for the purposes herein specified.

5. The step or steps F' and their operating mechanism, substantially as described, and the finger I, whereby they are controlled, arranged to arrest the motion of the lay O and prevent its touching the goods when the machine is working idly, as herein specified.

6. The lever L and its operating mechanism, substantially as described, in combination with and controlled by the finger I, the movable hair-holder D, and the selector N, serving to hold the hair out of the reach of the selector after a hair is seized until the figure is completed, substantially as and for the purposes herein specified.

7. The selector-guide A', in combination with the selector N and with the cradle D, arranged to direct the selector, as and for the purposes specified.

8. In combination with the finger I, the hair-supports A'', standing close to the path of the selector N, for the purposes specified.



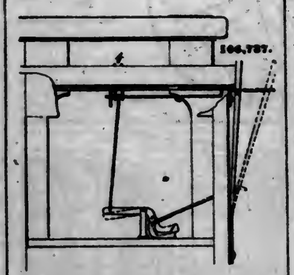
166,733. FOLDING ROCKING-CHAIRS. O. S. Vail, New York, N. Y. [Filed June 23, 1874.]

A folding rocking-chair, constructed with a seat, B, pivoted to the front and rear legs, guide-rods *a*, and pins *d* and *f*, in combination with rockers D, slotted plates E, and hinges *g*, arranged and operating as shown and described.

166,734. FLOWS. W. S. Wadsworth, Miami County, Kans. [Filed May 24, 1875.]

Brief.—Shackles or braces for securing two ordinary plows together.

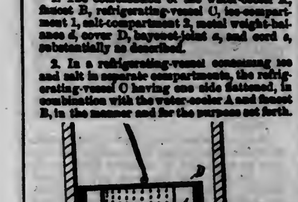
In a gang-plow composed of two ordinary plows, the brace B, attached to the handle of one plow and to the beam of the other, in combination with the angular brace K, having the adjustable clevis *b*, substantially as shown and described.



166,734.

166,735. CONNECTING STEAM, GAS, OR WATER PIPES. Caleb C. Walworth, Boston, Mass. [Filed July 3, 1875.]

The above-described improved process of connecting steam, gas, or water pipes, the same consisting in making one or both of the connecting-surfaces grooved or threaded, and swaging or driving together the parts thus formed to upset the grooved or threaded portion or portions, substantially as shown and described.



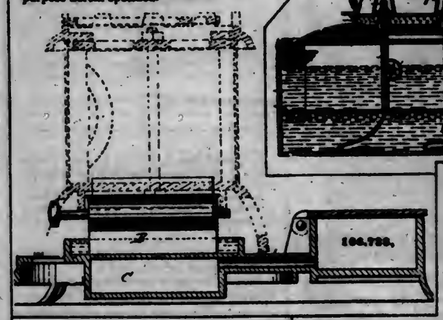
166,737.

166,736. WATER-COOLERS. L. B. Woolfolk, Lexington, Ky. [Filed July 16, 1875.]

Brief.—Ice and salt box, sunk by a weight in its bottom, is cut away on one side that water may not freeze next to the faucet. Weight is set against the cut-away side to restore the balance when freezing-box is raised and lowered by the cord. Cover of freezing-box is bayonet-jointed, and made larger than the box, that it may turn slightly around despite the corners of the box, to engage the lug and slot of the joint.

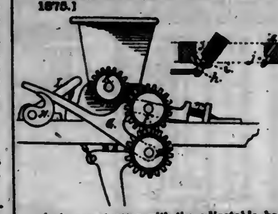
1. The combination of the water-cooler A, faucet B, refrigerating-vessel C, ice-compartment 1, salt-compartment 2, metal weight-balance *d*, cover D, bayonet-joint *e*, and cord *g*, substantially as described.

2. In a refrigerating-vessel containing ice and salt in separate compartments, the refrigerating-vessel C having one side flattened, in combination with the water-cooler A and faucet B, in the manner and for the purposes set forth.



166,737. STOPPING MECHANISMS FOR LOOMS. Andrew S. Wyse, Providence, R. I. [Filed Feb. 26, 1875.]

In combination with the shipping mechanism of a loom and suitable connecting mechanism, the finger *f*, adapted to be reciprocated vertically through the lathe, all operating together substantially as described, to withdraw the finger below the shuttle-race, when the belt is shifted to the loose pulley, and retain it in that position as long as the belt remains upon the loose pulley, as and for the purposes set forth.



166,738. OIL-STOVES. Abram Q. Alle, Cleveland, Ohio. [Filed Aug. 6, 1875.]

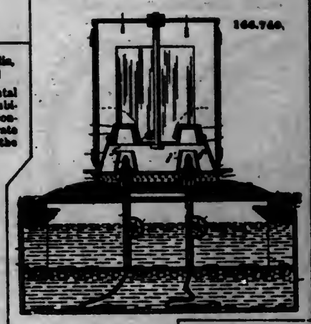
In an oil-burning stove, the supplemental reservoir D, elevated as described, in combination with the depressed reservoir C, connecting-tube B, where the oil is kept separate from the stove, all constructed as and for the purpose herein specified.

166,738.

166,739. GRAIN-DRILLS. Wales Aldrich, Dayton, Ohio, assignor to Dayton Machine Company, same place. [Filed June 8, 1875.]

1. In combination with the adjustable bar B, having its ends slotted to receive the pendent arms *i*, pivoted just above the frame of the drill, the pivoted trigger A, catches *j*, and shifting-rod D, substantially as and for the purpose specified.

2. The cam G, spring *n*, wheels H, F, and E, cam H, and bar I, arranged in the manner and for the purpose set forth.



166,740. OIL-STOVES. Hosea Allen, Titusville, Pa., assignor of part of his right to G. Shamburg, E. G. Patterson, Jonathan Watson, and Robt. L. Karnochan. [Filed July 9, 1875.]

1. The combination, in an oil-stove, of the oil-reservoir, the burners, and the evaporating-chamber, constructed with a centrally-perforated lid, and having its walls perforated above the water-line, and an inwardly-projecting flange also above the water-line, to prevent the splashing of the water through the ventilating-apertures, while freely admitting the passage of air to the burners, as set forth.

2. The combination, in an oil-stove, of the oil-reservoir, the evaporating-chamber having perforated side walls and a centrally-perforated lid, the burners, the deflectors *f'*, and a supplementary diaphragm, G, and its deflectors, these members being constructed and operating substantially as hereinbefore set forth.

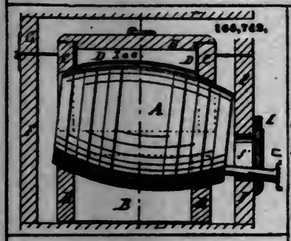
3. The combination, in an oil-stove, of the oil-reservoir, the evaporating-chamber having perforated side walls and a centrally-perforated lid, the burners, the deflector *f'*, the supplementary diaphragm G, its deflectors, and the illuminating-chamber, these members being constructed and operating substantially as hereinbefore set forth.

4. The combination of the burners, the deflectors *f'*, the illuminating-chamber, the diaphragm G, its deflecting-cones, their hinged hoods, and their handles, these members being constructed and operating substantially as hereinbefore set forth.

166,740.

166,741.

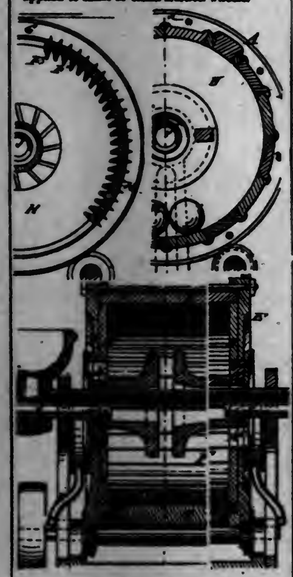
166,741. SAFETY CENTER-PINIONS FOR WATCHES. Chas. R. Bacon and Leotheld C. Brown, San Francisco, Cal., assignors to Cornell Watch Company, same place. [Filed June 19, 1875.]



1. The combination, with a center-wheel of a watch, of a detachable center-pinion having teeth extended toward the center-wheel, and an intermediate check-spring placed between pinion and center-wheel, and attached at one end to the latter, substantially in the manner and for the purpose set forth.

2. A detachable safety center-pinion, provided with teeth extended to project beyond the solid center part toward the center-wheel, and form alternating recesses for the check-spring, substantially as specified.

166,742. BEER-REFRIGERATORS. John N. Robert, Denison, Tex. [Filed July 10, 1875.]



The beer-refrigerator formed of the old B, the ice-box O D E, and the outer box or case F G, constructed substantially as herein shown and described, to adapt it to receive a beer-keg, as set forth.

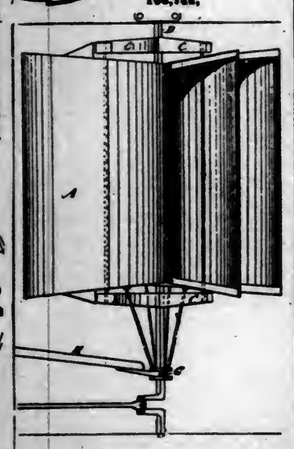
166,742.

WET AND DRY ORE CRUSHERS. Henry Bothhoff, Central City, Colo., assignor to himself and Charles F. Hendrie, same place. [Filed May 1, 1875.]

Brief.—As a wet-crusher: The ore admitted through hopper and hollow shaft into revolving cylinder is pulped by the balls, and passes out through registers adjustable vertically to raise or lower the central openings; thence passes through hoppers to amalgamating-coppers. Quicksilver may be introduced to the cylinder; or grates may be inserted in head-holes, and the pulp passed out through them into settlers, where the amalgam can be separated, ore in tailings which will not amalgamate to be then smelted. As a dry-crusher: Ore fed dry, and passes out through spaces between the staves, which are corrugated on the inner side. Cylinder revolved by power applied to shaft of small friction-wheels.

1. A wet-pulverizer for ores, discharging the pulp near its center through a series of registers, H, of varying altitude, thereby regulating the fineness of the crushed ore by its own gravity.

2. The combination of heads B B, having flanges C and lining H, with end-curved staves F, having rib, the said staves and heads being bolted together in the manner described.

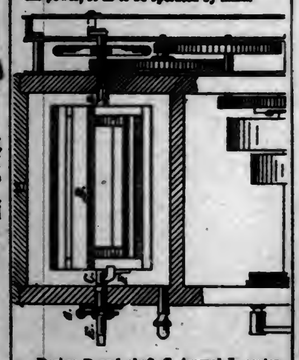


3. A dry-pulverizer for ores, having staves made narrow, bifurcated and corrugated on the inside, as and for the purpose specified.

166,743. WIRE-WEAVER. Horace J. Schinhall, Jr., Millington, Ill., assignor to himself and Samuel H. Foster, same place. [Filed July 24, 1875.]

Brief.—Jaws shaped like the eye of a staple, and pivoted at the middle of the top and bottom to horizontal arms reaching from the shaft, so that they may swing into radial positions to take the wind, and into a circle to close, so that the wheel will not be turned by the wind, and the buckets are connected to a slider on the shaft, which is moved by a lever to open and close the buckets, for starting and stopping the machine.

166,744.



1. Curved fans A, pivoted to arms C of a shaft, D, to open and close in the manner described.

2. The combination of a slider, G, and lever H with curved fans A, pivoted to the arms of the wheel, as described.

166,745. CHURNS. John Butler, Berlin, Wis. [Filed July 10, 1875.]

Brief.—The dasher can be disconnected from the power, so as to be operated by hand.

Dasher B and shaft C, journal I, center shaft B, catch F, and pin G, all in combination, substantially as described.

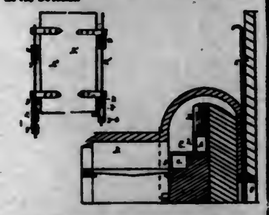
166,746. TRAM-STICKER. John R. Dyer, Attica, Mich., assignor to himself and A. E. Fish, same place. [Filed May 8, 1875.]

Brief.—Means for adjusting the "quill" of the trammer.

166,746.

The combination of the tram A, adjustable lever B, adjusting-screw E, and quill H, substantially as and for the purpose set forth.

166,747. SUBMERGED-BOTTLE. James J. Christie, Camden, N. J., assignor of one-half his right to Jas. A. Armstrong, same place. [Filed June 14, 1875.]



The nurse-bottle constructed of a body with a neck at one end, and a nipple integral with the body, upon the surface of the body proper of the bottle, for securing a vent-cap, substantially as and for the purpose set forth.

166,748. WATERPROOFING COMPOUNDS FOR LEATHER. James Clemm, Brooklyn, N. Y. [Filed Feb. 12, 1875.]

A waterproofing compound for leather, formed of paraffine, tallow, and resin, in about the proportions herein set forth.

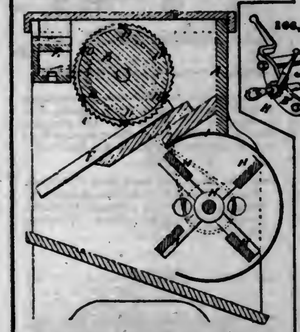
166,749. FURNACE FOR BRICK-KILNS. W. S. Colwell, Pittsburg, Pa. [Filed May 20, 1875.]

Brief.—Fresh air is supplied to the products of combustion through the openings, and they may be conducted to different parts of the kiln by means of the flues and dampered arches. By turning the cements on the plate, the door can be raised to leave a draft-passage at its bottom.

1. The furnace B, provided with chamber C, spreader D, and flues J J1 m, and air-flues e f, with openings g h, substantially as herein described.

2. The furnace B, having chamber C, spreader D, flues J J1 m, air-flues e f, with openings g h, in combination with the dampers p and fire-arches q, substantially as herein described, and for the purpose set forth.

3. The doors A' B', provided with plates r', having eccentrics t, cranks y y', and stops v, in combination with the furnace B, whereby the doors are adjustable for admitting a current of air under them and over the fire in the furnace, substantially as and for the purpose herein before described and set forth.



166,750. RAILROAD-RAIL-JOINT FASTENER. John Corson, Washington, D. C. [Filed June 30, 1875.]

The rail-joint fastener consisting of a saddle-piece having crown portion B and forked portions A A, which firmly embrace the web of the rails, and support the shouldered heads thereof while resting upon the flanges, in combination with the rails C C, cut away as to their heads to admit the crown-piece B, and having abutting webs and flanges, substantially as set forth.

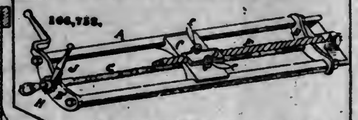
166,751. COIN-SHELLING. Hiram C. Crookmore and John W. McMillin, Salado, Tex. [Filed Apr. 17, 1875.]

Brief.—The shelling-cylinder is provided at the feeding end with peripheral saws, to tear the husks from the ears.

The combination of the circular saws D and the strips C, applied to the periphery of cylinder B, radial and parallel to its axis, respectively, in combination with the open-side feed-box, as shown and described, whereby the husk-stripping and shelling operations are successively performed.

166,752. DENTAL PLUGGERS. T. Cromett, San Francisco, Cal. [Filed Mar. 25, 1875.]

1. In a dental plugger, the arm f, pivoted, as described, and having the plugging-point J secured to its outer end at right angles to the stem B, in combination with the spring-hammer C and intermediate segment-block O, substantially as and for the purpose described.



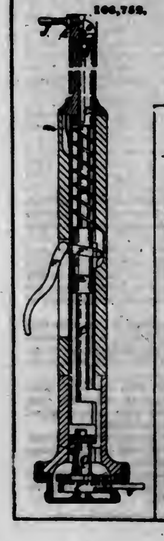
2. The segment-block O, pivoted at its angle, and having two faces at right angles to each other, in combination with the hammer C and movable plugging-point J, all combined and arranged to operate substantially as above described.

3. The cap W, with its shaft V and pinion U, in combination with the coupling-ring X, substantially as and for the purpose above described.

166,753. ROPE-STRETCHERS. C. C. Curtis, Stratford, N. H. [Filed Mar. 24, 1875.]

Brief.—The link at the end of the frame is secured to some stationary object. The rope is put through the guide at the other end, secured in the clamp, and stretched as the clamp travels on the screw, which is turned by means of the pawl at the front. The handle on the side prevents the frame from canting.

166,753.



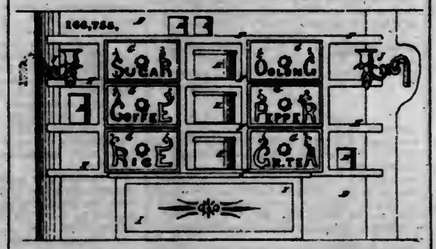
Is a rope-stretcher, constructed as described, the parallel rails A A, connected by the fixed heads B and B', the latter provided with the lever L, in combination with the sliding cross-head C, clamping-levers c c, cap D, screw O, pawl J, and guide M, all arranged to operate substantially as and for the purpose set forth.

166,754. METHODS OF ATTACHING PINS TO BROOCHES. Charles B. Dusenbury, Mansfield, Mass. [Filed Dec. 6, 1874.]

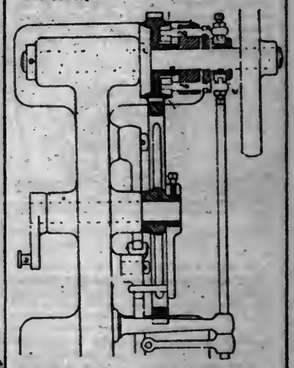
Brief.—The hinge extremity of the pin occupies the space between two projecting lips or ears, and the axis by which it is to be confined, and on which it is to turn, is made of the metal of the ears themselves, that is forced into the eye of the pin on each side by a punch.

The herein-described method of applying a pin to brooches and other articles by means of a suitable die or set-punch driven into one or both the lips d of the stud b from the out-side, to strike up or form upon the inside of such lip a tent or spur, e, which extends into the eye of the pin, in the manner and for the purposes specified.

166,752.



166,754.



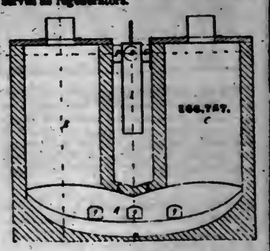
166,755. TOY STOVES. Elias Durisch, New York, N. Y. [Filed July 17, 1875.]

166,755.

A toy grocery-store, A B C, made of sheet-metal, and provided with the detachable sign and ornament D E, the shelves F, the drawers G, the boxes or canisters H, a movable counter, I, and the pivoted detachable candle-brackets or chandeliers J, substantially as herein shown and described.

166,756. HEELING-MACHINES. Alvin D. Elliott, Geo. E. Fellows, and Stephen A. Simmons, Lawrence, assignors to Jas. W. Brooks, trustee, Boston, Mass. [Filed June 24, 1875.]

1. The combination of the shaft adapted to move the heel-trimming mechanism of a heeling-machine with a toothed wheel on such shaft, and with a toothed wheel and clutch on a second shaft, to operate substantially as set forth.



2. The rod g, fork f, collar d, and pins h, in combination with the clutch c and toothed wheel S, substantially as described.

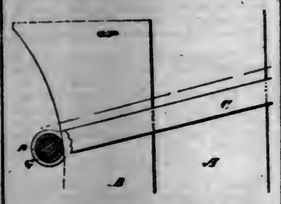
3. The combination, with the clutch c c and toothed wheel S, of the spring r and connecting mechanism for regulating the friction between the clutch and wheel, substantially as described.

166,757. FURNACES FOR MELTING METALS. William R. C. Bustin, Milton, Mass. [Filed July 8, 1875.]

Brief.—The four chambers all open at bottom into the hearth. The chambers are filled with iron or steel, and gas and air, being admitted at opposite ends of the induction-pipe D, pass down through the pieces of metal in the chambers on one side of the furnace, are ignited, and the products of their combustion pass up through the metal in the chambers on the other side, and out by the downtake I. On reversing the valves, the direction of the air and gas is reversed, passing through the heated metal. The metal to be melted thus serves as regenerators.

166,757.

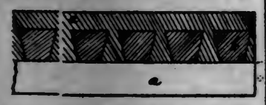
The compound furnace, substantially as described, composed of the main chamber A, the two pairs of auxiliary chambers B B' O O', and the pipe D, with its branches E F G H, and two valves K L, and edmit I, all arranged essentially in manner and to operate as and for the purpose specified.



166,758. ROTARY BALANCED VALVE. O. M. Ferrar, Buffalo, N. Y. [Filed June 21, 1875.]

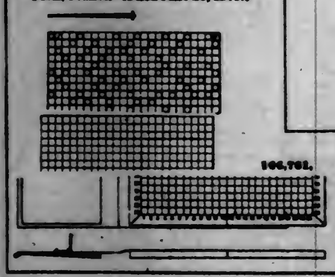
Brief.—The steam enters on each side of the valve, and is led to the cylinder, and exhausted therefrom by the oscillation of the valve. A passage on each side of the exhaust-passage allows steam to pass from the cylinder ports to the back of the valve, to assist in balancing it.

The cone-shaped valve C, provided with the passages J L J and the flattened sides *c c*, as and for the purposes specified.



166,759. SCAFFOLD-CLAMPS. William C. Fellows, Toledo, Ohio, assignor to himself and C. Whittingham, same place. [Filed July 10, 1875.]

1. The combination of the roller D, bolt G, yoke-clamp C, block B, and post A, substantially as specified.



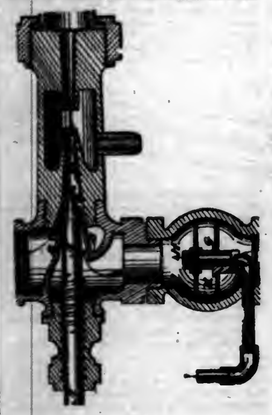
2. The block B, having a curved face whereon the clamp rests, substantially as specified.

166,760. CONSTRUCTION OF WALLS. Granville E. Field, Auburn, Me. [Filed June 29, 1875.]

The wall for buildings consisting of cross b and uprights a, prepared by immersion in tar or similar water-repellent substance, to prevent shrinking and swelling, as described, and having the spaces between and the surface covered with cement or like substance, substantially as and for the purposes set forth.

166,761. CRYPTOGRAPHY. A. L. Fleury, Paris, France. [Filed June 26, 1875.]

166,761.



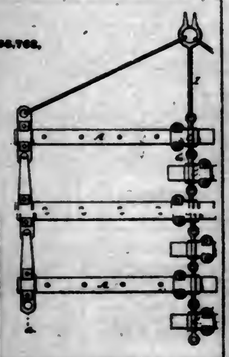
L As an improvement in cryptographic apparatus, the combination, with the perforated plate, Fig. 4, cross-lined to form squares, of the paper sheet, Fig. 6, prepared with corresponding squares, substantially as and for the purpose set forth.

2. The folding and framed tablet, provided on its horizontal and vertical margins with the serial numbers, in combination with the perforated plate and prepared-paper sheet, substantially as and for the purpose set forth.

3. In combination with the subject-matter of the above second clause of claim, the exterior wrapper or cover, as described and shown.

166,762. INJECTORS. Saml. Fowden, Philadelphia, Pa. [Filed July 17, 1875.]

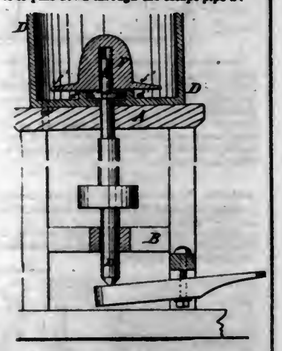
Brief.—An ejector (supplementary) is applied in the supply-pipe of the injector, to lift the supply preparatory to starting the injector. The delivery of this ejector is a tube set in a check-valve arranged in the supply-chamber.



The combination of spindle A, water-tube B, steam-inlet C, and mixing-tube D with a suitable tube having valve G, tube H, and jet I, as and for the purpose specified.

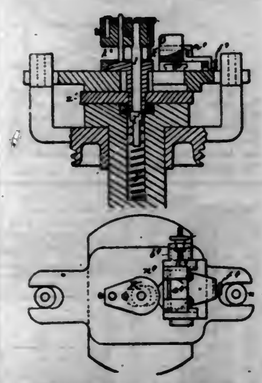
166,763. HARROWS. Levi Francisco, Oakland, Wis. [Filed May 24, 1875.]

Brief.—Two sets of tooth-bars are secured together at the outer ends by hinge-couplings, the inner ends overlapping each other, and secured by links and clips.



The two sets of parallel bars A and B, Fig. 1, having their outer ends coupled substantially as described, in combination with a single line of couplings for their inner ends, substantially as and for the purpose specified.

166,763.



166,764. MACHINES FOR STUFFING HATS. Granville B. Fuller, Middletown, N. Y. [Filed July 2, 1875.]

Brief.—By the rapid rotation of the hat-block the surplus stuffening or sizing matter is thrown off the hat-body. Cylinder D catches the matter thus thrown off, and allows it to pass down through the escape-pipe *F*.

The vessel D, provided with annular flange *d*, shaft-aperture and discharge-opening *d'*, in combination with the driving and elevating shaft E, provided with collar *e'* and hat-block *F f'*, substantially as shown and described.

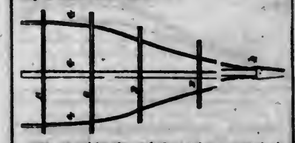
166,765. BOOT AND SHOE HEEL TRIMMER. Chas. W. Glidden, Lynn, and Stephen A. Simmons, Lawrence, assignors to Jas. W. Brooks, trustee, Boston, Mass. [Filed June 24, 1875.]

1. The heel-support and box and drivers, in combination with a loose plate for retaining the drivers in position, substantially as described.

2. The heel-support, box, loose plate, and rod *i*, in combination with and detachable from the heel-cutting mechanism, whereby the supports for heels of different sizes are made easily interchangeable, substantially as described.

3. The movable carriage, a turn-table with projecting pins and ledge *b'*, in combination with the plate grooved substantially as described, to move the turn-table and knife-holder, as set forth.

4. The combination, with the turn-table and trimming-knife, of an adjustable trimming-knife holder and slide-plate, to adjust the knife, substantially as described.

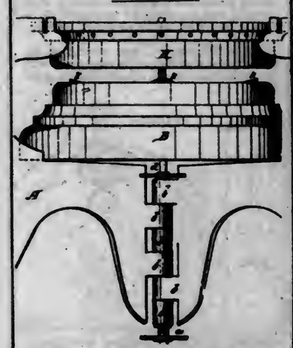


5. The combination of the knife *f* and cutting-gage *e'* with the gage *c* and heel-rest clamp, substantially as described.

6. The top-lift plate *n'*, box *k*, and heel-support, in combination with the locking-pin, substantially as described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON

166,766. GARDEN-TRELLISES. I. Goodspeed, Greenville, Conn. [Filed Mar. 22, 1875.]



Brief.—A number of strips of wood are secured at the lower end by a pin and metallic cap or thimble. The uprights are spread and curved into any desired form, and held in place by notched cross-bars.

The combination of the strips *a*, notched cross-pieces B, pins *b*, and metallic clip C, substantially as and for the purpose set forth.

166,767. NURSERY-LAMPS. Clark I. Gorham, Chicago, Ill. [Filed July 14, 1875.]

Brief.—The tube lessens friction. The air-passages supply air to the inside of the flame rising from the openings in the upper plate. The adjustable ring can be adapted to vessels of different sizes.

1. The combination of the leaves A, tube *a*, rod or plate *c*, and slotted head *d*, all constructed and operating substantially as and for the purpose specified.

2. The combination of the support consisting of the frame A, the lamp E, and pendent ring-stay H, all constructed and operating substantially as and for the purpose specified.

3. In combination with the body of the lamp B, the upper plate C, having openings *f*, and a central depression, *g*, provided with an opening, *h*, and the slide *i*, all constructed and operating substantially as and for the purpose specified.

4. In a lamp, in combination with the plate C, having openings *f*, the air-passages *k*, substantially as and for the purpose specified.

5. In combination with the body of the lamp B and perforated plate *n*, the asbestos cloth or paper *p*, the springs S, and wire-gauze *r*, all constructed, arranged, and operating substantially as and for the purpose specified.

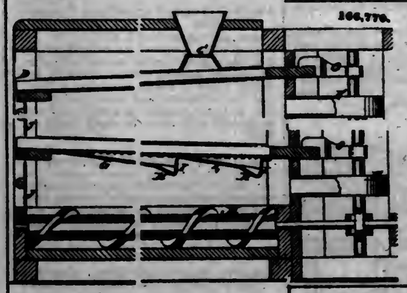
6. In combination with the standard, consisting of the leaves A, an adjustable ring, I, adapted to engage with the upper portion of the leaves A, substantially as and for the purpose specified.

166,768. STEAM-GENERATORS. J. Goulding, Worcester, Mass. [Filed July 6, 1875.]

Brief.—The water is partially converted into steam while passing in pipes through the connection-chambers. Should more water accumulate in the reservoir than is desirable, it is pumped out and recovered through an auxiliary pipe, also passing through the combustion-chamber, in which it is generated into steam.

In a steam-generator, the combination of the furnace A, provided with the partitions U T, the pump D, pipes I J K, and steam-chamber Q, constructed and arranged to operate substantially as set forth and specified.

166,769. SHOE TIPS OR PROTECTORS. Chas. T. Grilley, Boston, Mass. [Filed June 24, 1875.]



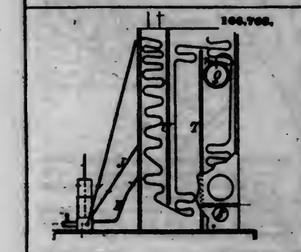
1. A shoe tip or protector built up of pieces of leather, substantially as described.

2. A shoe tip or protector for an upper, composed of two or more pieces of leather, united together, substantially as described, compressed, and adapted to present the edge of the leather outermost for a wearing-surface, substantially as set forth.

3. In the manufacture of leather tips or protectors for uppers, uniting the material to form the tips or protectors, and then compressing and hardening this leather in dies or molds, substantially as described.

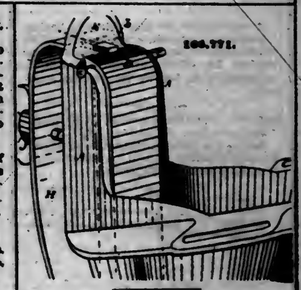
166,770. MIDDLINGS-PURIFIERS. Richard W. Gunter, Carrollton, Mo. [Filed Apr. 24, 1875.]

Brief.—There is a fan for each sieve, the inlets and outlets for the air both being controlled by regulators. The discharge-passages for the material are protected by wind-breakers.



166,770.

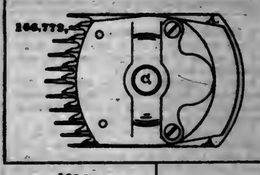
166,771. CORN-SHELLERS. W. H. Hall and C. S. Tingle, Tiffin, Ohio; said Tingle assignor to said Hall. [Filed Apr. 30, 1875.]



Brief.—The hopper has a rub-iron suspended within a recess at one side, and held against the ear by an adjustable spring, the upper end of which is formed into a tongue projecting through the raised back of the hopper over the top of the rub-iron, causing it in place.

The cheek-pieces A A, formed with a recess in the top edge for the reception of the pin which suspends the rub-iron, said rub-iron being secured by the end of the spring H, marked L, the end L of the spring H passing through the hole P in the back B, against which the rub-iron D rests, in combination with the hopper K, constructed as described, and for the purpose set forth.

166,771.

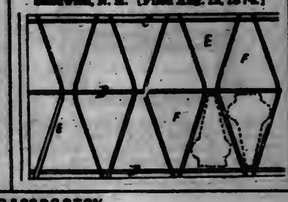


166,772. SHEEP-SHEARS. P. Harlow, Hyde Park, Mass. [Filed May 4, 1875.]

In multi-pointed sheep-shears, a lower cutter-plate having thin blades projecting as a guard beyond the upper cutter-plate, said blades being formed sled-runner shape on the under side toward the ends, each blade narrowing vertically to a knife-edge from the cutting-edge downward, and forming spaces, parallel, or nearly so, between the blades from the ends to the point of impact with the points of the upper cutter-plate.

166,772.

166,773.

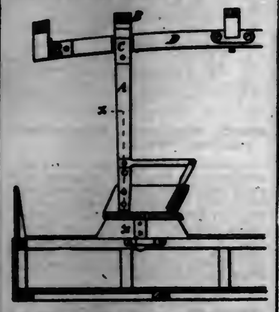


166,772. MOLDS FOR CASTINGS. Benjamin Harris, Marshalltown, Iowa. [Filed Nov. 21, 1874.]

1. A fusing mold-box having a cylindrical convexity, C, on its bottom, adapted to form an interior concave tearing-face on the under side of the lining metal poured in through the journal-box, substantially as described.

2. The rectangular journal-fusing mold-box A, provided with opposite handles B B and opposite lugs *a a*, at right angles to the handles, and the inside bottom of the box having a cast-molding convexity, C, substantially as described, and for the purpose set forth.

166,774. PACKING-BOXES. H. N. Hart, Sandwich, N. H. [Filed Aug. 12, 1874.]



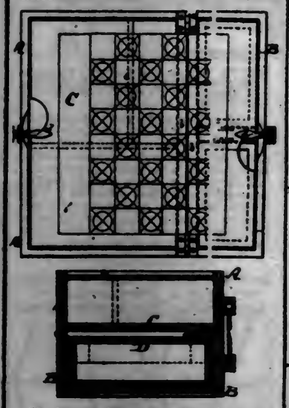
HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON

A seating-box for hose-chimneys, having a series of triangular compartments, E F, constructed and arranged in alternate order between the dividing-walls C, B, and D, substantially as and for the purpose specified.

166,776. TOYS FOR VEHICLES. J. F. Hager, St. Louis, Mo. [Filed Aug. 2, 1875.]

Brief.—The bows are united to the standards by metallic sockets, and to the side rails and hinged bonnet by sliding joints.

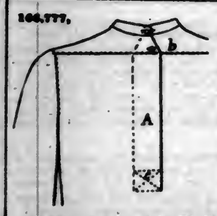
1. In a knock-down carriage-top, a bow made in three sections, A A and B, and united at the top by means of the metallic socket C, substantially as herein set forth.



2. The combination of the sectional carriage-bows A B, side rails D D, and arched plates E, united together by sliding joints *b*, substantially as herein set forth.

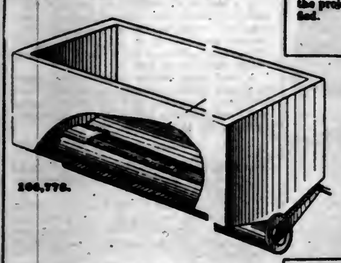
3. The end rails G with hinged rails H, in combination with the sectional bows A B and side rails D, all united together by sliding joint *b*, substantially as and for the purposes herein set forth.

4. In combination with a carriage-top frame, constructed as described, a carriage-cover having the exterior part and lining so sewed together as to leave passages for the arched pieces B and E to pass between them, and provided with loops to fasten it to the frame, substantially as herein set forth.



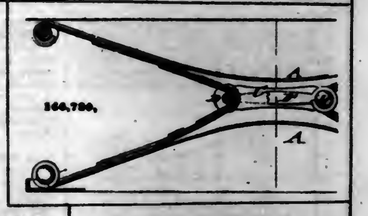
166,777. GAME-BOARDS. August Herzog, Gutenberg, N. J. [Filed July 12, 1875.]

Brief.—Instead of the ordinary backgammon-board in book form, the game-board is arranged as covers for the interior compartments of the box, the outside surfaces being dished.



The box consisting of two hinged receptacles, A B, provided with the interior hinged covers C D, forming a game-board, substantially as herein shown and described.

166,777.



166,778.

166,779.

166,780.

166,777. SHIRTS. John W. Hutchinson, Baltimore, Md. [Filed July 23, 1874.]

A new article of manufacture, an open-back shirt having at the back, yoke, and neck-band of the same the wide and straight lap A, stitched on at *c*, and tapering upward between the yoke and neck-band, as shown, and provided with the fastenings *a* and *b*, substantially as and for the purpose specified.

166,778. SUGAR COOLING AND DRAINING APPARATUS. Joseph H. Hymans, Alexandria, La. [Filed June 5, 1875.]

Brief.—The bottom of the cooler is inclined from the sides toward the longitudinal center. The slotted draining-tube is contained in a slotted sleeve or trough, rotated by a crank. The connection is closed when the sugar is hot; as it cools the opening is made gradually, being fully open when the sugar is cold and firm.

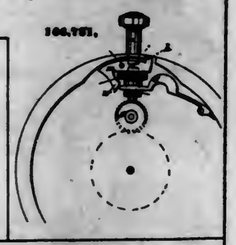
A sugar cooler and drainer composed of a cooling-vessel having bottom inclined from the sides to the central longitudinal slot, in connection with a right-fitting revolving draining-tube, provided with corresponding slots at diametrically-opposite points, substantially as and for the purpose set forth.

166,779. GRAIN-DRILL TUBES. George L. Ives, Galesburg, Mich., assignor to himself and Henry L. Keith, same place. [Filed June 12, 1875.]

A tooth for grain-drill tubes, consisting of front wedge-shaped furrow-opener A and shank C, the rear cavity D running through both, being straight to cross-line *f*, and passing out on a rearward curve near the bottom, as shown and described.

166,779.

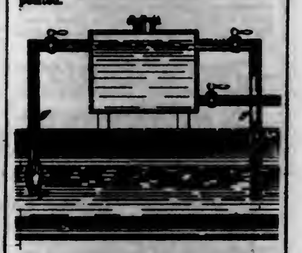
166,780. VEHICLE-SPRINGS. Henry Jeffrey, Seymour, Ind. [Filed June 12, 1875.]



The top and bottom tension-springs A A, combined with intermediate leaf-springs, connected by shoe C, bolts D, and links D', as and for the purpose specified.

166,781. STEM WINDING AND SETTING DEVICES FOR WATCHES. Louis Kahn, New York, N. Y. [Filed Apr. 13, 1875.]

Brief.—A lever, operated by the sliding stem, has two projections—one for moving the sliding clutch and holding it in position while winding, and the other for automatically releasing the clutch by the closing of the case.



The double-armed lever, pivoted as described, and provided at its extremities with the projections *w* and *h*, substantially as specified.

166,781.

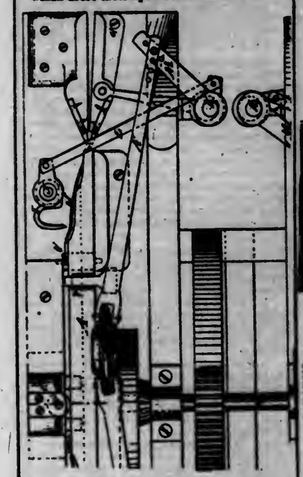
166,782. BOILER-CLEANERS. T. O. Kemp, Beamsville, Canada. [Filed June 5, 1875.]

Brief.—The water circulates through an outside chamber, in which the sediment is deposited.

The combination, with boiler and superposed reservoir, of pipes *g g*, provided with stop-cocks, one having mouths *n n* at surface of boiler-water, and the other more deeply down into said water, as and for the purpose specified.

166,782.

166,783. HARDENED SHAFTS. Eleazer Kempshall, New Britain, Conn., assignor to W. J. Phelps and W. P. Abernethy, Springfield, Mass. [Filed May 4, 1875.]



Brief.—An extra notch or shoulder on the rear end of the tongue locks it in place, and prevents its being accidentally opened.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON

A snap-hook, having the hook *b'*, the inwardly-swinging tongue *c*, having at its rear end the mortise *d*, with shoulder *e*, and the spring *f* lying within the pocket *b'*, all constructed, combined, and arranged substantially as shown and described.

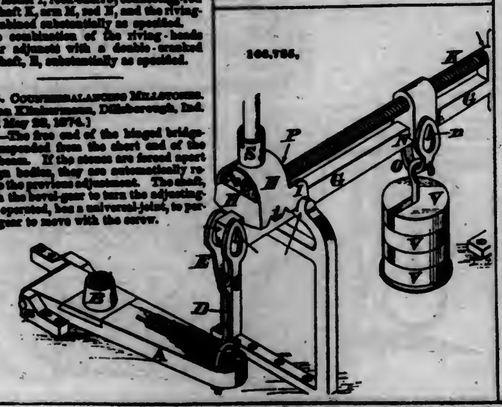
166,784. SHINGLE-MACHINES. John J. Kendall, Greensborough, N. C. [Filed May 8, 1875.]

Brief.—The machine is double, operating upon two shingle-bolts at the same time, rives the shingles from the bolts, and then conveys them automatically to the shaving-knives, which dress them upon both sides.

1. The combination of a double-faced stationary head and two rising-cutters with a reciprocating-rising head, substantially as shown and described, whereby a blank may be rived by each movement of the head, substantially as specified.

2. The combination of the spring-clamp F and feeder I with the movable rising-head, substantially as specified.

3. The feeder I, combined with the movable rising-head and the guideway E in the arrangement described, whereby the blank is shifted in front of the head when presented to the cutters, substantially as specified.



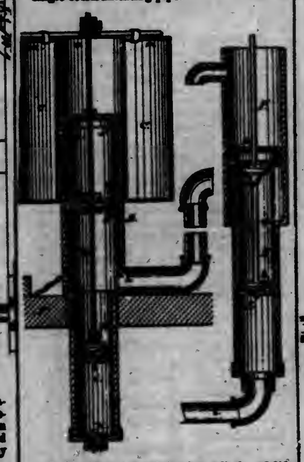
4. The oscillating cutter P, in combination with the connecting T, rock-shaft K, and the rock-shaft geared with the rising-head A, substantially as specified.

5. The feeder I, rock-shaft J, connecting-rod L, rock-shaft K, arm M, rod N, and the rising-head, combined substantially as specified.

6. The combination of the rising-heads and their adjuncts with a double-crushed driving-shaft, B, substantially as specified.

166,785. COUNTERBALANCED MILL-STONES. Hiram Kitchenman, Dillsborough, Ind. [Filed May 26, 1875.]

Brief.—The free end of the hinged bridge-tree is suspended from the short end of the balance-beam. If the stones are forced apart by foreign bodies, they are automatically returned to the previous adjustment. The shaft, by which the bevel-gear is turned, by which the adjusting-screw is operated, has a universal-joint, to permit the gear to move with the screw.



1. The combination of pivoted bridge-tree A *a*, having removable step B, detachable connection O D E, and steelyard G, having weights V, and whose supporting-bool F has bearings *f f*, as and for the purposes set forth.

2. The housing H, having chocks I I', provided with a series of notches, *i i'*, for changing the position of the bearings, as set forth.

3. In combination with the vertical shafts B T, the bevel-wheels P Q and coupling S, as and for the purpose set forth.

166,786. PUMPS. Adam Knecht, Rebecca, and Michael Knecht, Grantsville, Md. [Filed Apr. 10, 1875.]

Brief.—A differential force-pump is employed to operate, by means of the interposed column of water in the communicating pipe, a similar pump placed in the well. The differential character of the pump admits of all the water being delivered through the upper pump, and with the employment of but a single communicating pipe.

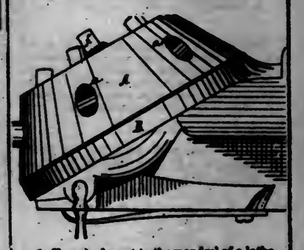
1. The force-pump A, having cylinder of differing bores, and open connected pistons fitting said bores, and double-valved rod applied to said pistons, as shown, in combination with an auxiliary differential pump, and both receiving its water from, and operating said auxiliary pump through, a single communicating pipe, *i*, all substantially as set forth.

2. The auxiliary differential pump B, having cylinder of different bores, and provided with valved pistons *e* and pistons *d*, containing automatic regulating or safety valve *g*, both upon the rod G, with or without the weight

166,786.

attached, in combination with a force-pump and communicating pipe, substantially as and for the purpose described.

3. The pump B, having one portion of the cylinder larger than the other, for the purpose of causing the pistons to move by supplying pressure between the two pistons, as shown and described.



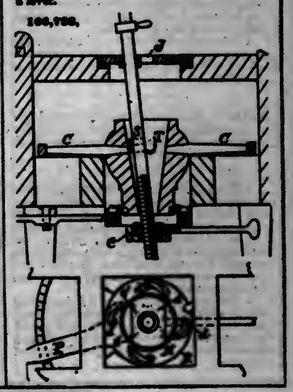
4. In a compound pump, as shown, a valve controlled by the stroke of the piston, and arranged to act automatically to regulate the volume of water in the cylinders and connecting pipe, substantially as described.

5. A weight, C, made and constructed in the shape of an annular vessel, or of any suitable form, to be filled with gravel or some other substance, in combination with the compound pump described and shown, for the purpose set forth.

6. The combination of the piston G, a rod or tube extending therefrom through the cylinder-head, and a crank-bar or tube suitably attached thereto and to the weight, as and for the purpose set forth.

166,787. TOOL-HOLDING ATTACHMENTS FOR METAL-LATHES. Wm. Kratzsch, Dayton, Ohio, assignor to G. W. Hughes and C. H. Penn, same place. [Filed Apr. 15, 1875.]

Brief.—A pedicled shank for attachment to the spindle of a lathe. The tools are carried in sockets made in a frustum at right angles to the sides. The frustum is pivoted to the shank at an angle, so that the tools may be alternately brought into line with the axis of the spindle by turning the frustum upon its pivot.



1. For attachment to the mandrel of a lathe, the tool-carrying frustum A and body B, the former attached to the latter at an angle, substantially as described.

2. The herein-described improved attachment, consisting of the body B, lugs *i*, pivot *f*, bearing *j*, disk *m*, ring A, and frustum A, provided with recesses *o* and set-screws *c*, all substantially as described, and for the purpose specified.

166,788. HUB-BORING MACHINES. John Lee, Lowan, Iowa. [Filed July 6, 1875.]

Brief.—The hub is clamped by a series of dogs attached to a ring, which is operated by a lever.

166,788.

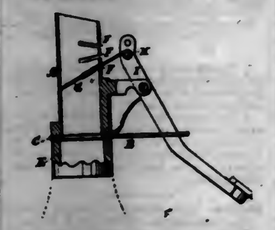
HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON

1. The self-centering device consisting of the movable ring N, having lever P and pivoted dogs d, in combination with circular guide O, having notches o', substantially as described.

2. In combination with the guide-plate G, having slot J, set-screw H, and cutter I, the self-centering devices consisting of the movable ring N, pivoted dogs d, circular guide O, having notches o', and lever P, substantially as described.

166,792. BRIDGING. Martin Loiner, New York, N. Y. [Filed Dec. 10, 1874.]

Brief.—The bristles are held upon the wires by twisting or braiding, and the wires are secured to the backing by being passed through slots or holes, and bent upon the opposite side from the face.



The combination, with block C, of the bristle-holding wires B, twisted and fastened over the block, as and for the purpose specified.

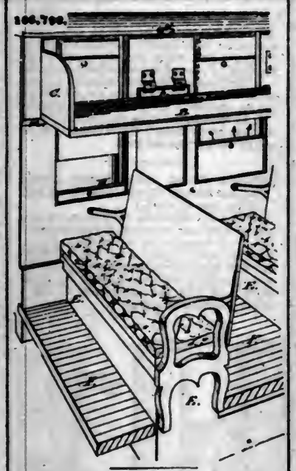
166,793. PROCESSES FOR PRODUCING AMALGAMATED SILVERING FOR MIRRORS. Jean J. E. Lenoir, Paris, France. [Filed Aug. 9, 1875.]

The process of amalgamating the silver films of mirror-surfaces by the application thereto of solutions of mercurial salts, substantially in the manner described, for the purpose of improving the color and increasing the durability of such mirror-surfaces.

166,794. SHOT-CHARGERS FOR SHOT-POUCHES. J. S. Long, Mikville, Ill. [Filed May 28, 1875.]

1. The cut-off valve S, having a cleaning-ring, O, in combination with the barrel A, having an offset, B, under the valve on the closing side, substantially as specified.

2. The casing of plate F for the gaging-valve G, arranged radially to the point of connection of the valve with the lever, substantially as specified.

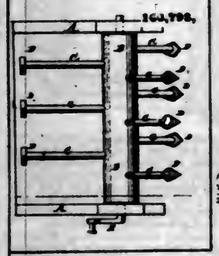


166,795. SLEEPING-CARS. Christian H. Lucas, Athens, Ga., assignee of one-half his right to J. F. Divine, Washington, D. C. [Filed Mar. 26, 1875.]

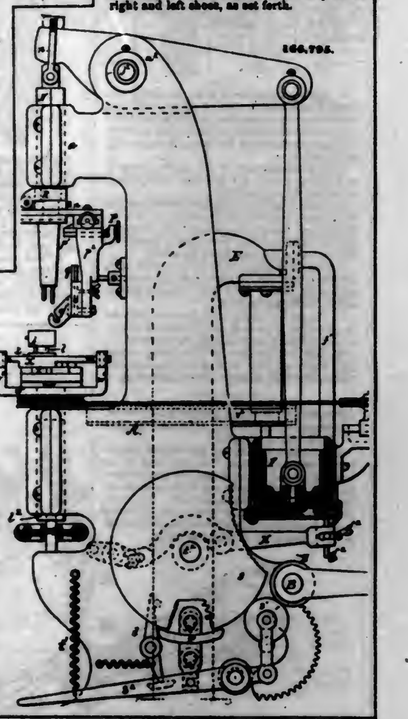
1. The berth B, forming the inner paneling of the car, supported upon the molding n, and secured to the side of the car by the catches a and plate b, in the manner set forth.

2. In combination with the berth B, the folding leaves C C, hinged to the side of the car, and forming, when open, the head and foot boards of the berth, as well as a part of its support, as described.

3. The folding-supports E E E, consisting of two continuous metallic standards, open below the floor of the car, with ends turned up through the floor under the catches and covered by the cast-castings, as shown and described.

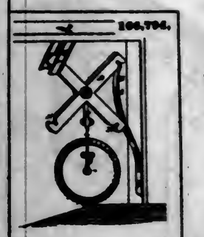


166,796.



166,796. ICE-BREAKING. Joseph T. Martin, Newark, N. J. [Filed July 17, 1875.]

The ice-breaker, substantially as shown and described, consisting of the shaft B, carrying the radial arms C, said arms being rigidly secured to said shaft, and provided at their outer ends with ax or wedge shaped heads D, the whole mounted in a suitable frame, adapted to be secured to a vessel, in the manner shown and described.



166,797.

166,798.

166,799.

166,794. FARE-BOXES. William C. McGill, Washington, D. C. [Filed June 12, 1875.]

In combination with the revolving frame B, spring E, arranged to hold the frame in such manner as to prevent a backward movement and to force the frame around, so that one of its arms will strike the ticket and press it from the opening into the receptacle below after having been partly thrown around by the ticket being forced through opening D, substantially as herein represented and shown.

166,795. MACHINES FOR ATTACHING AND TRIMMING HEELS. Gordon McKay, Cambridge, Hedley P. Fairfield, Boston, and Chas. W. Glidden, Lynn, assignors to Jas. W. Brooks, trustee, Boston, Mass. [Filed June 24, 1875.]

Brief.—The jack-plate is attached to a vertically-reciprocating bar depending from the end of a walking-beam, which is operated by compressed air acting through a cylinder, piston, and link. After the heel is secured to the boot or shoe, without its removal, the trimming mechanism is thrown into action. The knife-holder is carried by a turn-table, which is free to rotate in a reciprocating carriage, which is moved by projections on a cross-plate, which enter openings in the carriage, the cross-plate resting upon a spindle, which is moved by a band or cord attached to a sliding carriage, receiving motion from a rotating shaft.

1. The walking-beam and its connecting-rod and piston, adapted to be operated by compressed air, in combination with the bar N and last-carrying bar, substantially as described.

2. The jack-holding plate n' and the support for the heel-rest clamp, connected together through arm p', and together adjustable, substantially as and for the purpose described.

3. The bar N, in combination with the jack-holding plate n', adjustable on the bar, substantially as described, to adapt the jack to right and left shoes, as set forth.

166,795.

4. The heel-rest clamp Q, provided with hinged wings or levers 3, a spring, and piston 6, constructed and operating substantially as and for the purpose described.

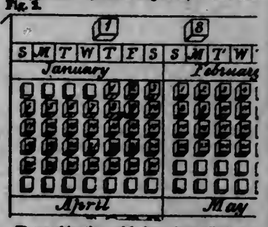
5. The heel-rest clamp Q, provided with ears q', in combination with the adjustable slotted-arced support q', and arm p', and jack-holding plate n', substantially as and for the purpose described.

6. In a heeling-machine, the walking-beam F, link x, and bar N, in combination with the jack-bar and heel-rest clamp, connected with and carried by the bar, substantially as described.

7. In a machine for attaching heels, the plunger D of the air-compressing apparatus, provided with the perforated head d, movable plate, and plug, in combination with the support c, having opening d' to receive the plug, and with valve to retain the compressed air in the cylinder, substantially as and for the purpose described.

8. In a machine for attaching heels, the compressed air-receiver B, its connected pipe f', and the valve-chest G, in combination with the piston F, its link j, walking-beam bar N, and last-carrying bar, substantially as and for the purpose described.

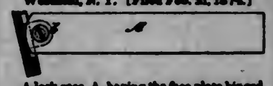
9. In a heeling-machine, the crank b', adjustable two-part link C, and plunger D of the air-pump, substantially as and for the purpose described.



10. The combination of the valve-chest, valve, and valve-rod of a heeling-machine with the levers B h, and treadles for operating the levers, substantially as described.

11. The pivoted vibrating-radius bar, crank, and adjustable connection between the crank and radius-bar, in combination with the sliding carriage and cord for operating the heel-trimming mechanism, substantially as and for the purpose described.

12. The plate X, adapted to carry a heel-trimming mechanism, in combination with the forked cross-plate, provided with lugs n' n', substantially as and for the purpose set forth.



166,796. CALENDARS. David J. Miller, Santa Fe, N. Mex. [Filed June 17, 1875.]

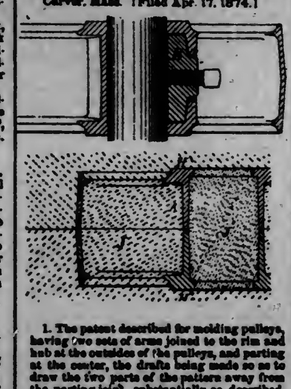
Brief.—For each month forty-two adjustable pegs are provided, and upon each (according to the number of days in the month) are marked the date of the month and the number of the day in the year with relation to each other. In each month-column one or more of the adjustable pegs are provided with a supplementary indicating-slide, as shown in *Fig. 1.*

The combination, with the reciprocally-translatable dating-rods, of adjustable supplementary date-indicators a, substantially as and for the purpose herein set forth and described.

166,797. ADJUSTABLE FACE-PLATES FOR LOCKS. Eugene M. Hix and Jas. B. Hix, Westfield, N. Y. [Filed Feb. 21, 1874.]

A lock-case, A, having the face-plate hinged or pivoted to it, whereby the plate can be adjusted to the bevel edge of a door, substantially as described.

166,798. KNOCK-DOWN BEDSTEADS. Wm. H. Moore, Lebanon, N. H. [Filed June 5, 1875.]

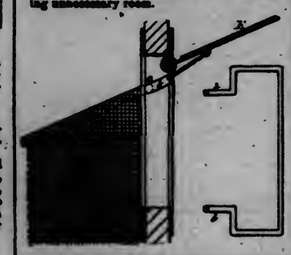


Brief.—The lower sections of the head and foot boards are held in place by the hooks, which rest in the cavities in the standards, and the upper sections are secured by the screws, the middle sections being held in grooves in the adjacent edges of the upper and lower sections.

166,798.

The combination, with the standards A, grooved at B and having cavity F, and the boards C D E, of the hooks G and screws H, applied as and for the purpose set forth.

166,799. CASTING PULLEYS. Jno. Murdock, Carver, Mass. [Filed Apr. 17, 1874.]

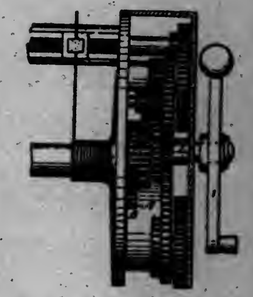


1. The patent described for molding pulleys, having two sets of arms joined to the rim and hub at the outsides of the pulleys, and parting at the center, the drafts being made so as to draw the two parts of the pattern away from the parting-joint, substantially as described.

2. The pulley made with two sets of arms joined to the rim at or near its edges, and to each other by a thin hub, as a new manufacture.

3. The recesses in the hub, in combination with the detached nuts and set-screws, substantially as described.

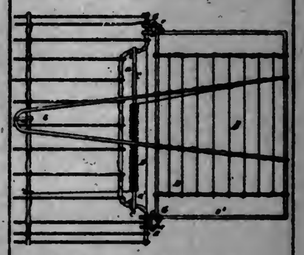
166,800. LETTER-BOXES. E. S. Newcomer, Oregon, Ill. [Filed June 10, 1875.]



Brief.—The bag or receptacle is composed of net-work or other flexible material, and is attached at its mouth to a frame, (quadrilateral in shape,) which is pivoted to a door coincident with its letter-chute, and connected to the name-plate or cover of the chute in such manner that by raising the latter the receptacle will be distended, and upon lowering it the bag will collapse, thus not occupying unnecessary room.

The combination of a double letter receptacle, with a hinged bag at its mouth, provided with arms b a, connected to the door-plate E, forming the cover of the letter-chute, whereby, when the door-plate is raised, the mouth of the receptacle is extended to receive the letters, substantially as described.

166,801. TRAVERSE-MOTIONS. Charles L. Noe, Bergen Point, N. J. [Filed July 10, 1875.]



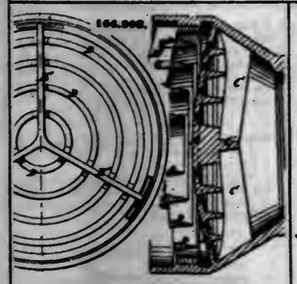
Brief.—One of the cog-rims operates to turn the screw in one direction, and the other turns it the reverse, thus producing a continuous traverse of the guide.

The combination of a master-wheel, having two half or nearly half circular cog-rims on opposite sides and in different planes, and two transmitting-pinions, the arrangement being such that one of said pinions transmits the motion direct, and the other transmits it through the first, and thus produces reciprocal motion, substantially in the manner described.

166,802. ANIMAL-TRAPS. Ebenezer Oliver, New York, N. Y. [Filed July 3, 1875.]

Brief.—Relates to the method of applying the spring to the door, and to the device for locking the door after it is sprung.

1. The combination of front body-wire, having offset a', with the short wire O, to enable coiled spring D to be applied, as shown and described.



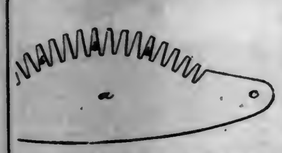
2. The trap-door B, having bottom wire prolonged laterally at each side, and having vertical extensions b' b', in combination with vertical wires E E attached to body-frame to allow the rings O to work, as specified.

3. The hooks a', formed in the upper part of the wires E, in combination with the sliding rings O and the wires b', substantially as and for the purpose herein shown and described.

166,803. HOSE-NOZZLES. Charles Oyston, Little Falls, N. Y. [Filed June 26, 1875.]

Brief.—The nozzle has a plate with concentric annular openings combined with connecting-arms. It also has concentric ring-wedges, with their connecting-arms below, and combined with the annular openings. The object is to divide the stream with the least resistance, and to prevent fouling from the impurities in the water.

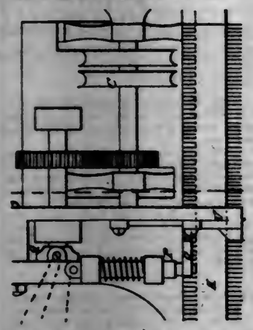
166,803.



1. The plate B, provided with concentric annular openings, in combination with the arms C and the shell A, substantially as herein shown and described.

2. The concentric ring-wedges D and their connecting-arms E, in combination with the shell A, and with the concentric annular openings of the plate B, substantially as herein shown and described.

166,804. Blanks for Box-Toes of Boots and Shoes. Nathaniel R. Packard, Brockton, Mass. [Filed May 7, 1875.]

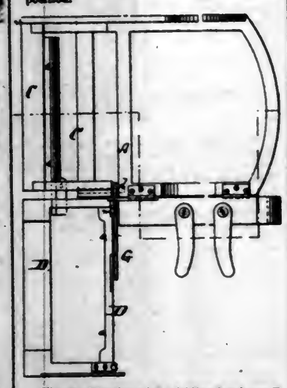


Brief.—The outer or toe portion of the blank to be turned under is notched or serrated.

As a new article of manufacture, the blank *c*, having the serrations *b*, and ears or prolongations *c*, substantially as described, for the purpose specified.

166,805. Machines for Sewing Hosiery-Seams. William Pearson, Philadelphia, Pa. [Filed Dec. 26, 1874.]

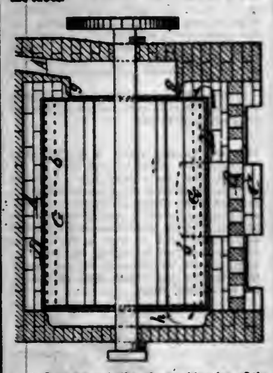
Brief.—The bed of the machine is so constructed that the needle-bar or work-supporting carriage may be entered at one end of the machine, and, after having traversed the entire length of the machine, to present the work to the action of the sewing mechanism, be discharged from the other end thereof. The cam which actuates the feeding-pawl is made adjustable, to regulate the throw of the latter, whereby the machine is adapted to work of different degrees of fineness.



1. In combination with the bed or frame, constructed as described, the rock-bar or carriage K, provided with grooved points to receive and carry the loops of the edges of knitted fabrics in pairs to be sewed together, with a feeding mechanism engaging in teeth coincident in distance with the grooved points, by which the said bar may be fed entirely through the machine, and discharged therefrom after presenting the work to the sewing mechanism, as set forth.

2. The adjustable cam Q, combined with the rock-shaft P, and pawl O, and rock-bar K, as set forth and described.

166,806. Sofa-Bedsteads. John Petry, New York, N. Y. [Filed Jan. 18, 1875.]

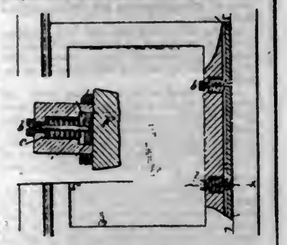


Brief.—The rod is pivoted to the stationary frame and folding head-rest, and guides the latter in its movement, and, in connection with the projecting leg, supports it in its extended position.

The combination of the folding head-rest D with the rod G, connecting it to the frame A, and with the projecting leg *i*, fixed head-rest C, and folding seat E, all arranged substantially as herein shown and described.

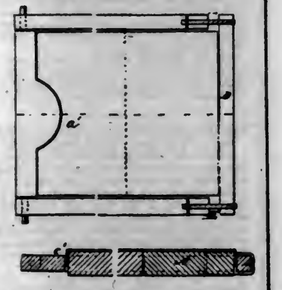
166,807. Rotary Steam-Boilers. Charles W. Pierce, New York, N. Y. [Filed July 17, 1875.]

Brief.—As the boiler revolves the water is caught up and carried over by buckets that partially surround the tubes. Chambers are provided at each end of the boiler, by which the products of combustion return through the tubes.



1. In a rotary boiler, the combination of the flue G with buckets *b*, substantially as set forth.

2. The combination, with a rotary boiler, of a furnace having annular flange *g* and annular chamber *h*, substantially as shown and described.



166,808. Ham-Holders. Seraiah M. Pratt, Cherokee, Iowa, assignor of one-half his right to H. C. Kellogg, same place. [Filed July 23, 1875.]

Brief.—A rubber-lined strip inserted in a mortise in the edge of the window-sash is made to bear with adjustable pressure against the window-frame by means of a spring-encircled screw-bolt, the cap of which projects a little beyond the inside line of the sash, giving the device ready adjustability.

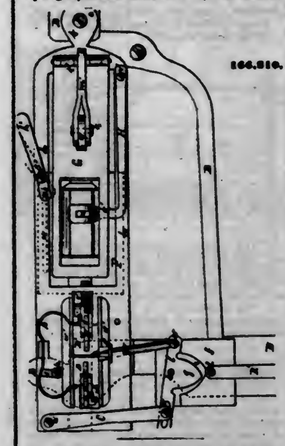
The combination, with the window-sash, of the rubber-lined strip *a*, screw-bolts *c*, screw-caps *b*, and spiral springs *c*, in the manner and for the purposes set forth.

166,809. Ironing-Boards. Orlando S. Pride, Yonkers, N. Y., assignor to himself and John E. Woodruff, same place. [Filed Apr. 24, 1875.]

An ironing-board, in two parts, hinged together, combined with a frame, having sidebars B B, elastically connected with rear bar D, as and for the purpose specified.

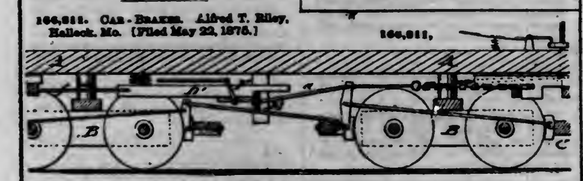
166,810. Button-Hole Attachments for Sewing-Machines. Wm. Randel, Troy, N. Y. [Filed May 1, 1875.]

Brief.—To one end of the bed-piece of the attachment is pivoted a supporting-plate that carries the clamping and feeding mechanisms. This plate receives a vibratory motion from a reciprocating bar, acting upon a cam of peculiar construction, which is connected to the said plate. In the opposite end of this vibratory plate from its pivot, in suitable slides, are arranged blocks, carrying upon their under side detents, which engage with racks formed on the feed-bar that carries the clamping mechanism. The vibrating cam before mentioned has connected to its one side a wedge, which, through a guide on the supporting-plate, operates the said detents. The racks upon the feed-bar are formed on both edges of the same, with the teeth of the one pointing in an opposite direction to the other, so that, by operating a cam upon the supporting-plate, either the one rocks, or the other may be brought under the detents, as it is desired to feed the buttonhole either in the one direction or the other.



1. The combination of the feed-plate F, the feed-bar E with its ratchets *n* and *n'*, the dogs P and P' pivoted in the blocks D and D', respectively, the spring S, the reciprocating feed-wedge W, and the switch N, as and for purpose described.

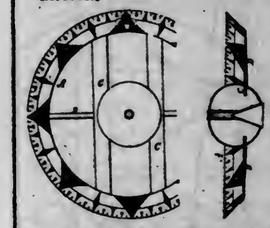
2. The combination, with the plate O, pivoted at *h*, and the feeding and clamping mechanism, of the pivoted connecting-rod G, the cam-lever *i*, the reciprocating driving-rod R', provided with the pin *d*, cam *g*, and the plate *f*, as described, and for the purpose specified.



3. The combination, with plate O, pivoted at *h*, block D D', dogs P P', springs S and *s s'*, and the feed-bar E, of the pivoted connecting-rod C, cam-lever *i*, feed-wedge W, and reciprocating driving-rod R', as described, and for the purpose specified.

4. The combination of the feed-plate F, the feed-bar E with its ratchets *n* and *n'*, the dogs P and P', the blocks D and D', the spring S, the reciprocating feed-wedge W, the switch N', the plate O pivoted at *h*, the connecting-rod C, the cam-lever *i*, the reciprocating driving-rod R', pivoted with the pin *d*, the cam *g*, the plate *f*, the hinged clamp C, jaws *j j*, the spring H, and eccentric lever *m'*, as described.

166,810.

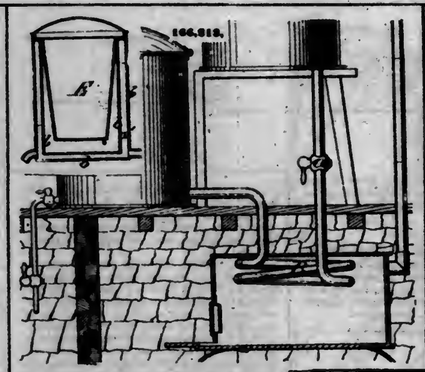


166,811. Car-Brakes. Alfred T. Riley, Hallock, Mo. [Filed May 22, 1875.]

The band-spring E, made fast at each end and about midway of frame A, in combination with brake-lever B connected therewith by rod *c*, as and for the purpose specified.

166,812. Mariners' Compasses. Edward S. Ritchie, Brookline, Mass. [Filed July 20, 1875.]

An improved liquid-compass card, composed of the concentrated buoyant air-vessel, the perforated plate or divided ring A, and one or more magnets, C, or sand and arms D, arranged and constructed substantially as set forth.



166,813. Apparatus for Threshing Buttons. J. C. Hoxie, Wauseon, Ohio. [Filed Feb. 13, 1875.]

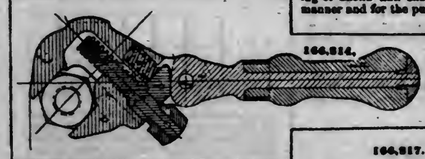
Brief.—The suspended vessel is surrounded by an air-space, which is enveloped by a water-chamber.

166,813.

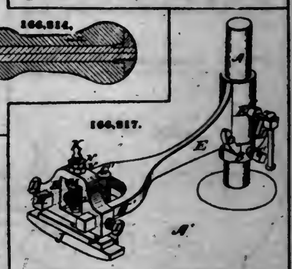
In an apparatus for tempering batter, a furnace, A, and a cold-water reservoir, C, in combination with a warm-water reservoir, D, having double surrounding walls, and an annular space, with a suspended vessel, E, substantially as and for the purpose set forth.

166,814.

166,815.



166,816. Welding Compounds. John Scott, Jr., and Amos S. Scott, Conteeville, Pa. [Filed July 17, 1875.]



Brief.—Mixes the ingredients together in the proportions of one (1) part of kaolin to two (2) parts of sand.

The welding compound described, consisting of kaolin and sand, substantially in the manner and for the purpose set forth.

166,814.

166,817.

166,817. Variety-Moulding Machines. James Geary, Boston, Mass. [Filed Dec. 15, 1874.]

Brief.—The guard is made adjustable, so as to cover either of the two cutter-heads, as may be desired by the operator of the machine.

1. In a variety-molding or other wood-working machine, an arm or bar pivoted at a point equidistant from the right and left hand cutters, in such manner as to swing horizontally, carrying on its swinging end suitable devices for holding down the stock and protecting the workman's hands from the cutters, and adapted to be held so as to operate interchangeably with said cutters, substantially as described, for the purpose specified.

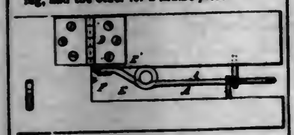
2. The vertical standard A, located at a point equidistant from the cutters, and having the adjustable collar B, provided with yoke D, in combination with the horizontally-swinging vertically-adjustable arm E, having suitable attachments on its swinging end, for holding the stock and protecting the workman's hands, and the right and left hand cutters G G, all arranged and operating substantially as and for the purpose specified.

3. The horizontally-adjustable cross-head H, having the spring pressure-block J, in combination with the swinging arm E, substantially as and for the purpose specified.

4. The pressure-block J, having the vertical rod K, lock-nuts N, collars M, and spring I, in combination with the cross-head H, substantially as and for the purpose specified.

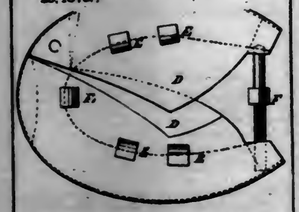
166,818. Claw-Bars. Andrew Shaw, Petroleum, W. Va. [Filed June 26, 1875.]

Brief.—The clutch-jaw raises the spike; when partly drawn the leverage is increased by dropping the toothed end of the clutch, and fastening with the spring-bolt.



166,819.

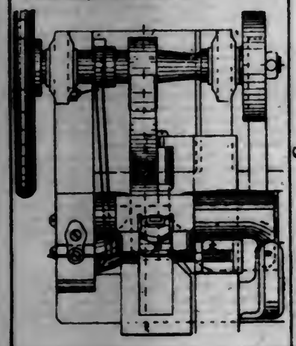
The combination, with the lever A and clutch-bar B, having teeth H, of the spring trip-bolt F, substantially as shown and described.



166,819. SHUTTER-FASTENING. Joel Shedd, Waltham, Mass. [Filed June 29, 1875.]

Brief.—The lever-catch is replaced by a single wire with spring-coil, serving as a fulcrum, and eyes at either end—one for a fastening, and the other for a thumb-piece.

A wire blind-fastener having a horizontal spring-arm, A', projecting end G, inclined or brace arm B', intermediate spring-coil E, and horizontal eye F, the same being constructed and adapted to be applied to the blind or shutter, substantially as and for the purposes set forth.



166,820. HOUSEHORSE. Arthur C. Snowden, South Norwalk, Conn. [Filed Jan. 20, 1875.]

The correspondingly-constructed plates D D, attached to an ordinary shoe by means of lugs E E and screw F, as shown and described.

166,821. MANUFACTURE OF CUT-NAILS. George Stacy, Montreal, Canada, assignor of one-half his right to Henry Mulholland, same place. [Filed June 26, 1875.]

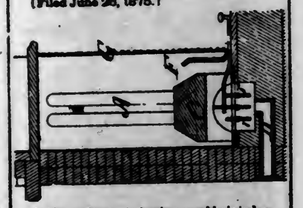
Brief.—A pair of the ordinary dies for cutting bred-headed chisel-pointed nails, combined with the nipper, griper, and header of the ordinary cut-nail machine.

1. The combination, for the manufacture of headed chisel-pointed nails, of the dies *p q*, having the configuration, and supported and operated, as herein specified, with the header, the griping-lever, and the nipper, as shown and set forth.

2. The herein described improvement on that method of manufacturing chisel-pointed nails set forth in Letters Patent No. 165,360, the same consisting in operating in the manner described with a pair of cutting-dies of the structure and configuration specified, upon a square-edge nail-plate that is turned over after each cut to be again operated on by the same dies, and in subsequently subjecting the blanks or brad-headed nails thus produced to the heading operation, as set forth, for the production of headed chisel-pointed nails.

166,822. BRICK PAVEMENTS. Saml. Strong, Washington, D. C., assignor of one-half his right to Ebon C. Ingersoll, same place. [Filed July 22, 1876.]

A pavement composed of hard-burnt bricks, set upon their edges or ends upon a water-tight concrete foundation, with the interstices between them filled with tar, pitch, cement, grouting, or any other material that will render the pavement impervious to water, substantially as described.



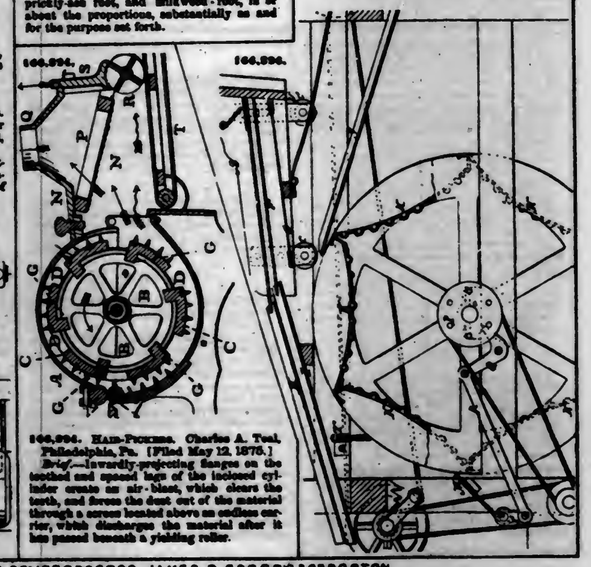
166,823. MEDICAL COMPOSITIONS. Nathan Sullivan, Humboldt, Tenn. [Filed Jan. 16, 1876.]

The medical composition consisting of a tincture of pulverized *Lygnodes Virginica*, prickly-ash root, and milkweed-root, in or about the proportions, substantially as and for the purpose set forth.

1. The hollow picking cylinder B, with toothed lugs C, having inwardly projecting blades or flanges O and spaces D between them, in combination with the casing A and with the chamber N, having a screen, P, above the outwardly conveying apron T, substantially as and for the purpose set forth.

2. The discharge-chamber N, with spout Q, screen P, and outwardly-conveying apron T, in combination with the automatically-operating roller R, substantially as and for the purpose set forth.

166,825. HEATING AND VENTILATING DEVICES. Alfred E. Thorp, New York, N. Y. [Filed June 26, 1875.]



1. The radiator A, having a cold-air-induction pipe and register arranged below it, in combination with the deflecting and conducting plate F and screen G, substantially as described, and for the purpose set forth.

2. The combination of the deflecting and conducting plate F with the induction-tube D and steam-coil A, substantially as specified.

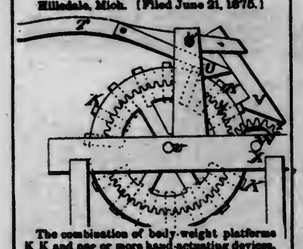
166,826. GRAIN-SEPARATORS. William B. Torley, Milwaukee, Wis. [Filed May 28, 1875.]

Brief.—A reciprocating feeder, provided with screens operating in connection with stationary chutes, runs off the larger foreign matters and the best wheat. The rest of the wheat, with seeds, &c., intermixed, falls upon a rotating polygonal drum having externally concave indented faces. The indentations receive the seeds and dust, while the wheat, being too large to settle into them, is received and thrown off by an intermittently-vibrating chute. A stationary brush aids to prevent the fall of the grain from the drum until the desired moment.

166,824.

166,824. HAIR-PICKERS. Charles A. Teel, Philadelphia, Pa. [Filed May 12, 1876.]

Brief.—Inwardly-projecting flanges on the toothed and opened legs of the inclosed cylinder create an air-blast, which clears the teeth, and forces the dust out of the material through a screen located above an endless carrier, which discharges the material after it has passed beneath a yielding roller.

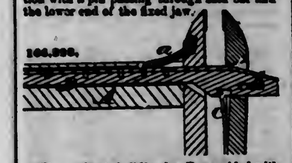


166,826.

1. A polygonal drum having externally concave and indented faces K, as and for the purpose specified.

2. The combination of a swinging chute and polygonal rotary separating-drum, as and for the purpose set forth.

3. The combination of a fixed brush and rotary indented polygonal drum, as and for the purpose described.



166,827. COMBINED BODY-WEIGHTS AND HAND-POWERS. Charles Van De Mark, Hillsdale, Mich. [Filed June 21, 1875.]

The combination of body-weight platforms K K and one or more hand-actuating devices, T U V, operating together, for applying both the weight of the body and power of the arms of the same person or persons simultaneously, to drive machinery or produce mechanical effects, substantially as herein specified.

166,828. BENCH-VISES. Anselm Veilleux, New Richmond, Wis. [Filed Mar. 6, 1875.]

Brief.—The movable jaw of the vise can be adjusted at any desired distance from the fixed jaw, by means of a bar adjustable through slots in the upper part of the jaws, and having perforations upon its upper surface to receive the end of a retaining-dog pivoted to the rear of the fixed jaw, and provided at its outer end with a slot for the reception of a wedge. Objects are firmly gripped between the jaws by an adjustable perforated bar passing through a notch in the lower end of the movable jaw, and operated by a toggle foot-lever through vertical slots in both jaws, in connection with a pin passing through said bar and the lower end of the fixed jaw.

166,828.

The perforated sliding bar D, provided with a slot at its outer end for the reception of the wedge b, and the stationary jaw B, having the dog a, in combination with the movable spring-jaw B', toggles G G', and sliding bar F, operating substantially as described.

166,829. BROOMING-MACHINES. Daniel A. Wagner, Buchanan, Mich. [Filed June 19, 1875.]

1. The combination, with the roller A, of the swinging hopper E, having lip b, adapted to be held in contact with the said roller, substantially as specified.

2. The combination, with the hopper E, of the adjustable gate W and adjustable partitions v v', substantially as specified.

3. The combination and arrangement of a removable drawer, I, with the inclines n n' q, brush f p n, cleaning-rollers G G' G', and brooming-rollers A D, substantially as specified.

4. The vibrating box J, in combination with the cleaning-roller G and brush n, substantially as specified.

5. The rigid table F f, in combination with the rollers D G G', substantially as specified.

166,829.

166,830. SHARPENING-MACHINES. A. S. Weaver, Joy, N. Y. [Filed Apr. 17, 1876.]

1. The cam-levers E and spring S, combined with table P, as and for the purpose set forth.

2. The rack-bar D, crane K, and arm F, jointed together and combined with yoke having pinion, to give a horizontal movement to the grinding-wheel.

166,830.

166,831. KNITTING-MACHINES. Nathaniel W. Woodcock, Providence, R. I. [Filed Oct. 10, 1875.]

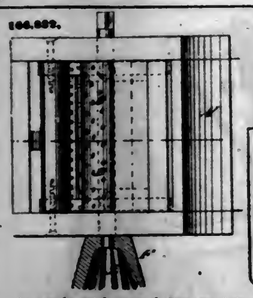
Brief.—Improvement on the Abel Patent No. 165,537. As external notched wheel presses alternately inward. A "presser-guide" bears against the last-formed loops, and prevents them rising with the needles. The latch-guard is cut away at the point where the needles are divided, is curved downward at its ends, and is, as well as all the wheels and the weft-guide, is adjustable in several directions, so that they may be placed in proper relative positions on the machine. The "pockets" prevent undue compression and breakage of the yarn.

1. In a circular latch-needle knitting-machine, the combination, with the latch-needles and their seat-rib A'', of the external regulating-wheel E and the internal dividing-wheel C, constructed and arranged substantially as specified.

2. The combination, with the latch-needles of a knitting-machine and their annular seat-rib A'', of the internal presser-guide L, internal dividing-wheel C, and external latch-guard F, constructed and arranged substantially as specified.

3. The combination, with the latch-needles and cam-rise of a circular weft-thread knitting-machine, of the adjustable latch-guard F, having the form and arrangement herein shown and described.

4. In a circular weft-thread knitting-machine, the combination, with the latch-needles, cam-rise, and internal dividing-wheel C, of the longitudinally and axially adjustable weft-thread guide E, substantially as specified.

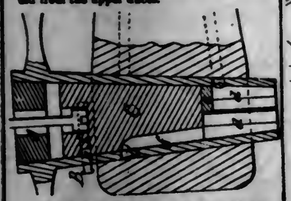


5. The annular needle-seat rib A'', grooved at A', and having the needle-bearings slotted outward through the external wall, in contact with the needles in their lower portions, and enlarged at their upper portions to form thread-pockets *b*, all said parts being constructed and arranged substantially as specified.

6. In a circular weft-thread knitting-machine, the knitting-head, consisting of the wheels B O I, the latch-guard F, and the thread-guides B D, each axially adjustable in two planes at right angles with each other, and longitudinally adjustable in two directions at right angles with each other, the post *f*, and the presser-guide L, all constructed and arranged in connection with the seat-rib A'', the latch-needles, and the frame of the machine, substantially as specified.

166,832. CORN-SHELLERS. G. Williams, Tobeconna, Tex. [Filed Apr. 24, 1875.]

Brief.—For removing small kernels before shelling the entire ear.

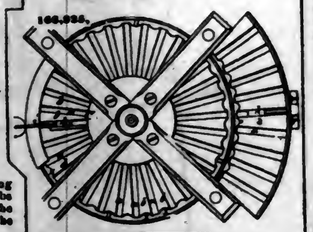


166,832.

An attachment for corn-shellers, consisting of block F, having a conical cavity with ribs or teeth on the inside, and arranged upon the extended end of cylinder-journal, as and for the purpose specified.

166,833. FAUCETS. Ebenezer Wilson, Otto, N. Y. (Filed Feb. 27, 1875.)

Brief.—The body of the faucet is provided with four ducts or passages, through which liquid can be drawn from different vessels. Said ducts are controlled by a rotating plug having apertures in it which register with said ducts. Inside of said rotating plug is located a smaller plug, (operated by a detachable key,) which controls the discharge of liquid from the upper ducts.



1. In a faucet, the tapering body A, having ducts 1 2 3 4, and the tapering plug B, having angular ducts *d* and perforations *b b*, combined and arranged substantially as specified.

2. The rotating tapering plug C, angular groove *f*, in combination with the plug B, having apertures *b* and ducts *d*, and the tapering body A, having ducts 1 2 3 4, substantially as specified.

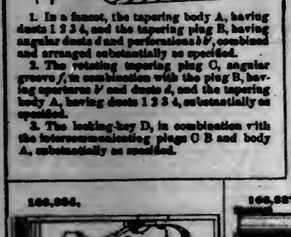
3. The locking-key D, in combination with the interconnecting plugs C B and body A, substantially as specified.

In a machine for grinding wood-pulp, the combination of a revolving emery-rim and a stationary wheel formed with a series of radial grooves, *a*, and the partition *b* between said grooves formed with vertical grooves *x* at their outer ends, and slides *h* placed in the grooves *a*, all substantially as and for the purpose herein set forth.

166,835.

166,836. PAPER-WEIGHTS. John F. Adams, Irvington, assignor to John V. Brower and B. Brower, New York, N. Y. (Filed Dec. 23, 1874.)

Brief.—A cast-iron base carries a hone.



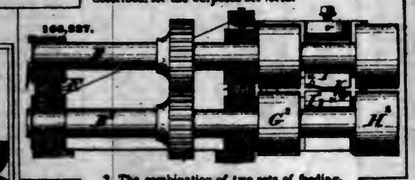
A paper-weight constructed, substantially as described, to serve as a support for the sharpening-hone, arranged as set forth.

166,837. MACHINES FOR STRIPPING LEATHER-BOARD, &c. Emery Andrews, Wolcottville, Ct. (Filed Jan. 20, 1875.)

Brief.—The knife is adapted to cut between two sets of feed-rolls, and above independently-adjustable guides provided with set-screws, for changing the inclination of the cutting-edge, as may be desired.

1. In combination with independent supporting-guides I I', a stripping and skiving knife, K, arranged and supported outside of the feeding-rolls in the direction of their length, or out of their plane or planes of rotation, instead of between the peripheries of the rolls, as heretofore, substantially as herein described, for the purposes set forth.

166,834.



166,838. LOCKING-LATCHES. A. Worster, Groveton, N. H. (Filed Apr. 29, 1875.)

In a locking-latch, the combination of a locking-bolt provided with two arms, D and H, forming an obtuse angle on the under or lower side, as shown in the drawings, and provided with a pin, *c*, and notch *i*, the fixed pin *d*, the spring F, and the latch G, provided with the pin *h*, and operating on the pivot *f* near its center, together with the semicircular cam E, operating by means of the usual knob and shaft on the upper rear extremity of the latch G, as herein before described, and for the purpose set forth.

166,839. PAPER-STOCK GRINDERS. O. Abell, Walcott, Vt. (Filed June 10, 1875.)

166,839.

2. The combination of two sets of feeding-rolls, G G' H H', and a stripping and skiving knife, K, arranged between the inner ends of the two pair of rolls, to secure an equal feed on each side of the knife, and independent support and guidance at the cutting-point, substantially as herein set forth.

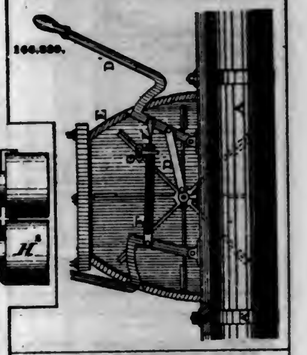
3. In combination with feed-rolls, a pair of supporting-guides, I I', constructed independently of the rolls, and of the knife and knife-stock, and adjustable correspondingly with the rolls, substantially as herein shown and described, for delivering the sheet metal to the knife, in the manner set forth.

4. The guides I I', provided with the pin *n* and set-screw *o'*, for supporting the respective edges of the knife K, and for adjusting the knife as to inclination, substantially as described.

5. The double clamp-stock, composed of the holder L and clamps M N, constructed and combined substantially as shown and described, for supporting the outer end of the knife, and for adjusting the same, in the manner set forth.

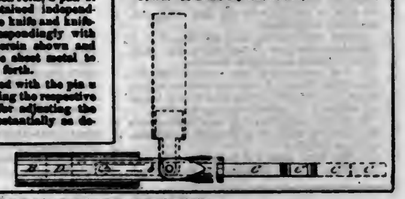
6. The combination of the edge-guide O, the main guides I I', the rolls G G' H H', and the knife K, arranged and operating substantially as herein shown and described, for the purpose specified.

166,836. PADLOCKS. William H. Andrews, New Haven, Conn., assignor to Mallory, Wheeler & Co., same place. (Filed July 9, 1875.)



The combination, in a padlock, of the bar B, the pivoted catch C, the slot H in the edge of the lock, the rotating notched cam P, and drop E upon the outside for rotating said cam, and the key L, substantially as described.

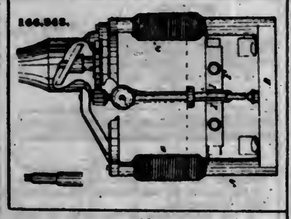
166,839. PROPELLING MECHANISMS FOR BOATS. William Accough, Buffalo, N. Y. (Filed June 14, 1875.)



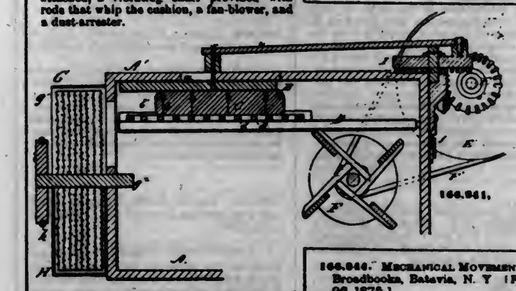
1. The pivoted levers D, extending through the front and rear walls of the paddle-box, in combination with the connecting-rods D' and F, cranks D', and the paddle-wheel C, the whole arranged to operate substantially as described, and for the use and purpose set forth.

2. The combination, with the boat levers D, extending through the front and rear sides of the wheel-box, of the connecting-rods, consisting of the socket F, sliding bar F', and the key G, whereby the levers are connected and disconnected, substantially as described and shown.

166,839.



166,840. APPARATUS FOR CHARGING DRILL-HOLES. Barson G. Baldwin, Leighton, Iowa. (Filed July 20, 1875.)



The improved blasting-charger herein described, consisting of the tube A, having the charge-tube or cylinder B pivoted thereto, and sliding rod C, having the button D pivoted thereto, combined and operating substantially in the manner and for the purpose hereinbefore set forth.

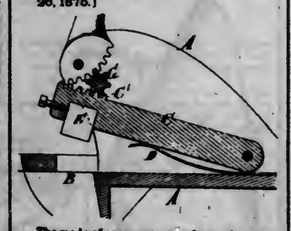
166,842.

166,841. CUSHION-CLEANING MACHINES. Job B. Barry, Philadelphia, Pa., assignor of one-half his right to William R. Jerome, same place. (Filed Feb. 26, 1875.)

Brief.—The box has a hinged lid with a sliding frame underneath, to which the cushion is attached, a vibrating shaft provided with rods that whip the cushion, a fan-blower, and a dust-arrester.

166,841.

1. A car-cushion-cleaning machine having a lid, A', provided with a traversing frame, B, substantially as shown and described.



2. The combination, with the beater-shaft D and main shaft K, of the worm *e'*, wheel I, arm *i'*, and traversing frame B, operating in unison, substantially as shown and described.

3. A dust-arrester having a wire screen or disk or disks, *f*, for the purpose set forth.

4. The cylinder G, disks *c*, and case H, constructed and operating substantially as shown and described.

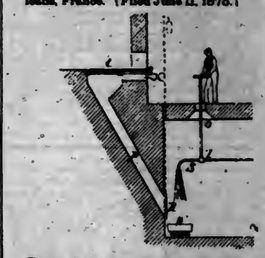
5. The combination of the box A, having the hinged lid A' and traversing frame B, the whipping-shaft D, having rods *d d*, the fan-blower F, shaft E, and dust-arrester G H, constructed and arranged for operation substantially as shown and described.

166,842. MECHANICAL MOVEMENTS. Peter Broadbooks, Batavia, N. Y. (Filed Jan. 26, 1875.)

The mode of communicating forward motion to the part C by means of the cam-headed lever F and the intermediate and interengaged traveling roller G, substantially as set forth.

166,843. BABY-JUMPERS. R. W. Caldwell, Zanesville, Ohio. (Filed Jan. 26, 1875.)

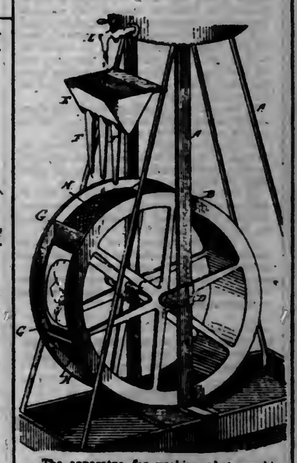
Brief.—The cradle and hobby-horse are interchangeable, and can be adjusted in different positions on the bar, according to the weight of the child.



1. The combination of the base N, springs G G, slotted bar E, foot-rest I, and spring R, substantially as and for the purposes herein set forth.

2. The hobby-horse Z, base D, pommel V, chair B, and clamping device *p*, substantially as and for the purposes herein set forth.

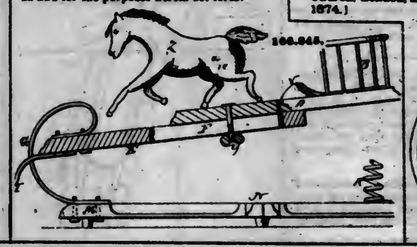
3. The combination of the base N with its flat widened surface end M, springs G G and E, foot-rest I, crib A, loop S, clamping device *y*, and slotted bar E, substantially as and for the purposes herein set forth.



4. The combination of the hobby-horse Z, base or bottom D, pommel V, chair B, clamping device *y*, and the slotted spring-bar E, connected to the base M N, all substantially as and for the purposes herein set forth.

166,844. APPARATUS FOR ECONOMIZING FUEL. Louis Charles Ernest Carre, Orleans, France. (Filed June 11, 1875.)

The combination of the tilting grate A and chute F with the water-pipe S, arranged above the receptacle into which the coke is discharged, substantially as described.

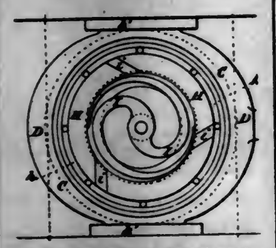


166,845. MACHINES FOR WASHING PHOTOGRAPHS. Jacob L. Caylor, Bonham, Tex. (Filed July 26, 1875.)

The apparatus for washing photographic prints, consisting, essentially, of the bucket-wheel C, having netted or woven fabric attached to its periphery for the reception of the pictures, the trough E, provided with distributing-spouts F, and the water-supply tank I above the same, provided with a tube and stop-cock for directing the water in the spout, all combined and arranged to operate substantially as and for the purpose described.

166,846. BALANCED VALVES. Walter Chas. Church, London, England. (Filed Mar. 2, 1874.)

166,845.



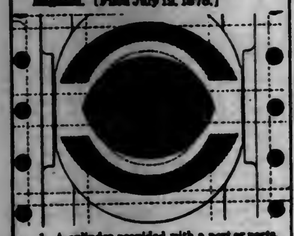
166,846.

166,843. ELECTRO-MAGNETIC DENTAL ENGINES. Joaquim Bishop, Sugartown, assignor to Samuel S. White, Philadelphia, Pa. (Filed Aug. 6, 1873.)

The herein before-described electro-magnetic dental engine, consisting of the combination of the frame, the revolving armature, independent electro-magnets of similar polarity, and the circuit-shifting break-lever, which throws one of the magnets into and the other out of action to reverse the direction of rotation of the armature, substantially as set forth.

1. The combination of the reciprocating frame D and the valve C, having a lateral bearing, by frictional contact with which an intermittent rotation is imparted, as described.

2. The combination of the valve C, loose ring H, sliding in contact with the top of the valve-chest, ring F, secured to the valve, and an L-shaped packing-ring, g, bearing upon the rings F and H, substantially as and for the purpose set forth.



3. The packing-ring H, groove h, and channels i i, and recesses communicating with the groove, as and for the purposes set forth.

4. The combination of the valve-ring H, having a beveled inner edge, and spring I, bearing against said beveled edge, substantially as set forth.

5. The combination of the valve C, ring F, and metallic packing-ring g, confined between the two, and reduced to diminish its bearing on the ring F, as set forth.

6. The combination, with the L-shaped packing-ring g, adapted to bearing surfaces at right angles with each other, of the overlapping segmental plates e, filling the recess or rabbet on the internal side of the L-shaped ring, all as set forth.

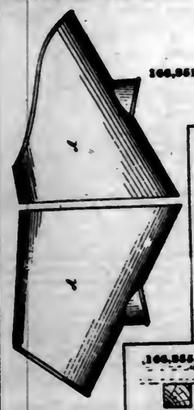
166,850. PUMPS FOR STEAM-ENGINE CYLINDERS. Walter C. Church, Westminster, England. [Filed July 12, 1875.]

1. A cylinder provided with a port or ports, a a, curved and expanding in width from the center to the ends, all as and for the purpose set forth.

2. The combination of the curved port or ports a with the exhaust-port b, widest on its transverse diameter, as set forth.

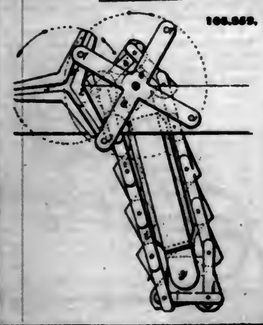
166,860. HUB-BRACE. John K. Clark, Berlin, N. Y. [Filed Jan. 14, 1875.]

Brief.—The rod has a flange on its lower edge, and is passed through the socket from below, the thimble-pieces passing through side slots in the socket. These slots are closed when the rod is in place by the clamp-wire running over them.



1. The rod C and the collar D, constructed with the slots G, in combination with the binding-wire E, having its ends arranged to close the slots G when the rod has been placed in the collar, and thereby secure the rod in place by the ends of the said binding-wire, substantially as described.

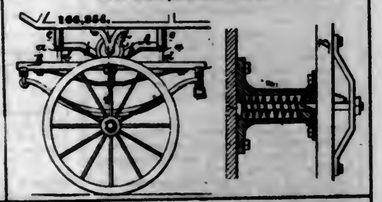
2. The combination of the collar D, constructed with the circular seat b, sockets H, and recesses G, extending laterally from the central opening F, the rod C having the flanges c and thumb-pieces e, and the wire E having its ends passed through the sockets H, substantially as described, and for the purpose set forth.



3. The collar D, constructed with the sockets H and bridges J, in combination with the rod C and binding-wire E, having its ends inserted beneath said bridges, and thereby securing the wires in place, substantially as set forth.

166,861. COAL-HODS. John Cochran, Purdy's Station, N. Y. [Filed Oct. 15, 1874.]

Brief.—The hod has a discharging-spout and a receiving one of larger size, which can also be used as a discharge.



166,862.

The combination of two blocks, A A', having their sides a b c d and e f g h constructed as herein shown, said blocks adapted to be bent up into the shape of two oblique truncated cones, and united at their bases to form a coal-hod, substantially as set forth.

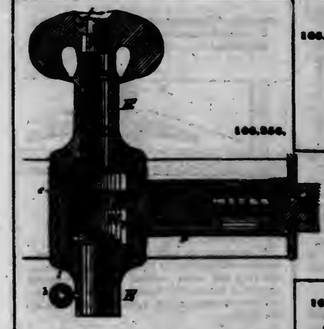
166,863.

166,864.

166,865.

166,866. RAILWAY-FROGS. Jas. Cumming, Buffalo, N. Y. [Filed May 10, 1875.]

Brief.—The flange-bearer rests upon a yielding cushion.



The combination, with the trunk-rails B B' and C C', intersecting each other at any angle, of a yielding bridge-piece, E, provided with the cushion F, and arranged within a recess in the chair-base, and held therein by the heads of the rails, substantially as described, and for the use and purpose set forth.

166,867. LOCKING-LATCHES. G. J. Dickson, Albany, N. Y. [Filed Apr. 2, 1875.]

1. The cross or double-hooked rod a of the sliding bolt C, within a bolt or swell, c, on the hollow spindle E, in combination with the inward projections or spurs i attached to said swell, substantially as specified.

2. The hollow tumbler H, in combination with the bolt or swell c on the hollow spindle E within which the tumbler is arranged, the inward projections or spurs i attached to said swell, and the cross or double-hooked rod a of the sliding bolt C, essentially as described.

3. The combination of the hollow spindle E, made in two parts and joined together at b, the hooks a b, the recess d d, and the bolt or swell c of the hollow spindle, provided with inward projections or spurs i i, substantially as specified.

4. The knob or thumb-piece A connected with the night-catch attachment or mechanism through the hollow spindle E, in transverse relation to the latter, for operation substantially as specified.

5. The arrangement of the hollow cylindrical tumbler H within the swell c of the hollow spindle E, in combination with the night-catch attachment G and the shouldered end of the sliding bolt C, substantially as and for the purpose specified.

6. The combination, with the sliding bolt C, the inward projections or spurs i on the swell c, and the hollow cylindrical tumbler H, of the box S on the sliding bolt, and the connecting-nut r, essentially as and for the purposes herein set forth.

7. The screw-box J, in combination with the case or shell B and sliding latch C, substantially as specified.

8. The combination of the screw-boxes or tubes P and J, with the hollow spindle E and sliding bolt C for securing the lock, essentially as described.

9. The sleeve or cylinder L, arranged within the hollow spindle F, and provided with one or more guards, e, in combination with the rotating key, bolt, or cylinder g and the hollow tumbler H, substantially as and for the purposes specified.

166,868. CHEMICAL TELEGRAPHY. Thomas A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. [Filed July 26, 1874.]

Brief.—Current passing through moistened paper causes evolution of hydrogen, which, uniting with tellurium of styles, forms hydrotelluric acid, leaving red mark on paper.

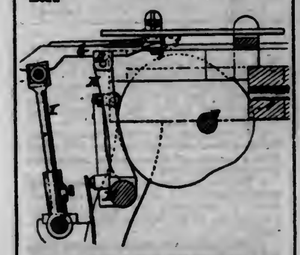
1. The method of recording telegraph or other signals by the electro decomposition upon moistened paper or other material of a stylus of tellurium

2. A paper moistened with hydrates of lime, potash, or the cyanides of potassium, for use with a tellurium stylus, for the purpose set forth

166,869. CHEMICAL TELEGRAPHY. Thomas A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. [Filed July 26, 1874.]

Brief.—Oxygen evolved at tin stylus forms protoxide of tin, which reduces the sesquisalt to a proto salt of iron, which combines with the ferro-cyanide of potassium, to form Prussian blue.

The combination of a sesquisalt of iron with the ferrocyanide of potassium, and a tin stylus, for the purpose set forth.



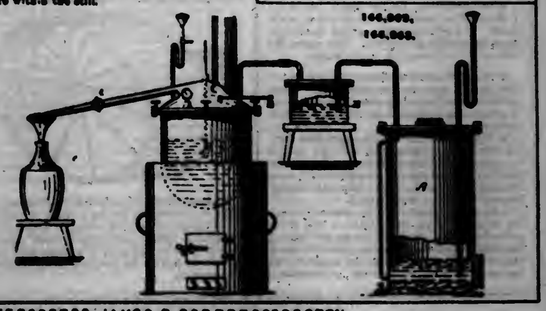
166,870. CHEMICAL TELEGRAPHY. Thomas A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. [Filed July 26, 1874.]

Brief.—Oxygen evolved at styles raises protoxide to a sesqui or per oxide, which combines with the sulpho-cyanide of potassium, to form red sulpho-cyanide of iron.

The combination of a protosalt of iron, sulpho-cyanide of potassium, and a non-oxidizable stylus, for the purpose set forth.

166,871. FEED DEVICES FOR NAIL-FORGING MACHINES. Lucius A. Dodge, Keeseville, N. Y. [Filed July ., 1875.]

Brief.—The gripper-slide G is mounted upon arms H I, attached, respectively, to the rock-shafts E and J, the object being to move it in a true horizontal plane. The cam C gives the backward and the spring F the forward movement.



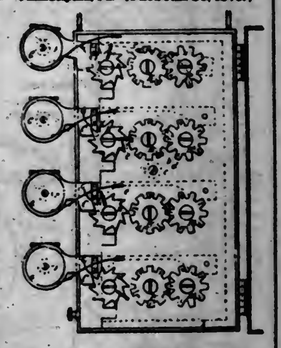
The combination, with the reciprocating gripper-slide G, of the supporting-pivots d d', carried by swinging arms H I, attached to rock-shafts E J, and constituting a free parallel motion for the support, guidance, and operation of said slide, substantially as specified.

166,872. MEANS FOR HOLDING CONDUCTORS' PUNCHES. T. B. Doolittle, Bridgeport, Conn. [Filed May 8, 1875.]

A holder, C, adapted for use with a check or alarm punch or fare-register, consisting of a part, a, for the back of the hand, a connecting-piece, d, and a band, c, for the wrist, all substantially as and for the purpose described.

166,873. APPARATUS FOR THE MANUFACTURE OF SALICYLIC ACID. Wilhelm Ebrenfried Graf, New York, assignor of one-half his right to Saml. W. Caufield, Piermont, N. Y. [Filed June 22, 1875.]

Brief.—A carbonic-acid apparatus and washer are connected with a still, which latter is furnished with a safety valve, and has a step-rest in the neck, in order to create pressure within the still.



166,874. PROCESSES OF PRODUCING SALICYLIC ACID. Wilhelm Ebrenfried Graf, New York, assignor to himself and Saml. W. Caufield, Piermont, N. Y. [Filed June 22, 1875.]

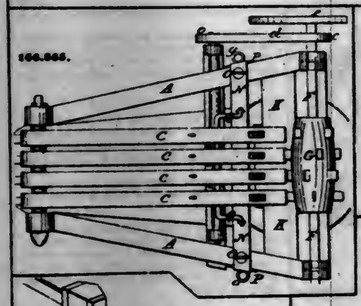
Brief.—As an improvement upon the ordinary process, conducts it in a closed still under pressure.

The process herein described of manufacturing salicylic acid by conducting carbonic acid from a generator into a closed still, which contains a mixture of carbolic acid and an alkali, while its ingredients are heated, substantially as specified.

166,875. FARE-REGISTERS. David Eldridge, Philadelphia, Pa. [Filed Jan. 30, 1875.]

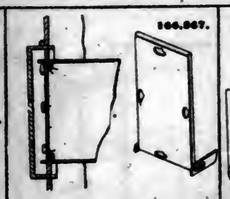
1. The movable visible indicators G, in combination with the bells or annunciators, to indicate the registry of the fare by both sight and sound, substantially as described.

2. The signal-wheels G, or equivalent device, in combination with the levers C, or other mechanism which operates the registering-wheels, in such a manner that each signal shall be set in motion simultaneously with the registering-wheel with which it is combined, substantially as set forth.



166,876. MEAT-CHOPPERS. Wm. L. Fallis, Wesley, Pa. [Filed June 6, 1875.]

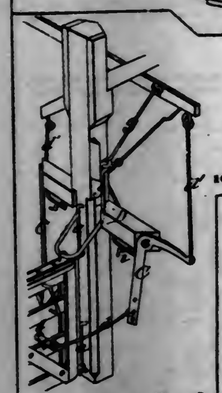
1. The combination of the crooked rod Q with the pivoted cutter-carrying levers and frame of a meat-chopper, as and for the purpose set forth.



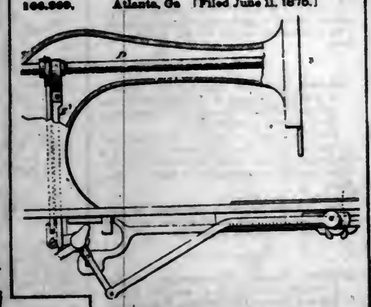
2. The stop-bar N for limiting the descent of the knives, provided with the slotted adjusting-plates P and the adjusting and clamp screws O p, whereby the stop-bar is adjusted, braced, and clamped in position, substantially as herein set forth.

166,877. 166,878.

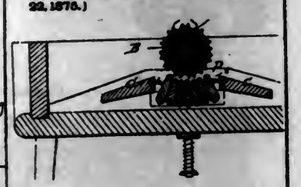
166,866.



166,867.



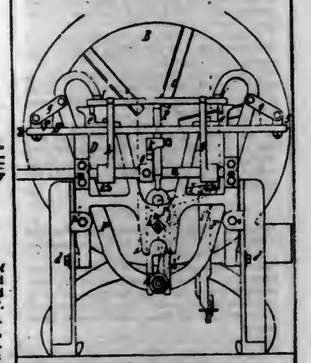
166,868.



166,866.

166,869.

166,870.



166,871. Washing-Machines George W. Holmes, Council Bluffs, Iowa. [Filed July 22, 1875.]

In combination with the aprons C C, vertically-pivoted plate, D D, and springs between the two, the India-rubber roller B secured around a shaft, and provided with longitudinal corrugations *x* and *y*, of unequal sizes, as set forth.

166,872. Machines for Jointing Staves. Edward Holmes and Britain Holmes, Buffalo, N. Y. [Filed Aug. 7, 1874.]

Brief.—The peculiar form of the parts to which the cutters on the cutter-wheel are attached enables it to throw the long shavings from the edges of the staves toward its periphery, from which they pass through a suitable orifice away from the machine.

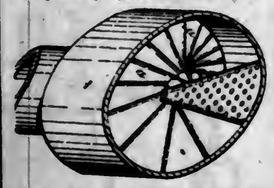
1. The combination, with the cutter-wheel B of a stave-jointing machine, provided with the projections *b'*, of a case partially inclosing the cutter-wheel, and forming in connection therewith a fan, by which the shavings are collected and carried off, substantially as herein before set forth.

2. The combination, with the hinged frame D, stave rests, and clamping-arms F F, of the links *g g*, substantially as and for the purpose herein before set forth.

3. The combination, with the frame D and clamping-arms F F, of the link *s*, bell-crank lever I *l'*, and treadle and link J *j'*, substantially as and for the purpose herein before set forth.

4. The combination, with the swinging frame and clamping-arms, of the shaft *m*, guide-arms L, central support Z, and cam O, substantially as and for the purpose herein before set forth.

5. The combination, with the clamping-arms, provided with concave jaws *f*, of the pivoted self-adjusting rests *e'*, by which the staves are clamped and their edges presented to the cutter-wheel at different angles, according to the width of the staves, substantially as herein before set forth.



6. The combination, with the standards A and concave cutter-wheel, of the swinging curve-supporting frame D, with its pivots *d*, made vertically adjustable in slots in the standard A, to regulate the bilge or curve given to the edge of the stave, substantially as herein before set forth.

166,869. Sewing-Machines T. J. Harper, Atlanta, Ga. [Filed June 11, 1875.]

The combination, in a sewing-machine, of the driving-shaft D, the vertically-guided needle-bar C, the eccentrics E' and F' on said driving-shaft, the two rock-shafts E and F, connected independently to the said eccentrics, and carrying, respectively, arms H' and R, with the feed-lever H, hung upon a fulcrum, L, forward of the feed-bar, and extending back to, and in connection with, the said arms H' and R, whereby it receives a combined reciprocating and vertical vibratory movement, and the feed-bar *f*, all substantially as specified.

166,870. Spark-Arresters D Hawkesworth, Digby, Canada. [Filed July 26, 1875.]

Brief.—The sparks are intercepted by triangular inverted pans, arranged spirally in the smoke-stack from bottom to top, and extending laterally beyond the center.

The spark-arrester herein described, consisting of a cylinder, A, having a series of internal triangular plates, *a a*, arranged circumferentially and spirally, overlapping each other sidewise and at the points, substantially in the manner and for the purpose herein shown and specified.

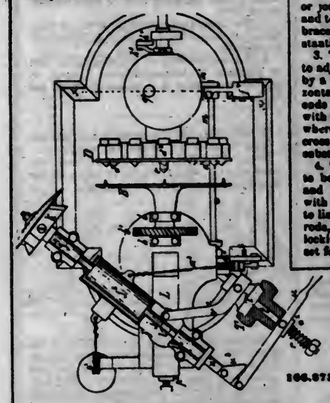
166,866. Automatic Gates. Henry L. Furris and Cyrus Lewis, Alden, Ill. [Filed Apr. 24, 1875.]

Brief.—To open the gate, draw either of the levers E forcibly downward, which, through linked connections, raises the gate, releases the latch, and swings the gate against one of the catches *i*, formed upon the lower ends of endwise-movable spring-rods *j*. A pull upon the opposite lever E releases the latch *i*, and closes the gate.

The combination, with the catches *i* on the rods of endwise-movable rods *j*, of a spring for returning the said catches to their proper position for engagement with staple latches *h* on the gate, substantially as specified.

166,867. Gas Apparatus. Adonis Giachet, Alexandria, Va. [Filed July 21, 1875.]

Brief.—The retort forms the fire-back of the stove. The ebullition-pipe of the gas-holder has a broad disk-shaped top. Gas enters the holder below the surface of the water.



1. In combination with the stove and retort-door, the box-door, the inner edges of which project within the line of the door for the purpose of preventing leakage into the room, as described.

2. The combination of the retort-door having pivot-pins, as described, with the slotted supporting-arms, the construction being such that the door is capable of adjustment upon the supporting-arms, for the purpose of tightly closing the retort, as described.

3. In combination with the gasometer having its supply-pipe discharging in the lower part of the tank, the discharge-pipe *f'* having the disk-shaped cap *f'*, the construction being such that the gas enters at the edges of the cap and passes out at its center, as described.

166,873. Machines for Sawing Barrel-Heads. Edw. Holmes and Britain Holmes, Buffalo, N. Y. [Filed Aug. 7, 1874.]

Brief.—The frame carrying the saw-arbor is made adjustable toward and from the head-clamps in a line with their axis.

1. The combination of the clamping-heads, cutter, cutter-shaft, and swinging frame or bearings thereof, with the pivot of said swinging frame or bearings made adjustable in line of the axis of the clamping-heads, substantially as and for the purposes hereinbefore set forth.

2. The combination, with the clamping-head D, toggle-joint *f' f''*, and foot-lever *f'*, of the locking spring-catch *g*, substantially as herein before set forth.

3. The combination, with the clamping-head D and locking device, of the releasing-cam and shaft *h' i*, arm *h''*, hooked rod *h'*, and revolving cam *i*, substantially as and for the purpose hereinbefore set forth.

4. The combination, with the treadle of the clamping mechanism, of the rock-shaft *m*, arm *w'*, chain *w''*, spring *w'*, and swinging cutter-frame J, for simultaneously clamping the head-blank and swinging the cutter in contact with the latter, substantially as herein before set forth.

5. The combination, with the swinging frame and driving-shaft, of the clutch T T' and clutch-arm *v'*, substantially as and for the purpose herein before set forth.

6. The combination, with the friction-clutch T T' and arm *v'*, of the auxiliary releasing spring-lever *u* and adjustable stop *u'*, substantially as herein before set forth.

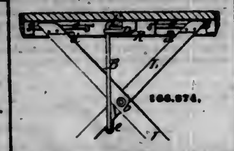
7. The combination, with the sliding pivot-block L and clamping-head D, of the oval cam *q*, roller *q'*, and mechanism connecting the latter with the block L for cutting the heads slightly oval, substantially as herein before set forth.

8. The combination, with the clamping-head D, provided with the oval cam *q*, of the weight *q''*, for causing the head D, after being released, to assume the proper position for the next cutting operation, substantially as herein before set forth.

9. The combination, with the swinging frame and sliding pivot-block L, of the chain *w'*, connecting with the treadle and provided with a spring for taking up the slack thereof, substantially as herein before set forth.

10. The spring head-rest *s*, arranged so as to be swung out of the way by the head-blank as it revolves, substantially as herein shown and described.

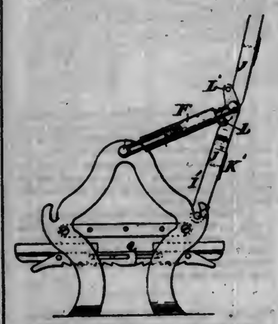
166,872. Adjustable Folding Tables. Cyrus S. Hood, Corning, N. Y. [Filed July 12, 1875.]



Brief.—The legs in each pair are loosely pivoted together in an X shape. The upper ends slide on rods, so that the table can be adjusted in height, and that the legs may also be folded against the table-top.

1. In a cutting and basting table, the combination, with the table T, of the supporting cross-legs L, having the horizontal rods *a*, with the table and the cross-joist-bolt *b* connection, whereby the legs may be adjusted upon their rod-hinges by a sliding movement cross-wise to raise and lower the table, and be folded with the table lengthwise, substantially as herein set forth.

2. The combination, with the legs L, hinged or jointed at *b* and *a*, to be adjusted in height, and to fold inward, as described, of the hinged brace-rod B and hold-fast button O *i*, substantially as and for the purpose described.



3. The combination, with the legs L, hinged to adjust the table to a greater or less height by a sliding movement cross-wise upon horizontal way-rods *a*, of side pins *c* on the hinged ends of said legs, the cross-rail E, provided with the notches *d*, and the brace hold-fasts *i*, whereby the legs are locked and braced both cross-wise and length-wise to support the table, substantially as herein set forth.

4. The combination, with the X-legs, hinged to be adjusted upon horizontal way-rods *a*, and provided with pins *c*, for interlocking with the cross-rail, of the steps *c'*, whereby to limit the movement of the legs upon said rods, to bring them coincident with the interlocking notches, substantially as herein set forth.

166,874.

166,873. Railway-Car Seats. Numon N. Horton, Kansas City, Mo. [Filed Dec 1, 1874.]

1. The stays E E' F, formed with screw-threads for adjusting the back, in the manner substantially as described.

2. The stays E E' F, constructed with screw-threads for adjusting the seat-back, and with a slot at each end sliding on studs on the seat arm and back, respectively, for the purposes set forth.

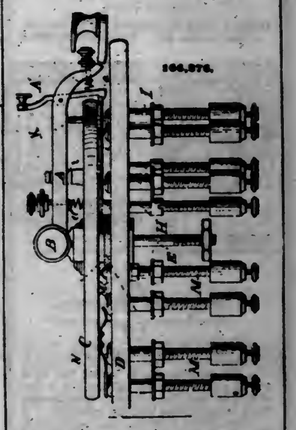
3. The combination of the pivoted central section H, the two end sections I I', arms J J', and the stops K K', as described, whereby the lower section is held in line with the central section, as explained.

4. The head-rest I and arms J, pivoted at the axis of the back H, and provided with stops L, to engage beneath the stays F, as set forth.

166,874. Compound Telegraph-Keys. Marcus L. M. Hunney, Menlo Park, assignor of one-half his right to Geo. W. Barker and William Ettinger, Jersey City, N. J. [Filed Aug. 6, 1875.]

Brief.—In base of key is formed a switch-board, so that by revolving the key it may be thrown into any desired one of the circuits connected thereto.

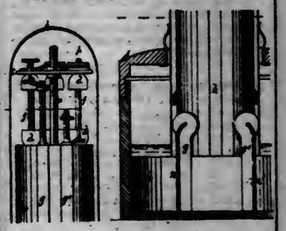
1. The combination, with a single key, of one or more naviles, each representing a different wire or circuit, and all so arranged that the movement of said key or its support serves to bring said key into suitable connection with any desired one of said wires or circuits, substantially as described.



2. The combination of a single key-lever, contact-point, and anvils, as described, with a connector and local contact, so arranged that upon the movement of said key to connect with any one of the line-circuits the local battery and proper sounder connections are simultaneously made, substantially as and for the purposes set forth.

3. The combination, with the main or operative lever, of an auxiliary or spring lever, adapted to hold the main circuit closed when such circuit is not in use, whereby but a single contact-point is needed, substantially as and for the purposes set forth.

4. The combination of two disks or plates, one provided with a single key lever, and the other provided with one or more contact-points, through which various telegraphic circuits pass, one plate being movable in relation to the other, whereby the movement of one plate upon the other brings the key-lever into position to operate any desired circuit of the series, substantially as set forth.



5. The combination of the key, the table C, and spring O with posts M, circle-connector M', and post N, substantially as and for the purposes set forth.

6. The combination of the key A and latch-spring A' *a* with the circuit-plate O, posts K and I *i*, substantially as and for the purposes set forth.

166,876.

166,877. Electric Lights. Stephane Alexandrovitch Kosloff, Paris, France. [Filed June 23, 1875.]

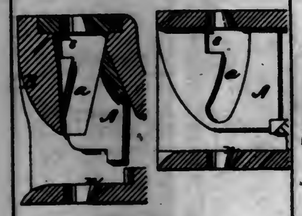
1. The carbon electrodes provided with insulated supports independent of the metallic conductor, substantially as herein described.

2. The combination of the carbon-pins *f*, having the enlarged ends *d*, with the metal conductors *e*, inserted into the said enlarged ends of the carbons, substantially as shown and described, for the object specified.

3. The combination of the carbon-pins *f*, having the enlarged ends *d*, the wires *e*, and the links *c*, flexibly connecting said wires and the principal conductors, as herein shown and described.

4. The supporting column *h*, arranged within and filling a portion of the globe or cover *k*, substantially as and for the purpose herein specified.

5. The combination of the globe h, the ori-ence h, and the valve n, surrounding said ori-ence horizontal and the plate, and constructed to permit the escape of the dilated air from the globe, and prevent the entrance of the external air, substantially as shown and described.



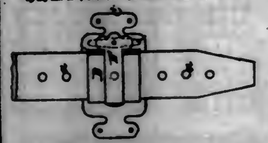
6. The combination of the thin sticks of carbon f, their enlarged ends d, the wires e, inserted in said enlarged ends, the flexible connections a, the insulating plate c, the plates r, screw i, pins p, washers q, and nuts k, substantially as and for the purpose described.

7. The combination, with the carbon of carbon electrodes, and a flexible connection connecting with the electric conductors, and constructed to automatically pass the electric current from one carbon electrode to the other in case of the breakage of either, as set forth.

166,878. DENTAL CEMENTS. M. T. Labbe, Paris, France. [Filed May 20, 1875.]

The herein-described dental cement, consisting of oxide of zinc, oxide of iron, calcined silica, in the proportions substantially as specified, combined with the agglutinating solution, consisting of chloride of zinc and hydrochloric acid, in the proportions and prepared substantially as described.

166,879. CAR-COUPLINGS. Wm. Lennon, Union Bridge, Md. [Filed July 23, 1875.]



1. The coupling-pin F, having the cross-arms f f, and the lower end inclined or bevelled on its rear edge, as shown at n, substantially as and for the purposes specified.

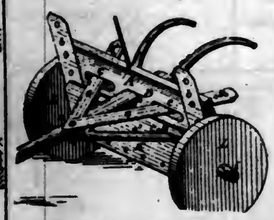
2. The blocks A, having the grooves a a inclined downward and forward, in combination with the pin F, having cross-arms f f, substantially as and for the purposes set forth.

3. The blocks A, having the grooves a a, combined with the shoulders r r at the upper end of the grooves, and operating in combination with the pin F, as described, for the purposes specified.

166,880. BUCKLES. Laurens Looser, Brooklyn, E. D., N. Y. [Filed Aug. 6, 1875.]

A buckle composed of a guide-bar, B, for a belt or strap, a hinged bar, F, subscribing at right angles to the guiding-channel, and having a bevelled end and a spring beneath its back, substantially as shown and described.

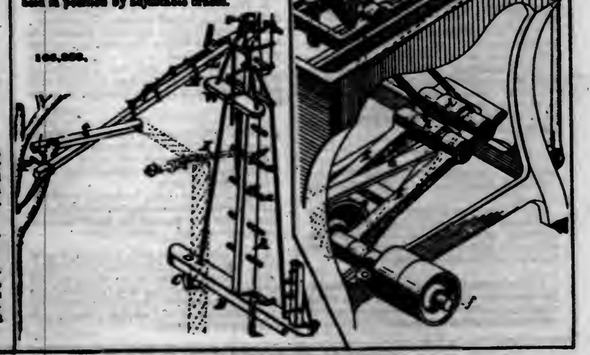
166,881. INCRUSTA-TABLES. R. G. McClain, Bloomington, Ill. [Filed June 26, 1875.]



The combination, with the leaning-board A and hinged legs D D and E E, of the link b, notched rod c, and adjustable slide b, with set-screw d, and the sliding arms e e, substantially as and for the purposes herein set forth.

166,882. SCRAPERS. Joseph Megill, Coalton, Md. [Filed July 7, 1875.]

Brief.—A road-scraper with adjustable tongue, having two pairs of arms pivoted thereto, the lower pair diverging downward to act as braces, and both pairs passing through slots in the scraper-frame and secured by pins. The adjustable main frame is provided with a scraper and a plow, and with perforations to adjust it upon the side of the frame.



1. The combination of the adjustable tongue C, having two pairs of arms or brackets, e e e e, pivoted thereto, and the latter pair, e' e', diverging in a downward direction from e e, with the adjustable main frame A, having slots or perforations B B B B, and bar or scraper K, substantially as and for the purpose herein set forth.

2. The combination of the adjustable main frame A, having bar or scraper K, with the plow P, having perforations p p, by which it may be adjusted upon the side of said frame, substantially in the manner and for the purpose herein set forth.

166,883. LADDERS. Abraham S. Miller, Republic, Ohio, assignor of one-half his right to P. P. Wilber, same place. [Filed July 12, 1875.]

Brief.—The ladder consists of a single plane of timber, with cross-pieces or rounds passing through it, and is intended to be used in a vertical position. The base of said ladder is supplied with adjusting-timbers, and the ladder is held in position by adjustable braces.

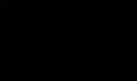
166,884.

1. The combination of a vertical ladder-standard and a brace or stay-brace for securing the same to any object with which it may be used, substantially as herein described.

2. The combination of the standard A, base-beam B, and adjusting-post D, substantially as set forth.

3. The combination, with the brace or stay-bar L', of the serrated hooks U, substantially as set forth.

4. The combination of the adjustable seat or platform W, suspension-cord X, hook Y, and vertical ladder A a, substantially as set forth.



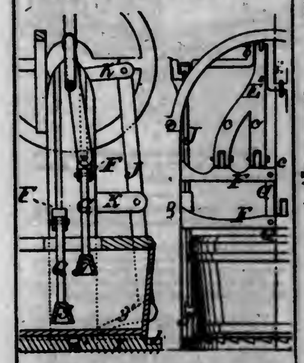
166,885. SHADE-HOLDERS. Thos. Morse, New York, N. Y. [Filed Feb. 13, 1875.]

Brief.—The radius-arms are provided with notches, with which the lower edges of the slots in the gravitating-arms engage.

The combination, in a shade-holder, of the gravitating-arms, provided with slots, with radius-arms extending from a central collar, said gravitating-arms and radius-arms being constructed to operate substantially as and for the purpose specified.

166,886. BEARING-SURFACES FOR SPINDLES. Elias D. Murby, New York, N. Y. [Filed Mar. 4, 1875.]

A bearing or wearing surface for journals and other purposes, composed of a paper coil or roll compressed in direction of its axis, substantially as specified.

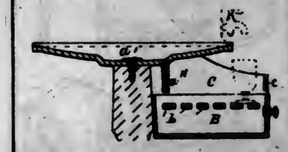


166,887. PREPARATIONS FOR BEARING-SURFACES FOR SPINDLES. Elias D. Murby, New York, N. Y. [Filed Mar. 4, 1875.]

The preparation of paper bearing and wearing surfaces for spindles and other purposes by the treatment of the paper with a hardening solution composed of glue and water, with or without other ingredients, substantially as specified.

166,888. SAWING-MACHINES. A. T. Nichols, Williamsport, Pa. [Filed June 8, 1875.]

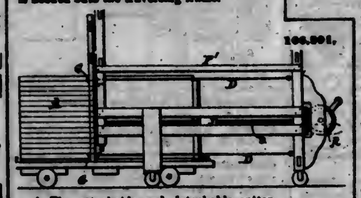
The drum E E, hinged to the shaft f, free at their outer ends, and having pulleys h h, and acting as a guide and a tightener for the belt G, in combination with the device for moving the saw-frame, substantially as herein set forth.



166,889. WASHING-MACHINES. Daniel Palmer, Mahlon Palmer, and Charles B. Briggs, Iola, Kans. [Filed June 5, 1875.]

The horizontally-reciprocating pounder-shafts G and their crank-heads F, moving vertically in guides, in combination with the crank-shaft C, pinions E' E', vibrating lever J, provided with pawl g, and the rotary tub and its support I, provided with a rack, all operating substantially as described.

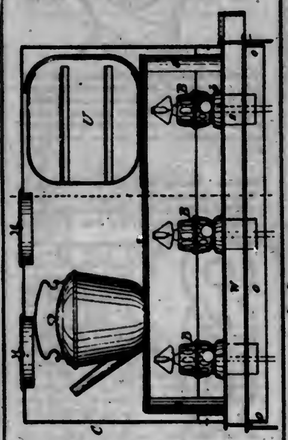
166,890. STANDS FOR WATER-COOLERS. Christopher R. Porter, Philadelphia, Pa. [Filed July 6, 1875.]



Brief.—A drawer receives the drip from the tumbler, and also from the platform that holds the cooler, said drawer being located near the top of the standard.

The sliding and removable drawer B, with its series of grate-bars b', and the supporting side pieces C C and their connecting-piece c, in combination with the platform a', provided with the drip-tube c', the said parts being constructed and arranged substantially as and for the purposes set forth.

166,891. SOAP-SHAVING MACHINES. John C. Babcock, Indianapolis, Ind. [Filed May 21, 1875.]



Brief.—The cutter-frame may be placed before the block of soap to be drawn backward, or behind the block to be pushed forward. It is hooked onto the traversing frame.

1. The attachable and detachable cutter-frame C, constructed as described, and held in place by iron rods D D, as and for the purpose herein shown.

2. The combination and arrangement of screw-rods O O, gearing E E, cross-bar J, slide-cover I, cutter-frame C, and connecting-rods D, with a suitable frame, F', operating substantially as and for the purpose herein set forth.

166,892. LAMP-STOVES. Mary F. Rathbun, Owego, N. Y. [Filed Jan. 2, 1875.]

1. The combination, with the closed movable cap C, provided with the open space c', of the inner stand a for cooking-vessels, the burners B, and the closed water-protection plate W, whereby the heat is supplied to all sides of the cooking-vessels within the chamber of the cap, and the reflection of the heat therefrom upon the surface-water prevented.

2. The water-plate W, provided with the burners B, in combination with the valved apertures or holes, passing directly through the water in the chamber-plate, to accommodate the wick-tubes, and keep them from being unduly heated, as shown and described.

3. The open-top reservoir O and the closed water-protection cover W, fitted within each other by the vertical marginal flanges e, whereby the water-plate, with its burners, may be removed from the reservoir to allow it to be filled quickly and easily, and prevent explosions.

166,893. CRUTCHES. William Redhoffer, St. Louis, assignor of two-thirds his right to W. H. Odell, St. Louis, and Jos. S. Odell, Kansas City, Mo. [Filed Dec. 4, 1874.]

Brief.—The elbow-rest is composed of a tin cylinder provided with seamless flanged rims at top and bottom. The cover has the hole through which the dasher-shaft passes re-enforced with an iron ring, so that it can be removed by a blow of the dasher without battering it. The dasher-shaft is wedged into the dasher, and a tin cap soldered over the end.

1. A churn-cylinder composed of tin-plate, constructed with flanged ends, and provided with a flanged base and a flanged rim, both of which are seamless, and which are united to the cylinder by a telescoped soldered joint, substantially as described.

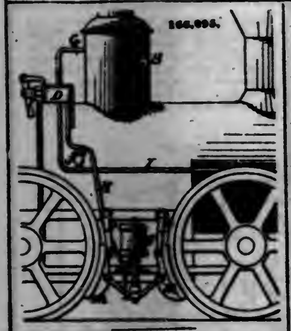
2. The close-fitting concave tin-plate cap or cover of a reciprocating churn, with an iron shouldering rim at its center, substantially as described, whereby the removal of the cap may be effected without injury thereto by an upward blow of the dasher, as set forth.

3. The churn-dasher composed of the expanded wooden handle, the tube t, and plate f, in combination with the hollow frustums of cones, substantially as described.

166,894. WASHING APPARATUS. John F. Reilly, Washington, D. C. [Filed May 21, 1875.]

The combination, with cover A and pan B, of the intermediate longitudinal perforated steam-pipe E and the overflow-pipe H, arranged substantially as and for the purpose described.

166,895. STEAM-BRAKES FOR LOCOMOTIVES. Leonard B. Gallaway, Mount Vernon, Ill., assignor of one-half his right to Edward F. Winslow, St. Louis, Mo., and George S. Winslow, Mount Vernon, Ill. [Filed July 16, 1875.]



Brief.—A safety-valve is arranged in the supply-pipe, and delivers surplus steam into the exhaust-pipe.

1. In a locomotive steam-brake, the over-pressure valve J, placed in inlet-pipe H, which communicates from steam-chest to brake-cylinder, connected to and communicating with exhaust-pipe I, as and for the purposes described.

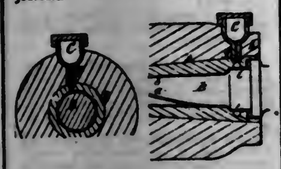
2. The combination, with the supply and exhaust pipes H I, communicating through the over-pressure valve J, of the slide-valve D, steam-drum B, and brake-cylinders B, all arranged as described, substantially as and for the purposes set forth.

3. The combination and arrangement of the exhaust-pipe I, leading from the slide-valve to the smoke-box of the locomotive, with the over-pressure valve J and supply-pipe H, substantially as and for the purposes specified.

166,898.

166,899. Fabrics for Coverlets. Henry Schoderwald, Philadelphia, Pa. [Filed May 31, 1875.]

A quilt fabric of compact, uniform texture throughout, double, and figured on both faces, consisting of alternate coarse and fine warps and wefts, the fine weft interwoven with and tying down the two warps alternately on the opposite faces, as set forth, thereby forming two fabrics, combining between them the coarse weft, which, with the fine warp, composes part of the figure, while in the remainder the coarse warp alone appears.

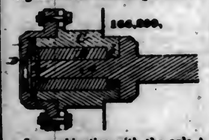


166,897. Stove-Ornaments Machines. C. E. Schoenmeyer, Cumberland, Md., assignor of one-half his right to J. H. Furey, same place. [Filed July 10, 1875.]

In combination with the adjustable jaw K and the movable jaw H, provided with a slotted arm, G, and pivoted at or near its bottom, the cam E and shaft C, arranged above the plane of the axis of the jaw, and operating to move the jaw H through a quarter circle, substantially as and for the purposes set forth.

166,898. Lubricating-Axles for Vehicles. Alexander Gabriel, Rochester, N. Y. [Filed July 10, 1875.]

Brief.—To equally diffuse the oil over the journals.



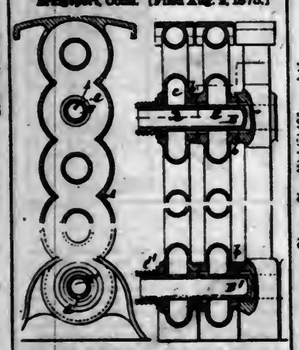
The spindle B, having the grooves a a, extending in spiral lines in opposite directions from the cavity c at one end of the spindle, and supported by the closed space d at the other, and adapted to operate in connection with the axle-box D and oil-cup C, substantially as described, for the purposes specified.

166,899. Car-Wheels. Andrew Schrock, Massillon, Ohio, assignor of one-half his right to Killinger & Co., same place. [Filed Jan. 26, 1875.]

Brief.—Cap on outside of wheel for excluding dirt while admitting lubricant.

166,900.

In combination with the axle A, sleeve B, and flanged hub C, the cap D, secured upon the exterior rim of the hub, as set forth.



166,900. Caps. Adolph Schwarz, New York, N. Y. [Filed Aug. 6, 1875.]

Brief.—Provides an elongated "ear and neck muff," which may be attached to either side of the cap. When not in use it is wound around the lower part of the crown, and there fastened by suitable devices.

As a new article or manufacture, a head-covering, consisting of the crown portion A, provided with a fastening device, a, and folding visor C, the elongated neck and ear muff B, provided with fastening devices b c, substantially as described, and for the purpose set forth.

166,901. Steam-Radiators. William B. Snow, Brooklyn, N. Y., assignor to himself and Bates, Cole & Burnham Company, Bridgeport, Conn. [Filed Aug. 2, 1875.]

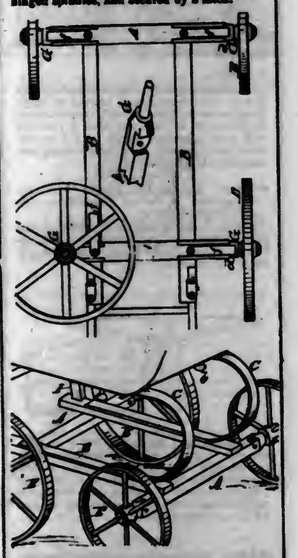
1. In a radiator composed of independent upright sections, the combination, with said sections, of perforated inlet- and egress pipes, constructed to unite or tie the several sections together at their joints, substantially as specified.

2. The screw-threaded flanged heads G G' in combination with the perforated pipes B B, and the radiator-sections A A, each heads forming chambers, between which and the nuts D D' on the said pipes the radiator-sections are clamped, substantially as herein set forth.

3. The obliquely-arranged perforations e in the ingress-pipe B, in combination with the upper curved or circular passages c of the sections A, substantially as and for the purpose specified.

166,902. Hame-Fastenings. Saml. Spicer, Goodrich, Mich. [Filed June 21, 1875.]

1. The lever C having a slotted aperture, c', for the pin a, teeth c', arranged to engage the teeth b of the slide, and also its free end, fitted to engage in the notch c', as and for the purpose set forth.



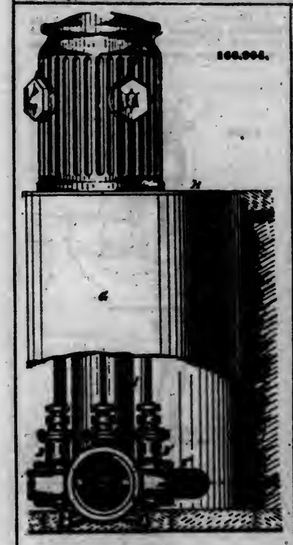
166,902.

2. The combination and arrangement of the body A, slide B, and slotted lever C, as and for the purpose set forth.

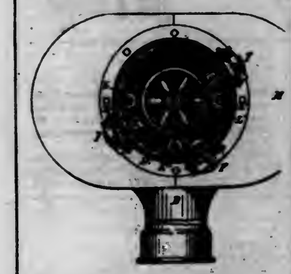
166,903. Children's Carriages. Joseph F. Staub, Greenville, Ill. [Filed June 23, 1875.]

Brief.—The carriage-body is fastened by a loop and set-screw to one end of the springs, the other being fastened to a frame supported upon axles having wheels fastened to them on hinged spindles, and secured by a latch.

1. A baby-carriage having its wheels placed upon hinged spindles, so as to turn the wheels under the supporting-frame, for the purposes herein set forth.



2. The combination of the supporting-frame A B, hinged spindles G, wheels E, and latches f, substantially as and for the purposes herein set forth.

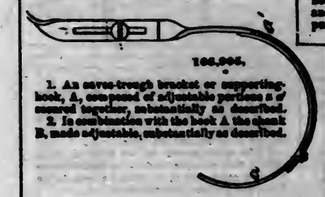


3. The combination, with the frame A B, supported upon folding wheels E, of the springs U C, the arb D, with loops a, and set-screws b, all substantially as and for the purposes herein set forth.

166,904. Steam Fire-Engine Hydrants. Richard T. H. Stillman, Philadelphia, Pa. [Filed June 10, 1875.]

Brief.—The valves are operated by a spur wheel or wheels and pinions, so arranged that they may be opened and closed together, or one or two valves may be operated independently of the others. The valve mechanism and lever part of hydrant are inclosed in a case of suitable material, as shown.

166,904.



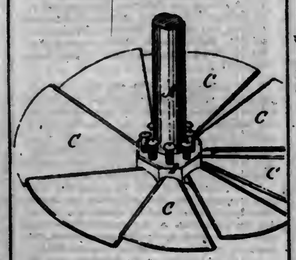
1. The combination of the main pipe D, branches E, E', and F, valve-casings E, E', and F', and vertical discharge-pipes G G G', substantially as herein shown and described.

2. The combination, in a steam fire-engine hydrant, of a casing, G, provided with an adjustable cover, H, and made of sufficient capacity to admit a person for the purpose of oiling or repairing the valves or any of the parts beneath the ground surface, substantially as shown and described.

3. The combination of the valve-rods K, K', and K'', pinions L, L', and L'', spur-wheel M, and bevel-wheel N, arranged to operate the main valves in unison or independently, as occasion require, substantially as shown and described.

166,905. Raven-Trough Hangers. Henry K. Stobler and Thomas F. Stobler, Mount Joy, Pa. [Filed July 17, 1875.]

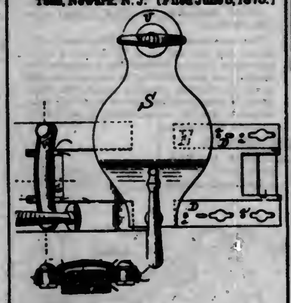
166,905.



1. An eave-trough bracket or supporting-hook, A, composed of adjustable portions a a' secured together, substantially as described.

2. In combination with the hook A the shank B, made adjustable, substantially as described.

166,906. Augers for Flour-Packers. Samuel Taggart, Indianapolis, Ind. [Filed June 6, 1875.]



Brief.—The blades may be set at any angle desired in packing the various kinds of flour.

1. A flour-packing auger, having sectional or independent blades, capable of being set at any desired angle or degree of inclination, substantially as herein shown, for the purposes set forth.

2. The combination of the sectional adjustable blades C, having shanks a, with the hub B, shaft A, and fastening-screws b, as and for the purposes set forth.

166,907. Harness Saddle-Trees. Andw. Tone, Newark, N. J. [Filed June 5, 1875.]

1. The removable bridge I, constructed and operating substantially as and for the purposes set forth.

2. In a jockey-saddle, the removable bridge W secured to the lower end of the tree to hold the skirt and backband in place, as herein described.

3. Rest S, provided with extension U, in combination with turret V, or bolt, substantially as and for the purposes set forth.

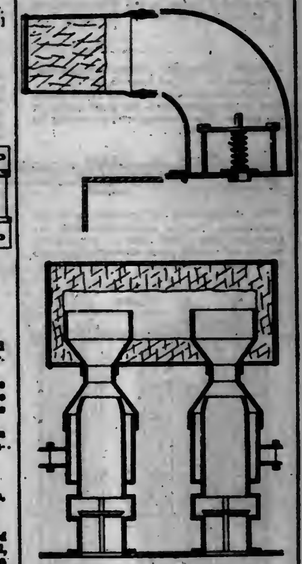
166,908. Animal-Forks. Henry Weston, Scamp, Iowa. [Filed July 20, 1875.]

1. An animal-poke adapted to be placed longitudinally upon the face of the animal, having a nose-ring at the lower end, and a forwardly-projecting tongue at the top, as and for the purposes described.

2. The combination, with bar A, having nose-ring B and tongue C, of cross-bar D, and the rings and rods E F, as and for the purposes set forth.

166,908.

166,909. Rings for Spinning-Frames. J. W. Wattles, Canton, Mass. [Filed Mar. 24, 1875.]



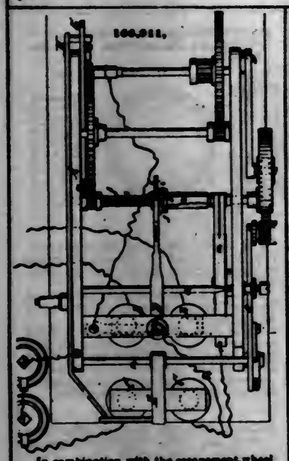
1. A spinning-frame ring provided with the two races a b, and the intermediate groove c entirely encircling it, and arranged as described.

2. A spinning-frame ring provided with two races, a b, and an eccentric, f, arranged therewith as specified.

3. The combination of a split or sectional annular or ring-holder, B, with a spinning-frame ring, A, provided with two races, and an intermediate groove, c, or eccentric f, or with both groove and eccentric, all being substantially as and to operate as specified.

166,910. Exhaust-Nozzles. Hartshorn White and Morris Levy, Phillipsburg, N. J. [Filed July 14, 1875.]

Brief.—The steam exhausts into an absorbent surrounded with a sheet of perforated flexible material, through which it escapes into the atmosphere.



The combination, with a steam-pipe, of a perforated hood or lampmant constructed of rubber or other flexible material, and filled with an absorbent material, substantially as and for the object specified.

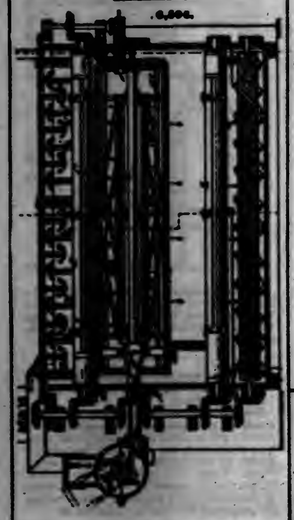
166,911. Printing-Telegraphs. Alois Wirsching, Brooklyn, E. D., N. Y. [Filed Apr. 30, 1875.]

Brief.—Circuit to printing-magnet is through a revolving pin upon escapement-wheel, and a revolving pin attached to toothed collar upon type-wheel shaft, the two being brought together by the stopping of the escapement-wheel. When the wheel begins to revolve, the pin upon it is carried forward by the strong of the coiled spring against a non-conducting pin projecting from the insulated collar.

166,911.

In combination with the escapement-wheel, mounted loosely on the type-wheel shaft of a printing-telegraph, and connected to the same by a spiral spring, and with the armature of the line-magnet, the pins *g h i*, insulated metallic collar *j*, spring *m*, and printing-magnet C, substantially as and for the purpose set forth.

166,919. Vernier. Alfred Young, Philadelphia, Pa. (Filed June 16, 1870.)



Brief.—Glass cover of the vernier is graduated to correspond with the graduations on the vernier, thus avoiding error in reading by reason of parallax.

166,919.

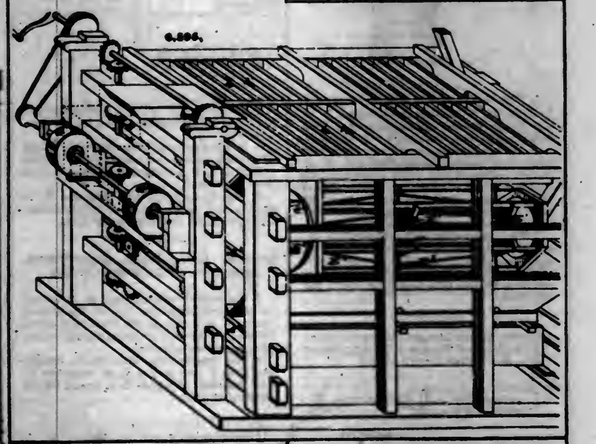
The vernier-cover A, provided with the graduations *a a*, in combination with the graduated plate C and plate D, carrying the vernier and vernier-cover, substantially as and for the purpose set forth.

6,506.

REISSUES.

6,506. Machines for Bolting Flour. W. F. Cochrane, La Fayette, Ind., assignor, by mesne assignments, to himself, Rodney Mason, and William Warder. Patent No. 37,221, dated Jan. 6, 1863; reissue No. 6,029, dated Aug. 20, 1874. (Filed July 26, 1870.)

1. In combination with the bolt and air pipes and valves for feeding and delivering without allowing the air to pass therewith, the collecting-chamber for simultaneously feeding, separating, and delivering the flour, while the light particles carried with the air current are deposited, and the blast continuously maintained, substantially as set forth.



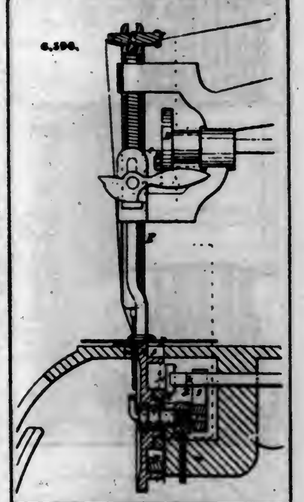
2. In combination with the screen and blast and suction-pipes, the collecting or deposit chamber, wherein dead-air spaces are formed for the deposition of the specifically heavier particles carried up by the atmospheric currents by gravity, substantially as set forth.

3. In combination with the screen and fan for inducing air-currents through the screen, the trapped feed, which prevents the passage of the air at the same time that it admits the meal to the chest, and the collecting or deposit chamber through which the air is forced, wherein the solid particles carried out by the current are deposited by gravity in the dead-air spaces, substantially as set forth.

6,506. Machines for Bolting Flour. W. F. Cochrane, La Fayette, Ind., assignor, by mesne assignments, to himself, Rodney Mason, and William Warder. Patent No. 37,221, dated Jan. 6, 1863; reissue No. 6,029, dated Aug. 20, 1874. (Filed Aug. 11, 1876.)

The combination, in a bolting-chest, of a screen and fan and pipe for directing an atmospheric current through the meshes of the screen, and the collecting or deposit chamber in the air-adduction passage, wherein the deposition of solid particles drawn up by the blast occurs by gravity, substantially as set forth.

6,506.

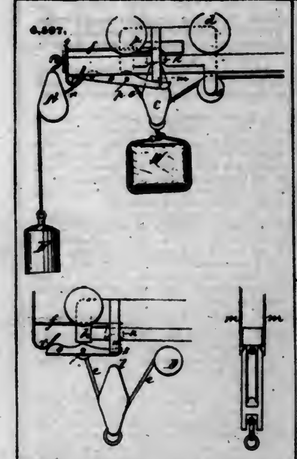


6,506. Sewing-Machine. Christopher Redgrave, Marlborough, N. H., assignor to Matilda D. Sharps, Philadelphia, Pa. Patent No. 60,093, dated Oct. 9, 1866. (Filed July 7, 1875.)

1. The combination of the horizontal rod B, having holes *r* for the passage of the thread, the pressure-pin *o*, and arbor B, substantially as and for the purpose set forth.

2. The combination of the screw *n* with the stationary projection J, having a slot, *t*, and the nut E, for adjusting and supporting the feed mechanism, substantially as set forth.

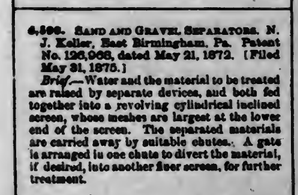
6,506.



6,507. Hoisting Apparatus. Joseph Hoffman, Lebanon, N. J., assignor, by mesne assignments, of one-half interest to N. W. Hoffman. Patent No. 117,778, dated Aug. 8, 1871. (Filed June 21, 1875.)

Brief.—As soon as the body is raised to the desired position, the device is changed into a carrying apparatus, to carry the article raised.

1. The elevating pulley and the weight-ropes *a a*, the hooks *m m* or their equivalent, in combination with the lever *o o*, and incline *r*, for disengaging the pulley, substantially as and for the purposes set forth.



2. The arrangement of the hook or lever catch *f*, and movable block *k*, in combination with the catch-rods *n n*, lever *o o*, and frame A, as and for the purposes described.

6,507.

6,508. Sand and Gravel Separators. N. J. Keller, East Birmingham, Pa. Patent No. 126,003, dated May 21, 1872. (Filed May 31, 1875.)

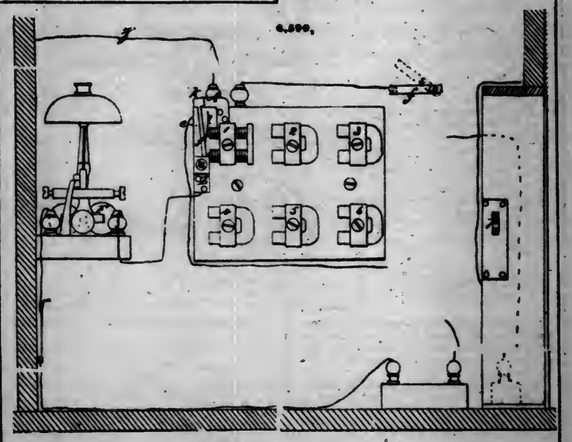
Brief.—Water and the material to be treated are raised by separate devices, and both fed together into a revolving cylindrical inclined screen, whose meshes are largest at the lower end of the screen. The separated materials are carried away by suitable chutes. A gate is arranged in one chute to divert the material, if desired, into another finer screen, for further treatment.

6,508.

1. The combination of a dredging apparatus for dredging and elevating the material, a screen for separating the material, and a device for elevating and discharging water into the screen, substantially as specified.

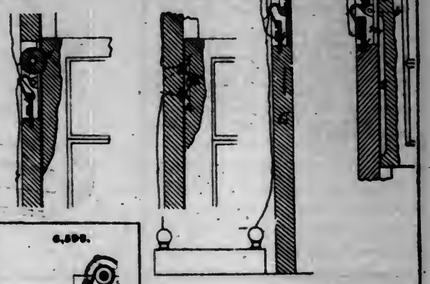
2. The combination of a screen composed of two or more sections of different-sized mesh, two or more receptacles for receiving the separated material, and a device for supplying water to the screen, substantially as specified.

3. The combination of a cylindrical screen, suitable devices for elevating water and the material to be separated, and feeding the same to the screen, a receptacle or receptacles for the material which has passed the screen, and an elevator or elevators for conveying away the screened material.



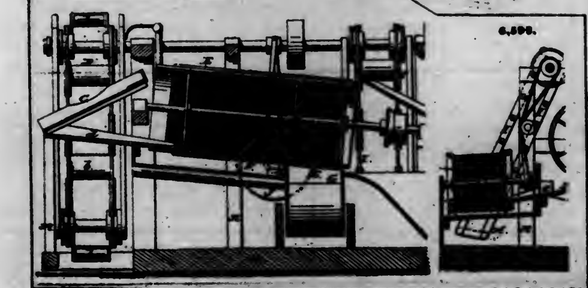
4. The combination of the screen E, chute F, provided with gate *e*, and the screen J, substantially as and for the purpose specified.

6,509.



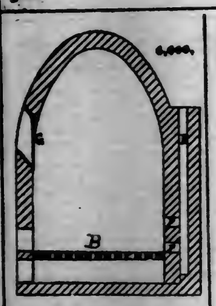
1. The improved house-alarm, substantially as hereinbefore described, consisting of the combination of the following elements, viz: first, a series of electro-magnetic circuits; second, an indicator to designate the respective circuits; third, an alarm apparatus common to all the circuits of the series; fourth, the window or door springs—the whole operating, as set forth, to put in operation the alarm apparatus that is common to all the circuits of the series, and to indicate the particular circuit of the series which is attacked.

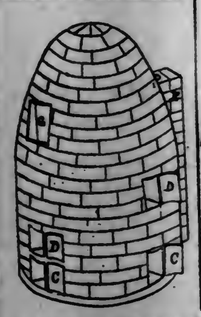
2. The combination, substantially as before set forth, of the following devices, viz: the series of magnetic circuits, the alarm apparatus common to all the circuits of the series, and the switch for disconnecting a particular circuit of the series of circuits from the alarm apparatus without disconnecting the remainder of the series of circuits from that apparatus.



6,509.

6,509. Electro-Magnetic House-Alarm. Wm. G. Russell and Abraham Firth, Boston, Mass., executors of William Whiting, deceased, assignors to Edwin T. Holmes. Patent No. 20,970, dated July 20, 1858; extended seven years. (Filed July 23, 1875.)



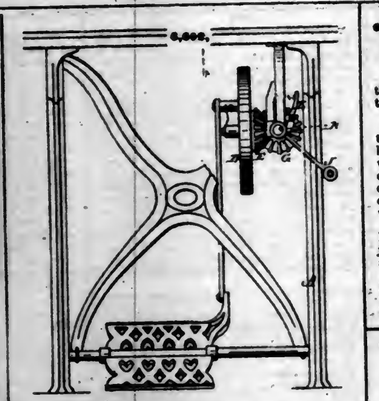


6,508.

6,600. Furnaces for Burning Refuse, Sawdust, &c. Ira O. Smith, Muskegon, Mich., assignee of one-half his right to F. Walker, same place. Patent No. 90,796, dated Feb. 16, 1870. (Filed June 29, 1875.)

1. In a refuse-burner, the combination of a combustion-chamber, a reverberating-dome directly above and forming the upper part of the combustion-chamber, and an exit for the products of combustion near the lower part of the combustion-chamber, substantially as and for the purposes set forth.

2. In a refuse-burning furnace, the combination of the self-closing door, hung upon the inner wall thereof, and the inclined chute terminating at such door, substantially as and for the purposes set forth.



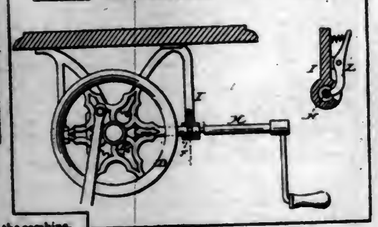
3. In a refuse-burning furnace, substantially as described, the grate B, doors C, D, and C, and the openings covered by them, the exit F, and flue E, combined to operate substantially as and for the purpose set forth

---

6,001. EXPLOSIVE COMPOUNDS. Raymond Calsac, Toulouse, France. Patent No. 163,920, dated Mar. 30, 1875. [Filed June 26, 1875.]

1. A mining-powder composed of nitrate of potash, sulphur, lamp-black, and tanning-bark or sawdust, and sulphate of iron, substantially in the manner and in the proportions set forth.

2. The process of forming a compound for mining purposes which shall be incombustible at low temperature, and non-explosive except when under pressure, by first heating nitrate of potash, carbon, and sulphur, in the presence of sawdust and a solution of sulphate of iron, till a homogeneous liquid mass is produced, then cooling and drying the same, as described.



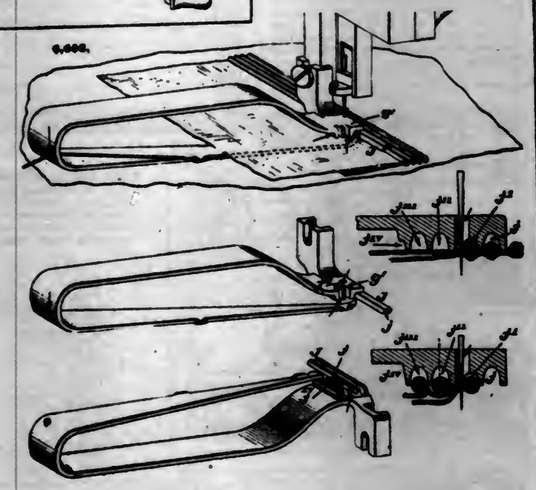
6,002. TREADLES FOR SEWING-MACHINES. Robert Francis Willcox, Memphis, Tenn. Patent No. 165,133, dated Sept. 16, 1874. [Filed July 19, 1875.]

Brief.—An attachment is provided whereby the motive power may be changed from treadle to hand-crank, and vice versa when desired.

1. The adjustable shaft arranged under the table to the right of the operator, having a hand-crank at one end, and provided with a wheel at the other end, which is engaged or disengaged at will from the operative wheel of the machine, so that the movement can be changed from treadle to hand power, or vice versa, substantially as set forth.

2. The combination, with the hand-wheel D of a sewing-machine, of wheels E G, adjustable shaft H, and crank J, substantially as and for the purposes herein set forth.

3. The combination of the adjustable shaft H, having circumferential grooves *x x*, and the spring-catch L, as and for the purposes herein set forth.



6,003. CORDERS FOR SEWING-MACHINES. Wm. Wilcox, Cincinnati, Ohio. Patent No. 146,736, dated Jan. 20, 1874. [Filed Feb. 18, 1875.]

1. A sewing-machine corder, provided with a foot having grooves on both sides of the needle-hole, for optional use in cording with single or double thicknesses, as explained.

2. In a sewing-machine corder, a presser-foot, provided with a prolongation or tongue, J, projecting toward the direction from which the goods are fed, as described.

3. In a sewing-machine corder, the presser-foot *g*, provided with a prolongation or tongue, J, and with notched grooves *g' g''*, located on the opposite side of the needle-hole from said tongue J, as described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 8. TUESDAY, AUGUST 24, 1875. PRICE { $5,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

FRANK BOEHM & CO.—*Appeal.*

[*Appeal from the Examiner of Trade-Marks in the matter of the application of Frank Boehm & Co., for registration of trade-mark for* WINES, BRANDIES, &c.—*Decided August 2?*, 1875.]

The words in section 4937 of the Revised Statutes, "the class of merchandise and the particular description of goods comprised in that class," construed.

The word "Centennial" was sought to be registered as a trade-mark, to be applied to "that class of merchandise containing alcoholic spirits," and it was held that it was not required that the trade-mark should be registered for each of these articles of the general class of alcoholic spirits.

There appears to be nothing in the statute to prevent an applicant for registration of a trade-mark from including in his specification either a whole class of merchandise or several specified descriptions thereof. *Smith et al.* vs. *Reynolds & Jacobs*, (3 OFFICIAL GAZETTE, p. 214,) cited in support.

SPEAR, *Acting Commissioner:*

Applicants ask to have registered as their trade-mark the word "Centennial," to be used on the different brands of "wines and spirits" which they are engaged in manufacturing.

They state in their specification that—

the class of merchandise to which this trade-mark has been applied is that containing alcoholic spirits, and the particular goods comprised in such class to which this trade-mark has been or is intended to be appropriated, are Bourbon, wheat, and rye whiskies, wines, brandies, gins, and bitters.

The Examiner objects that the specification is not confined to a "particular description of goods," but comprises a general class of merchandise, whereas the law appears to contemplate that distinct descriptions of merchandise should be the subjects of separate applications.

The reference in the statute (sec. 4937) to the subject-matter of an application for registration of a trade-mark is contained in the first requirement, which is as follows:

First, by causing to be recorded in the Patent Office a statement specifying the names of the parties and their residences and place of business who desire the protection of the trade-mark; *the class of merchandise and the particular description of goods comprised in such class*, by which the trade-mark has been or is intended to be appropriated; a description of the trade-mark itself, &c.

Applicants state plainly what their class of merchandise is, and specify the particular description of goods comprised in such class to which they intend to appropriate their trade-mark.

I know of no decision of the courts, nor does the Examiner cite any in support of his position, that the law contemplates that different descriptions of the same class of goods should be made the subjects of separate applications. On the contrary, the most recently-published decision which has come to my notice gives the clause of the statute under consideration quite a different interpretation. This is the case of *Smith et al. vs. Reynolds & Jacobs*, (3 OFFICIAL GAZETTE, p. 214.) Smith had registered a trade-mark simply for "paints," a term as generic in its character as "alcoholic spirits." The court said—

It is also objected that although the registration-papers specify "paints" as the class of merchandise, yet there is no designation of the particular description of goods comprised in such class, to which the trade-mark is or is to be appropriated. But the parties describe themselves as engaged in the manufacture and sale of paints generally, which they state they use and have a right to use, and desire to have protected. They cover the whole class of merchandise called "paints," and every description of goods comprised in such class. That being clearly stated by them, any further specification was unnecessary.

It is true that the use of such comprehensive terms is a very bad practice, but the evil results appear to fall on those applicants alone who take the risk. For instance, in the case cited the defendants having shown that the trade-mark adopted by the plaintiffs had been previously used by another party on a certain class of paints, the court held that the registration was invalid and entirely so, because, unlike a patent, there was no provision by which a suit upon a registration could be maintained where the grant was valid to a part but not as to the whole. This danger of including within the terms of a registration more than applicants can maintain, will probably serve to restrict the practice of making the descriptions too comprehensive. At any rate, under the construction given it in the above-named case, there appears to be nothing in the statute to prevent an applicant from including in his specification a whole class of merchandise, as was there done, or of several specified descriptions thereof only, as is done in the present case.

To hold that the particular descriptions of goods specified by applicants in this case, with the exception perhaps of the word "bitters," do not belong to one class would seem to be an unnecessary refinement, since they may all be included and would commonly be recognized, though of diverse manufacture, under the same general terms. Since, therefore, applicants have stated the class and the particular description of goods under this class, unless it appears that the same mark has been applied to one or more of such articles prior to the present applicants, they are entitled to registration.

"Bitters," however, is a designation of a kind of goods not belonging exclusively to the class of alcoholic spirits. It cannot be properly embraced by this application, and it therefore should be stricken out.

With this exception the decision of the Examiner is reversed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, DISTRICT OF MASSACHUSETTS.

HENRY W. PUTNAM *vs.* E. D. WEATHERBEE *et al.*

[*In equity.—Before* SHEPLEY, *J.—May*, 1875.]

Where a patent has been a long time in existence, has been renewed by the Patent Office after the expiration of the original term and in the face of opposition, and has been sustained by the adjudications of several of the federal courts, the patentee is entitled to protection by a preliminary injunction, at least until the adjudication of some tribunal shall decide the patent invalid.

Where a motion for an injunction was heard outside the district where the suit was pending, the order withheld until the court should be sitting within the district.

The bottle-stopper fastening covered by the Putnam reissue of January 19, 1864, which consists of a piece of *wire* of U-form with the ends *returned* and connected to the bottle, (in order that the pressure on the cork or stopper may cause the fastener to hold more securely,) is not anticipated by the *sheet-metal* U-shaped yoke of the Allender fastening of 1855.

The *wire* embeds in the cork, under pressure from within, and thus prevents the fastener from "tripping;" it also presents a change of form which permits the fastener to be pressed off without injury to the thumbs of the operator or to the cork.

Consideration given to the fact that the Commissioner of Patents, in both granting and extending the patent, was aware of the nature of the Allender device, but held that the Putnam fastener contained something more than the mere substitution of a wire U-shaped yoke for a sheet-metal U-shaped yoke.

[This was a suit in equity brought for an alleged infringement of reissued letters patent granted to Henry W. Putnam January 19, 1864, for an "Improvement in Bottle-Stopper Fastenings." The invention will be found illustrated in the reported case of *Putnam* vs. *Hickey*, (5 Fisher, 334.)

The present suit came up upon a motion for a preliminary injunction. Although the suit was pending in the Massachusetts district, the motion was heard by the circuit judge, while sitting at Portland in July, 1874. His opinion upon the motion was as follows:]

[*W. H. Clifford* and *Thomas H. Dodge*, for complainant.
Benj. F. Thurston, for defendants.]

SHEPLEY, *J.*:

In the view which I take of the first claim of this patent, which is—

> Forming the fastener at the part that comes over the cork of a piece of wire of a U-form, with the ends returned and connected to the bottle, in order that the pressure on the cork or stopper may cause the fastener to hold more securely, as specified—

considering it in connection with the specification in the patent, it is not necessary that the wire which forms the U should be returned upon itself in a direction directly the reverse of that in which it is before the turn; but it is a sufficient compliance with the first claim of that patent, if the wire, instead of being returned in a reverse direction from that which it had before, is returned at right angles, or approximately so, so as to be connected with the wire which encircles the neck of the bottle in the manner specified in the patent.

In the construction which I give to this first claim there can be no question that the defendants' contrivance is an infringement. The only question, therefore, for consideration, is whether the first claim of this patent be or not a valid claim; and that question is one of significance, principally in its relation to the Allender contrivance. The Allender contrivance was considered by the Commissioner of Patents when this patent was granted. The disclaimer of the patentee clearly has reference to a contrivance like the Allender contrivance; and, taking that into consideration, the Patent Office granted the patent. It has since been sustained by the adjudications of several of the federal courts, it has been in existence a long time, and it has been renewed by the Patent Office after the expiration of the original term. Under these circumstances, I think this is a clear case, in which the patentee is entitled to the presumption, *prima facie*, which his patent gives, aided as it is by the long enjoyment and by the adjudications of the courts, and is entitled to protection by a preliminary injunction.

In the construction which I give of the claim, the only defense which could be maintained would be to destroy the validity of the plaintiff's patent; and I think, when the patent has been in existence so long, has been renewed after a contest, and has been adjudicated in favor of the patentee by the courts, he is entitled to the benefit of it, until the adjudication of some tribunal shall decide that his patent is invalid.

This case is pending in the Massachusetts district, and when the court is in session there, the order for a preliminary injunction will be issued.

I do not express any opinion as to the question which has been presented in the hearing on this case, as to the validity of the issue of this patent, with reference to the existence of the Allender contrivance; but, as I have before said, I think the position in which the patent stands entitles the patentee, upon well established principles, to the benefit of the legal presumption in his favor until that question is decided.

Subsequently the suit came on for final hearing before Judge Shepley. The following is the opinion of the court at final hearing:

SHEPLEY, *J.*:

This bill of complaint is founded on the reissued Letters Patent No. 1,606, dated January 19, 1864, and extended for seven years from and after the 15th of March, 1873, for an "Improvement in Bottle-Stopper Fastenings."

This invention is more particularly applicable to fasteners for the corks or stoppers of bottles for aerated waters. These bottles are generally filled under a pressure of two or three atmospheres, for the purpose of holding in solution the carbonic-acid gas with which the liquid is charged. The corks are forced down by the plunger of the bottling-machine, and it is desirable to have a stopper-fastening which can be turned over the cork while the cork is under the plunger, which shall hold the cork securely against the pressure tending to force it out and to "trip" the fastener after the plunger is withdrawn, and which can be withdrawn in one direction from over the stopper, when desired, and left in good condition for future use.

The nature of the complainant's invention is stated by him to consist "in forming the fastener of wire bent in such a manner that if the pressure upon the cork is sufficient to bind said wire-fastener it will retain the cork more firmly, and the cork required to be pushed in before the fastener can be pushed aside, thus causing the pressure to render the fastening more secure instead of more liable to failure."

In view of the state of the art as disclosed in the evidence, I find nothing in the previous inventions relied upon as anticipating the complainant's invention, which requires any extended statement, as, if the invention of Putnam was anticipated, it must have been by the invention described in the letters patent granted to John Allender, July 24, 1855, the bottle-stopper fastener of Allender most nearly approximating that of Putnam.

The Allender fastener at first glance appears to embody nearly every substantial characteristic of the first claim in the Putnam patent. Like the Putnam, it is intended and adapted for use in bottles to be filled with aerated liquids by means of a bottling-machine. It has a hinged bail or yoke of a U-form to allow room for the cork-forcing plunger of the bottling-machine, and to allow the fastener to be applied while the plunger is holding down the cork. Like the Putnam, it is adapted to be used with successive corks and is a permanent fastener. Putnam appears to have been aware of the existence of the Allender patent, for he disclaims "a fastener made of sheet metal with an U-shaped opening to pass the plunger," which disclaimer was clearly intended to apply to Allender's device. The Commissioner of Patents in granting the Putnam patent, and in extending it also when the extension was opposed, must have been satisfied that the use of the U-shaped wire yoke or bail in the Putnam fastener, with its ends returned and hinged upon the wire surrounding the neck of the bottle, contained something more than the mere substitution of the wire Ushaped yoke in the Putnam for the sheet-metal U-shaped yoke in the Allender fastener. The mere substitution of one known material for another in a known combination is not the subject of letters patent, though such substituted material is a cheaper or better one for the purpose. (*Bean* vs. *Smallwood*, 2 Story, 411; *Hotchkiss* vs. *Greenwood*, 11 Howard, 248; *Stimson* vs. *Woodman*, 10 Wall, 121.) Of late great care has been exercised at the Patent Office; and the recent very intelligent decisions in the Patent Office, refusing to issue patents where there has been only the exercise of taste and good judgment without invention in the substitution of one material for another in a known combination, require the courts to give to the decisions of the Office a most respectful consideration. I think it appears from the evidence in this case that there are not only great practical advantages in the use of a wire bail over the sheet-metal fastener, but that the result claimed by the patentee and aimed at in his invention of embedding the wire in the cork under pressure from within the bottle, so that it is impossible to swing the fastener to the left without first pressing the cork downward, thus preventing the fastener from tripping; while at the same time it presents a change of form (the convenient form of the Putnam fastener allowing it to be pressed off or aside from the cork without injury to the thumbs of the operator or to the cork itself) presents a patentable difference, and not such a mere substitution of one material for another as would exist in the case of the substitution of wire of one metal for wire formed of a different metal in the same form of fastener.

It is not always easy to draw the line of distinction between the embodiment of invention and the mere exercise of judgment and mechanical skill; and not without some hesitation have I reached the conclusion that there is sufficient invention in this case to sustain the first claim of the patent, in view of the state of the art as existing at the time of the Putnam patent.

The only remaining question is as to infringement. Construing the patent, as I do, that the return of the wire from the U does not mean necessarily a retroversion of the wire in the same direction and then a bending down at right angles, or nearly so, toward the neck of the bottle, but is sufficiently answered by a return at right angles, or nearly so, toward the neck of the bottle, the infringement in this case is clear. The defendants' fastener has the wire returned, so that the direction and result of the strain between the neck of the bottle and the surrounding wire and the U-formed fastener is the same as in the Putnam device.

Decree that defendants infringe the first claim of complainant's patent, and for injunction and account.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF NEW YORK.

MARGARET MYERS, EXECUTRIX, &c., AND EUGENE S. EUNSON *vs.* JOHN DUNBAR AND JEREMIAH HOPPER.

[*In equity.—Before* BLATCHFORD, *J.—November*, 1874.]

A final decree in an equity suit awarded a recovery in favor of the complainants for a specified amount, and then proceeded to decree that the defendants pay to the master the sum of $500 allowed to him as his compensation, less such sum as the defendants had already paid him, and that the complainants have execution for the sum awarded to them.

The defendants appealed from the whole of the decree, giving to the complainants a bond to respond for the amount which the decree awards to the complainants as a recovery, and a citation was issued and served. The defendants, having previously paid the master $35, refused to pay more; and the master applied for an attachment against them for $465: *Held*, that the provision for the payment of the master was not subject to be stayed in its operation by proceedings such as are employed to stay the execution of a decree *inter partes*. The attachment was granted.

[*F. A. Betts*, for the motion.
S. J. Glassey, opposed.]

BLATCHFORD, *J.*:

In this case a final decree was entered in May last on the report of the master overruling exceptions taken by both parties to his report, and ordering "that the compensation of the master herein be fixed, determined, and settled, (including what may have already been advanced or paid to him,) at the sum of five hundred dollars." The decree then proceeded to award a recovery to the plaintiffs against the defendants for the sum of $9,120 94, and $636 32 interest thereon from the date of the report to the date of the decree, being in all $9,807 26, and to decree, "that said defendants pay to

the master the said sum of five hundred dollars allowed to the master as compensation, less such sum as may have been paid or advanced to said master by the defendants, and that the complainants have execution or other proper process of the court for the said sum awarded to them."

The 82d rule in equity provides that "the compensation to be allowed to every master in chancery for his services in any particular case shall be fixed by the Circuit Court in its discretion, having regard to all the circumstances thereof, and the compensation shall be charged upon and borne by such of the parties in the cause as the court shall direct;" and that "the master shall not retain his report as security for his compensation; but, when the compensation is allowed by the court, he shall be entitled to an attachment for the amount against the party who is ordered to pay the same, if, upon notice thereof, he does not pay it within the time prescribed by the court." The 10th rule in equity provides that "every person, not being a party in any cause, who has obtained an order, or in whose favor an order shall have been made, shall be enabled to enforce obedience to such order by the same process as if he were a party to the cause." The defendants have paid to the master the sum of $35 on account of such compensation, and no more. Demand has been made upon the defendants by the master for the payment of the residue of the $500, but it has not been paid. Prior to the date of the master's report, the plaintiffs advanced to the master $100 on account of his compensation, and, after the date of the report and before the entry of the final decree, the plaintiffs advanced to the master $200 more on account of his compensation. The master now applies to the court for an attachment against the defendants for the $465.

The defendants have taken an appeal to the Supreme Court from the whole of the decree. They have given a bond with sureties in the penalty of $21,000 to the plaintiffs, conditioned that the appellants "shall prosecute their said appeal to effect and answer all damages and costs if they fail to make their plea good." The bond has been approved as to form and amount, and the sufficiency of the sureties and a citation has been issued and served. The citation was made returnable to the first day of the present term of the Supreme Court, now past.

In opposition to the granting of the application, the defendants contend that the 82d rule is subject in its application to the provisions of law regulating appeals; that the defendants have appealed from the whole of the decree, and have given security, by bond, for the full performance of its requirements if it shall be affirmed, and, therefore, all proceedings upon the decree are superseded and stayed: that the cause is pending in the Supreme Court; that injustice to the defendants will result if the application is granted, in case the defendants should succeed on the appeal, because the defendants will not be able to recover back from the master any money paid to him; and that, if the plaintiffs pay the amount due to the master, they will be able, if the decree is affirmed, to recover that amount on the bond.

Although the defendants have taken an appeal from the whole of the decree, their bond does not cover the amount directed to be paid to the master. It is a bond to the plaintiffs payable to the plaintiffs, and is a bond only to respond for the amount which the decree awards to the plaintiffs as a recovery, and for which execution is awarded to the plaintiffs by the decree. The bond is not one under which either the master or the plaintiffs could recover the $465 from the defendants. Notwithstanding the appeal it remains for this court to enforce the provision of the decree for the payment of the master.

Nor would the case be varied if the defendants had given a bond to the master to stay proceedings to enforce payment of his compensation. The order as to the compensation of the master might as well have been in a separate order, and not have formed a part of the final decree. The master is not a party to the suit in any sense, and it was not intended that a provision for his payment should be subject to be stayed in its operation by proceedings such as are employed to stay the execution of a decree *inter partes*. The 82d rule prescribes the mode in which an officer of the court is to be compensated, and where the court directs which of the parties is to be charged with and bear the compensation of the master, whether in the first instance or ultimately, the direction must be carried out as between the master and such party, however, ultimately, such party may be entitled as against the other party to the suit to relief or reimbursement in respect of the amount paid to the master. If the defendants succeed as against the plaintiffs in reversing the decree they will indeed not be able to recover back any money from the master, but it will be competent for the court, if, on such reversal, costs of the suit shall be awarded to the defendants, to regard the amount paid by the defendants to the master as a part of such costs, and to enable the defendants to recover such amount from the plaintiffs. The amount disbursed by the defendants to the master will merely take its place with other items of disbursements, as to which the defendants, with a decree against them, now have no recovery, but which may form part of a recovery in case they shall have a decree in their favor.

The application is granted.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date August 24, 1875.]

8,572 and 8,573.—Embroidery-Patterns.—EMIL CRISAND, New Haven, Conn., assignor to HENRY ST. JOHN, same place.—Cases GG and HH. Applications filed July 19 and August 9, 1875. Term of patents 3½ years.

8,574.—Picture-Frames.—ARTHUR B. DIMMET, Bloomington, Ill. Application filed July 22, 1875. Term of patent 7 years.

8,575.—Handle for Vases.—JOSEPH W. FISKE, New York, N. Y. Application filed July 6, 1875. Term of patent 7 years.

8,576.—Fan.—JOHN F. LANGWORTHY, New York, N. Y. Application filed August 16, 1875. Term of patent 3½ years.

8,577.—Ornamental Finger-Ring, &c.—AUGUSTUS R. LENDER, Washington, D. C. Application filed July 26, 1875. Term of patent 3½ years.

8,578 to 8,580, inclusive.—Fan.—SIMEON L. BARINDS, Memphis, Tenn.—Cases A, B, and C. Applications filed August 20, 1875. Term of patents 3½ years.

8,581.—Medal.—JOSEPH C. DEMING, Norfolk, Va. Application filed July 31, 1875. Term of patent 7 years.

8,582.—Dancing-Programme.—PHILIP HAKE, Hoboken, N. J. Application filed July 12, 1875. Term of patent 7 years.

310.—Title: "Peters' Catarrh Remedy."—C. W. PETERS, Fort Madison, Iowa. Application filed August 20, 1875.

311.—Title: "Peaches.—Carmine, Lamdin & Co."—JOHN A. SIMPSON, Baltimore, Md. Applicated filed August 13, 1875.

312.—Title: "The Dueber Watch-Case M'f'g Co."—THE DUEBER WATCH-CASE MANUFACTURING COMPANY, Cincinnati, Ohio. Application filed August 13, 1875.

313.—Title: "W. J. Wilcox & Co., Prime Leaf-Lard."—W. J. WILCOX & Co., New York, N. Y. Application filed August 17, 1875.

INDEX OF INVENTIONS PATENTED AUGUST 24, 1875.

	Class No.	No. of Patent.
Alarm register, fire, Pierce and Griswold	50	167,116
Anchor tripper, E. G. Gaillac	137	167,093
Animal poke, S. N. Gustin	144	167,097
Auger, earth, C. A. Brockett	51	167,061
Axles, machine for turning, W. H. Heffley, (reissue)	172	6,615
Bedstead fastening, G. Bostwick	62	166,961
Bessemer converters, turning, W. F. Durfee	85	167,077

	Class No.	No. of Patent.
Boats, keel for, A. Stevenson	137	167,036
Boiler feed regulator, J. F. Stratton	148	166,945
Boiler, flue and tubular steam, I. Barton	148	167,054
Boiler, vertical gas burning, Z. S. Durfee	149	167,080
Boiler, wash, J. D. Egler	91	167 082
Boiler, wash, H. F. Thurston	91	166,949
Boilers, crown bar for steam, J. McPhail	148	167,004
Boilers, fire box for locomotive and other, Z. S. Durfee	149	167 079
Boilers, &c., handle for wash, J. W. Bates	91	167,055
Bolt heading machines, die for, J. Browning	14	167 062
Bottle stopper, W. Vom Hofe	1	167,141
Brick machine, D. Wood	20	167,147
Bridge, draw, W. M. Black	21	166,959
Bridge, truss, W. M. Black	21	166,960
Bridges, hydrostatic compensatory apparatus for metallic, W. R. King	21	166,930
Broom making machine, W. R. Allen	22	167,051
Buckle, lever, S. Wales	23	167,041
Buckle loop, F. A. Neider	23	167,014
Burner, Argand gas, J. B. Fuller	64	166,926
Burner, lamp, J. A. Pease	90	167,017
Butter from the oils of animal fats, making a substitute for, W. E. Andrew	35	166,955
Butter worker, P. Embree	45	167,084
Can, oil, J. Askwith	87	166,956
Cane and umbrella, combined, Colby and Coffin	165	167,070
Car brake, J. Raddin	122	166,937
Car coupling, P. Harper	122	166 967
Car coupling, W. H. Ward	124	167,043
Car, hand, B. F. Ray	121	167,119
Car, lumber, J. L. Ridgely, Jr	121	167,121
Car, passenger, M. A. Rikli	121	167,122
Car wheel lubricator, J. Woodville	122	167,048
Cars, device for propelling, W. Eppelsheimer	120	166,975
Cars on short curves, turning, W. Eppelsheimer	120	166,976
Card, business, B. M. Wilkerson	146	167,045
Carriage bow, J. A. Topliff	31	166,950
Carriage spring, E. Chamberlin	31	167,065
Carriage springs, machine for setting, T. B. De Forest	31	166,918
Cartridge cases, machine for making and heading, J. V. Meiga	32	167,005
Cartridge feeding case for machine guns, D. W. C. Farrington	32	166,923
Cartridges, feed case for, D. C. Farrington	32	166 924
Casting water traps, mold for, J. M. Reid	34	167,021
Center board, J. L. Dickenson	137	166,970
Chains, detachable link for, C. H. and A. L. Gillingham	60	166 983
Chair, folding, F. Hickman	62	167,098
Chairs, mechanism for supporting leg rests for, G. D. Goss	62	167,095
Champagne freezer, C. H. Ludwig	58	166,996
Check reins, safety loop for, S. A. Marker	72	167,109
Cheese vat, C. W. F. Street	45	166,946
Chimney cowl, E. Cole	166	166,968
Chuck, Perot and Beltenman	100	167,018
Clamp, T. Sandbach	29	167,197
Cloth measure register, J. Brown, Jr	43	166,964
Clothes frame, G. G. Crowley	91	167,072
Columns and cylinders, machine for capping the joint flanges of hollow, J. L. Piper	163	167,117
Commode ventilator, Stanton and Riley	8	167,032
Compass, mariner's, E. S. Ritchie, (reissue)	50	6,607
Core barrel, C. Dockray	33	167,075
Corn marker, W. H. Rider	133	166,939
Cornstalk puller, H. Lee	73	167,105
Crane, I. Hahn	79	166,985
Culinary implement, J. Ebbert	88	167,081
Culinary vessel, C. O. Line	154	167,106
Cultivator teeth, J. Flynn	43	166,979
Currycomb, W. E. Lawrence, (reissue)	144	6,605
Currying calf skins, P. Ware, Jr	92	167,142
Curtain roller and bracket, G. W. Beers	62	167,056
Desk, folding school, D. I. Stagg	62	167,033
Drill, rock, E. S. Winchester, (reissue)	134	6,610
Drilling metal, machine for, J. S. Shoonover	100	167,026
Eggs, apparatus for preserving, Stone and Murray	116	167,135
Engine, disk steam, G. R. Winkler	150	167,146
Engine, rotary, W. M. Stevenson	150	167,134
Exercising machine, J. Tiebout	143	167,137
Exhaust mechanism, C. D. Smith	148	167,131
Faucet, A. Fuller	167	167,092
Faucet, beer, J. G. Adams	167	167,049
Fence, farm, A. Miller	52	167,007
Fence tightener, wire, H. P. Barnes	52	167,052
Ferns, plants, &c., preserving, H. M. Lee	35	166,995
Fire arm lock, F. Taylor	55	166,947
Fire arms, attaching magazines to, H. Metcalfe	18	166,006
Fire place, C. S. Rankin	154	167,090
Flask and bottle, W. T. Fry, (reissue)	68	6,613
Flour bolt, G. T., and A. Smith, (reissue)	57	6,619
Fluxing composition, A. Paraf	99	167,016
Fracture apparatus, B. Danby	156	167,073
Fruit and jelly press, H. Nadermann	19	167,013
Fuel, making quick burning, W. A. Shepard	61	166,941
Furnace for reducing ores of precious metals, J. H. Boyd, (reissue)	99	6,610
Furnace for smelting ore, W. E. C. Eustis	99	166,977
Furnaces, device for supplying steam blast to, E. J. Jones	149	167,103
Gas burning boilers, vertical, Z. S. Durfee	149	167,080
Gas for fuel, grate for generating, Z. S. Durfee	154	167,078
Gas machine, portable carbureted hydrogen, J. M. Clark	66	166 914
Gas stove, J. Q. Birkey	65	167,058
Gate, automatic, W. W. McKay	52	167,003
Gelatine from salted fish skins, extracting, J. S. Rogers	35	167,123
Grain drill, J. T. Lynam	133	166,997
Grate bar, W. Farris	149	167,087
Grate bar, H. Ryder	149	167,126
Grate bar, S. Van Syckel	149	166,951
Grate for generating gas for fuel, Z. S. Durfee	154	167,078
Harness mounting, C. M. Theberath	72	167,040
Harrow, W. S. O'Brien, (reissue)	73	6,606
Harrow and cultivater, combined, W. McCray	73	167,002
Harvester, S. W. Tyler, (reissue)	74	6,609
Hat, C. Sinclair	76	167,029
Hat blocking machine, E. C. Fales	76	167,086
Hat blocking and shaping machine, R. Eickemeyer	76	167,063
Heater, air and water, W. H. Richardson	147	167,130
Heater, drum, C. Skinner	154	167,129
Heel plate, G. Dunlop	16	166,972
Heel trimming machine, A. McDowell	16	166,933
Hinge, spring, R. M. C. Parker	24	167,114
Horse collar and hame, combined, A. Macaulay	72	166,932
Horses, expanding bit for, J. Smith, Jr	72	167,130
Horseshoe blanks, roll for making, Greenwood and Clarke	60	167,096
Horseshoes, manufacture of, A. B. Seymour	60	167,027
Horseshoeing tool, C. R. Donner	60	166 971
Hose bridge, L. T. Kruse	167	166,991
Indicator, low water, C. E. Christian	148	167,069
Insect destroying compound, G. W. Davis	35	166,917
Jeweler's screw press, Potter and Richardson	86	167,019
Key fastener, B. J. Loomis	93	167,107
Kindling wood bale, J. Rowbotham	174	167,124
Label and tag machine, C. E. Sawyer	117	166,940
Ladder, step, J. J. Stephan	30	167,037
Lamp, S. S. Newton	90	167,113
Lamp, B. B. Schneider	90	167,128
Lamp black apparatus, P. Neff	107	166,936
Lamp bowls and other glass articles to pedestals, attaching, S. S. Barrie	90	167,053
Lantern, J. J. Marcy	90	167,108
Lantern, magic, C. Fontayne	157	167,090
Lantern, signal, G. J. Cave	138	166,966
Latch, locking, P. S. Felter	93	167,088
Lawn roller, D. Copeland, Jr	73	166,915
Lead traps, manufacture of, F. N. Du Bois	136	167,076
Limekiln, W. S. Sampson, (reissue)	153	6,608
Lock, permutation, D. K. Miller	93	167,008
Locomotive tire heater, T. T. Peak	94	167,115
Locomotive steam brake cylinder, J. N. Lauder	122	166,994
Locomotives, cattle alarm for, E. Smith	94	166,943
Loom shedding mechanism, R. B. Goodyear	95	166 928
Lubricator, car wheel, J. Woodville	122	167,048
Malt, apparatus for drying, G. Clark	19	166,913
Marbleizing surfaces, Steele and Bayer	54	167,034
Mechanical movement, A. and I. Beck	67	166,958
Millstones, proof staff for, J. C. Kepler	57	166,929
Mowing and reaping machines, pitman box for, C. H. Salzman	67	167,025
Nail, picture, O. W. Taft	103	167,039
Nut lock, D. and S. A. Beaton	14	166,957
Ore washer, L. D. Stephens	3	167,133
Overcoat, A. R. Underdown	34	167,139
Oyster ranges, grate for, C. H. Carling	154	166,965
Packing for stuffing boxes, A. P. Lanterman	151	167,104
Packing, piston, J. Richards	151	167,093
Paging and numbering machine, W. Von Doehn	117	166,952
Paper bag machine, J. Hatfield	109	166,988
Paper box, T. J. Powers, (reissue)	109	6 618
Paper cutter, rotary, F. E. Woodward	109	166,954
Paper picture frame, O. K. Bradford	109	166,962
Passenger register, J. B. Benton	42	167,057
Pencil, G. W. McGill	146	166,934
Photographic plate, O. B. Evans	111	166,922
Pipe coupling, C. F. Henis	167	166,989
Piston connection, self packing, J. W. Burr	150	167,064
Planing machine, W. Wells	173	167,145
Plow clevis, side hill, F. C. Merrill	114	166 935
Power brake, friction, W. H. Ward	122	167 044
Power, spring, V. Moeslein	67	167,009
Propeller, screw, J. L. Thornycroft	139	167,136
Pump, chain, C. Fishbaugh, (reissue)	118	6,619
Pump, force and suction, B. Branson	118	167,060
Pump valve, lift, F. A. Ruhl	118	167,125
Purifier, middlings, A. Hunter	57	167,102
Quartz mills, distributing quicksilver in, M. P. Boes	3	167,059
Quicksilver in quartz mills, distributing, M. P. Boes	3	167,059
Railroad gate, J. H. Eberhart	120	166,973
Railroad rail joint, J. C. Wright	120	167,047
Rake, horse hay, B. Owen, (reissue)	74	6,617
Ranges, grate for oyster, C. H. Carling	154	166,965
Rice, polishing and scouring, P. R. Lachicotte	57	166,992
Rivets, machine for drilling, M. Bray	14	166,963
Ruler, H. J. Richardson	97	166,938
Sash holder and curtain fixture, combined, J. Weatherce	24	167,144

	Class No.	No. of Patent.
Sausage meat mixer, J. E. Smith	25	167,031
Screw cutting die, G. R. Stetson	14	167,035
Sewer trap and mold therefor, cement, D. Copeland, Jr	20	166 916
Sewing machine needle, G. W. Lascell	134	166,993
Sewing machine treadle, adjustable, Curtiss and Burleigh	67	166,969
Sewing machine bobbin winder, W. Miller	134	167,111
Ship's swinging berth, T. P. Ford	137	167,091
Sifter, ash, Hull and Eppler	154	167,101
Spark arrester and stove register, combined, Freeman and Jones	154	166,981
Speaking tube, C. A. Fredericks, (reissue)	158	6,604
Stair rails, joint fastening for, W. H. Pritchett	24	167,118
Stamp mill feeder, J. Walker	3	167,042
Stereoscope, L. D. Sibley	118	166,942
Stove, J. W. Elliot	154	166,921
Strainer and funnel combined, C. W. and L. H. Heermance, (reissue)	170	6,614
Sugar manufacture, centrifugal machine in, F. O. Matthiessen	155	166,999
Sugar manufacture, centrifugal machine in, F. O. Matthiessen	155	167,000
Sugar manufacture, centrifugal machine in, F. O. Matthiessen	155	167,001
Suspenders, R. H. Eddy	38	166,974
Syringe, combination, W. P. Clotworthy	156	166,967
Table, ironing, M. Newman	91	167,112
Tacks, awls, &c., machine for making crimping, H. A. Williams	72	167,046
Tellurian, J. Troll	146	167,138
Tire bending machine, T. M. and A. F. Stansbury	60	166,944
Tire heater, locomotive, T. T. Peak	94	167,115
Tonga, pipe, J. M. Evarts	100	167,085
Toy block, arithmetical, J. C. Smith	143	167 030
Toy hoop or trundle, S. D. C. Langley	143	166,931
Toy money box, A. Feigl	143	166,978
Trap, self setting animal, Gibbs and Brown	143	166,927
Trunk, A. V. Romadka	162	167,024
Tube expander, E. W. Flagg	100	166,925
Umbrella, G. W. Francis	165	166,980
Vallses, handle attachment for, G. O. Monroe	162	167,011
Valve, globe, J. Moffet	152	167,010
Valve seats, &c., machine for dressing, N. P. Stevens	100	167,038
Valve, slide, J. W. Vermillion	152	167,140
Valves, device for operating throttle, P. Hinkle	152	167,099
Vehicle, side spar, E. Chamberlin	31	167,067
Vehicle spring, E. Chamberlin, (reissue)	31	6,611
Vehicle spring, E. Chamberlin	31	167,066
Vehicle spring, E. Chamberlin	31	167,068
Vehicle top, J. B. Relyea	31	167,022
Vehicles, side spar for, B. C. Shaw	31	167,028
Ventilator cap, H. A. Gouge	166	166,984
Vise, pipe and bolt, G. W. Milliner	60	167,110
Wagon wheel, J. Steiner	31	167,132
Wash bowl, hand, T. Maddock	8	166,998
Washing and wringing machine, combined, G. C. Eastman	91	166,920
Washing fluid, A. Thode	91	166,948
Washing machine, G. W. Cole	91	167,071
Watch case spring, A. S. Buckelew	36	167,063
Watches, collet for balance springs of, A. Jewett	36	166,990
Watches, independent escapement for, F. Fitt	35	167,089
Water closet, J. G. Jennings, (reissue)	5	6,616
Water traps, mold for casting, J. M. Reid	34	167,021
Water wheel, turbine, M. Washburn	168	167,143
Wax thread heating machine, W. J. Garton	16	167,094
Weather strip, W. H. Douglass	30	166,919
Wells, torpedo for oil, W. H. Harper	124	166 986
Windmill, J. Q. Adams	118	167,050
Windmill, C. Gates	118	166,982
Window screen, G. W. Heimbach	30	167,100
Wire straightening machine, C. P. S. Wardwell	170	166,953
Wool drier, J. M. Dick	48	167,074
Wrench, J. H. Morrissey	100	167,012
Wringer, Norris and Woods	91	167,015

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED AUGUST 24, 1875.

	Patent No.
Adam, J. G., Beer faucet	167,049
Adams, J. Q., Windmill	167,050
Allen, S. H., assignee	167,026
Allen, W. R., Broom making machine	167,051
Allison, W. C., J. W., and T. E., assignees	167,052
Andrew, W. E., Making a substitute for butter from the oils of animal fats	166,955
Askwith, J., Oil can	166,956
Barnes, H. P., Wire fence tightener	167,053
Barrie, S. S., Attaching lamp bowls and other glass articles to pedestals	167,053
Barton, I., Flue and tubular steam boilers	167,054
Bates, J. W., Handle for wash boilers, &c	167,055
Bayer and Steele	167,034
Beardsley, H. S., assignee, (reissue)	6,608
Beaton, D. and S. A., Nut lock	166,957
Beck, A. and I., Mechanical movement	166,958
Beers, G. W., Curtain roller and bracket	167,056
Beltenman and Perot	167,018
Benton, J. B., Passenger register	167,057
Bertner, R., assignee	167,025
Birkey, J. Q., Gas stove	167,058
Bitter, C. F., assignee	166,913
Black, W. M., Draw bridge	166,959
Black, W. M., Truss bridge	166,960
Boes, M. P., Distributing quicksilver in quartz mills	167,059
Boetwick, G., Bedstead fastening	166,961
Boyd, J. H., Furnace for reducing ores of precious metals, (reissue)	6,610
Bradford, O. K., Paper picture frame	166 962
Branson, B., Force and suction pump	167,060
Bray, M., Machine for drilling rivets	166,963
Bridgeport Brass Company, assignees	167,108
Brockett, C. A., Earth auger	167,061
Brown and Gibbs	166,927
Brown, C. E., assignee	167,140
Brown, J., Jr., Cloth measure register	166,964
Browning, J., Die for bolt heading machines	167,062
Buckelew, A. S., Watch case spring	167,063
Burleigh and Curtiss	166,969
Burr, G. W., Self packing piston connection	167,064
Carling, C. H., Grate for oyster ranges	166,965
Cave, G. J., Signal lantern	166,966
Chamberlin, E., Carriage spring	167,065
Chamberlin, E., Side spar vehicle	167,067
Chamberlin, E., Vehicle spring	167,066
Chamberlin, E., Vehicle spring	167,068
Chamberlin, E., Vehicle spring, (reissue)	6,611
Christian, C. E., Low water indicator	167,069
Clark, G., Apparatus for drying malt	166,913
Clarke, G. H., assignee	166,951
Clark, J. M., Portable carbureted hydrogen gas machine	166,914
Clarke and Greenwood	167,096
Cliff, E., assignee	167,055
Clotworthy, W. P., Combination syringe	166,967
Coffin and Colby	167,070
Colby, J. N. and J. E. Coffin, Combined cane and umbrella	167,070
Cole, E., Chimney cowl	166 968
Cole, G. W., Washing machine	167,071
Conklin, W. A., assignee	167,031
Copeland, D., Jr., Lawn roller	166,915
Copeland, D., Jr., Cement sewer trap and mold	166 916
Crandall, J. N., assignee	166,926
Crowley, G. G., Clothes frame	167,072
Culver, Page, and Hoyne, assignees	166,952
Curtiss, J. A., and S. G. Burleigh, Adjustable sewing machine treadle	166,969
Danby, B., Fracture apparatus	167,073
Davis, G. W., Insect destroying compound	166,917
De Forest, T. B., Machine for setting carriage springs	166,916
Dick, J. M., Wool drier	167,074
Dick, T. S., assignee	167,091
Dickenson, J. L., Center board	166,970
Dockray, C., Core barrel	167,075
Donner, C. R., Horseshoeing tool	166,971
Douglass, W. H., Weather strip	166,919
Draper, B. J., assignee	167,059
Du Bois, F. N., Manufacture of lead traps	167,076
Dunlop, G., Heel plate	166,972
Durfee, W. F., Turning Bessemer converters	167,077
Durfee, Z. S., Grate for generating gas for fuel	167,078
Durfee, Z. S., Fire box for locomotive and other boilers	167,079
Durfee, Z. S., Vertical gas burning boiler	167,080
Eastman, G. C., Combined washing and wringing machine	166,920
Ebbert, J., Culinary implement	167,081
Eberhart, J. H., Railroad gate	166,973
Eddy, R. H., Suspenders	166,974
Edmonds, G. D., assignee	166,925
Egler, J. D., Wash boiler	167,082
Eickemeyer, R., Machine for shaping and blocking hats	167,063
Elliot, J. W., Stove	166,921
Ely, G. H., assignee	166,950
Embree, P., Butter worker	167,084
Eppelsheimer, W., Device for propelling cars	166,975
Eppelsheimer, W., Turning cars on short curves	166,976
Eppler and Hull	167,101
Eustis, W. E. C., Furnace for smelting ore	166,977
Evans, O. B., Photographic plate	166,922
Evarts, J. M., Pipe tongs	167,085

TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED AUG 24, 1875.

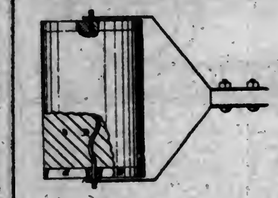
166,912. APPARATUS FOR DRYING MALT. George Clark, Buffalo, N. Y., assignor of one-half his right to Jos. Kast and Chas. F. Bitter, same place. [Filed July 17, 1875.]

1. The combination of the cylinder B, condenser F, reservoir G, and glass indicator-tube H, as and for the purposes specified.

2. The combination and arrangement of the flues K K M and damper *g*, substantially as and for the purposes set forth.

166,913. PORTABLE CARBURETED-HYDROGEN-GAS MACHINES. Jos. M. Clark, Lancaster, Pa. [Filed July 15, 1875.]

Brief.—Two hydrogen-gas generators are connected at the bottom with an acid-reservoir placed between them, and having a central partition. The carburetor, containing cotton and excelsior, surmounts the acid-reservoir.



3. The generator A, fitted with an inverted bell, D, and having a perforated vessel, B, supported therein, in combination with the acid-tank E and carbon-department I, all constructed and operating as specified.

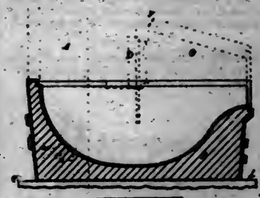
4. The vessels A E and inverted bell D, in combination with the carbon-department I, pipe I, and stop-cock *h*, for the purposes set forth.

5. The carbon-vessel I, provided with a burner and service-pipe connection, and having a pipe from each generator passing through a packing of cotton and excelsior therein, in combination with the independent acid-tank E and generators A, substantially as and for the purpose described.

166,914. LAWN-ROLLERS. David Copeland, Jr., Rochester, N. Y. [Filed May 3, 1875.]

Brief.—Two metallic heads are formed with dovetail arms and rim, connected by an axial crooked shaft, the ends projecting beyond the heads to form journals. The body of the roller is composed of concrete material, and is formed by tamping the concrete in a mold containing the heads and shaft, the dovetailed form of the heads and crooked shaft holding all the parts firmly together.

In a lawn-roller, the concrete body, the crooked shaft, and the dovetail heads and arms, all combined substantially as shown and described.



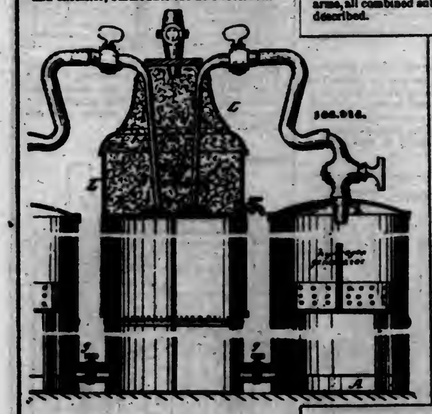
166,915. CEMENT SEWER-TRAPS AND MOLDS THEREFOR. David Copeland, Jr., Rochester, N. Y. [Filed Mar. 23, 1875.]

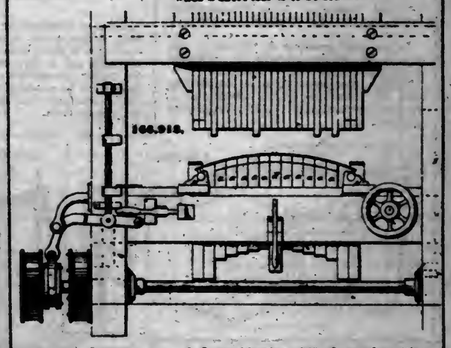
Brief.—The sewer-trap is made in sections composed of hydraulic cement.

1. A street sewer-trap consisting of sections A, B, and C, composed of hydraulic cement, and constructed as shown in Figs. 1, 2, and 4, so as to flare on all sides upward to a line considerably above the overflow, to prevent burning or injury by frost, as set forth.

2. The flask composed of the sections or sides H and hollow core G, in combination with the follower I, or its equivalent, constructed and arranged to operate conjointly as and for the purpose of molding the hydraulic-cement base B for sewer-traps.

3. The concave semicircular flask composed of the plates P and T and follower N, or its equivalent, constructed as and for the purpose set forth.





166,917. INSECT-DESTROYING COMPOUNDS. George W. Davis, Boston, Mass., assignor of one-half his right to Charles W. Lewis, same place. [Filed July 13, 1875.]

The composition of matter, consisting of carbonates of lime and magnesia, crude potash and iron pyrites, substantially as described, and for the purpose set forth.

166,918. MACHINES FOR SETTING CARRIAGE-SPRINGS. Thomas B. De Forest, Birmingham, Conn., assignor to Sarah A. De Forest and J. S. Passenger, same place. [Filed July 6, 1875.]

Brief.—The former is made in sections, and is carried by a vertically-moving slide. A series of weights arranged to slide vertically, but independently of each other, in a cross-beam of the frame, force the leaf upon the former as the latter comes in contact with them. Adjustable stops prevent the contact of the former with the unnecessary weights, when a short leaf is to be set.

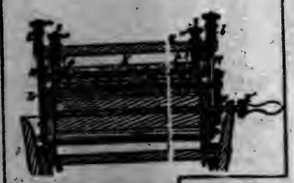
1. In combination with a former for setting carriage-springs, a series of vertical weights arranged to force the leaf onto the former, substantially as set forth.

2. In combination with a former for setting carriage-springs, a series of vertical weights, the lower or bearing ends constructed transversely concave, so as to bear upon the edges of the leaf, substantially as described.

3. In combination with a former for setting carriage-springs, a series of vertical weights, the lower ends of which are hinged, so as to turn transversely, substantially as described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

4. In combination with a former for setting carriage-springs, a series of vertical weights constructed with internal grooves, and provided with a water supply, so as to allow a free flow of water onto the set springs.

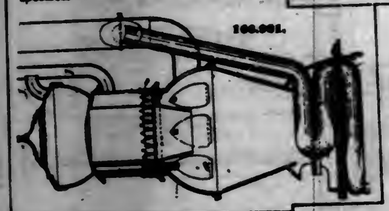


5. In combination with a former for setting carriage-springs, and a series of vertical weights for forcing the leaf onto the former, the adjustable stops S S', substantially as and for the purpose described.

166,919. WEATHER-STRIPS. W. H. Douglass, Chicago, Ill., assignor to C. H. Smith, same place. [Filed Feb. 10, 1875.]

In a weather-strip, a single strip of metal, secured to an elastic or other suitable strip by means of eyelets, substantially as described.

166,920. COMBINED WASHING AND WRINGING MACHINES. George C. Eastman, Lewiston, Me. [Filed Apr. 14, 1875.]



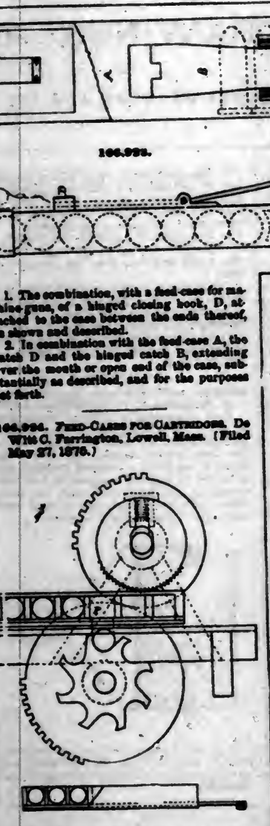
166,920.

The two rollers E I, geared together, as described, in combination with the three rollers K F F, arranged and provided with yielding pressure devices, the hangers M M, springs l l o o, screws n n g g, and bolts n n r r, as set forth, all being applied to and arranged in the frame B, as specified.

166,921. STOVES. John Wheeler Elliot, Toronto, Canada. [Filed Apr. 20, 1875.]

1. The water-reservoir A, pivoted by the pipe C, in combination with the pocket or cesspool D, substantially as specified.

2. The water-reservoir A, in combination with the steam-pipe J, and hot-air pipe I, arranged substantially as and for the purpose specified.



166,921.

166,922. PHOTOGRAPHIC PLATES. Oliver R. Evans Thierolf, Pa. [Filed Jan. 2, 1875.]

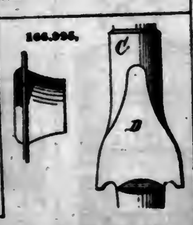
A photographic printing-surface, consisting essentially of disks white pearl powder, oxide of zinc, and collodion, combined in about the proportions, and prepared in the manner, substantially as hereinbefore described.

166,923. CARTRIDGE-FEEDING CASES FOR MACHINE-GUNS. De Witt C. Farrington, Lowell, Mass. [Filed May 27, 1875.]

A box or receptacle for cartridges, provided with compartments or guides to retain the cartridges in place, adapted to be used as a feed-case, and to be passed horizontally over the hopper or receiver of a machine-gun, either by hand or in combination with proper mechanical means, substantially as and for the purpose set forth.

166,924. FEED-CASES FOR CARTRIDGES. De Witt C. Farrington, Lowell, Mass. [Filed May 27, 1875.]

166,924.



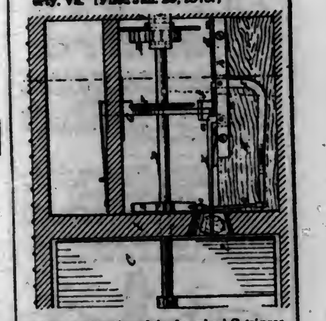
1. The combination, with a feed-case for machine-guns, of a hinged closing hook, D, attached to the case between the ends thereof, as shown and described.

2. In combination with the feed-case A, the catch D and the hinged catch B, extending over the mouth or open end of the case, substantially as described, and for the purposes set forth.

166,925. TUBE-EXPANDERS. Eli W. Fleet, Battle Creek, Mich., assignor to himself and Geo. D. Edmonds, same place. [Filed Apr. 6, 1875.]

Brief.—The tool is rotated and the projecting ends of the tube turned by the projecting recessed wings.

The above-described tube-expander, consisting of the spindle C, with flattened part D, having projecting lips d with curved notches e therein, all formed of one piece of metal, substantially as and for the purposes herein set forth.



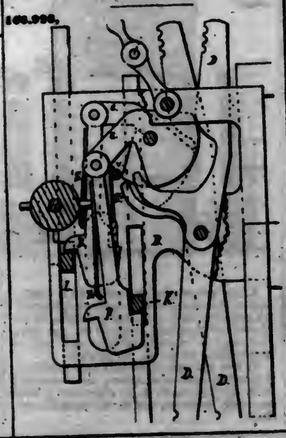
166,925.

166,926. ARGAND GAS-BURNERS. Jim B. Fuller, Brooklyn, N. Y., assignor of one-half his right to J. N. Crandall, Norwich, Conn. [Filed Aug. 4, 1875.]

1. The combination of the slotted or perforated tube F, the pin G, made and cut out as described, so as to form the inlet J, and the bushing E, all constructed and arranged within the pillar of an argand gas burner, substantially as and for the purposes described.

2. The combination of the lever H, the pin G, the tube F, and the bushing E, substantially as set forth.

166,927. SELF-SETTING ANIMAL-TRAPS. Peter B. Gibbs and James C. Brown, Liberty, Va. [Filed Jan. 20, 1875.]



The combination of the fan-wheel C, trigger K, dog I, and pawl G with a rainbet, F, shaft D, spider L, lever A, links e, and winding apparatus E, all constructed and arranged for operation, substantially as shown and described.

166,928. ARGAND GAS-BURNERS. Jim B. Fuller, Brooklyn, N. Y., assignor of one-half his right to J. N. Crandall, Norwich, Conn. [Filed Aug. 4, 1875.]

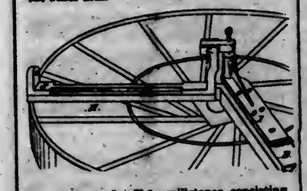
1. The combination of the slotted or perforated tube F, the pin G, made and cut out as described, so as to form the inlet J, and the bushing E, all constructed and arranged within the pillar of an argand gas burner, substantially as and for the purposes described.

2. The combination of the lever H, the pin G, the tube F, and the bushing E, substantially as set forth.

166,929. SELF-SETTING ANIMAL-TRAPS. Peter B. Gibbs and James C. Brown, Liberty, Va. [Filed Jan. 20, 1875.]

166,929.

The combination of the fan-wheel C, trigger K, dog I, and pawl G with a rainbet, F, shaft D, spider L, lever A, links e, and winding apparatus E, all constructed and arranged for operation, substantially as shown and described.

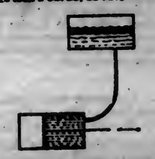


166,930. SHEDDING MECHANISMS FOR LOOMS. Robt. B. Goodyear, Philadelphia, assignor of one-half his right to Wolfenden, Shore & Co., Cardington, Pa. [Filed June 16, 1875.]

1. The jacks F, constructed with springs S S', in combination with the pin V and lifter and depresser bars K K', as described, and for the above purpose.

2. In an open-shed harness-motion, for the purpose of giving the heddles a full movement in either direction up or down, and holding them in that position as long as desired, the combination of the vertical lifting and depressing bars K K', vertical jack F, provided with the springs S S', lever-cam E, and vertical lever D, substantially as described.

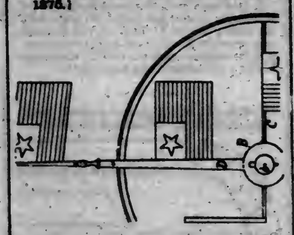
166,930. PROOF-STAFFS FOR MILLSTONES. Jacob C. Kepler, Richmond, Ind. [Filed Mar. 9, 1875.]



Brief.—The under surfaces of two arms, articulated at their ends, have paint or other substance on them. These surfaces are adjusted into a common plane by set-screws passing through ears on one arm, at the point of articulation, acting on a vertical portion of the other arm.

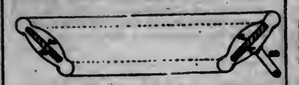
1. The proof-staff for millstones, consisting of a metallic bar having a lower level surface, provided with an articulated wooden arm having a lower level surface, and being capable of vertical adjustment to bring the level surfaces of the bar and arm into the same horizontal plane, substantially as set forth.

2. The metallic bar H having its lower surface level; provided with the vertical stud O having the lugs R and S, provided with the set-screws K and L, in combination with the wooden arm D having its lower surface level, provided with the metal plate J having the vertical stud I, constructed and operating substantially as and for the purposes set forth.



166,931. HYDROSTATIC COMPENSATORY APPARATUS FOR METALLIC BRIDGES. Wm. B. King, Wilkesbarre Point, near Wilkesbarre, Pa. [Filed Feb. 18, 1873.]

1. The combination, in a bridge or other analogous structure, of the cylinder secured upon one part of the structure, the piston of said cylinder connected with another part of the structure, the elevated tank containing liquid, and a pipe connecting the tank directly with the cylinder, these members being constructed and operating, substantially as hereinbefore set forth, to cause the hydrostatic pressure to act directly upon the movable parts of the structure, and to compensate said movement by the simple inlet or efflux of the liquid into or out of the cylinder.



2. In a bridge or other analogous structure, the combination, substantially as hereinbefore set forth, of a series of cylinders, each connected with its respective portion of the structure; a series of pistons correspondingly connected and working in the cylinders; an elevated tank containing liquid; a supply-pipe connecting this tank with one of the cylinders, and provided with a check-valve to prevent the return of the fluid to the tank; and a pipe connecting the flowing-chambers of the two cylinders, whereby an excess of strain upon a movement of one set of connections is transferred to or compensated by the other.

166,932. TOY HOOPS OR TROUBLES. Saml. D. C. Langley, Erie, Pa. [Filed June 18, 1875.]

The improved rolling or trundle hoop, herein described, provided with the decorated rods C, the hub B, and weighted rod D, all constructed and arranged to operate substantially as specified.

166,933. COMBINED HORSE-COLLARS AND HAMES. Aulay Macaulay, Cambridgeport, Mass. [Filed June 17, 1874.]

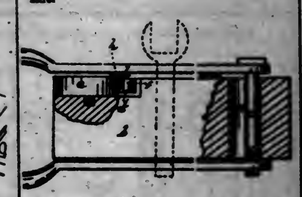
As a new article of manufacture, a horse-collar as constructed, consisting of the flexible continuous flat spring-steel band A, provided with staple B, bolts D D, D's C C, covering H, and stuffing F, all combined and arranged substantially in the manner described, as and for the purpose set forth.

166,934. HEEL-TRIMMING MACHINERY. A. McDowell, Lawrence, Mass. [Filed July 6, 1875.]

166,935. LAND-SLIDE APPARATUS. Peter Noll, Gambier, Ohio. [Filed June 17, 1875.]

Brief.—Detachable depositing plate fastens to the collecting-surface. Car underneath channeled to pass the burners. Brush or scraper, held against and carried by the car, pressed against the surface by a spiral spring. Burners may be turned aside, or pressed and pivotal surfaces swung aside, to facilitate cleaning of the surface.

166,936. PENCILS. Geo. W. McGill, New York, N. Y. [Filed May 24, 1875.]

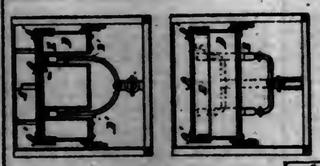


1. The erasive head or tip for pencils, having longitudinal projections or grooves formed in its base, to adapt it to be inserted and retained in a metal holder having a corresponding conformation, substantially as described.

2. The metallic tubular holder, provided with longitudinal projections or grooves, whereby it is adapted to receive and hold a rubber erasive head, substantially as described.

166,937. TIME-BELL-FLOW CHECKERS. F. C. Merrill, South Paris, Me. [Filed May 31, 1875.]

Brief.—A stud upon the clevis travels in crescent-shaped recess in the front end of the beam, while a longitudinal slot for the clevis-bolt allows it to move forward and back, and automatically change the draft from side to side.



1. In combination with the clevis c, having the bolt e and stud b, and the beam h, having the slot d, the plate c, having the curved slot f, the said slots being arranged and constructed as shown and described.

2. In combination with the clevis, made as described, and having the bolt and stud, the slotted plate c, having the opening i, as and for the purposes set forth.

166,938. LAND-SLIDE APPARATUS. Peter Noll, Gambier, Ohio. [Filed June 17, 1875.]

Brief.—Detachable depositing plate fastens to the collecting-surface. Car underneath channeled to pass the burners. Brush or scraper, held against and carried by the car, pressed against the surface by a spiral spring. Burners may be turned aside, or pressed and pivotal surfaces swung aside, to facilitate cleaning of the surface.

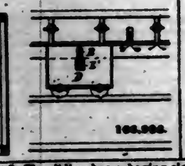
1. As an apparatus for the manufacture of lamp-black, the combination, with the burner B, of a convex surface A, located above the flames from the said burners, with its convexity toward the said flames, substantially as and for the purpose described.

2. The combination, with the burners B, and a surface, A, located above the flames from the said burners to receive the deposits of lamp-black, of adjustable depositing cups A' at all the edges of the said surface, substantially as and for the purpose described.

3. The combination, with burners B and surface A, of a car, D, with recesses D', to permit it to pass by the burners, substantially as and for the purpose described.

4. In an apparatus for the manufacture of lamp-black, the combination, with depositing-surface A, of burners B, located beneath the same, the said burners made adjustable, so as to be removed from the said surface to facilitate cleaning off the deposits, substantially as and for the purpose described.

5. The combination, with the convex surface A, substantially as described, of car D, scraper or brush E, and spring E', substantially as and for the purpose described.



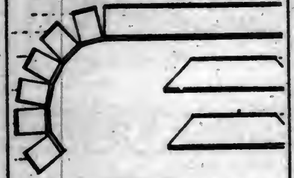
6. In an apparatus for the manufacture of lamp-black, the combination, with the burners B, of the convex surface A, substantially as described, the said surface A being readily removable from the burners, for the purpose of facilitating the cleaning of deposits therefrom, substantially as and for the purpose described.

7. The combination, with the burners B, of the suspended surface A, shaft F, and crank G H, substantially as and for the purpose described.

8. In an apparatus for the manufacture of lamp-black, the combination, with a depositing-surface, of burners projecting from the back of the said surface, just through, but not beyond, the said depositing-surface, substantially as and for the purpose described.

166,927. CAR-BRAKES. John Reddin, Lynn, Mass. [Filed Nov. 11, 1874.]

Brief.—Twin-beams operating through sliding rod, slotted beams, and toggles.

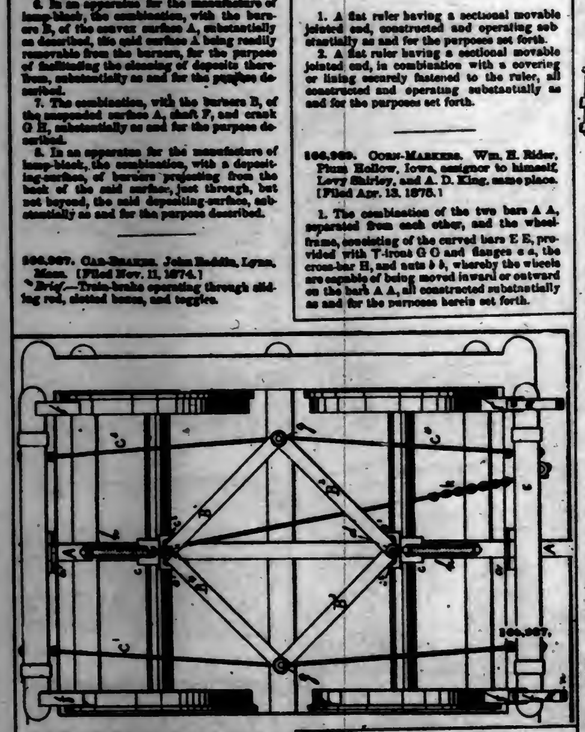


166,928.

3. The sliding bar c, having slotted projection c', to allow of the lateral adjustment of the links, substantially as set forth.

4. In a train-brake, the combination of the continuous central bar A and its stops with the sliding toggles B' B' B' B', substantially in a square form within the line of the wheels, and the connecting-rods C' C' C' C', and brake-beams 4, all substantially as set forth.

166,929. BOILERS. H. J. Richardson, Brooklyn, E. D., N. Y. [Filed May 26, 1870.]



1. A flat ruler having a sectional movable jointed end, constructed and operating substantially as and for the purposes set forth.

2. A flat ruler having a sectional movable jointed end, in combination with a covering or lining securely fastened to the ruler, all constructed and operating substantially as and for the purposes set forth.

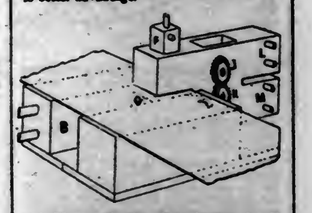
166,930. CORE-MAKERS. Wm. H. Rider, Plum Hollow, Iowa, assignor to himself, Levy Shirley, and A. D. King, same place. [Filed Apr. 13, 1875.]

1. The combination of the two bars A A, separated from each other, and the wheel-frame, consisting of the curved bars E E, provided with T-irons G G and flanges a a, the cross-bar H, and nuts b b, whereby the wheels are capable of being moved inward or outward on the bars A A, all constructed substantially as and for the purposes herein set forth.

166,927.

1. The combination, with the brake beam and shoe, of the bracket m and cushion n, substantially as and for the purpose set forth.

2. The combination of the central bar A and its stops with the spring h and sliding box c, substantially as and for the purpose set forth.



3. In combination with the bars A A, the laterally-adjustable wheels I, and the shaft C with cranks H, the plow M, connected to the straps s s and to the bar H, and laterally adjustable, in conjunction with the wheel I, all substantially as set forth.

3. The combination, with the circle J, of the pivoted bar K, with vertical arms L L, the friction-rollers m m, latch p, wheel P, and syringe n n, all substantially as and for the purposes herein set forth.

4. The combination, with the swiveled wheel P and latch p, of the plow M', connected and pivoted straps s' s', loop m, rods r r, and foot-treadle N', all substantially as and for the purpose herein set forth.

166,940. LABEL AND TAG MACHINES. Chas. E. Sawyer, Boston, Mass. [Filed Feb. 10, 1874.]

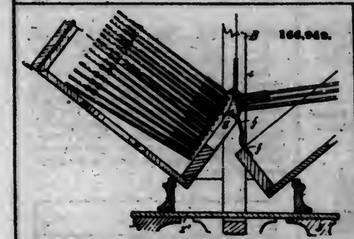
Brief.—The tags are fed over heating-boxes, and the patch strip over others, which soften the gum or cement, when the ribs unite the patch and pressure is upon the tag. The strip may be fed at an angle, so that it may be cut to better advantage.

1. The combination of the heating-box B with the cutters or dies F and G, or their equivalents, constructed substantially in the manner described, as and for the purposes set forth.

2. The combination of heating-boxes L and M, with feed-rolls J K and dies F G, or equivalents, constructed substantially in the manner described, as and for the purposes set forth.

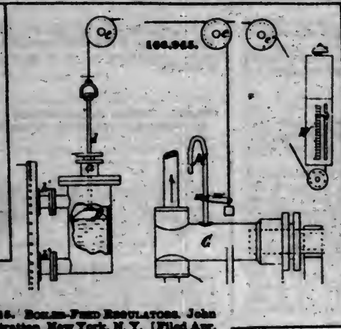
3. The combination of the heating-box B with the feed-rolls J and K, dies F and G, heating-boxes L and M, constructed to operate substantially in the manner described, as and for the purposes set forth.

166,941. PROCESSES FOR MAKING QUICK-BURNING FUEL. Wm. A. Shepard, New York, N. Y. [Filed Jan. 5, 1875.]



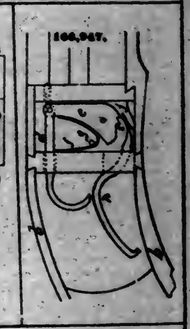
The process of making a quick-burning fuel, which consists in expelling the air and moisture of materials, such as are specified, placed in a close chamber, by means of superheated steam; then producing a vacuum by injecting a spray of cold water; then saturating the material while in vacuo with petroleum, the lighter products of which have been removed, and then drying the fuel in the chamber by sending through it a current of air, substantially as described.

166,942. STEREOSCOPES. L. D. Sibley, Vineland, N. J. [Filed Mar. 17, 1875.]



1. In a stereoscope, a platform, p, for supporting the back of a book, holding a series of pictures, and provided with an edge over which the leaves of the book are turned, substantially as shown and described.

2. The box made in two hinged parts, O O', opening from each other, each part being adapted for supporting the back and displaying the pictures as they are viewed from either side of the apparatus.



3. In combination with the lenses of a stereoscope, mechanism operating substantially as described, whereby they may be adjusted to or from each other, for the purpose set forth.

166,943.

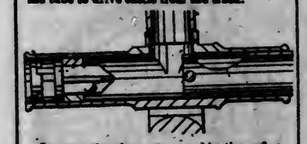
166,944.

166,947.

4. The leaf-frame of the book, for the reception and holding of stereoscopic pictures, constructed of continuous wire extending around all its four sides, substantially as and for the purposes set forth.

5. In combination with the wire frame o p q r, the notches s at their inner sides, whether made on the wire or on a separate piece, s', and applied to the frame, as and for the purpose set forth.

6. The movable and adjustable bars s, provided with swinging or sliding catches t, adapted to engage with teeth u on the leaves, substantially as and for the purpose set forth.

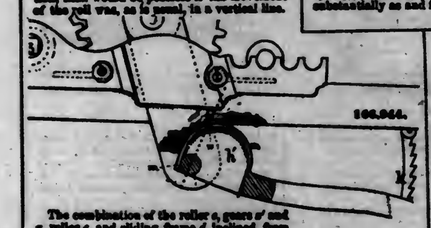


7. The movable and adjustable bars s, provided with swinging clasps v, adapted to receive and clasp the edges of the pictures, substantially as and for the purpose set forth.

8. The pieces t u, constructed as described, from sheet metal, and bent so as to form both the catch or pawl t and the clasp u, about at right angles to each other, and provided with a pivot-hole near its angle, substantially as and for the purpose described.

9. In combination with the swing-frame R, the reversible or turning lens-support fE, as and for the purpose described.

166,943. CATTLE-ALARMS FOR LOCOMOTIVES. B. Smith, Bloomington, Ill. [Filed June 1, 1875.]



Brief.—The device consists of a telescopic arrangement of tubes and a valve, so arranged that when one tube is pushed within the other the valve is opened and steam admitted from the boiler, whereby projectiles are thrown from the tube to drive cattle from the track.

In a cattle-alarm, the combination of a movable tube and a wing-valve, substantially as set forth.

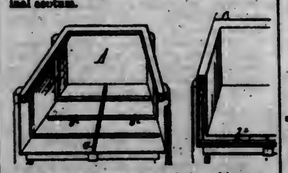
166,944. MACHINES FOR RENDERING TIMBER. Thomas M. Stansbury and Alex. F. Stansbury, Cambon, Ill. [Filed May 10, 1875.]

Brief.—The middle roll c is connected by gearing to the roll to which power is applied, and is journaled in a sliding frame somewhat inclined from a vertical line, and toward the roll with which it is geared, thus permitting to the middle roll a greater latitude of movement, while still retaining the gear connection, than would be possible if the movement of the roll was, as is usual, in a vertical line.

166,944.

The combination of the roller c, gears c' and g, roller c, and sliding frame d inclined, from the perpendicular toward said roller c, substantially as and for the purposes set forth.

166,951.



166,945. BOILER-FEED REGULATORS. John F. Gerstner, New York, N. Y. [Filed Apr. 20, 1875.]

Brief.—When the water in the boiler rises above its proper level, the valve in the air-pipe attached to the pump is opened, when the pump will work freely, yet be held in condition for working the moment the water falls and the cock is closed.

The cock m is the pipe M, adapted to induct air into the pump, as represented, in combination with the feed-pump G and with the float D, moving with the water-level of the boiler, as and for the purposes specified.

166,946. CHEESE-VATS. C. W. F. Street, Lanark, Ill. [Filed June 12, 1875.]

Brief.—The vat sits in a larger vessel, and below and at the outer sides of the inner vessel, water of any desired temperature circulates, jetting from the transverse tubes beneath, on opposite sides thereof, as said transverse tubes are held centrally by a longitudinal centam.

1. The partition a in the tank A, and in combination therewith the steam-pipes b', perforated in opposite directions on opposite sides of said partition, substantially as described.

2. The combination, with the tank A, of the horizontal steam-pipes b b', passing along the sides of the vat above the center thereof, and the perforated branch pipes b', passing below said center and across the bottom of the tank, so as to insure an equal distribution of the steam in said branch pipes, as and for the purpose set forth.

166,947. LOCKS FOR FIRE-ARMS. Ferdd. Taylor, Danbury, Conn. [Filed June 29, 1875.]

The hammer c, provided at its upper end with a pivoted hook, d, to serve as a means for cocking, in combination with a double spring, f, held in place by the stud or pin f', substantially as and for the purpose set forth.

166,948. WASHING-FLUIDS. Adolph Thode, Brooklyn, N. Y. [Filed Apr. 6, 1875.]

A washing-fluid consisting of potash, borax, chloride of sodium, soapwort, and water, in about the proportions specified.

166,949. WASH-BOILERS. H. F. Thurston, Porter, Me. [Filed June 7, 1875.]

Brief.—The base of the vessel, upon which the clothes-receptacle is secured, has three boiling-chambers on its bottom, which open at their inner sides into bridges connecting them together, the bridges having valves opening inward. From the tops of the chambers pipes conduct the boiling water into the center and sides of the clothes-receptacle, from which it passes through strainers and the valves in the bridges back into the boiling-chambers.

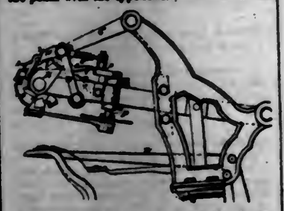
The wash-boiler constructed as described—that is, having the base a, provided with the chambers b b b, openings c, perforations f, the side pipes g, the inner pipes h, the bridges i, with their openings and valves, plate j, receptacle k, and drainage l, all as herein set forth.

166,950. CARRIAGE-BOWS. John A. Topliff, Elyria, Ohio, assignor of one-half his right to George H. Ely, same place. [Filed Nov. 10, 1874.]

1. In combination with the bent tubes of bow-sockets and wood bows or fillings, a steel or other hard-metal plate, welded or otherwise fastened within the tube to the cast-iron, substantially as and for the purpose specified.

2. The combination, with the metal tubes of bow-sockets, of a wooden filling, substantially as and for the purpose set forth.

166,951. GRAIN-RAKE. Samuel Van Syckel, Titusville, Pa., assignor to Geo. H. Clarke, Brooklyn, N. Y. [Filed July 20, 1875.]



Brief.—The bay-bar is kept in position by steps or lugs on top and a transverse bay at the bottom. By the removal of said bay the interlocking bars may be separately removed.

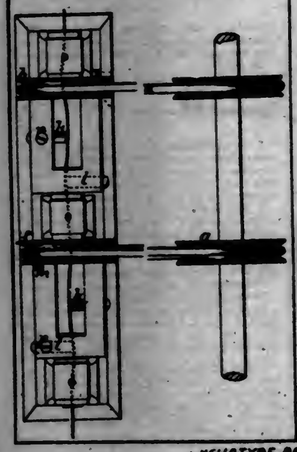
1. The combination, with the interlocking bars A A and bay-bar B, of the adjustable or removable steps C C, for preventing the bay-bar from springing upward, constructed and operating substantially in the manner described and specified.

2. The combination, with the interlocking bars A A and key-bar B, of the adjustable or removable stops C C and stationary stops or projections D D, constructed and operating substantially in the manner described and specified.

166,962. PAGING AND NUMBERING MACHINES. Wm. Von Deuhn, Chicago, Ill., assignor to Culver, Page & Hoyne, same place. [Filed Dec. 11, 1871.]

Brief.—The type-wheels are journaled to and between the bifurcated ends of lever B, and are inked by a reciprocating lever, q, which, together with an intermittingly-rotating ink disk, R, receives motion from the type-lever through the medium of toggle-levers C D. The type-wheels are brought into proper relation with each other by a suitable pawl and ratchet, and locked in position by cams h and g of washer f, and sliding dog d, and are kept elevated above the mast-bolt, when at rest, by a spring surrounding the rod that connects the pedal with the type-lever.

1. The peripherally-notched disk N, whereby the operative pawl rotates the type-wheel, in combination with the type-wheel and its aligning-bar, substantially as specified.



2. The aligning bar M, provided with a dependent cam or wedge-shaped projection, o, in combination with the disk N, whereby said bar is raised out of engagement with the type-wheel, substantially as specified.

3. The combination of the guide-plate or form K, pawl H, rider L, and ratchet I, substantially as specified.

4. The combination of the knee-lever C D D, the lever B, pawl H, and ratchet I, all constructed and operating substantially as specified.

5. The cam h, combined with cam g, upon the interposed steel cam-rocker f of the type-wheel, for the purpose of drawing the dog d into a locked position, substantially in the manner specified and shown, whereby the ordinary spring is dispensed with.

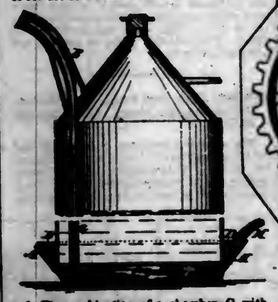
166,963. WIRE-STRAIGHTENING MACHINE. Chas. P. S. Wardwell, Lake Village, N. H. [Filed Feb. 27, 1875.]

The combination of two wire-straightening, A B, revolving in opposite directions, operating substantially as and for the purpose herein specified.

166,964. ROTARY PAPER-CUTTERS. Frank R. Woodward, Hill, N. H. [Filed Mar. 5, 1875.]

In combination with a suitable handle, a rotary cutter for cutting textile fabrics, paper, pasteboard, leather, glass, &c., which is shaped to the frustum of a cone, with a base slightly convex, so as to bring the bearing-point of the cutter on the pin, on which it turns, at one extremity of the hole in the cutter, and obviate friction against the side of the slot in the handle, in which the cutter is pivoted, substantially as described and specified.

166,965. METHODS OF MAKING A SUBSTITUTE FOR BUTTER FROM THE OILS OF ANIMAL FATS. Wm. B. Andrew, New York, N. Y. [Filed Aug. 12, 1870.]



1. The process of obtaining a product as a substitute for cooking butter, consisting of churning by itself suitably-prepared oil obtained from animal fat, whereby the oil globules are broken up, and afterward subjecting it to a low temperature, as described.

2. The process of manufacturing artificial butter by churning by itself suitably-prepared animal oil, as described, and then combining the product thus obtained with butter already formed upon cream, the oil product being placed in the churn and churned until a thorough amalgamation is effected, when the mass will partake of the flavor of natural cream butter, as described.

3. The product herein described, consisting of animal oil alone, and of the character described, having the globules broken up, and having the appearance and consistency of butter, as shown and specified.

166,966. OIL-CANS. John Ashwith, Chicago, Ill. [Filed July 24, 1875.]

Brief.—The drip-pan, attached to the bottom of the can to catch the drip from the nozzle, is provided with a chamber, out of which is a nozzle passing into the pouring-nozzle, so that the drip may be poured out with the contents of the can. It also has another nozzle for pouring out of the drip-pan, or for use as a handle to a can.

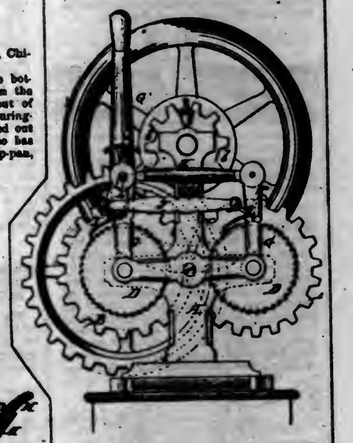
1. The combination of a chamber, C, with the drip-pan A and can, said chamber having a passage from the pan into it, and a nozzle for pouring out from it, substantially as specified.

2. The combination of a nozzle, G, with the drip-pan and the nozzle E of a can, substantially as specified.

3. The nozzle E of a drip-pan attachment to a can, located relatively to the can to serve for a handle thereto, substantially as specified.

166,967. NUT-LOCKS. David Beaton and S. A. Beaton, Philadelphia, Pa. [Filed Jan. 6, 1875.]

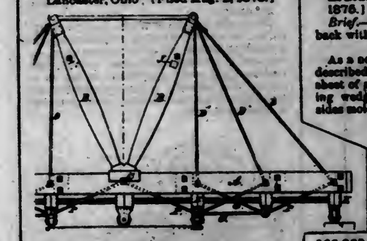
Brief.—A cup shaped washer has a pawl pivoted to the side, to engage with a ratchet on a part of the nut within the cup, by which loosening of the nut is prevented. The pawl is also provided with an arm projecting in the opposite direction, to engage with a circumscribing ring, which is turned by means of a wrench, to disengage the pawl to permit removal of the nut.



1. The nut D, provided with the serrated collar F, in combination with the cup-shaped washer E and dog J, constructed and operating as set forth.

2. The combination, with the serrated nut and locking dog or pawl, of the disengaging band M, substantially as and for the purpose set forth.

166,968. MECHANICAL MOVEMENTS. Andrew Beck and Israel Beck, Philipsburg, Pa. [Filed July 2, 1875.]



Brief.—A pair of double ratchet-wheels, with pinions, give motion, through a gear-wheel, to a pinion on a fly wheel, a connecting-rod thereon effecting reciprocating motion. One ratchet-wheel, operated by an extended lever, actuates the other by parallel motion-rods. Motion reversed by the forked end of a small lever moving crank-arms on the pawl-axles.

1. The combination, with the shafts a, e, and d, gear-wheels B, E, C, and b, and fly-wheel K, of the double ratchet-wheels D D, levers G G, connecting-bar H, and double pawls I I, substantially as and for the purposes herein set forth.

2. The combination of the double pawls I I, cranks c c, connecting-bar J, and shifting-lever L, all constructed substantially as and for the purposes herein set forth.

166,969. DRAW-BRIDGES. Wm. M. Black, Lancaster, Ohio. [Filed Aug. 2, 1875.]

1. In combination with the chords of turning draw-bridges, pairs of diverging posts placed over the pivot-beam, substantially as described, and for the purpose specified.

2. In combination, pairs of diverging posts placed on the chords of a turning draw-bridge over the pivot-beam, supporting-rods extending from the tops of the posts to graded points on the chords, substantially as shown, and for the purpose specified.

3. In combination with pairs of diverging posts placed on the chords of a turning draw-bridge over the pivot-beam, and supporting-rods extending from the tops of the posts to graded points on the chords, the connecting-bars F and diagonal tension-bars G, with the ring H, substantially as shown, and for the purpose specified.

4. In combination with the chords A, the diverging posts B, and the supporting-rods D, the tension-arm O and the rods P, substantially as described, and for the purpose specified.

166,970. TRUSS-BRIDGES. Wm. M. Black, Lancaster, Ohio. [Filed July 17, 1875.]

Brief.—An upper chord is combined with a catenarian arc composed of sections or sets of eye-bars, united by hitch-plates, and radial compression-posts, and diagonal tension-bars, by which the different strains are distributed. The lower chord is suspended by sets of diverging bars connected to the said hitch-plates. A cap with cleat and posts unites the upper chord and corner post, to protect the joints from the weather.

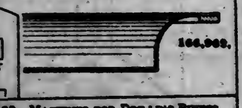
1. In combination with a catenarian tension-arc, an upper chord, radial compression-posts, and diagonal tension-bars, substantially as shown, and for the purpose specified.

2. The catenarian tension-arc C, composed of sections or sets of eye-bars, united by the hitch-plates D, substantially as shown, and for the purpose specified.

3. In combination with a catenarian tension-arc and end main posts, a lower chord, composed by sets of diverging bars, substantially as shown, and for the purpose specified.

4. The cap J, substantially as shown, and for the purpose specified.

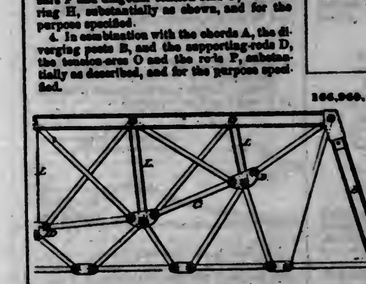
166,971. RIDGE-AND-FASTENINGS. G. Bostwick, Aurora, Ill. [Filed Nov. 12, 1874.]



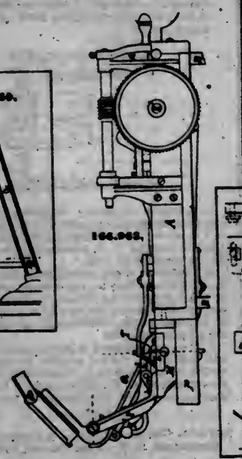
An open angle-iron post for bedsteads, having side plates E, with face-grooves b, for the fastening-wedges c of the side rails and the head and foot boards, substantially as set forth.

166,972. PAPER PICTURE-FRAMES. Oliver K. Bradford, Boston, Mass. [Filed Jan. 18, 1875.]

Brief.—The flaring rim is re-enforced at the back with a wooden frame.



As a new article of manufacture, the above-described paper frame, as constructed of one sheet of straw-board or similar material, having wedge-shaped corners cut out and the sides molded to form a flaring frame, as shown.



166,973.

166,973. MACHINES FOR DRILLING RIVETS. Mellen Bray, Newton, Mass. [Filed June 11, 1875.]

Brief.—A vibratory hopper with reversed circular chute attached, by virtue of which the rivets which pass out of the hopper heads up are delivered to an inclined stationary chute with the heads down, their passage down the inclined chute being facilitated by the strokes of a spring hammer to jar the chute. As they pass from the chute they are pushed into the notches of an intermittingly-revolving carrier-wheel, which carries them between two dies, which clamp and hold them while being drilled, after which the carrier conveys them in front of a discharger, which ejects them.

166,974.

1. In combination with an automatically-operated drill, a hopper, into which solid rivets may be placed in bulk, and from which they are discharged in regular order with their heads all in one direction, an inclined chute, down which the rivets slide to the drilling-point, and a pair of clamping-dies, arranged to seize the rivet, hold it while it is being drilled, and release it again when the drilling is completed, substantially as described.

2. In an apparatus for separating rivets, the combination of the finest inclined chute G, the curved shield r, the vibratory chute E, having a semi-circular end concentric with the axis about which it vibrates, and with the curved shield r, and a hopper attached to, and arranged to vibrate with, the chute E, substantially as described.

3. In combination with an automatically-operated drill, a hopper for separating the rivets, and an inclined chute leading therefrom, an intermittingly-rotating wheel or disk, provided with a series of pockets in its periphery, each adapted to receive a rivet from the chute and convey it into position to be drilled, substantially as described.

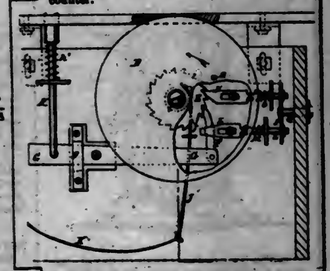
4. The combination of the carrier-wheel n and a pair of annular shields, O O, all constructed, arranged, and operating as and for the purposes described.

5. The combination of the inclined chute Q, carrier-wheel n, a pair of annular shields, O O, and the reciprocating plunger u', all constructed, arranged, and operating as and for the purposes described.

6. The combination of an intermittently-rotating carrier-wheel, provided with a series of pockets in its periphery, a pair of fixed or stationary shields, placed one upon either side of the said carrier-wheel, and a reciprocating plunger, arranged to discharge the drilled rivet from the carrier-wheel, substantially as described.

7. In combination with an automatically-operated drill and a pair of clamping-dies mounted upon the main frame A, the supplementary movable frame M, having mounted thereon the rivet separating and feeding devices, substantially as and for the purposes described.

8. In combination with an automatically-operated drill, a pair of clamping-dies, and an intermittently-rotated carrier-wheel, having a series of pockets in its periphery, the detent-wheel N and detent spring or lever N', arranged to operate substantially as described.



9. In combination with a hopper for separating rivets and an inclined chute leading therefrom, the lever t, provided with the hammer-head t', the cam T, provided with a series of lifter-toes, and the spring t', all arranged to operate as and for the purposes described.

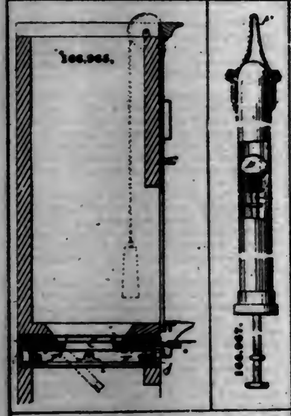
10. The combination, with an automatically-operated drill, of a pair of movable clamping-dies, f f, a pair of vibrating levers, J J, and the two edge cylinder-cams a and c', all arranged and operating substantially as described.

11. The saddles or frames J', pivoted to the levers J J, and adjustable thereon by means of the set-screws h' h', and having mounted therein the trunks h' h', all as and for the purposes described.

166,975. CLOTH-MEASURE REGISTERS. Jas. Brown, Jr., Matteawan, N. Y. [Filed July 21, 1875.]

Brief.—To be placed beneath the store-counter, each depression of the push-pin registering one yard upon a figured drum, whose edge shows through a slot in the counter.

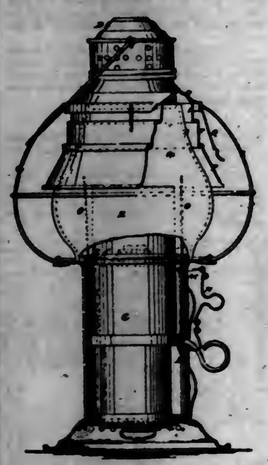
The combination of the register-wheel D, the ratchet-wheel R, the push-pawl P, the lever G, the push-rod and spring H h', the drum, cord, and spring I J K, the guard and spring L M, the stop-pawl and spring N O, the cross-bar P, and pull-rod Q, with each other and with the case A, to adapted the device to be attached to a store-counter, substantially as herein shown and described.



166,976. GRATES FOR COOKING-RANGES. C. H. Carling, New York, N. Y. [Filed July 21, 1875.]

Brief.—The central rectangular portion of the grate is pivoted at the rear, and may be dumped. The grate-frame is mounted on rollers, and may be rotated.

1. The combination of the rectangular pivoted grate O with the circular rotary plate f and with the top plate A, that has a rectangular opening, hereafter termed plate t, and ring j, all arranged substantially as herein shown and described.



2. The combination of the rotary plate f, grate-casing P, rectangular grate O, handle s, and bolt s with each other, all substantially as herein shown and described.

166,965.

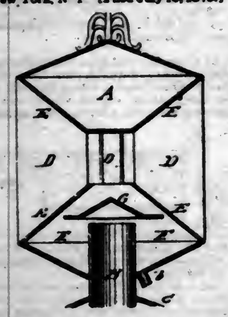
166,967.

166,966. SIGNAL-LANTERNS. Geo. J. Cove, Elizabeth, N. J. (Filed May 6, 1876.)

1. The intermediate handle H, flexibly connected with the two spring-catches L M, as and for the purposes specified.

2. The three wires O, passing up the sides of tubes G H, and resting against the globe, as and for the purposes described.

3. The spring-catch Q, pendent from cap D, and combined with the sliding sections of shade P, as and for the purposes set forth.

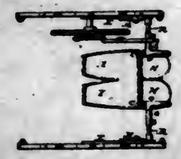


166,967. COMBINATION SYRINGE. Wm. P. Clotworthy, Baltimore, Md. (Filed Aug. 12, 1876.)

Brief.—A tip adapting a female syringe for male use is covered over an ordinary glass syringe by a rubber sleeve. The piston is made up partly of a hollow rubber bulb filled with air.

1. In combination with a syringe having a rounded and perforated end, as described, the spunk F, constructed to receive and fit the barrel of the syringe, and held to it by an elastic tubular collar, G, in the manner and for the purpose set forth.

2. In combination with the barrel and piston-rod of a syringe, the bulbous hollow spherical rubber piston D, constructed and operating in the manner and for the purpose specified.

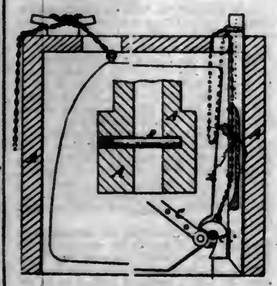


166,968. CHIMNEY-COWLS. Emeal Cole, New York, N. Y. (Filed July 10, 1876.)

1. The combination of cowl A, tube B, cap C, partitions D, and plates E with base-chamber F, in the manner and for the purpose described.

2. The combination of chamber F and diaphragm G, to conduct the rain-water to spout I, in the manner specified.

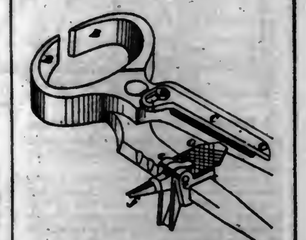
166,969. ADJUSTABLE SEWING-MACHINE TREADLES. James A. Curtiss and Samuel G. Burleigh, Grand Rapids, Mich. (Filed May 3, 1876.)



1. A treadle for sewing-machines, having two separate shafts, S, attached to foot-plates H I at points C, in combination with the adjustable bearings M E, substantially as and for the purposes set forth.

2. The hollow shafts S, with extension-rods R, inserted and held to any desired position, by means of set-screws or other device, for the purpose of adjusting the treadle to machines of different widths, substantially as and for the purposes set forth.

3. The arm a, attached to horizontal shaft S, and held in any desired position by thumb-screws or equivalents, in combination, with the extension-rods R and foot-plates H I, substantially as and for the purposes set forth.

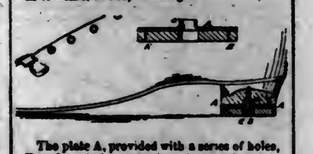


166,970. CENTER-BOARDS. J. L. Dickerson, Hempstead, N. Y. (Filed July 24, 1876.)

The combination of center-board trunk A, having a hole bored into but not through its timbers, a bolt, D, shorter than said hole, and a superimposed plug of wood to be driven into said hole, as and for the purpose specified.

166,971. HORSESHOEING TOOLS. Carl R. Donner, San Francisco, Cal. (Filed June 22, 1876.)

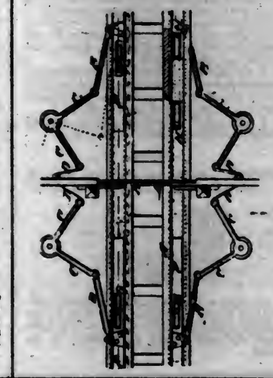
Brief.—To one lever of the nippers is attached an adjustable sliding thimble carrying a grooving-tool, by which a channel is cut in the hoof to receive the clinch of the nail, and also carrying a serrated plate to act as a clamp. The clinching is done by means of an adjustable plate on the other lever pressing or bending it down.



1. The scoop shaped graver *f*, adjustably fitted to the handles of a forceps, for the purpose of channeling the hoofs, substantially as and for the purpose described.

2. The laterally-adjustable plate C and vertically-adjustable plate C, in combination with the handle of the nippers B, substantially as and for the purpose set forth.

166,972. HEEL-PLATES. Geo. Dunlop, Williamsburg, N. Y. (Filed Dec. 28, 1874.)

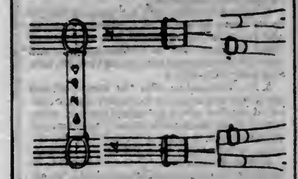


Brief.—The heel may be adjusted or turned as it wears, to keep it straight.

The plate A, provided with a series of holes, E, and a tabular projection, e', in combination with the pin C attached to the heel of a boot or shoe, and screw D, substantially as herein described.

166,973. RAILROAD-GATES. J. H. Eberhart, Sumter, S. C. (Filed July 17, 1875.)

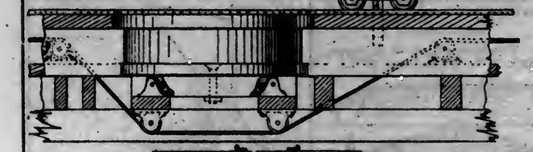
Brief.—A railroad-gate operated by the moving train by means of a dog secured to a slide which moves in proper ways; said dog being released from contact with the attachment upon the train by a spring arranged in the under side of the slide-frame, when the gate has been properly opened or closed. The gate is connected to the slides by suitable bell-crank and lever connections.



1. The combination of springs H with the slides F and dogs G, the springs being located at each end of the space traversed by the dogs, substantially as specified.

2. The combination of the slides F and bell-cranks C, and their connecting-rods D E, in the arrangement whereby in opening the gate sets the slide for closing it, and by closing the gate both slides are set for opening it, substantially as specified.

166,974. SUSPENDERS. Robt. Henry Eddy, Boston, Mass., assignor to A. G. Eddy, same place. (Filed July 6, 1871.)

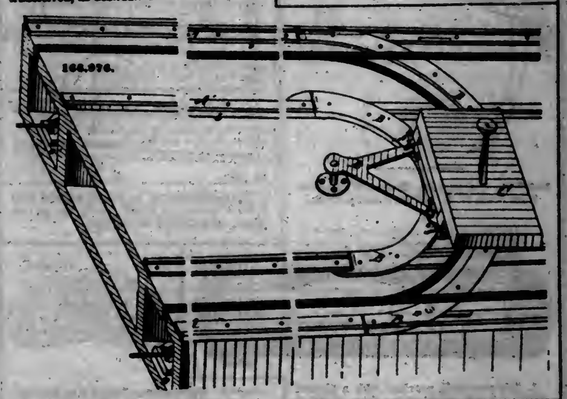


Brief.—The shoulder-straps are connected by an extensible and adjustable cross-strap.

As a new article of manufacture, suspenders composed of two independent shoulder-straps, A A, and the adjustable cross-strap B, constructed and applied thereto, substantially as shown and described, and for the purpose set forth.

166,975. DEVICES FOR PROPELLING CARS. William Eppelsheimer, San Francisco, Cal. (Filed June 26, 1876.)

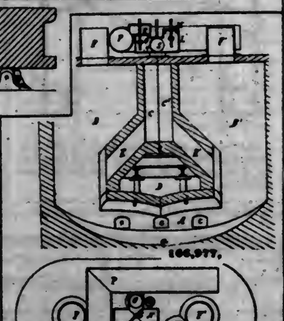
Brief.—An improvement in devices in which the cars are propelled by a traveling rope, consisting of a slot and passage-way through the turn-table or switch, through which the grappler can pass, thereby obviating the necessity of unlocking it at such points. The bed upon which the turn-table rotates is provided with rollers beneath the table, under which the rope passes, so as not to interfere with the action of the turn-table.



1. The construction of a railway-track provided with a subterraneous rope-chamber and a continuous narrow opening through the covering of such chamber, intended to be traversed by a rope-grappling device attached to a car, with a turn-table or switch, provided also with a rope-chamber under its surface-floor, and a slot through such floor into said chamber, which may open respectively into the rope-chamber and slit in the road-way of the main track, whereby the grappling device and its standard, attached to a car running on the road and across the switch or turn-table, may pass from the rope-chamber under the main track into the rope-chamber and slot in a branch track, or the reverse, all substantially as and for the purpose described.

2. The combination, with a railway-track, provided with a subterraneous rope-chamber, as described, of a turn-table, provided likewise with a sub-surface chamber similar to that under the railway-track, and also a passage underneath the body of said table, whereby the rope traveling under the railway-track may avoid the said table and leave it free to turn on its pivot, all substantially as described.

166,976. MEANS FOR TURNING CARS ON SHORT CURVES. William Eppelsheimer, San Francisco, Cal. (Filed July 6, 1876.)

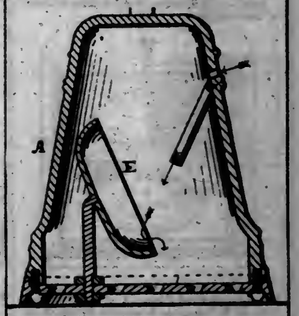


Brief.—A device for transferring cars from one track of two parallel lines to another, consisting of broad metal plate-rails extending in a semicircle from track to track, and a forked pivoted radius-bar, the outer ends of which are secured to the inner ends of the car. The car, when in motion, is caused by the radius-bar to follow the curved track, and thus is transferred, as desired.

In combination with two railway-tracks laid in the same street, the curved ways B and B' and the forked pivoted lever D, as and for the purpose described.

166,977. FURNACES FOR SMELTING ORE. Wm. H. C. Bostic, Milton, Mass. (Filed July 3, 1876.)

Brief.—Air and combustible gas are forced through ore and pig metal, and the products of combustion are conducted through similar charges, which thereby become heated and reduced.

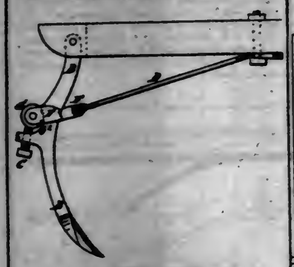


1. The compound furnace for treating ore and pig or scrap metal, the same being composed of the main chamber A, the two ore-receiving chambers B B', the metal-receiving chambers C C', the connecting-passages E E', and the system of gas and air inlet conduits I H H' L N, dampers K S, air-escape-regulating valve R, and odeet P, all being arranged and combined substantially as and to operate as described.

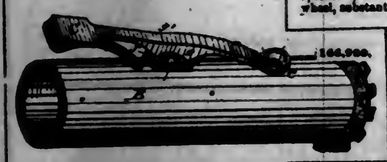
2. The compound furnace, as provided with the reparation chamber or space D, arranged with the main and auxiliary chambers A B B' C C' and the inclined passages E E', substantially in manner as described and represented.

3. In the manufacture of iron from the ore, or in remelting iron, the above-described process, which consists in forcing air and gas in separate columns through charges of metal, or ore and metal, and passing the resultant products of combustion through like charges, and next, by reversal of the direction of the said currents, passing the air and gas through the last-mentioned charges, and the products of combustion thereof through those first mentioned, whereby the charges to be melted serve to heat the gases for melting them, all being substantially as set forth.

166,978. TOY MONEY-BOXES. Alb. Feigl, Philadelphia, Pa. (Filed July 31, 1875.)



The toy money-box A, in combination with an inclosed gong or alarm, E, arranged to be sounded by the descending coin deposited in the box, substantially as and for the purpose set forth.

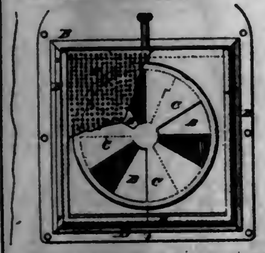


166,979. CULTIVATOR-TEETH. John Flynn, Menahen, Wis. (Filed May 15, 1876.)

Brief.—A slip-tooth with a spring and devices for changing the force required to move it from working position.

The combination of spring D F and wheel G with the pivoted tooth B, having the concavity b', leg b', and set-screw C, as shown and described, to operate as specified.

166,960. UMBRELLAS. George W. Francis, New York, N. Y. (Filed Feb. 12, 1875.)

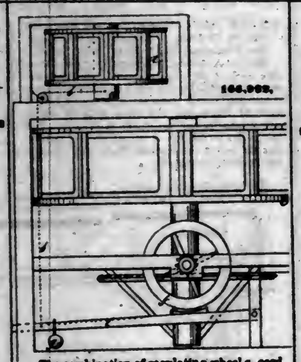


1. The runner B, provided with a pivoted spring-catch, C, made of one piece of metal, the cup-shaped end f of which is furnished with a central aperture, e', and its sides f f turned down for pivot-bearings, and the other end turned over and under to form the spring i, substantially as described.

2. In combination with spring-catch C, the groove a in the stick, terminating at both ends in concave cavities b b', having central projections c, for engaging with the aperture e' of spring-catch, substantially as and for the purpose herein specified.

3. The combination of runner B with spring-catch C, groove a, concave cavities b b', and pins c, when constructed and arranged substantially in the manner and for the purpose herein set forth.

166,961. COMBINED SPARK-ARRESTERS AND STOVE-REGISTERS. Thos. R. Freeman and Perley Y. Jones, Hyon, Wis. (Filed June 12, 1875.)



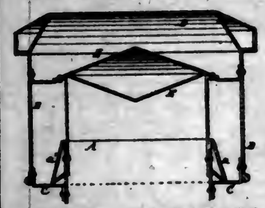
Brief.—The furaminous plate slides in front of the register.

The combination of frame B, having pivoted valve C, grooved frame D, and furaminous plate E, to form a spark-arrester for stoves, as set forth.

166,962. WINDMILLS. Chesley Gates, Locust Grove, Mo. (Filed June 26, 1875.)

Brief.—A small wind-wheel for regulating the speed of the large one is arranged when it is subject to the varying wind, and has a cord attached to its hub and connected to the brake-lever, so as to pull it against another wheel with more or less force, according to the action of the wind on it. The effect is varied by the adjustable weight.

The combination of regulating-wheel a, cord b, lever c, and the wheel f with the power-wheel, substantially as specified.



166,963. DETACHABLE LINKS FOR CHAINS. C. H. Gillingham and A. L. Gillingham, Geigerville, Ill. (Filed Jan. 30, 1875.)

Brief.—The link has a transverse slot at each end, and a longitudinal slot in the center. A T-shaped piece is fitted in the central slot, and is locked in place by a pin or rivet.

The body A and key B, constructed substantially as herein shown and described, and secured to each other detachably by a rivet or pin, C, as set forth.

166,964. VENTILATOR-CAPS. H. A. Gouge, New York, N. Y. (Filed Aug. 1, 1874.)

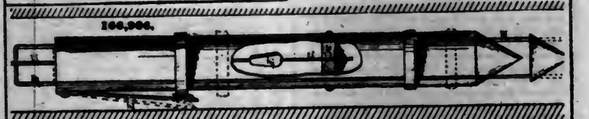
The tube A, overlapping body B, and rim-projecting deflector E, combined with the angular cornice-plate a', as and for the purpose specified.

166,965. CRANES. Ignatius Hahn, Pittsburg, Pa. (Filed June 26, 1875.)

Brief.—The post is hinged at bottom to a frame that has a circular bearing, and horizontal rotation in a water-annulus attached to the axle of wheels, which run on ways. Arms from this axle extend to a forward axle, to sustain the horizontality of the former. Moving freely in the annulus is a hydraulic cylinder, working a piston hinged to the forward part of the bottom of the post.

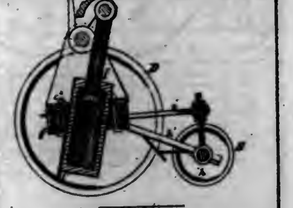
1. The combination of the crane-post, jib, and frame, the crane-post being hinged to the frame, so that the jib and post travel together in a vertical plane around a common axis, substantially as and for the purpose specified.

2. The combination of a crane-post, its supporting stand or frame, and suitable mechanism for raising and lowering the post and its load, the post being connected to its stand by a hinge joint or connection, and the power for raising and lowering the post being applied directly thereto, substantially as and for the purpose specified.



3. In combination with a crane-post hinged to its stand or frame, an oscillating cylinder and piston, the piston acting upon the post to raise and lower the same, substantially as and for the purpose specified.

4. In combination with a crane-post hinged to its frame or stand, an oscillating cylinder and piston acting upon the post to raise and lower the same, and an annular cylinder and piston for raising and cushioning the post, substantially as specified.

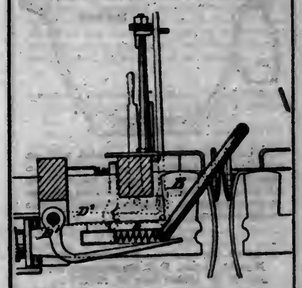


5. In combination with the crane-post and the piston and cylinder for raising the post upon its vertical pivot, a vertical rod and cross-arm or mechanism, substantially the same, for adjusting and preserving the level of the cylinder, substantially as specified.

6. The combination of the crane-post, its frame or stand, the oscillating cylinder for operating the post, and a single pair of supporting-wheels, the several parts being relatively arranged, so that the points of support, center of trunnions, and fulcrum are in a vertical line, whereby the weight of the load is transmitted directly to the ground, substantially as and for the purpose specified

166,966.

166,967. CAR-COUPLINGS. Peter Harper, Marshall, Tex. (Filed Mar. 29, 1875.)



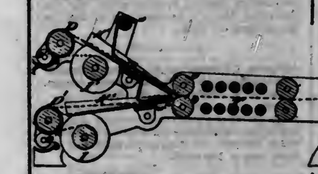
166,968. BOLTS FOR OIL-WELLS. W. R. Harper, Shamburg, Pa. (Filed May 10, 1875.)

1. The combination and arrangement substantially as herein shown and described of the spring L L, the bail D D, ring F, the rod C, the bridge H, and hammer I, by which the renovator is made to suspend itself in the well, and the explosion produced by the manipulations of the single cord B, substantially as set forth.

2. The described arrangement and combination of the cylinder M, with its springs N N, rods O O and P P, operating in connection with the shell A and its attachments, substantially as and for the purposes set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON

166,967. CAR-COUPLINGS. Peter Harper, Marshall, Tex. (Filed Mar. 29, 1875.)



1. A car-coupling composed of draw-bar, with upright hook-piece, a coupling-link swinging in a slot of the same, and a forked link controlling and raising lever, substantially as and for the purpose set forth.

2. The forked link controlling and raising lever, operated by intermediate spindle and lever connection from the platform, in combination with a retaining-hook mechanism of the spring buffer-rod, to hold link in raised position till released by concussion of cars, as set forth.

3. The combination of forked link-controlling lever, its operating mechanism, and the retaining hook-arm of the buffer-rod with a fulcrumed lever engaging the hook-arm, for admitting direct adjustment of link into horizontal or other position, as and for the purpose specified.

166,968. PAPER-BAG MACHINES. James Hatfield, Cincinnati, Ohio. (Filed Aug. 24, 1874.)

Brief.—The machine takes webs of paper from several reels, folds into continuous tubes, then folds the ends of these tubes into the form of satchel-bottom bags, then severs a bag-length from each tube, and delivers the completed bag from the machine. Two or more sizes of bags may be made side by side at the same time by peculiarities of the feed mechanism.

1. The folding-plates h' and m, constructed in parts laterally adjustable, as and for the purpose herein-before set forth.

2. The folders, composed of plates h' and m, arranged alternately above and below each other at their wide ends, with their narrow ends terminating in one common horizontal line, substantially as for the purpose set forth.

3. The expanding-bars o' mounted upon the bar i, substantially as shown, to constitute an adjustable former for the interior of the tube, as set forth.

4. The adjustable external guide o''', combined with the internal adjustable former-bars o', substantially as set forth.

5. The expander a, substantially as set forth, combined with the rollers B B and Y' Y''.

6. The combination of the expanding-bars q, with the rollers Y'' at the ends of the vibrating arms J J, for the purpose set forth.

7. Rollers E and B, provided with movable rings c, for the purpose set forth.

8. Combined with the feed-roller E, the spring i, to take up the continuous motion of the driver P'', combined with a suitable intermittent step, substantially for the purpose set forth.

9. The disk G, provided with the lugs s', arranged alternately nearer and farther from its center, combined with the feed-rollers, take-up springs i, and bar s', substantially as and for the purpose set forth.

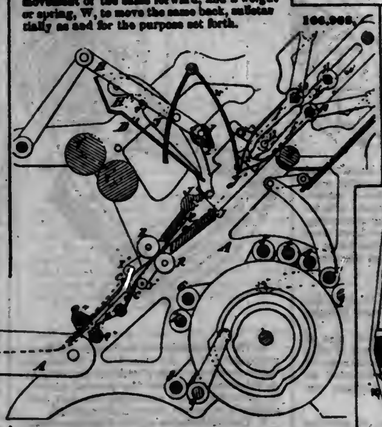
10. The jaws J, hinged at point g between the feed-rollers E, and having attached to and moving with them the bars L L', folders P P', and knife m, mechanism for holding, folding the bottoms of the bags, and for severing the tubes, substantially as and for the purpose set forth.

11. The folding-bars P and P', pivoted in swinging frame 18, hinged to the jaw-levers J, and arranged and operated substantially as and for the purpose set forth.

12. The reciprocating arms f, provided with springs g' to open and spread the end of the bag, substantially as and for the purpose set forth.

13. Folding-bars L and L', pivoted to and moving with jaws J, and operated substantially as and for the purpose set forth.

14. Shaft 12, arm f', spring s'', and pattern r'', combined with slotted frame A, and operated substantially as and for the purpose set forth.



15. The adjustable expanding bars or former o o pivoted to the bar i, which is provided with rollers e e, and combined with the rollers Q'' Q'' Y'' Y'', whereby said former is kept in place, as set forth.

16. The reciprocating holder s'', combined with reciprocating shaft 11, slotted sliding slotted plate w, arranged and operated substantially as and for the purpose set forth.

17. The blades I I S, to constitute a three-bladed griper, as described, to close separately the bottom folds of the bag, in the manner described, and convey said bag away from the jaws J, as set forth.

18. Combined with two gripers I I S, and reciprocating frame H, a cam, H'', to guide the movement of the same forward, and a weight or spring, W, to move the same back, substantially as and for the purpose set forth.

166,969.

1. The folding-plates h' and m, constructed in parts laterally adjustable, as and for the purpose herein-before set forth.

2. The folders, composed of plates h' and m, arranged alternately above and below each other at their wide ends, with their narrow ends terminating in one common horizontal line, substantially as for the purpose set forth.

3. The expanding-bars o' mounted upon the bar i, substantially as shown, to constitute an adjustable former for the interior of the tube, as set forth.

4. The adjustable external guide o''', combined with the internal adjustable former-bars o', substantially as set forth.

5. The expander a, substantially as set forth, combined with the rollers B B and Y'' Y''.

6. The combination of the expanding-bars q, with the rollers Y'' at the ends of the vibrating arms J J, for the purpose set forth.

7. Rollers E and B, provided with movable rings c, for the purpose set forth.

8. Combined with the feed-roller E, the spring i, to take up the continuous motion of the driver P'', combined with a suitable intermittent step, substantially for the purpose set forth.

9. The disk G, provided with the lugs s', arranged alternately nearer and farther from its center, combined with the feed-rollers, take-up springs i, and bar s', substantially as and for the purpose set forth.

10. The jaws J, hinged at point g between the feed-rollers E, and having attached to and moving with them the bars L L', folders P P', and knife m, mechanism for holding, folding the bottoms of the bags, and for severing the tubes, substantially as and for the purpose set forth.

11. The folding-bars P and P', pivoted in swinging frame 18, hinged to the jaw-levers J, and arranged and operated substantially as and for the purpose set forth.

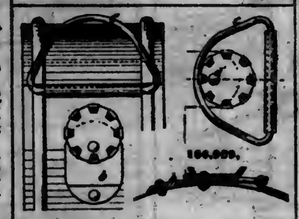
12. The reciprocating arms f, provided with springs g' to open and spread the end of the bag, substantially as and for the purpose set forth.

13. Folding-bars L and L', pivoted to and moving with jaws J, and operated substantially as and for the purpose set forth.

14. Shaft 12, arm f', spring s'', and pattern r'', combined with slotted frame A, and operated substantially as and for the purpose set forth.

15. The adjustable expanding bars or former o o pivoted to the bar i, which is provided with rollers e e, and combined with the rollers Q'' Q'' Y'' Y'', whereby said former is kept in place, as set forth.

16. The reciprocating holder s'', combined with reciprocating shaft 11, slotted sliding slotted plate w, arranged and operated substantially as and for the purpose set forth.



17. The blades I I S, to constitute a three-bladed griper, as described, to close separately the bottom folds of the bag, in the manner described, and convey said bag away from the jaws J, as set forth.

18. Combined with two gripers I I S, and reciprocating frame H, a cam, H'', to guide the movement of the same forward, and a weight or spring, W, to move the same back, substantially as and for the purpose set forth.

19. Combined with the gripers I I S, the guide-plate H'' and guide-rods s', constituting a conveying-basket, arranged and operating to deliver the bags to the pressing-rollers, in the manner set forth.

20. Severing-blade w', constructed with a series of sharp-edged or lancet blades, set close to face and overlapping, so as to present a continuous cutting-edge, and operated in the manner and for the purpose set forth.

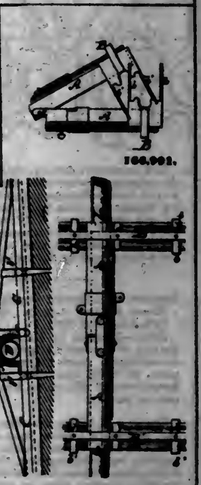
21. In combination with the operative mechanism of a paper-bag machine, feeding devices operating at different speeds, whereby the said machine may simultaneously produce bags of different sizes.

166,969.

166,970. FIFE-COUPLINGS. Chas. F. Henis, Philadelphia, Pa. (Filed May 22, 1875.)

1. The eccentric and eccentric plate, in combination with the hinged loop, for the purpose set forth.

2. The combination of the eccentric, eccentric plate, rivets d d', hinged loop c, and the sheet metal of which the coupling is composed, substantially as shown and described.



166,970. COLLETS FOR BALANCE-SPRINGS OF WATCHES. Augustus Jewett, Lynn, Mass. (Filed Feb. 8, 1875.)

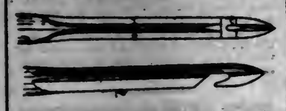
Brief.—A collet constructed as described, so that the inner end of the balance-spring may be attached as near as possible to the center of the balance.

A collet for the balance-spring of a watch, formed so as to bring one of its sides close to the arbor of the balance-wheel, the end of the spring being inserted diagonally into the side so formed, substantially as described, for the purpose specified.

166,969.

166,971. HOBS-REMOVER. Leavitt T. Kruse, New York, N. Y., assignor of one-fourth his right to Charles Wegener, same place. (Filed July 31, 1875.)

Brief.—A hose-jumper consisting of arched rails supported by prongs which straddle the street-rails and are driven into the ground; said arched rails being connected transversely by a hose-casing, jointed in the middle, whereby the jumper can be folded when not in use.

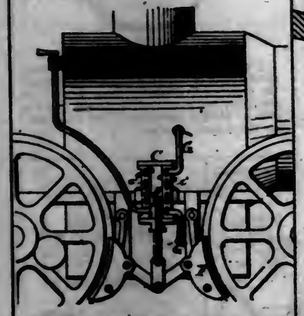


In a hose-bridge, the combination of the jointed casing A with the arched rails B B', which have the prongs b b', all substantially as herein shown and described.

166,972. SCOURING AND POLISHING RICE. P. R. Lachicotte, Waccamaw, (Georgetown P. O.,) S. C., assignor to P. R. Lachicotte & Sons, same place. (Filed Apr. 17, 1875.)

The method of scouring and polishing rice by applying friction-surfaces to the previously-hulled article comminuted with the ash of rice-chaff, as set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON



166,995. SEWING-MACHINE NEEDLES. Geo. W. Lowell, Syracuse, N. Y. (Filed Apr. 14, 1875.)

The needle herein described, having the longitudinal grooves in the contiguous elevated quarters, extending from the point, back, or eye, upward to or nearly to its top c, thereby a thin tongue, b, is formed, all being constructed as shown and described.

166,996. LOCOMOTIVE STEAM-BRAKE ATTACHMENT. Jos. H. Lander, Concord, N. H., assignor to himself and Sam. M. Penn, St. Albans, Vt. (Filed July 6, 1875.)

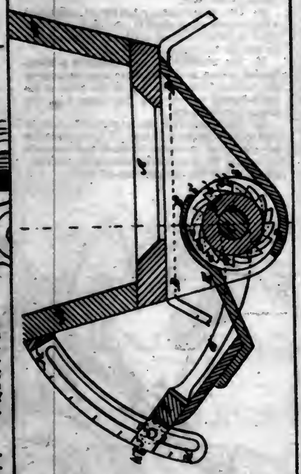
Brief.—The cylinder is provided with a hot-water jacket.

In a locomotive driving-wheel steam-brake, the cylinder C, constructed with double walls *c c* and intermediate space or jacket *d*, extending downward from top to bottom, with inlet and outlet pipes *f* G', communicating therewith, and adapted to receive direct from the boiler a constant stream or circulation of hot water, as and for the purposes described.

166,998. PERMANENT PENCIL PLATES, &c. Henry M. Lee, London, Great Britain. (Filed Sept. 10, 1874.)

Brief.—Blackboards, &c., constructed upon or in imitation of composition of cork or cuttle-bone, with natural or metallic pencil, or India dyes. May be mounted on pasteboard, &c., or on frames of cloth, oilcloth, linen, paper, varnish, or paint.

The process herein described, of pressing and preserving grasses, ferns, &c., by first thoroughly drying them (if the blooming specimens be selected; secondly, washing them; thirdly, drying them between sheets of blotting-paper; fourthly, pressing them by suitable means; fifthly, drying them; and, sixthly, arranging them between plates of glass hermetically sealed, as and for the purposes described.



166,999. CHANDELIER-PENDANT. Charles H. Lemcke, New York, N. Y. (Filed July 26, 1875.)

1. The combination, with revolving shaft C, supported in frame over cooler, of the cross-bar D, provided with pivoted arm E on each end, the said arms having corresponding end jaws, as and for the purposes specified.

2. The combination, with arms E E, of screw F, pivoted to one arm, and passing through the other, and provided with clamp-nut, as and for the purposes described.

166,997. GRAIN-DRILLS. John T. Lyman, Louisville, Ky. (Filed June 8, 1875.)

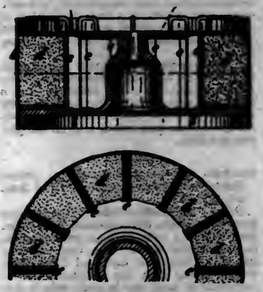
Brief.—Passing through the lower part of the hopper is the shaft, upon which is keyed one or more wheels having projections that are made concave on the front and rounded on their rear side. Around the bearing of the shaft, on the inner surface of the box, are formed projections, slightly eccentric, for the reception of a curved cut-off, the rear end of which projects rearward and upward, and is attached to a cross-bar that moves on a guide, and one for adjusting the amount of seed to be sown.

1. The combination of the box B, the dropping-wheels D *F*, the shovelers *b' b'*, and the valve or circular plate B with the seed-hopper A, the cross-bar F, and the pivoted arms G, for controlling and equalizing the feed, substantially as herein shown and described.

2. The combination of the dropping-wheels D *F*, the valve or circular plate B, the cross-bar F, and the pivoted arms G with the curved and slotted bar E, arm J, and the index K, substantially as herein shown and described.

166,998. HAND WASH-BOWLS. Thos. Middleditch, Trenton, N. J. (Filed Aug. 4, 1875.)

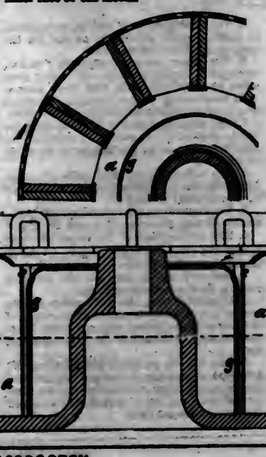
Brief.—The bowl has the circumferential grove and escape-hole, to allow the water which has risen over the top to flow off.



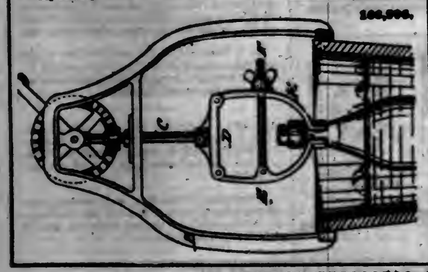
166,998.

A hand wash-bowl, A, provided with an overflow or waste-way, B, combined with a groove, *a*, running around the entire rim *b*, substantially as shown, and provided with one or more vent-holes, *c*, leading from said groove to the waste-way B.

166,999. CENTRIFUGAL MACHINES IN SUGAR-MANUFACTURE. F. O. Matthiessen, Irvington, N. Y. (Filed July 23, 1875.)



Brief.—The pillars *c* are firmly fixed to the top of the disk *b*, and their upper ends are fitted to and support the deflector *f*. The pillars *c*, serving as a lap-joint for the molds, prevent the liquor from losing out through the molds *d*, while the deflector *f* maintains the treating-liquor in contact with all parts of the outer wall *e*.

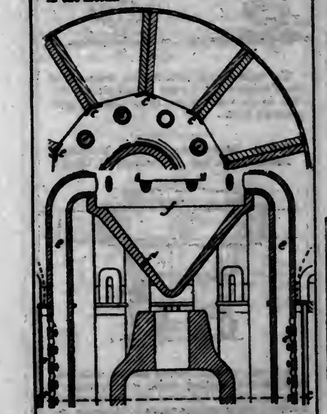


The perforated cylinder A, provided with the vertical pillars *c*, in combination with the deflecting flange *f*, substantially as and for the purpose set forth.

167,000. CENTRIFUGAL MACHINES IN SUGAR-MANUFACTURE. F. O. Matthiessen, Irvington, N. Y. (Filed July 23, 1875.)

Brief.—To insure a uniform action upon the sugar-blocks of a prescribed quantity of steaming-liquor, which is introduced into the receiver upon between the central partition and the inner faces of the molds.

The perforated drum of a centrifugal machine, substantially such as described, provided with the vertical pillars *c*, in combination with the series of distributing-pipes *e*, substantially as shown and described.



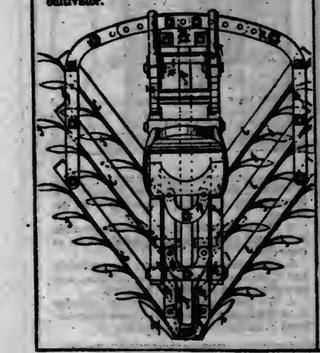
166,998.

167,000.

In a centrifugal sugar-liquoring apparatus, substantially such as described, the circular partition *g*, arranged within the perforated cylinder A, substantially as shown, and constituting the inner boundary of an annular chamber, *c*, of prescribed capacity, substantially as and for the purposes set forth.

167,001. CENTRIFUGAL MACHINES IN SUGAR-MANUFACTURE. F. O. Matthiessen, Irvington, N. Y. (Filed Aug. 10, 1875.)

Brief.—The white liquor is poured in the reservoir *f*, after the molds containing the hard sugar have been placed in the drum. The centrifugal machine is then put in motion, and the white liquor is driven by centrifugal action up the inclined conical bottom of the reservoir, and outward into the distributing-pipes, down which it falls, and from which it is injected, through the perforations *e'*, directly against the inner faces of the sugar contained in the molds.

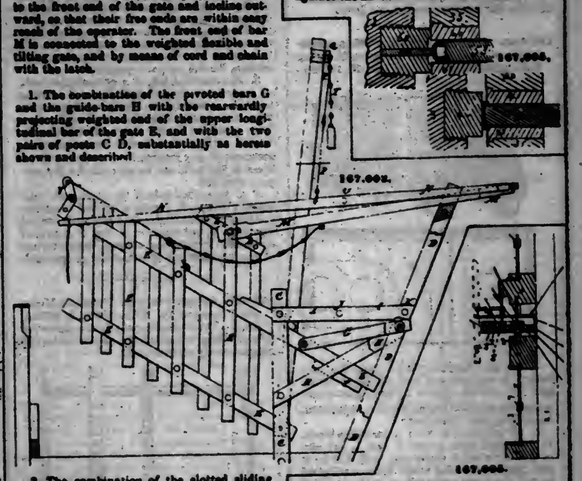


1. The combination of a series of perforated distributing-pipes, arranged as shown with reference to the inner faces of the blocks of sugar contained in the molds, with a central receiver having a downward conical bottom, substantially as and for the purposes described.

2. The perforated drum of a centrifugal machine, substantially such as described, provided with the vertical pillars *c*, in combination with the series of distributing-pipes *e*, substantially as shown and described.

167,002. CORRUGATED HARROWS AND CULTIVATORS. Wm. McCrey, Black Oak, Mo. (Filed June 5, 1875.)

Brief.—A center beam has three pivoted side beams on either side, with spreading-bars and handles at the rear end. The teeth are flat and curved, and each teeth in the side bars capable of independent adjustment. The teeth on the center beam can be removed, converting the implement into a straddle-row cultivator.



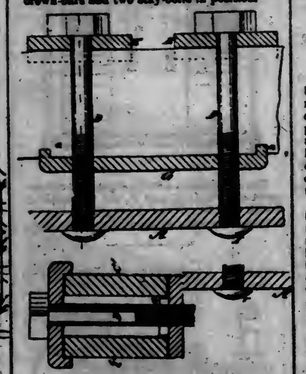
1. The combination of the central bar A, the side bars or wings C, the pivoted connecting-bars D E F, and the adjustable connecting-bars H, with each other, to form the framework of the machine, substantially as herein shown and described.

2. The teeth J, constructed as described, and secured adjustably to the wings C, substantially as herein shown and set forth.

167,003. AUTOMATIC GATES. W. W. McKay, Conlan, Iowa. (Filed July 3, 1875.)

Brief.—To the opposite sides of the rear end of bar M are pivoted the rear ends of end-wise-movable levers N, which project forward to the front end of the gate and incline outward, so that their free ends are within easy reach of the operator. The front end of bar M is connected to the weighted flexible and tilting gate, and by means of cord and chain with the latch.

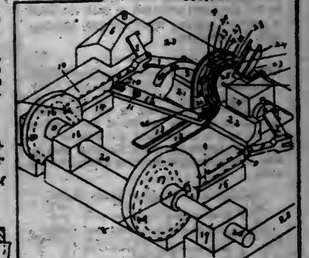
1. The combination of the pivoted bars G and the guide-bars H with the rearwardly projecting weighted end of the upper longitudinal bar of the gate E, and with the two pairs of posts C D, substantially as herein shown and described.



2. The combination of the slotted sliding bar M and the levers N with the gate E, and with the rear pair of posts D, substantially as herein shown and described.

3. The combination of the pivoted bar Q, the chains P and T, and the weight U with the levers N, by which the sliding bar M is operated to open and close the gate, substantially as herein shown and described.

167,004. CROWN-BARS FOR STEAM-BOILERS. Jas. McPhail, Ellis, Kans. (Filed Mar. 1, 1875.)



Brief.—Lock-bars serve to secure a pair of crown-bars and two stay-bolts in position.

The detachable lock-bar U, having end legs *a a*, in combination with the crown-sheet A, the crown-bar formed of the separate parts or sections C' C', the bolts D D, and the tie-plates B B, as shown and described, for the purpose specified.

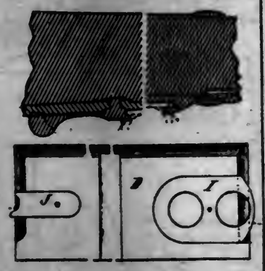
167,005. MACHINES FOR MAKING AND FOR HEADING CARTRIDGE-CASES. Jos. V. Meigs, Lowell, Mass. (Filed Dec. 8, 1874.)

Brief.—A rotatable circular die-plate, 36, carrying three tubular dies, placed vertically between its hub, abutting against two uprights, 26 and 27. An anvil-die in reciprocating block 3, actuated by toggles, and another block, 4, likewise reciprocated by toggles, that carries three punches corresponding to the three dies. Operation: The anvil is forced up against the die-plate on the one side, and a slug of metal having been rolled down into the die through chute 24, one of the three punches drives the metal into the die and against the anvil.

1. The combination, substantially as herein before set forth, of a die-plate, a hollow die mounted therein, in which die the blank cases or lumps of metal are headed or formed, a punch acting within the hollow die to head or make the case, and a resisting die, which is held or locked in contact with the hollow die during the operation of the punch in heading or forming the case, for the purpose specified.

2. The combination, substantially as hereinbefore set forth, of a die-plate, a hollow die mounted therein, a reciprocating die, a punch reciprocating in the hollow die, and mechanism, substantially such as described, for holding the hollow and reciprocating dies together during the action of the punch in heading or forming the case, whereby both dies are held or locked together while the punch is acting, for the purpose specified.

3. The combination, substantially as hereinbefore set forth, of a bed-plate, supports thereon, an intermittently-revolving die-plate mounted between the supports, hollow dies carried by the die-plate, a resisting-die, and a reciprocating punch acting in succession in the hollow dies as they come into line with the resisting-die, for the purpose specified.



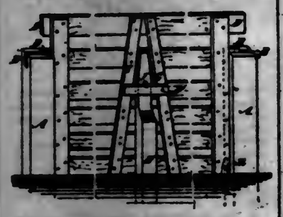
4. The combination, substantially as hereinbefore set forth, of an intermittently-revolving die-plate, hollow dies mounted there-

in, a rotating die, and a reciprocating head carrying a series of punches, each acting simultaneously in its corresponding hollow die, whereby the blank-cases or lamps of metal are inserted, formed, and ejected by a continuous operation, each punch acting simultaneously on its respective blank or case, and successively upon each.

4. The combination of a reciprocating rack, the gear-sleeve, its internal ratchets, the die-plate, its internal pawl, the ratchets on the periphery of the die-plate, and pawls on the die-plate support, substantially as set forth.

5. The combination of a bed-plate, a driving-shaft, cams, jointed pieces, the toggle-joints, a sliding punch-holder, a rotating-head, a die-plate, its rack, gear, and lever, substantially as and for the purposes set forth.

167,006. MEANS OF ATTACHING MAGAZINES TO FIRE-ARMS. Henry Metcalfe, U. S. A., Springfield, Mass. [Filed Dec. 16, 1874.]



1. The combination, with a gun, of a projection to support one end of the block D, and the pivoted lever c, to bear against and grasp the opposite end of the cartridge-block, substantially as described.

2. In combination with a cartridge-block, D, provided with plates J and I, the pivoted lever c and a projection, both said lever and projection being made upon or attached to the gun, and arranged to hold the block in a secure position upon the gun, substantially as described.

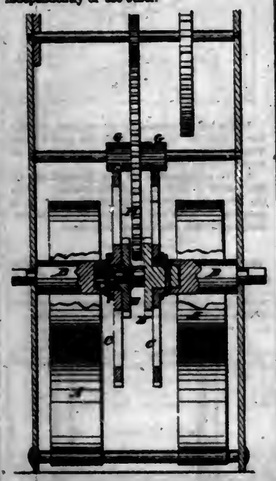
167,007. FARM-FENCES. Andrew Miller, Guntersville, Ala. [Filed June 12, 1875.]

Brief.—The top boards of the panels extend and rest in notches in the top of the ground-posts. The middle of the panel is passed over a ground-post and secured by a pin. The lower corners of the panel pass inside of mortises at the sides of the ground-post.

The combination, with panel having mortises D D, of top-notched posts A B, bottom steps E, slotted cross-pieces F G, tenons H, and pin J, as shown and described.

167,008. FIRESTARRER-LOCKS. Daniel K. Miller, Philadelphia, Pa. [Filed May 18, 1874.]

1. The combination, in a lock, of a driver forming part of or attached to a rotary spindle, a series of tumblers turning independently of each other, and an automatic device, which, upon the spindle being turned in one direction, is carried with the spindle and operates one or more tumblers, and when the spindle is turned in the opposite direction, is caused to recede immediately from the tumblers without turning with the spindle, as set forth.



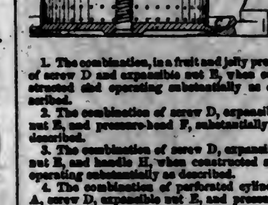
2. The combination, in a permutation-lock, of a driver attached to or forming part of the spindle and having only a rotary movement, a bolt, an automatic carrier, operated by the driver on the spindle, and a series of independent tumblers, whereby the said tumblers are turned and adjusted in respect to the bolt by a rotary movement of the driver in one direction, for the purpose specified.

3. The combination, in a permutation-lock, of a carrier, a bolt, and a series of rotating tumblers, whereby the tumblers most remote from the carrier after the whole series have been once set by the latter, must be again turned by the carrier before a separate readjustment of any intermediate tumbler, in respect to the bolt, can be effected, for the purpose specified.

4. A permutation-lock in which are combined a driver, F, having a beveled shoulder, h, and shoulders or steps i, a series of notched tumblers, E, and a carrier or dog, F', operated by the said driver F and adapted to the notches of the tumblers, all substantially as specified.

167,009. SPRING-POWERS. Valentine Mosslein, Waterloo, Ill. [Filed June 5, 1875.]

Brief.—The two spring-shafts are connected by a coupling which allows one to be turned independently of the other.



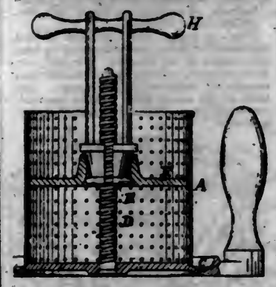
The combination of two independent spring-powers, A, B, C, E, and F, and the coupling I with a pinion, G, and driving-wheel H of a transmitting-train, substantially as specified.

167,010. GLOBE-VALVES. John Moffat, Passaic, N. J. [Filed Jan. 9, 1875.]

The body a having the plain tapering metallic valve-seat c, in combination with metallic conical V-shaped ribbed valve f and screw-spindle e, all constructed and arranged substantially as and for the purpose herein specified.

167,011. HANDLE ATTACHMENTS FOR VALISES. George O. Monroe, Newark, N. J. [Filed July 16, 1875.]

The valise-handle attachment, composed of the T-headed loop b c and slotted plate d riveted to the valise frame, as and for the purposes set forth.



167,012. WRENCHES. John H. Morrissey, Indianapolis, Ind. [Filed July 10, 1875.]

A wheel-wrench, having socket, with diametrically-extending arms, in combination with the recessed hub-band of a vehicle-wheel, having locking-springs applied thereto for retaining the wrench in position to turn the nuts, and in reversed position without engaging the same, substantially as and for the purpose set forth.

167,013. FRUIT AND JELLY PRESSES. Henry Niedermann, Newport, Ky. [Filed July 14, 1875.]

Brief.—The vat is made in sections, so that it may be expanded, so as to slide up and down the screw, or contracted, so as to engage the screw and operate the pressure-head.

1. The combination, in a fruit and jelly press, of screw D and expansible vat E, when constructed and operating substantially as described.

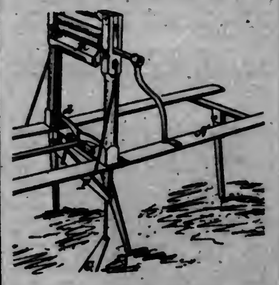
2. The combination of screw D, expansible vat E, and pressure-head F, substantially as described.

3. The combination of screw D, expansible vat E, and handle H, when constructed and operating substantially as described.

4. The combination of perforated cylinder A, screw D, expansible vat E, and pressure-head F, substantially as described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

167,014. BUCKLE-LOOPS. Fredk. A. Neider, Madison, Ind. [Filed July 10, 1875.]

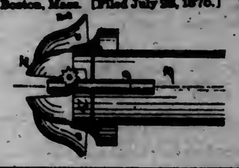


An improved buckle-loop composed of flanged buckle-fastening plate tacked to the leather parts, in connection with a metallic box sliding and locking thereon, substantially in the manner and for the purpose set forth.

167,015. WRINGERS. Daniel W. Norris and Newell B. Woods, Elgin, Ill.; said Norris assignor to Frank Woods, Pittsburg, Pa. [Filed Feb. 6, 1875.]

Brief.—Pressure is applied to the rollers by a treadle, a spring, levers, and rods; a detachable drip-board, that may be applied in front or rear of the rolls.

1. The lever or levers F G, combined with the bowed spring E, the links c c', the bar B', the rods d d, and the rolls C D, substantially as and for the purposes set forth.

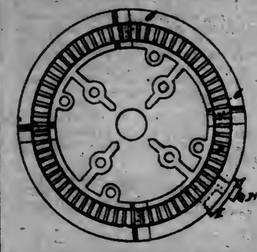


2. The removable drip-board adapted to be attached in front or rear of the rolls at —, combined with the keys or buttons a, and the roll shafts and standards, substantially as and for the purposes set forth.

167,016. FLUXING COMPOSITIONS. Alfred Forel, San Francisco, Cal. [Filed July 20, 1875.]

A composition to be used as a flux, in the manner described, said composition consisting of a mixture of sulphate of soda or potash, and pulverized charcoal, in the proportions herein specified.

167,017. LAMP-BURNERS. Julius A. Fraser, Boston, Mass. [Filed July 28, 1875.]



1. In combination with the removable cap E, provided with flame-orifice, the air-ducts c, attached to the sides thereof, and adapted to conduct air to the sides of the flame, substantially as set forth.

2. The detachable cap E, provided with air-ducts c, in combination with the tube B, reservoir C, and wick-tube D, substantially as and for the purpose set forth.

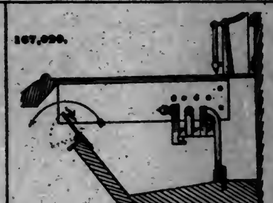
167,018. CHUCKS. Edward S. Parot and H. C. Bottenman, Philadelphia, Pa. [Filed June 26, 1875.]

Brief.—The circular rack D is raised or lowered, to put it in or out of gear with the cogs on the jaw-screws, by turning a circular cam-piece under B, and the present invention is a peculiar mode of securing said cam-piece at either end of its movement.

The combination of stop-lug I with the shank H of the shifting-ring E and the slotted shell of the chuck, substantially as specified.

167,019. JEWELLERS' SCREW-PLATES. Jas. B. Potter and Alfred J. Richardson, Providence, R. I. [Filed Apr. 26, 1875.]

Brief.—The nut is made separate, so that it may be replaced when worn. The lower collar of the rest passes freely over the lower screw-thread.



1. The nut E, constructed separate and attached to the frame A, in combination with the slides H, all constructed as and for the purposes set forth.

2. The combination, in a jeweler's press, of the stop F with the right and left screws and the nut E, as and for the purpose specified.

167,020. FIRE-PLACES. Charles S. Rankin, College Hill, Ohio. [Filed June 19, 1874.]

In combination with a fire-place having recesses in the sides of its jambs, double folding doors, which are permanently hinged to the sides of the jambs, and are capable of being folded into the recesses therein, substantially as specified.

167,021. MOLDS FOR CASTING WATER-TRAPS. John M. Reid, Montreal, Canada. [Filed Feb. 9, 1875.]

Brief.—The screen can be folded back into a recess at the side of the fire-place.

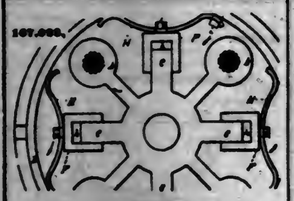
1. The screw e and V, each made of one piece of metal and slightly tapering, in combination with the blocks A A', introduced at the head of the pipe, as and for the purposes set forth.

2. The swinging loop r and key or wedge, in combination with the screw V e, as and for the purposes set forth.

167,022. VEHICLE-TOPS. Jerome B. Relyea, Hicksville, assignor to himself and Lewis B. Brewster, Bryan, Ohio. [Filed June 12, 1875.]

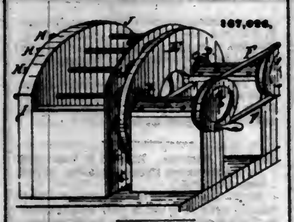
Brief.—The plate screws onto the bow of the top.

An attachment for the rear bow of a vehicle-top, consisting of a rubber block, B, recessed in the middle, and projecting beyond the cap-holders a' a' of plate A, as and for the purpose specified.



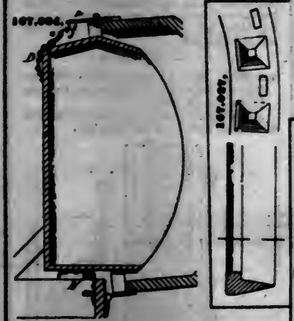
167,023. PISTON-PACKINGS. J. Richards, Philadelphia, Pa. [Filed Aug. 2, 1875.]

1. The combination of the clips F, flanges A, and springs E, with the arms or legs c, and packing-rings C C and D, for cutting out the packing, substantially as set forth.



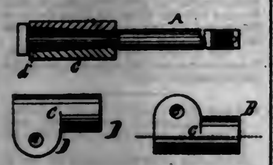
2. The combination of a spring, E, with the outer packing-ring D, having a pin, f, and a clip, F, having a slanting-pin, f', whereby to prevent the turning outward of said ring D, substantially as set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON



167,026.

167,027.

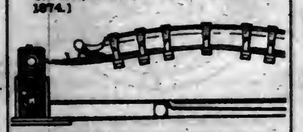


167,026. TRUNK. Antony V. Romadka, Milwaukee, Wis., assignor to Romadka Brothers, same place. [Filed June 24, 1875.]

In combination with a hinged removable trunk-tray, the chain D and hook *d*, adapted to engage with the staple *f* of the trunk-loop E, in the manner and for the purpose described.

167,028. PITMAN-BOXES FOR MOWING AND REAPING MACHINES. Christn. H. Salmonsen, Quincy, Ill., assignor to himself, Andrew Wichey, and Reuben Bortner, same place. [Filed July 6, 1875.]

Brief.—The pitman-box is made reversible to increase or lessen the height of cut of the sickle-bar. The box has an aperture gradually incurved from a circle at one end to an oval at the other, to allow of horizontal play.



The pitman-box C, composed of the parts B and D, provided with the apertures *d* and *c*, as and for the purpose substantially as described.

167,029. MACHINES FOR DRILLING METAL. James G. Schoonover, Corry, Pa., assignor of two-thirds his right to C. G. Maynard and G. H. Allen, same place. [Filed Feb. 24, 1875.]

Brief.—A reciprocating movement is given to the studded plate B by eccentric connections with the driving-shafts. A series of small disks are attached rigidly to the series of bit-shafts. The studs on the plate B are made to enter holes in the disks, and serve as cranks to revolve them when the plate is reciprocated.

The combination, substantially as herein shown and described, of the perforated disks G G, attached to the bit-shafts H H, reciprocating plate or disk B, provided with studs L L, small cranks B B, washers D D, and disks O O.

167,030. SIDE SPRING FOR VEHICLES. Benj. C. Shaw, Indianapolis, Ind. [Filed Dec. 5, 1874.]

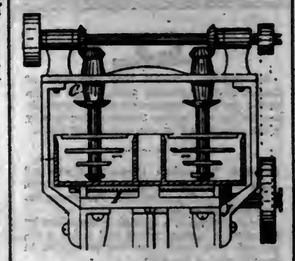
The side spring for carriages herein described, consisting of long steel spring or plate L and shorter plates J and K superposed upon the long springs between the center and either end thereof and the wooden bar D, all secured together by clips, substantially as set forth.

167,031. HATS. Chas. Stastnik, New York, N. Y. [Filed July 19, 1875.]

Brief.—Provides the interior of a hat with an adjustable diaphragm, so that its weight or pressure will be upon the tip of the cranium in lieu of the forehead.

The curved supporting-wires C, combined with a screw-plate, B, in the manner described, to enable it to be adjusted to a higher or lower position in the hat.

167,032. ARITHMETICAL TOY BLOCKS. John C. Smith, Brooklyn, N. Y. [Filed June 7, 1875.]

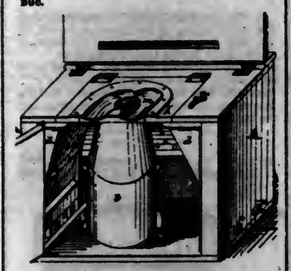


Brief.—The blocks are preferably triangular in shape, to stand readily upright upon their bases.

The arithmetical toy herein described, consisting of blocks of wood or other material of various lengths, divided on one side into parts, with arabic numerals, by pictures, and containing upon another side a numeral or word indicative of the number of said pictures, substantially as and for the purposes specified.

167,033. SAUSAGE-MEAT MIXERS. John B. Smith, Buffalo, N. Y. [Filed July 22, 1875.]

Brief.—A suitable vessel is revolved by proper gearing, and at the same time one or more sets of mixers are rotated in the tub.



1. A meat-mixer consisting of a suitable vessel and a series of arms for mixing arrangement, substantially as and for the purposes described.

2. The combination of one or more series of arms with a rotating or movable meat box or tub, substantially as and for the purposes specified.

167,034. COMMODE-VENTILATORS. Ephm. W. Stanton and Thomas M. Riley, Philadelphia, Pa. [Filed Jan. 26, 1874.]

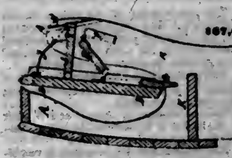
Brief.—A case with inlet-openings for the passage of air into the pot-compartment, and valves for regulating the draft, in combination with an air-chamber, which partly surrounds said compartment, being divided therefrom by perforated partitions, through which the odor is caused to pass by the draft, and escape into a sensitive valve chamber, and from thence through a pipe into a chimney or other flue.

1. A commode having inlet-passages provided with valves for regulating the passage of air into its interior, around the pot, and outlet-passages communicating with a chimney or flue, for the purpose of ventilating the commode, substantially as set forth.

2. The combination of the vertical lever H and links *e* with the lid *c* and valves *f*, for the automatic opening and closing of the latter, substantially as set forth.

3. The swinging valve *w*, in combination with the case A and pot *b*, for closing the mouth of the pot *b*, the valve being closed by the vertical lever H, substantially as set forth.

4. The compartment *c* having sensitive valves *y* for preventing a back draft into the air-chamber *f*, substantially as set forth.



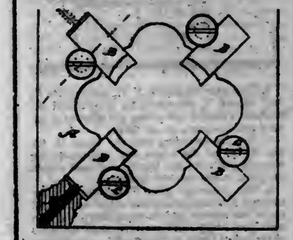
5. The stamped cast or sheet up by means of dies, substantially as set forth.

6. The pot *b* having perforations *v*, in combination with the cover *u*, the said cover closing the perforations, substantially as and for the purpose set forth.

167,035. FOLDING SCHOOL-DESKS. David I. Stagg, New York, N. Y. [Filed May 26, 1875.]

1. The combination of the folding or hinged arms H and the connecting or stationary plate F with the leaf D and the standards A, substantially as herein shown and described.

167,036.



2. A folding school-desk provided with bars J, arranged as shown and described, to serve both as handles to the leaf and brace to the shelf.

167,037. PROCESSES OF MARBLEIZING SURFACES. Samuel W. Steele and Jos. Bayer, Northfield, Vt. [Filed Jan. 14, 1874.]

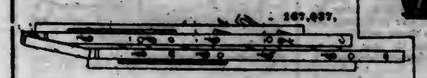
1. The series of compositions for marbleizing surfaces, consisting, essentially, of the following-named ingredients, to wit: No. 1, spirits of turpentine, boiled oil, gum-sandrac, saltpeter, beef's gall, and coloring matter; No. 2, spirits of turpentine, boiled oil, nitric acid, and coloring matter; and, No. 3, gum-arabic, sugar, glue, beef's gall, and water, in the proportions substantially as and for the purposes set forth.

2. The process of marbleizing surfaces, consisting, essentially, of first painting the same with composition No. 1, and then dipping in composition No. 3, upon which has been floated composition No. 2, substantially in the manner and for the purpose described.

167,038. SCREW-CUTTING DIES. George R. Stetson, New Bedford, Mass. [Filed Aug. 6, 1875.]

1. The chasers B fitted to tapered slots in the solid die-stock A, and secured by a binding-screw, C, in the manner described.

2. The combination, with the chaser B fitted in a tapered slot and secured by a binding-screw, C, of an adjusting-screw, E, substantially as specified.



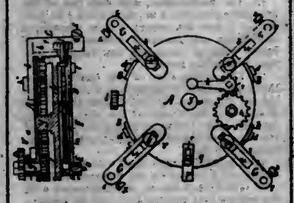
167,039. EYELS FOR BOATS. A. Stevenson, Kittery, Me. [Filed Apr. 19, 1875.]

The new article of manufacture described, to wit, a keel for a boat or vessel with stem and stern post all made of a single piece of wood bent in the form required, substantially as described.

167,040. STEP-LADDERS. John J. Stephan, Boston, Mass. [Filed July 29, 1875.]

Brief.—The steps of the ladder are pivoted to the stiles in such a manner as to admit of the ladder's being completely folded up when not in use.

167,037.



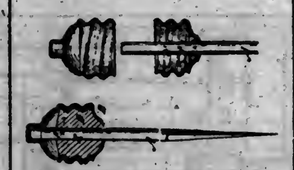
1. A folding step-ladder in which the ends of the steps are pivoted between parallel stripes *a b c d*, forming the sides of the ladder, substantially as and for the purpose described.

2. The steps *f*, pivoted at each end on a line at right angles to the direction of the length of the sides of the ladder, substantially as and for the purpose set forth.

3. In combination with the strips *a b c d*, the upper stem *m*, secured to the strips *b d* by pivoted hinges, substantially as and for the purpose described.

167,041. MACHINES FOR DRESSING VALVE-SEATS, &c. Nathan P. Stevens, Hopkinton, N. H. [Filed July 3, 1875.]

Brief.—The tool-bearing wheel is supported by a disk pendent from adjustable legs, which are adapted to be secured to the projecting screws of a steam-engine cylinder, or by bolts inserted in the hollow legs to other objects to be operated upon.



1. In combination with the tool-wheel C, and its supporter A, provided with mechanism for revolving the said tool-wheel, the series of slotted adjustable legs G, substantially as described, held to the said supporter by clamp-screws *e* going through the slots of the said legs.

2. An adjustable leg, G, composed of the slotted bar *a*, the tube *f*, and set-screw *x*, as explained.

3. In combination with the tool-wheel C, and tool-carrier E, the supporter D extended diametrically across the center of the tool-wheel, and constructed to enable the tool to be moved from under the center of the wheel outwardly to or beyond its circumference, all as set forth.

4. The combination of the series of adjustable pins E, with the tool-wheel C, and with its supporter A, grooved in and around its circumference, as specified.

167,042. PICTURE-NAILS. Owen W. Taft, New York, N. Y. [Filed June 26, 1875.]

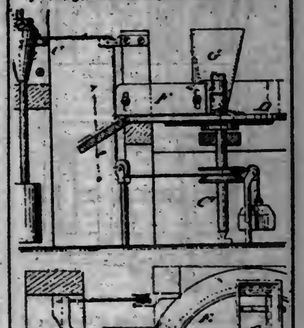
1. The improved picture-nail head made of two stamped sheet-metal parts, B C, having the sides ornamented with spiral corrugations forming screw-threads, by which the cap is connected to the permanent part, substantially as specified.

2. The permanent part of a picture-nail head composed of a stamped and spirally-threaded sheet-metal cap, B, and a filling of solder, D, substantially as specified.

167,043. HARNESS-MOUNTINGS. Charles M. Theberath, Newark, N. J. [Filed May 6, 1875.]

167,043.

Harness-mountings of the character set forth, formed with turned-up or raised and projecting metal edges, and having laid in the recesses or shoulders so provided the covering or plating, substantially as described.



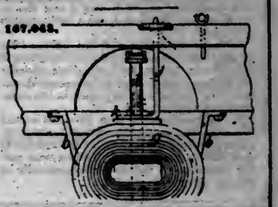
167,044. LEVER-BUCKLES. Sgoorney Wales, New York, assignor of one-half his right to Nathaniel H. Furman, Tarrytown, N. Y. [Filed Nov. 20, 1874.]

Brief.—The lower end of the short arm of the lever is bent in a plane parallel with that of the back plate.

A buckle having the cam-lever B C P, substantially as and for the purpose specified.

167,045. STAMP-MILL FEEDERS. S. Walker, Sonora, Cal. [Filed Apr. 24, 1875.]

Brief.—The table revolves with the hands of a watch. Saddle motion is imparted to it from the stamp-shaft, as it descends, by the conical pulley thereon, lever on the stamp-frame, intervening pulleys, and weighted rope, which acts by friction on the table-shaft, while recoil is prevented by friction of the cog-or ratchet and pawl. Ore is fed to the table by the hopper and passes around until deflected by the adjustable guide plates to the mortar.

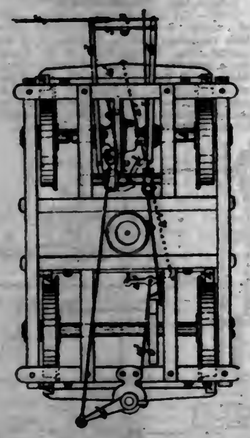


1. The combination, with collar B and lever C, of disk D, having ring E, director F, and hopper G, as and for the purpose specified.

2. The combination of the rotating disk-shaft, fixed pulley, and weighted rope and pulley connection with adjustable actuating-lever and inverted conical collar of stamp-shaft, to revolve gradually the disk in connection with strokes of shaft, as set forth.

3. The combination of ore gage-piece or director, having guide-plate and set-screws, with supporting-piece of shaft-hub and surrounding rim, to be set to feed greater or less quantity of ore, substantially as described.

167,046.



167,642. CAR-COUPLERS. Wm. H. Ward, Auburn, N. Y. (Filed Mar. 4, 1875.)

1. The lifter *j k*, for the coupling-pin *d*, having a sliding movement upon and independent of the latter, to allow it to descend to the lowest position beneath the platform out of the way, when the pin is elevated in position for coupling, as set forth.

2. The combination with the L-shaped lifter *j k*, having a sliding movement upon and independent of the pin *d*, of the guide *n* and the coupling-pin, whereby the lifter is supported in its lowest position when the pin is supported for coupling, as set forth.

167,644. FRICTION POWER-BRAKES. Wm. H. Ward, Auburn, N. Y. (Filed Jan. 28, 1876.)

Brief.—Pulling-cord brings friction-disks together, which, through rods and levers, by momentum of train, operate brakes. Amount of friction regulated by ballast weights.

1. The disks *a c c c* on one of the axles of each car, combined with the brake-connecting devices, for applying and releasing the brakes of the cars truck and those of the corresponding truck at the other end of the car, substantially as set forth.

2. The combination, in a friction power-brake, of the rotating main-disk *a* and the disks *c c* with the yoke-levers *d d*, their connecting joint-lever *e f f*, and the ball-cord *n*, whereby the disks *c c* are forced against the rotating disk *a* to make the frictional contact, substantially as set forth.

3. The combination, with friction brake-disks *a c c*, levers *d f f*, and the ball-cord *n*, of the chain *p* and the armed rock-shaft *r r'*, connecting with the brake-beam, whereby the outer disks are allowed a partial rotation with the main-disk, to put on and hold the brakes until the ball-cord is allowed its freedom, all substantially as set forth.

4. The combination, with the train-cord *s* and the branch lines *m*, of the double and cone pulleys *l f j*, weights *k m'*, and the bent-ed levers connecting with the friction-disks, whereby the friction-disks are put into operation through the medium of the train-cord, and held in operation until said cord is released, as described.

5. The double cone-pulley *j*, in combination with the ballast-weight *k*, cord *i*, and the lever devices of the friction-disks, substantially as set forth.

6. The combination, with the pulleys *l f j*, of the loose washers *o o* and the projections *p p'* and *q q* on the washers and pulleys, whereby the pulleys *l f* may have an independent motion to compensate for any slack in the train-cord, as described.

7. The combination, with the disks *c c c* and the main-disk *a*, of the slotted connecting-yokes *y y*, whereby the disks *c c c* are caused to rock either, to loosen their abutment part-tial rotation with the disk *a*, substantially as and for the purpose set forth.

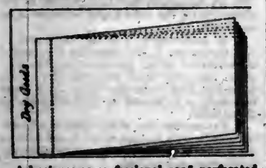
8. The combination, with disks *c c*, having both a sliding and partial rotary motion in relation to the axle-disk *a*, of the bearing-sleeves *r r'*, as and for the purpose set forth.

9. The combination, with the friction-disks *c c* and the levers *d d*, of the double spring *g*, for suspending and opening the levers, as and for the purposes set forth.

10. The combination, with the adjustable clamp *s* on the rod *f'*, the joint-lever *f f'*, and the friction-disks, of the hook *p*, substantially as and for the purpose set forth.

11. The combination, with the friction-disks *c c*, chain-connection *p*, and the armed rock-shaft *r r'*, connecting with the brake devices, of the arm *c*, rod *s'*, and counter-weight *t*, as and for the purpose described.

12. The combination, with the friction-disks *c c*, chain *p*, connected on opposite sides of center of the disk, armed rock-shaft *r r'*, and rod *u*, with the double-cranked rod *v' v'' v'*, and the rods *v'* and *v'*, connecting the brake-bars, as and for the purpose set forth.



13. The combination, with each car, of the graduating-weights *k m'*, their cords *i m'*, pulleys *l f j*, and the branch line *m*, whereby a loaded car may receive a greater amount of brake force by increasing the weights, substantially as set forth.

14. The combination of the truck-wheels, the rod *u*, double crank-rods *v'*, *v''*, and *v'*, and the rod *v'*, connecting the double brake-bars *v'* and *v'* of the wheels of one axle, whereby the brakes are applied to the opposite sides of the wheels of one axle of each truck, substantially as set forth.

15. The disks *c c*, provided with the air and dust holes *y*, as and for the purpose set forth.

16. The branch line *m*, in combination with the pulleys *l f j*, weights *k m'*, and the braking devices, whereby each car is provided with its own means for applying the brakes without regard to the ball-cord or platform-brakes, substantially as set forth.

167,645. BUSINESS-CARDS. B. M. Wilkerson, Baltimore, Md. (Filed Oct. 15, 1875.)

A business or professional card perforated near one of its edges, and having that part of its back between the perforations and its edge dry-gummed, substantially as and for the purpose set forth.

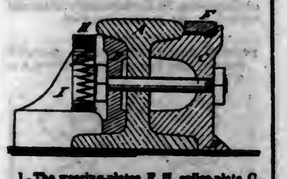
---

1. The combination of the rollers, having the coincident disc or grooves for forming tenks, &c., provided with the raised notched surfaces forming the sides and edges of said disc or grooves, as shown and described.

2. The combination, with the friction-disk *a*, of the feeder S L, lever M, and cams O and Q, substantially as specified.

3. The combination of cams U and W with lever M, feeder S L, and the die-rollers, substantially as specified.

4. The cams U and W, arranged in combination with lever M and its spring P, and in relation to cam O, whereby the feeder is enabled to shift back on the wire for a new bold, as described.



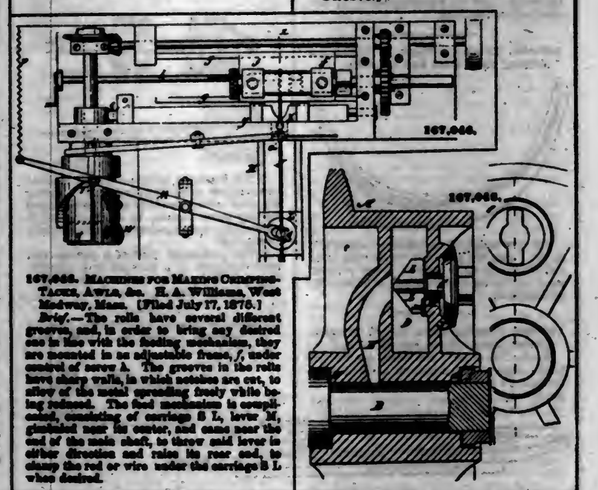
5. The grapers *a b*, combined with the die-rollers and the feeder S L, substantially as specified.

6. The combination of grapers *a b*, cutters X Y, and the feeder S L with the die-rollers, substantially as specified.

7. The roller-bearings, mounted on ways and provided with an adjusting-screw, in combination with automatic feed mechanism, substantially as specified.

167,647. RAILROAD-RAIL JOINTS. Joseph C. Wright, Monocasy Station, Pa. (Filed Apr. 24, 1875.)

Brief.—A rail-joint provided with a yielding flange and tread-bearer to prevent the pounding of the ends of the rails by the impact of the wheels.

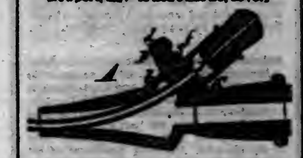


1. The wearing-plates F H, splice-plate C, and blocks I, combined as shown and described, whereby the plates are allowed to extend and contract, as set forth.

2. The inside-spring wearing-plate H, for the flange of the wheel, and outside-spring wearing-plate for the tread, combined with a rail-joint in the manner described.

3. The wearing-plate F, arranged in the channel E of the splice-plate to spring or yield under the wheels, and fastened thereto by the ends bent around the projections at the ends of the splice-plate, substantially as herein described.

167,648. CAR-WHEEL LUBRICATORS. Jno. Woodville, Washington, Ind. (Filed Apr. 24, 1875.)

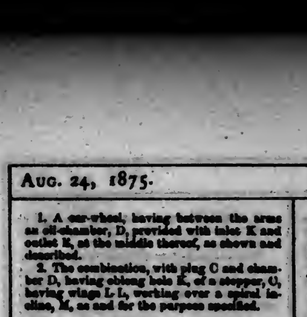


167,649. MACHINES FOR MAKING CHENILLE-TACKS, AWLS, &c. H. A. Williams, West Medway, Mass. (Filed July 17, 1876.)

Brief.—The rolls have several different grooves, and, in order to bring any desired one in line with the feeding mechanism, they are mounted in an adjustable frame, *f*, under control of screw A. The grooves in the rolls have sharp walls, in which notches are cut, to allow of the metal spreading freely while being reduced. The feed mechanism is complicated, consisting of carriage S L, lever M, pivoted near its center, and cams near the end of the main shaft, to throw said lever in either direction and raise its rear end, to clamp the rod or wire under the carriage S L when desired.

1. A car-wheel, having between the arms an oil-chamber, D, provided with inlet K and outlet E, as the middle thereof, as shown and described.

2. The combination, with ring C and chamber D, having oblong hole K, of a stopper, C, having wings L L, working over a spiral incline, M, as and for the purpose specified.



167,650. BEER-FAUCETS. John G. Adam, Newport, Ky. (Filed June 26, 1876.)

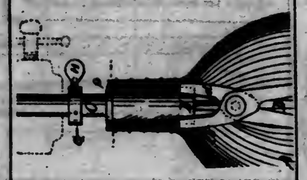
in a beer-faucet, the top A, provided with the offset *h*, in combination with the standard F, having a tenon, *d*, the slotted follower E, pointed *a*, and set-screw *f*, substantially as and for the purpose set forth.

167,650. WINDMILLS. John Q. Adams, Macomlin, Ill. (Filed Jan. 4, 1876.)

Brief.—A turn-table in which an inner stationary hollow cylinder is used, provided at its base with two circular bands or steps, on the outer one of which the outer movable cylinder rests and turns, the outer movable cylinder being also provided at its top with an inner circular band, bearing against the stationary cylinder near its top, by which construction an annular space is left between the bottom of the cylinders. There is also an outer cylindrical casing surrounding the wind-wheel shaft, and having a removable top, for the purpose of removing or gaining access to the shaft. Rotary seals on the governing-wheel are formed with threaded openings to receive the connecting-rods of the wind-wheel, in order to present the sections of the wheel equally to the wind.

1. The inner stationary cylinder *a*, provided at its base with the circular bands or steps *d d'*, in combination with the outer cylinder *d'*, having an inner circular band, *d'*, at its top and an outer circular band, *d'*, at its base, whereby an open annular space is left between the cylinders, substantially as described, and for the purposes set forth.

2. The outer cylindrical casing O, surrounding and supporting the wind-wheel shaft, the top *o'* of which is removable, substantially as described, and for the purposes set forth.



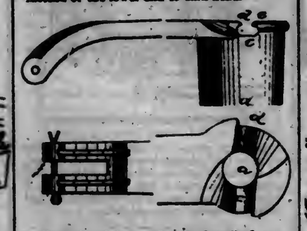
---

3. The sand S, rotating on its axis, attached to the outer face-plate of the governing-wheel A, and provided with the screw-threaded portion in its bend, in combination with the adjustable connecting-rod G', having its inner end screw-threaded, substantially as described, and for the purposes set forth.

4. The combination of the plates W and pivots *i*, with the radial arms and independent motions of the wind-wheel, substantially as described, for the purpose specified.

167,651. BROOM-MAKING MACHINES. W. R. Allen, Galesburg, Ill. (Filed Jan. 4, 1876.)

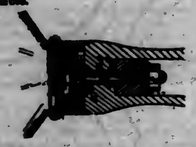
Brief.—To make a broom upon the handle-socket a hollow mandrel enters the socket, at the inner end of which it is held by cogs, while the broom is formed around said cogs, the part of the mandrel on hold ends of heal, to prevent damage to trimming-tools.



1. The mandrel C, having the conical or tapering portion *c*, covered with soft metal, or other pliable compound, substantially as and for the purpose specified.

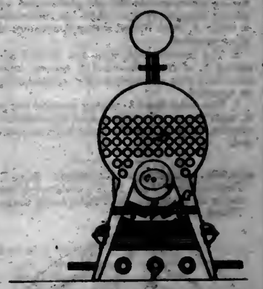
2. The mandrel C, having the tapering end *c*, in combination with the lugs D, having the tongue E, collar G, and thumb-screw H, substantially as and for the purpose specified.

167,652. WIRE-FENCE TIGHTENERS. H. P. Barnes, Bristol, Ill. (Filed July 31, 1876.)



Brief.—To render the instrument, from its own weight, less liable to withdraw the head *a* from the coil opened in, when the instrument is secured to the wire by the claw *f*. The groove and points *c d e* are formed at the top instead of the lower end of said head.

The wire-tightener herein described, consisting of a head, *a*, having a groove, *c*, in the top, and projections *d e* thereon, and an arm or lever, *b*, provided with a notch, *f*, substantially as and for the purposes set forth.



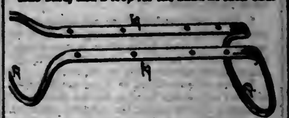
167,653. MODES OF ATTACHING LAMP-BOWLS AND OTHER GLASS ARTICLES TO PEDESTALS. Samuel S. Borrie, Rutherford Park, N. J. (Filed Mar. 4, 1875.)

Brief.—The shell may be in one piece and filled with plastic glass when the bowl is blown, or it may be made in two pieces, which are held to their embrace of the bottom by the thimble.

The metallic shell E, in combination with the bolster J and bolt K, substantially as and for the purpose shown and described.

167,654. FLUE AND TUBULAR STEAM-BOILERS. Isaac Burton, Williamsport, Pa. (Filed July 14, 1876.)

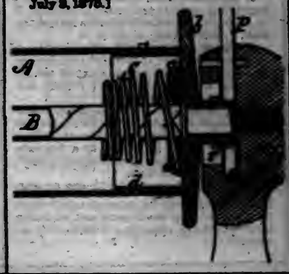
1. In a horizontal tubular boiler, the supporting water-legs, forming the sides of the fire-box, ash-pit, and combustion-chamber, and extending the entire length of the boiler, diverging downwardly from the crown-sheet in a straight line, substantially as described and shown, for the purposes set forth.



2. In a horizontal tubular boiler, the combination of the supporting water-legs, forming the sides of the fire-box, ash-pit, and combustion-chamber, and extending the entire length of the boiler, diverging downwardly from the crown-sheet in a straight line, and the circular crown-sheet, substantially as described and shown.

3. In a horizontal tubular boiler having a circular crown-sheet, the crown-sheet extended to the rear into a cylinder which passes through the back sheet of the boiler, and is provided with a proper opening, so as to give entrance into the water and steam space of the boiler, substantially as described and shown.

4. In a horizontal tubular boiler, two or more sediment-collectors, M M', placed in the combustion-chamber and connecting the inner sheets of the water-legs, the said water-legs being provided with hand-holes in their outer sheets opposite to the ends of the said collectors, when the several parts are constructed and arranged substantially as described and shown.

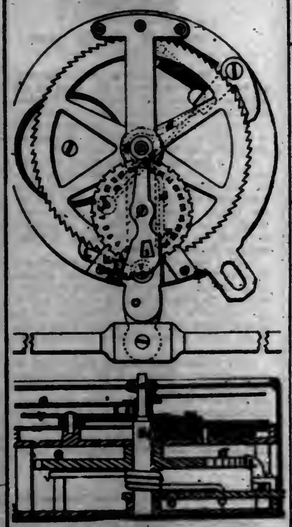


167,655. HANDLES FOR WARE-BOILERS, &c. Joseph W. Bates, Mississippi, Miss., assignor of one-half his right to Hiram Cole, Washington, D. C. (Filed July 10, 1876.)

Brief.—The handle is composed of a single unit of metal, bent so as to form two parallel side bars, and a loop for the head at each end.

The double handle D D, with parallel connecting-bars E E, substantially as and for the purposes herein set forth.

167,656. CURTAIN ROLLERS AND BRACKETS. Geo. W. Beers, Bridgeport, Conn. (Filed July 8, 1876.)



1. In a certain roller, the pawl D, having screw-threaded recess r, cylindrical recess r', groove g, and pawl P, in combination with spring s, arranged in the said groove, and notching the pawl, ratchet-wheel e on roller-head A, roller A, shaft B, and spring S, substantially as specified.

2. The combination, with the shaft B and spring S, of the roller-head A, having inner annulus a, with attaching-lugs a', substantially as specified.

3. The roller-head A, having annular flange d, inner ring a, with lugs a', and edge ratchet-wheel e, adapted for use substantially as specified.

167,667. FARMERS'-REGISTERS. John B. Benton, New York, N. Y., assignor of his right to Hamilton B. Towle, same place. [Filed Mar. 12, 1875.]

1. The actuating-lever C and spring w, in combination with a common central pivot around which they both turn or act, substantially as set forth.

2. The combination of an actuating-lever and a spring-wheel of a spring, arranged to actuate the wheel by its force in one plane, and to furnish force to produce friction in another plane, substantially as set forth.

3. One or more disks, W V, in combination with an adjustable hand, c, for the purpose of showing any change in the relative positions of adjustable and permanent hands making indications on a dial or dial, substantially as set forth.

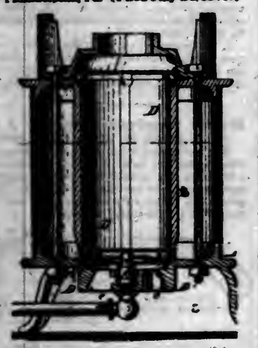
4. The combination of a movable hand or indicator and a permanent hand or index of a registering apparatus, and an alarm actuated by the same prime mover, substantially as set forth.

5. The combination of the index-hands of a registering-machine and one or more disks, W V, carrying in combination with a registering-disk, J, substantially as set forth.

6. The combination, with a ratchet-wheel, of the stop s and pawl L, provided with inclined recess l' to hold the ratchet-wheel at the termination of its predetermined motion, substantially as set forth.

7. The combination, with a frictional or clutch device, of a shoulder, in order that the adjustable hand, c may be moved by a key independent of any motion of the supporting-shaft, substantially as set forth.

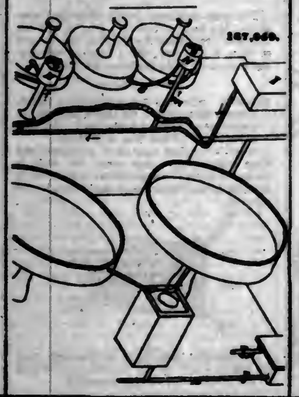
8. The rod E, provided with one or more handles fixed upon the same, in combination with a registering mechanism, and actuating such registering apparatus substantially as set forth.



9. The rod E, provided with one or more portable or detached wrenches or handles, in combination with a registering mechanism, and actuating such registering apparatus or mechanism substantially as set forth.

10. The combination, with a registering mechanism and an actuating-lever, of an intermediate spring or motor placed under tension by the movement of the actuating-lever impelled by the hand of the operator in one direction, and acting in motion the registering mechanism upon the return movement of the lever in the other direction, substantially as set forth.

11. In combination with the mechanism of a registering-machine actuated by a wrench or handle worked by the hand of the operator, a spring to drive said mechanism by the reaction of the same after it has been put into a state of tension, substantially as set forth.



12. The means of attaching to, and releasing the instrument from, the place where used, by means of the hook or horn and the parts bearing upon the same, substantially as set forth.

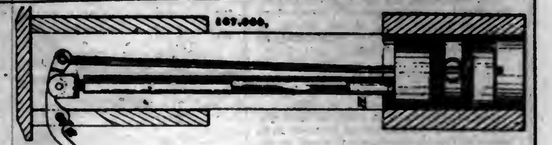
167,668. Gas-Stoves. John Q. Birkey, Philadelphia, Pa. [Filed July 24, 1875.]

In a gas-stove, the combination, with the cylinder D D', made in two parts, as described, of the contracted air-inlets c c, inlets i i, and annular diaphragm h, with the burner or tip E arranged in the center, substantially as and for the purposes herein set forth.

167,669. Fodder-Cutters. Martin Bell, Jr., Sandusky City, Ohio. [Filed July 24, 1875.]

1. In a fodder-cutter, the combination, with the knife-head B, of the adjustable gage-plate C, provided with the lugs a a, and the adjusting-screws b b, substantially as and for the purposes set forth.

2. The combination, with the knife-head B, of the gage-plate C, provided with the lugs a a, and the adjusting-screws b b, and the feed-roller D, provided with the adjusting-screws c c, substantially as and for the purposes set forth.



167,670. Distributing Quicksilver in Quartz-Mills. Martin P. Boss, Virginia City, Nev. [Filed July 13, 1875.]

Brief.—Quicksilver is forced by water-pressure up into an elevated tank, and is thence distributed through measuring-vessels to the amalgamator; thence will charge to settlers and a strainer, and back to the elevated tank.

The elevated tank I, connected with measuring-vessel N by means of pipes l m, with their cocks or plug c and the conducting-tubes s, all combined and arranged to operate substantially as and for the purpose described.

167,671. Force and Suction Pumps. Benj. Branson, Barnesville, Ohio, assignor to himself, Jos. Branson, and Levi Branson, same place. [Filed Apr. 6, 1875.]

Brief.—Forms the air chamber of a long tube of small bore, and combines the same with the piston as a rod, the peculiar form of air-chamber procuring steadiness of the stream during slow motion of the pump.

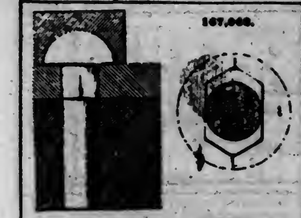
1. In a force-pump, an air-chamber constructed in the form of a long tube of small bore, for the purpose of procuring a slower action of the compressed air, a retarded delivery of the water therefrom, and a consequent steadiness of the stream from the pump when the latter is operated slowly, substantially as shown and described.

2. The combination of two pistons, one placed above the other in the same cylinder, and two piston-rods connected therewith and to the same operating-lever, the rod of the suction-piston passing through the force-piston, and one or both of said piston-rods made hollow, to form an elongated air-chamber to produce a steady stream of water, all substantially as and for the purposes set forth.

167,672. Hame-Attachs. C. A. Brockett, Kansas City, Mo. [Filed July 16, 1875.]

Brief.—A wall-auger consisting of a square shaft with spiral sections, provided with vertical and transverse grooves for the admission of air. The shaft may be grooved, slot, to correspond with the vertical grooves in the sections.

1. The sections D of a wall-auger, provided with one or more grooves or recesses, and interior grooves g in the hub C, as and for the purpose herein set forth.



2. The combination of the shaft A, having point B and one or more longitudinal grooves, a; the sections C D, with one or more interior grooves, g, and the collets f between the sections and at the bottom, substantially as and for the purpose herein set forth.

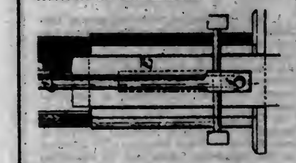
167,673. Dies for Bolt-Heading Machines. Joseph Browning, Philadelphia, Pa., assignor of one-half his right to Wm. C. Allison, J. W. Allison, and T. B. Allison, same place. [Filed Apr. 19, 1875.]

Brief.—The particular hexagonal shape of the cock-squaring die-cavity (seen when the die is closed) makes it possible to turn the blank without so widely separating the die-sections as is required in dies presenting quadrangular cavities. Otherwise the invention is fully explained by the claim and drawings.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO BOSTON

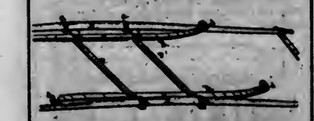
The combination of the bending-die of a bolt-machine with dies H and K, which, when closed, present an opening of the shape illustrated and described, for the formation of the square neck of the bolt, in the manner specified.

167,675. Watch-Case Springs. Ansel S. Buckalew, Colusa, Cal. [Filed June 30, 1874.]



Brief.—A watch-case spring that may be readily fitted to different sizes of cases by filing the projections, said projections being made very thin and slight.

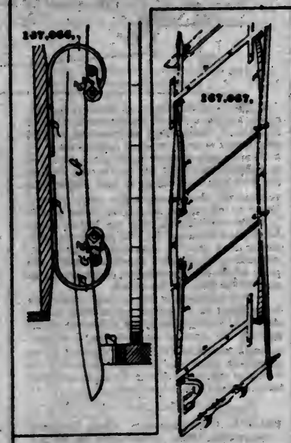
As a new article of manufacture, the watch-case spring consisting of the flat bar A, having its inner edge curved, and formed with the spring a at one end, the lateral projection B at the other end, and the depending support B near the middle part, said projection and support being constructed as shown, and for the purpose specified.



167,676. Self-Packing Piston-Connections. George W. Burr, East Lime, N. Y. [Filed July 24, 1875.]

Brief.—The piston being operated from below by a cross-head attached to the piston-rod, and extending out through side slots in the cylinder, there to connect with the pitman or brake rod. Flat slides running in guide-rims are applied to cover the slots, which, by atmospheric pressure, work tightly over the same, thereby enabling the stuffing-box to be dispensed with, and a direct vertical unobstructed course for the water afforded.

The combination, with a cylinder, A, provided with slots a a, of the piston-connection D, passing through said slots, and the slides E E, covering said slots and forming a packing, substantially as herein described.

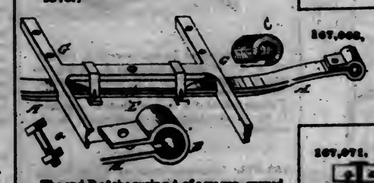


167,677. Gallows-Grabbers. Edwin Chamberlin, Troy, N. Y. [Filed Apr. 2, 1875.]

The longitudinal springs B B and transverse springs D E, in combination with shackles C, spars A A, blocks S, rigid cross-bars L and Q, all constructed and arranged to operate substantially as and for the purpose herein set forth.

167,678. Vehicle-Springs. Edwin Chamberlin, Troy, N. Y. [Filed Apr. 10, 1875.]

The combination, with the side bars A A and vehicle-body C, of the irons D, with springs E, cross-bars G, with arms b, the bolts c, and rubber springs d, all substantially as and for the purposes herein set forth.



167,679. Side-Spar Vehicles. Edwin Chamberlin, Troy, N. Y., assignor of two-thirds his right to Leo Chamberlin and Edward Chamberlin, same place. [Filed Apr. 3, 1875.]

1. The steel spring B, having angular projection c, in combination with the side spars A and cross-rods F, substantially as and for the purpose herein described.

2. The rigid cross-bars C and side spars A, in combination with the springs B, extending to near the center, and secured, by the angular projections c, to the spars A, and constructed substantially as and for the purpose herein set forth.

3. The body cross-rods F, with crank-loop f, shaft f', springs B, and cross-bars C, in combination with the spars A, the springs B reaching near the center, and secured to the spars, all constructed and arranged substantially as and for the purpose herein set forth.

167,680. Vehicle-Springs. Edwin Chamberlin, Troy, N. Y., assignor of two-thirds his right to Leo Chamberlin and Edward Chamberlin, same place. [Filed Feb. 24, 1875.]

The end B of the spring A of a wagon, curved so as to form an eye, and provided with perforation c, in combination with the crank-loop D, packing C and b, bolt c, and cross-bars G, all constructed and arranged substantially as and for the purposes set forth.

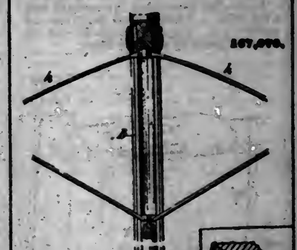
167,681. Low-Water Indicators. C. E. Christian, Erie, Pa. [Filed May 10, 1875.]

Brief.—A fusible plug inserted in the crown-sheet melts when the water in the boiler gets low, and allows a valve-stem to drop, which, in turn, opens a valve that admits steam to the whistle.

The combination, with the boiler A and crown-sheet B, of the collar E, with valve-seat c therein, fusible plug m, valve-rod d, with valve h, the spring i, and whistle-lever G, all substantially as and for the purposes herein set forth.

167,682. Vehicle-Springs. Edwin Chamberlin, Troy, N. Y., assignor of two-thirds his right to Leo Chamberlin and Edward Chamberlin, same place. [Filed Feb. 24, 1875.]

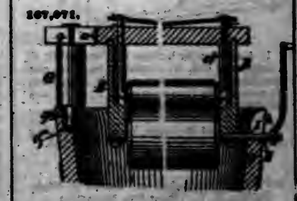
167,683. Combined Gauge and Umbrella. John N. Colby and John H. Coffin, Mystic Bridge, Conn. [Filed June 9, 1875.]



Brief.—When the frame is closed, the ribs and stretchers fall into longitudinal slots in the hollow stem, and by a turn of the slide they are entirely inclosed in the stem.

1. In a combined cane and umbrella, the combination, substantially as described, of a slotted tube, forming the stem of a cane, with ribs and stretchers adapted to the slots of the tube, as set forth.

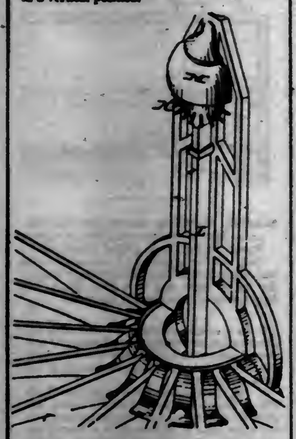
2. The combination of the inner tube B, the rib A, hinged to the end of the same, and slide D, and the stretchers hinged thereto, with the outer tube A, admitting of a limited lateral movement on the said inner tube, all substantially as set forth.



3. The combination of the runner F, the screw-pin e, the slide D, and outer and inner tubes A and B, all substantially as specified.

4. The combination of the outer and inner slotted tubes and rib A with the runner E and its internal projections m.

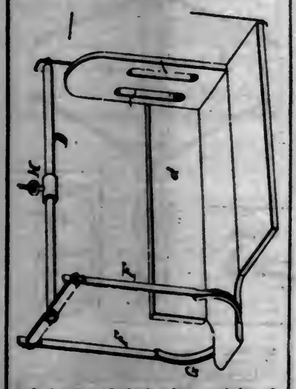
167,670. Washing-Machines. Gideon W. Cole, Canton, Ill. [Filed July 22, 1874.]



The roller-carrying frame A B B, having block D and tongue J, constructed as described, in combination with the tub K, having groove g'', slot h, and grooved plate L, substantially as and for the purpose specified.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO BOSTON

167,072. CLOTHES-FRAME. G. G. Crowley, Somerville, N. Y. [Filed Feb. 11, 1875.]

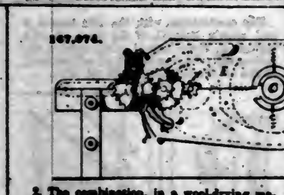


Brief.—A vertical sliding bar has a cap attached at the upper end with radial pins, which hold the arms in place when they are folded in a vertical position.

The cap M, constructed as stated, and provided with the pegs N, in combination with the bar L, for the purpose set forth.

167,073. FRACTURE APPARATUS. S. Darby, Philadelphia, Pa. [Filed June 12, 1875.]

Brief.—The fracture-bar is suspended from a rod above it, which extends lengthwise and parallel to it. The rod is connected with the supporting-cord by a sliding sleeve.



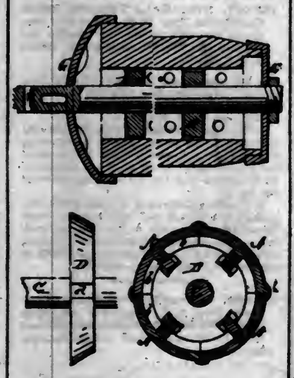
1. A support for broken legs consisting of a suspended box, A, pivoted at one end, and provided at the opposite end with a segment, B, arranged to turn on a stud, F, all as and for the purpose set forth.

2. The combination of the suspended box A with the bar or frame D, and the sliding block E, as and for the purpose described.

167,074. WOOL-DRYING. James M. Dale, Buffalo, N. Y. [Filed Feb. 19, 1875.]

Brief.—Air may be discharged into part E, either above or below the support a.

1. The combination, in a wool-drying machine, having a receiving-chamber, D', of the drying-grate E, the supporting-rollers J J, and the fan G, the whole arranged in said receiving-chamber, substantially as and for the purpose described.



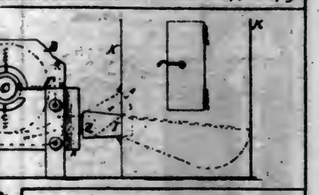
167,074.

2. The combination, in a wool-drying machine, having a fan, C, an air-trunk, D', and a picker, F, constructed as described, so that the current of air is impelled against the wool, at its entrance, of an air-guide plate, arranged to partially surround the picker and deliver the wool below the center of said picker, and prevent the wool from the fan being carried by the reverse revolution of the picker.

3. The combination, with the drying-chamber K, and air-trunk D', of a wool-drying machine, of a pivoted conveyer-apron, I, constructed to be adjusted above or beneath the grate of the drying-chamber, substantially as and for the purpose described.

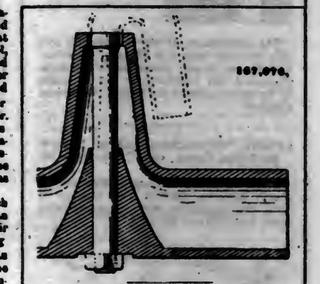
4. In a machine for drying wool with which is combined an air-forcing mechanism, and an air-trunk, arranged to impel a current of air against the wool at its entrance, a drying-chamber, connected with said machine by an adjustable spout, and arranged to receive the wool and the air for drying the same, substantially as shown and described.

167,075. CORN-SHELLER. Chas. Dockrey, Zanesville, Ohio. [Filed June 24, 1875.]



The corn-barrel herein described, consisting of the perforated staves A A, having the closing-strips b b, ribs B B, inclines a a', internal cones b b, conical disks D D, having T-shaped slots d d, central shaft C, and cone E C, all constructed and arranged as described.

167,076. MANUFACTURE OF LEAD TRAPS. Frederick H. De Bois, New York, N. Y. [Filed July 12, 1875.]



Brief.—The pistons working in the receiving-cylinders A' A'' move the two streams of lead with equal speeds, and, therefore, supply the same amount of lead to all parts of the orifice, when the straight parts of the trap are to be formed. When the curved parts are to be formed, the speed of one of the streams is reduced, while that of the other is increased, in virtue of which the pipe will be caused to bend over toward the side which is supplied with the least amount of lead.

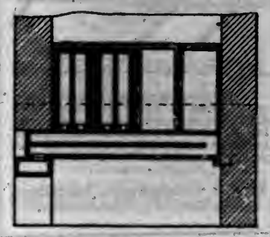
1. As an improvement in the art of making lead traps for plumbers' use, the ejectment of two or more convergent streams of metal moving with unequal velocities through an annular orifice or die, substantially as herein shown and described.

2. The improved apparatus herein described and shown, to be used in the manufacture of lead traps for plumbers' use.

167,076.

167,077. TURBINE REGENERATIVE CONVERTERS. Wm. P. Durbe, Philadelphia, Pa. [Filed Mar. 17, 1875.]

Brief.—Turns the converter by surrounding one end of the extended axis with a cylinder, in which is a rotating piston attached to the axis. On admitting steam or water on either side of a diaphragm in the cylinder, the piston revolves and turns the converter.



1. The combination, with the arm of Bessemer converters, of partially-rotating pistons, working in cylinders or segments of cylinders attached to a suitable support, whereby, through the application of suitable pressure upon said pistons, the converters may be turned or tipped, substantially as described and shown.

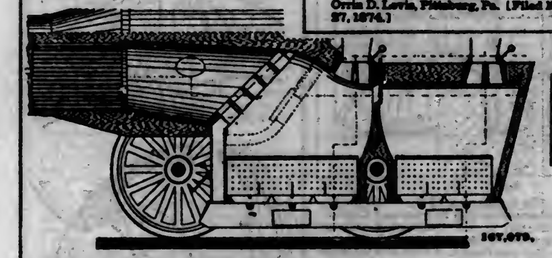
2. The combination of radial pistons C, attached to the arm of Bessemer converters, with cylinders B and abutments D, attached to the supporting framework in which the converters move, and with suitable pipes *f f*, for conducting fluids and vapors, under pressure, to the cylinders, for the purpose of turning or tipping the converters, substantially as described and shown.

167,078. GRATES FOR GENERATING GAS FOR FUEL. Wm. Beloth S. Durbe, New York, N. Y. [Filed Feb. 1, 1875.]

Brief.—Grates are made gaseous by mixing with clay to their manufacture combustible material.

167,079.

1. Furnace grates for generating gas for fuel, and for consuming or distilling fine coals and other finely-comminuted fuels, made from fire-brick, or other suitable refractory materials, substantially as described and shown.



2. The combination of vertical perches and perforated grates running parallel to each other through gas-producers and furnaces with ordinary grate-bars, substantially as and for the purposes described and shown.

3. The combination of vertical perches and perforated grates with tipping grate-bars, for the purpose of facilitating the removal of cinders, substantially as and for the purposes described and shown.

4. The combination of vertical perches and perforated grates with air-boxes, designed for heating the air passing through said grates, and also for permitting mixtures of air, steam, or other vapors and gases to pass through said vertical grates while common air is passing through the ordinary grates, substantially as described and shown.

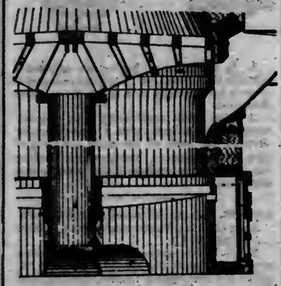
167,079. FIRE-BOXES FOR LOCOMOTIVE AND OTHER BOILERS. Beloth S. Durbe, New York, N. Y. [Filed Feb. 20, 1875.]

Brief.—The furnace is divided into compartments, in which coal is coked and the gases extracted. Valves are arranged in partition to regulate the admission of said gases to a perforated diaphragm, through which air is also admitted; air and gases issuing in jets simultaneously from separate apertures into a combustion-chamber, where they are mingled and consumed.

167,079.

1. In locomotive and other horizontal boilers designed for burning fuel as a gas, fuel-combustion chambers confined within the water-walls of the boilers, divided by gas-burning diaphragms, through which all the gases generated in the fuel-chambers and the air effecting their combustion, pass and mingle in fine converging streams or jets, substantially as described and shown.

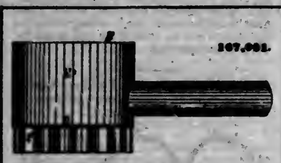
2. The diaphragm specially designed for these boilers, constructed of iron, with iron pipes for the flow of the gases from the fuel-chamber, in such wise as that the air to be combined with the heated gases produced in the fuel-chamber shall circulate around the iron pipes in the diaphragms through which the gases pass to the combustion-chamber, and thus become highly heated before the combustion occurs, while preventing the overheating of the iron casing, substantially as described and shown.



3. Water or other gas-tight and heat-resisting diaphragms, provided with gas-tight valves in them, and arranged so as to divide and entirely separate the different fuel-chambers, when more than one is used, and enable each fuel-chamber to be more or less completely shut off from the gas-distributing chamber and combustion-diaphragm, substantially as described and shown.

4. The combination of the gas-producing chambers, gas-distributing chambers, gas-burning diaphragms, and combustion-chambers in gas-burning boilers, substantially as herein described and shown.

5. In boilers constructed to burn gas from either wood or coal, or both, the combination of transverse diaphragms containing valves, with longitudinal water-diaphragms separating the fuel-chamber into two or more distinct chambers, substantially as described and shown.



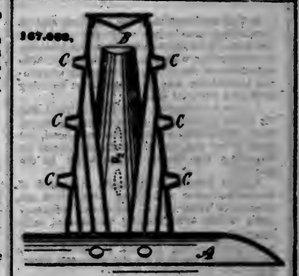
167,080. VERTICAL GAS-BURNING BOILERS. Beloth S. Durbe, New York, N. Y. [Filed Mar. 9, 1875.]

Brief.—Air is supplied to the combustion-diaphragm through a vertical stand-pipe located in the center of the boiler.

The combination with vertical steam-boilers with internal fire-boxes, the gas-burning diaphragms *a*, air-pipes *b*, &c., and feeding-hoppers *d d*, substantially as described and shown.

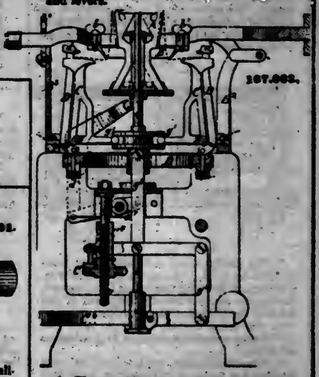
167,081. CULINARY IMPLEMENTS. Jerry Hibbert, Martin's Ferry, Ohio, assignor, by mesne assignments, to W. A. Conklin and Orrin D. Lovis, Pittsburg, Pa. [Filed Nov. 27, 1874.]

167,081.



As a new article of manufacture the culinary implement herein described, consisting of the hollow cylinder A, with corrugated cutting edge B, corrugated cutting and crimping edge C, perforated diaphragm D, and hollow handle F, substantially as specified.

167,082. WASH-BOILERS. Jacob D. Hyler, Pittsburg, Pa. [Filed May 31, 1875.]



The improved steam clothes-washer, consisting of the perforated base A, central oblong and tapering shell B, having flanged openings C, at different heights respectively, and communicating by separate flues *c* with the base A, and having, also, the end flues *d*, all constructed and arranged substantially as shown and described.

167,083. MACHINES FOR SHAPING AND BLOCKING HATS. Rudolf Hohenmayer, Yonkers, N. Y. [Filed July 6, 1875.]

Brief.—The lifting of the hat-block is effected by means of a hand-lever, operating through a rock-shaft, levers, cross-head, and links, rendered adjustable by means of a screw, and graduated to certain sizes by a scale or gage. The hat-block is expansible, and the lifting mechanism is so combined with the expanding mechanism that they occupy under all circumstances the same position with relation to each other. The expanding mechanism is combined with a graduated scale and adjusting mechanism, so that the hand-lever, which expands the block, may be readily set for effecting the precise degree of expansion required. The hat-block and its lifting mechanism is combined with brim-stretching tongs, which are capable of being opened and closed independently of either the contracting mechanism or the beading-ring, and the tongs are rendered adjustable by means of a controlling-ring and a screw. The brim-stretching tongs are composed of numerous jaws, the lower members of which have extended flaring surfaces for receiving the hat-brim and directing its edge into the open mouths. The upper jaws are opened, closed, and clamped upon the brim by means of a clamping-ring and levers, and maintained in any desired position by means of stops on the hand-lever. Each upper jaw is combined with a spring, which secures effective operation on brims of varied thicknesses. The contracting-tongs are operated by a controlling-ring and levers.

167,083.

1. The combination, with the hat-block mounted on a sliding spindle, of the cross-head, links, double levers, rock-shaft, and hand-lever, substantially as described.

2. The combination, with the hat-block and lifting mechanism, of a graduated scale or gage and an adjusting-screw, substantially as described, whereby the operator may readily adjust the lifting mechanism for lifting the block to any required height.

3. The combination, with the hat-block, its expanding mechanism, and its lifting mechanism, of a rock-shaft, substantially as described, whereby, in operation, the expanding mechanism and the lifting mechanism are maintained at all times in the same position with relation to each other, regardless of their position with relation to other parts of the machine.

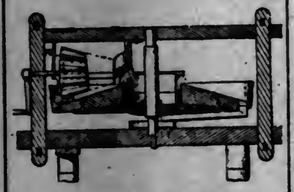
4. The combination of the hat-block and its expanding mechanism with the graduated cams and the adjusting-screw, which operates in conjunction with the expanding-lever substantially as described, whereby the expanding mechanism may be adjusted for blocking hats of a required size.

5. The combination, with the hat-block and its lifting mechanism, of the stretching tongs, their contracting-levers, the crown-band, the hand-wheel nut, and the stationary screw for adjusting the levers, substantially as described.

6. The contracting-tongs, composed of transverse lower and upper jaws, which are capable of being opened and closed independently of the contracting mechanism, substantially as described, in combination with a contracting-ring and its adjusting-screw, substantially as and for the purposes specified.

7. The stretching tongs, composed of a series of vertically-sliding short upper jaws, and vertically-stationary long lower jaws, substantially as described.

8. The vertically-moving clamping-jaws of the tongs, in combination with a clamping-ring and levers, substantially as described, whereby the said jaws may be simultaneously made to engage with and clamp the brim of a hat, as set forth.



9. The combination of the clamping-ring, which opens and closes the jaws of the tongs, with the link and a clamping-lever provided with cams, substantially as described, whereby the jaws may be correctly maintained in position whether opened or closed.

10. The combination, with the vertically-moving jaws and their clamping-ring, of the springs attached to each jaw, substantially as described, whereby said jaws may properly close upon brims of varied thickness.

11. The combination of the contracting-tongs, composed of the series of upper and lower jaws, with their controlling ring and levers, substantially as described, whereby the outward and inward movement of said jaws may be simultaneously effected.

167,664. Butter-Workers. P. Embree, West Chester, Pa. [Filed July 6, 1875.]

Brief.—The butter-worker has a fluted conical roller, journaled at one end in an adjustable hanger, to allow the roller to deviate from a radial line, so as to work the butter toward the center. There are also adjustable scrapers hung in hangers to throw the butter under the roller. The crown-wheel in the center of the rotating table forms a discharge-pipe for such milk as may be thrown over it by the action of the roller.

1. The combination, substantially as hereinbefore set forth, of the rotating table, for supporting and carrying the butter to be worked, having the crown-wheel forming part of the sides of the central milk-collecting chamber, with the fluted conical roller, the table and roller being connected together by gearing, as set forth.

2. The combination, substantially as hereinbefore set forth, of the rotating table having a central gear-wheel, with the fluted conical roller journaled at one end in a fixed bearing, and at the other in an adjustable hanger, as described, whereby said roller may be moved and adjusted from a radial line with respect to the table, for the purpose of working the butter substantially toward the center of the table.

3. The combination, with the rotating table having a central gear-wheel and milk-collecting chamber, of the butter-guides suspended from adjustable hangers at each end of the roller, whereby the said guides can be moved with the roller and the distance between said guides and the table regulated to prevent the triturating of the butter, substantially as described.

4. The combination of the rotating table having the central gear-wheel, the adjustable butter-guides, fluted adjustable roller, and discharge-spout leading from the peripheral groove, substantially as herein shown and described.

167,665. Pipe-Tongs. James M. Evarts, New Haven, Conn. [Filed Nov. 24, 1874.]

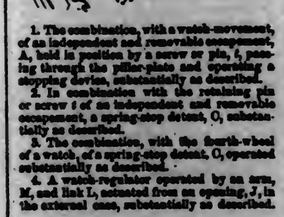
1. In a pipe-tongs, having an adjustable jaw, the slot surrounded by beveled or rounded guards substantially as and for the purpose described.

2. Pipe-tongs constructed with the fulcrum-pin, combined with a screw passing through the head of the same, the ends of said screw lying in bearings and holding the jaws together, substantially as shown and described.

167,666. Machines for Blocking Hats. Eben C. Fales, Foxborough, Mass. [Filed July 16, 1875.]

Brief.—The invention is an improvement on applicant's Patent No. 139,133, dated May 20, 1873; and it consists in the reciprocating head D, provided with a series of spring-ribs, C, which, when pressure is applied to their crown-head, flatten out the brim of the hat, otherwise blocked in the machine.

1. The combination of the block A, sectional stretching-ring B, cross-head I, bed P, flexible ribs C, and cross-head D, substantially as and for the purpose specified.



2. The combination, in a machine for blocking hats, &c., constructed to operate substantially as herein before described, of the cross-head D and the elastic ribs C, arranged to press and flatten out the brim of the hat, as and for the purpose specified.

167,667. Grate-Bars. William Farris, Yarmouth, Me. [Filed Jan. 7, 1875.]

1. The grate-bar formed of plate *a*, arched its whole length, as described, and having perforations at *b*, and provided with suitable projecting pieces *d*, substantially as and for the purposes set forth.

2. In combination with the arched grate-bars *a*, constructed as described, the rake or slicer *g*, perforated at *c*, and arched to fit over and operate upon said bars, substantially as and for the purposes set forth.

167,668. Locking-Latches. P. S. Potter, Cassenovia, N. Y. [Filed June 18, 1875.]

1. The fence-bar I, in combination with the arbor B and tumblers C, substantially as represented and set forth.

2. The tumblers C, having a series of notches, in combination with the fence-bar I, arbor B, and thimble A, having grooves *a a*, substantially as described.

3. The elliptic springs D, in combination with the arbor B and fence-bar I, substantially as and for the purposes set forth.

4. The bolt G, having a recess, *b'* which is bounded on one side by the irregular edge *c'*, and on the other side by the straight edge *d'*, in combination with the cam and stop E, and the springs L and M, substantially as and for the purposes specified.

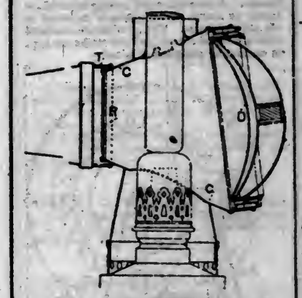
167,669. Escapements for Watches. Frederic Pitt, Ottawa, Canada, assignor of one-half his right to Wm. Fingland and Benj. J. Draper, same place. [Filed June 2, 1875.]

Brief.—A removable plate, holding the escapement and regulating devices, is held in position by a single screw, which operates a stop device for stopping the movement of the remaining parts of the works when the escapement is removed.

1. The combination, with a watch-movement, of an independent and removable escapement, A, held in position by a screw or pin, *i*, passing through the pillar-plate and operating a stopping device, substantially as described.

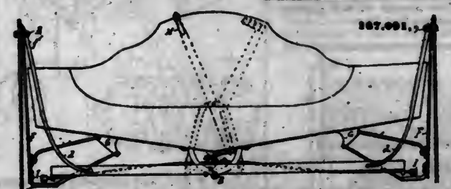
2. In combination with the retaining pin or screw *i* of an independent and removable escapement, a spring-stop detent, O, substantially as described.

3. The combination, with the fourth-wheel of a watch, of a spring-stop detent, O, operated substantially as described.



4. A watch-regulator operated by an arm, M, and link L, actuated from an opening, J, in the external case, substantially as described.

167,670. Magic Lanterns. C. Fontayne, New York, N. Y. [Filed July 9, 1875.]

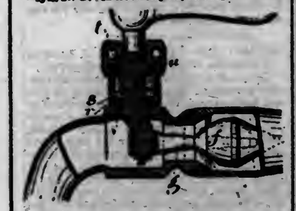


1. In a magic lantern, the combination of a reflector with a magnifying-lens, when the axis of the support of said reflector forms such an angle with the axis of the lens as to prevent the projection of the image of the burner on the screen.

2. In combination with the reflector D and the cone C, the springs H for holding the reflector D in proper position when cone adjusted, substantially as described.

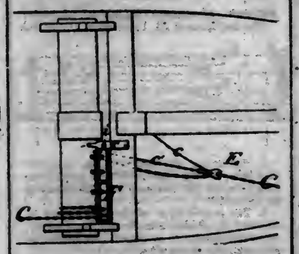
3. The combination of the reflectors D and C, with the pivoted bearings between the two, substantially as described.

167,671. Swinging Rests for Reps. T. P. Ford, Brooklyn, assignor of one-half his right to Thos. S. Dick, Green Point, N. Y. [Filed June 4, 1875.]



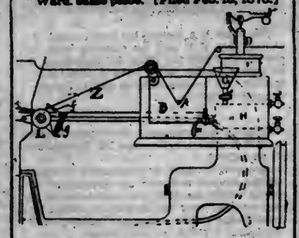
1. The berth carried and balanced on an oscillating axle, B, at or near the center of its length, in combination with the frame-carriage C, suspension-rods *d d*, oscillating cross-beams D, and guide-frames F constructed to the carriage, and jointed at the top to the cross-beam D, and by a double connection-rod to the under side of the berth at G, substantially as and for the purpose set forth.

2. In a swinging berth, the means of locking and controlling the movements of the carriage-frame between the bulk-heads, consisting of bolts I I, combined with a system of levers, substantially as described, operated by a hand-lever, H, and ratchet, or its equivalent, substantially as and for the purpose above set forth.



3. The described method of compensating, in a suspended and self-balancing berth, for the preponderance of weight in the upper part of the human body by supporting the berth at a point in its length more or less removed from its center, such point of support being located beneath the lowest point of the berth, substantially as set forth.

167,672. Faucets. Albert Fuller, Brooklyn, N. Y. [Filed May 31, 1875.]



1. The packing-gland, made of the rim *a*, screwing upon the outside of the cylinder containing the packing *c*, and the cylindrical follower *f* passing into the gland-chamber, in combination with the spindle *f* and collar *e*, substantially as set forth.

167,673. Anchor-Trippers. R. G. Gallee, Jonesport, Me. [Filed June 5, 1875.]

In an anchor-tripping device, the sparred rotating tripping-bar F, with a means for preventing its rotation, in combination with the claw E and chains *c c'*, substantially as and for the purpose set forth.

167,674. Wax-Thread-Heating Machines. Wm. J. Garton, Toronto, Canada, assignor of one-half his right to Wm. Ward, same place. [Filed Feb. 16, 1875.]

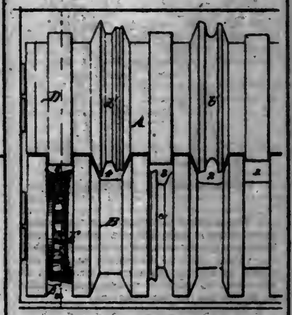
1. The described combination and arrangement of the steam-generating boiler, its dome and safety-valve, the cistern or compartment B, the upper water-supply tank G, the lower water-tank H, adapted to be supplied from tank G, and their respective tapes *t* and *u*, the whole *o* erating as and for the purpose set forth.

2. The steam-drum I, arranged to turn upon a hollow perforated steam-pipe, in combination with the thread-guides *b f* and spring *g*, all substantially as and for the purpose described.

167,675. Mechanisms for Supporting Log-Rests for Chairs. George D. Goss, Boston, Mass. [Filed June 1, 1875.]

1. The slide-frame C, provided with the grooves *b* and perforated ears *f*, in combination with the chair A, provided with the studded brackets D and the support-rods E, all being arranged and applied as set forth.

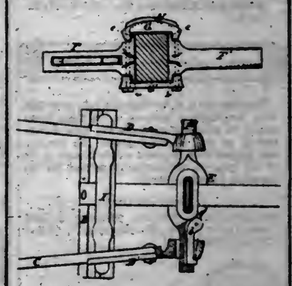
2. The leg-rest B and its two rods H K, (one being supported by stationary and the other by pivoted arms, as described,) in combination with the slide-frame C and the slotted and botched plates F F G G, applied to it as set forth.



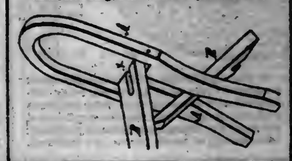
---

3. The combination of the rod M, slide-frame C, leg-rest B, notched plates F F G G, rods H K, and arms I L, all arranged substantially as specified.

167,676.



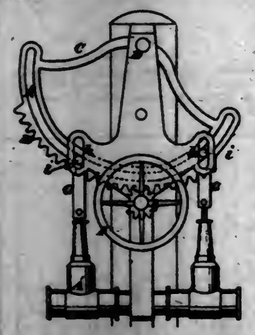
167,676. Rolls for Making Horseshoe-Blanks. Wm. M. Greenwood and John N. Clarke, Cincinnati, Ohio. [Filed Aug. 9, 1875.]



The combination of the rolls A and B, one provided with a die with convex projections and shoulder upon its face for forming corrugations and nail-crease upon the shoe-blank, the other being provided with a plain counter-die, the two arranged to work together, substantially as described.

167,677. Animal-Power. Gaml. N. Gastia, Mexico, N. Y. [Filed July 2, 1875.]

The combination, with the tongue, of the crown-head, consisting of the steam-pieces F F, having beveled flanges *c c*, the clamps G G, and the staple H, secured by nuts, substantially as and for the purpose specified.

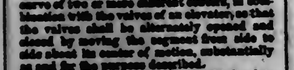


167,678. Folding Chairs. Francis Hickman, Reading, Pa. [Filed Apr. 1, 1875.]

The within-described chair, consisting of the part A, cut out as shown, the part B hinged thereto, and having slot *s* and stop C, and the part B hinged about midway to the part A, all substantially as and for the purpose herein set forth.

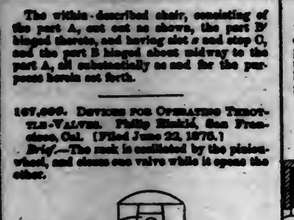
167,099. Device for Operating Throttle-Valves. Philip Bishkl, San Francisco, Cal. (Filed June 22, 1875.)

Brief.—The rock is controlled by the pinion-wheel, and closes one valve while it opens the other.



1. The segment C, formed in a continuous curve of two or more different centers, in combination with the valves of an elevator, so that the valves shall be alternately opened and closed by moving the segment from side to side about its center of motion, substantially as and for the purpose described.

2. The stationary guide-plate *f* with its slots *h*, in combination with the yoke G and pins *i* of the valve-stems and the slotted segment C, the whole constructed to operate substantially as and for the purpose herein described.



3. In combination with the slotted segment C, connected as shown, and provided with the toothed rack R, the operating pinion and rope-wheel F and the safety-stop L, substantially as herein described.

167,100. Window-Screens. George W. Helmbach, Allentown, Pa. (Filed July 17, 1875.)

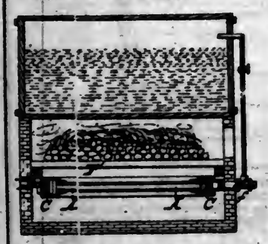
The screens A B, having side rails provided with longitudinal grooves, *c*, on their inner edges, in combination with the bars D, attached to the meeting-rails of the screens, and formed with tenons *b* on their ends to fit in the grooves, substantially as and for the purpose herein set forth.

167,101. Ash-Sifters. Maurice B. Hull and Andrw. Rapier, Brooklyn, N. Y. (Filed July 1, 1875.)

1. The combination of the two independent perforated shells A' A², the former being constructed with the solid cylindrical gudgeons *c'* *c'*, and the latter with the hollow cylindrical gudgeons *c²* *c²*, fitting upon the solid gudgeons, substantially as herein shown and described.

2. The perforated shells A' A², provided with hollow gudgeons *c'* *c'* and solid gudgeons *c²* *c²*, one of the latter having the projecting pin *b*, in combination with the collar C, having the notch *a* and constructed to pass by and lock behind the pin *b*, substantially as and for the purpose described.

167,102. Middlings-Purifiers. Andrew Hunter, Quincy, Ill. (Filed Mar. 18, 1875.)



1. The screen provided with the longitudinal strip, in combination with a knocker or knockers, for the purpose, and substantially as described.

2. The combination of the spring-bar E, hammer F, pivoted arm H, and hammer H', with the screen B, arranged and operating substantially as described.

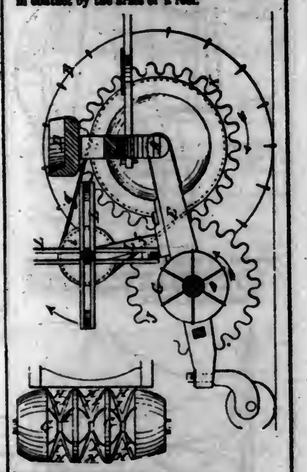
167,103. Devices for Supplying Steam-Blast to Furnaces. Evan J. Jones, Indianapolis, Ind. (Filed Aug. 14, 1875.)

Brief.—Steam is supplied through pipes having tapered ends and longitudinal openings. The area of the opening is regulated according to the amount of end pressure brought to bear upon the pipes.

The pipes A A, having the longitudinal V-shaped slots B B and the tapering ends, in combination with the pipes or receptacles C C, having sockets, screw rods or plates D D, and nuts *d d*, substantially as and for the purpose set forth.

167,104. Packings for Stuffing-Boxes. A. P. Lasterman, Chicago, Ill. (Filed July 24, 1875.)

Brief.—The shaft is surrounded by spiral wedge-shaped sections, the interstices between which are filled with elastic material, and covered by a flexible outer covering, the whole being placed within the ordinary stuffing-box.

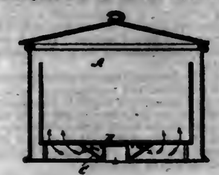


1. The combination of the spiral wedge-shaped sections, adapted to fit around the journal or shaft, the flexible or elastic covering surrounding the same, and the journal-box within which the whole is combined, substantially as described.

2. The combination of the spiral wedge-shaped packing-sections, the grooves at their ends, and binding-ring for holding them in place, and the outer covering of elastic material wound in successive layers around the same, substantially as described.

3. The combination of the spiral wedge-shaped packing-sections, the elastic packing in the interstices between the same, and the elastic or flexible outer covering, substantially as described.

167,105. Cotton-Stalk Pullers. Henry Lee, Mahaleyville, Ind. (Filed June 11, 1875.)

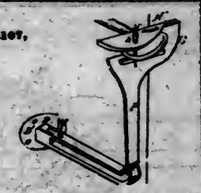


Brief.—Two bearing-wheels, each provided with cog-gear, have a bent or arched axle-tree, to which is journaled a roller-frame, the rear end of which is supported upon caster-wheels. A grooved roller, having a forced rotation by means of cog-gears, is mounted in the pivoted frame. The grooves are provided with V-shaped blades, and the stalks are kept in contact by the arms of a reel.

1. In a field stalk-puller, the combination of a revolving pulling-cylinder, having circumferential angular grooves and biting and pulling rings located therein, with the revolving reel, substantially as herein described.

2. The combination, with the pulling-cylinder frame E, hinged to the axle, and supported by the casters F, of the gear-wheels J K, at each end of the cylinder and axle, as and for the purpose described.

167,106. Outlawry Vessels. O. O. Linn, Indianapolis, Ind. (Filed Jan. 26, 1875.)



The detachable perforated outwardly-flaring ring C, combined with the sleeve D, which holds it in place, the partially-perforated plate B, which rests upon its open top, and the vessel A, as shown and described.

167,107. Key-Fasteners. B. J. Loomis, Ashtabula, Ohio. (Filed July 21, 1875.)

Brief.—A hinged and slotted standard suitably secured to the door, and having its free end bent upward, carries an arm provided at one end with a loop fitting to the slotted standard, and at the other with a pair of jaws, which receive and pass over the loop of the door-key, a fastening-pin securing the same in position, and all tampering with the key being thereby prevented. There is also a catch, which, when the device is turned down out of the way, secures it in folded position, the slot in the standard permitting ready adjustability to keys of varying lengths or thicknesses.

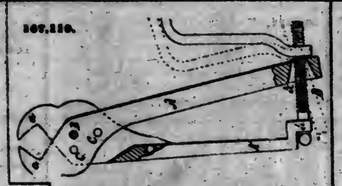
1. A key-fastener, consisting of a support, D, hinged standard B, provided with the slot *c*, arm F, and jaw G, substantially as and for the purposes described.

167,107.

2. The combination, with the slotted standard E, of the jaw F and pin H, in connection with a key, C, substantially as and for the purposes described.

3. The combination of catch I with the standard E and arm F, substantially as and for the purposes described.

167,108. Lanterns. J. J. Marcy, Bridgeport, Conn., assignor to Bridgeport Brass Company, same place. (Filed July 24, 1875.)

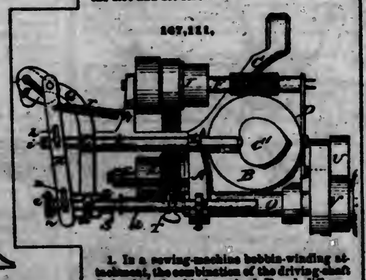


167,109.

1. The combination, substantially as hereinbefore set forth, of the independent combination H, pivoted to the removable lantern-cap B, the yoke-shaped frame R, secured to the bonnet of the lantern, and passing through vertical elongated openings or slots *f* in the cap of the lantern, as and for the purpose described.

2. The slots *f f*, formed by slitting the metal of the cap or top D, and turning in the edges, to constitute inwardly-projecting wings *e e*, in combination with the upper cross-bar of the yoke-frame R, essentially as described.

167,110.

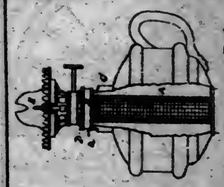


A pipe and bolt vise consisting of T-screw D, combined with lever A, having oblong hole *a'*, and bar A', having open-slotted end projection *a'*, as and for the purpose specified.

167,111. Bonnet-Wirings for Sewing-Machines. Wm. Miller, Boston, assignor to himself and Augustus Seaver, Milford, Mass. (Filed June 9, 1875.)

Brief.—The heart-cam, which gives motion through the bar and lever to the rod that carries the thread-guide, is made capable of being rotated at different rates of speed by being connected with a system of differential pulleys. The motion of the thread-guide can thus be adapted to different-sized thread or silk. The guide is made in two parts, jointed, and provided with a spring to ensure its constant contact with the bobbin. The bar, keyed to the fulcrum-plate, connects the rods, and is provided with a spring, which preserves the contact of the rod with the cam. The fulcrum-plate is made adjustable by means of the slot and set-screw.

167,111.

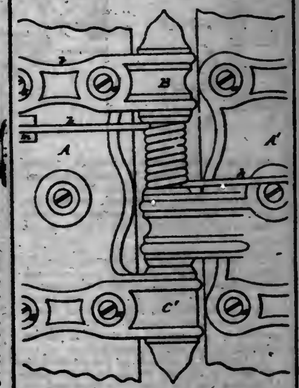


1. In a sewing-machine bobbin-winding attachment, the combination of the driving-shaft O, having the friction-wheel P and differential pulleys V, the intermediate arbor L, having two sets of differential pulleys, K U, the arbor F, having the differential pulleys J and worm-gear G, and the gear-wheel S having the cam O', all located in a suitable frame, connected and arranged as set forth, and adapted to rotate the cam O at different rates of speed, substantially as and for the purposes specified.

2. The reciprocating thread-guide T, in combination with the sliding bars S *k*, connecting bar or lever R, spring *r*, fulcrum-plate *p*, and cam O', substantially as and for the purpose specified.

3. The thread-guide T, composed of the two parts *g h*, jointed or hinged together and provided with the spring *s* and eye *i*, substantially as and for the purpose specified.

167,112. Lamps. Stephen S. Newton, Binghamton, N. Y. (Filed Mar. 12, 1875.)

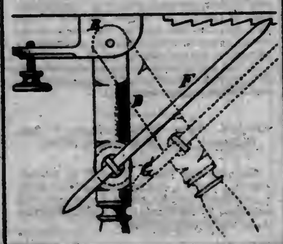


1. The herein-described safety attachment for lamps, consisting of collar C, the metal collar B, the gauze A, attached to the collar B, and the non-conducting collar D, substantially as set forth.

2. In a lamp, the combination of the collar C, the supplemental collar B, and the friction-strip *a*, substantially as set forth.

167,113. Grape-Hooks. R. M. O. Parker, Memphis, Tenn. (Filed June 29, 1875.)

Brief.—A spring-hinge, having a removable cap and separable cap-plate, receives the spread arms of the coil-spring in suitable notches upon the leaves. There is also an eli-socket, having within it a transverse bearing, cast with the leaf and socket, upon which the lower end of the plate or spindle-arm rests.

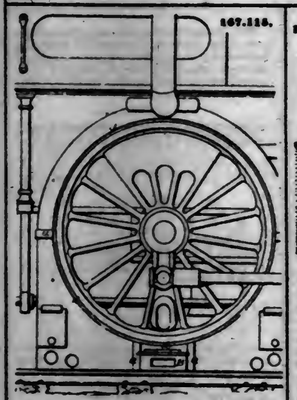


1. A hinge-leaf having an eli-socket, C', and within the same the transverse bearing *d*, cast with said leaf and socket, substantially as specified.

2. The combination, with the leaves A A', removable cap B, and spindle-arm *c'*, of the spring *c* and its spread arms *b b*, bearing in recesses *a a* in said leaves, substantially as specified.

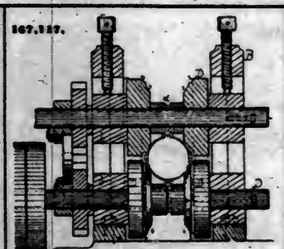
167,114. Locomotive-Tire Heaters. T. T. Peak, Bidora, Iowa, assignor of one-half his right to F. B. Woodruff, same place. (Filed May 28, 1875.)

Brief.—The inner free edges of the fire-boxes and cap are to be clamped against the faces of the tire, to secure a tight joint.



167,115. Fishing-Rods. Edward Payson, Jr., Boston, Mass. (Filed June 28, 1875.)

The improved safety-loop for check-reins, herein described, consisting of a sleeve, *c*, having one or more projecting perforated lugs, *d*, arranged and operating substantially as and for the purpose shown and specified.

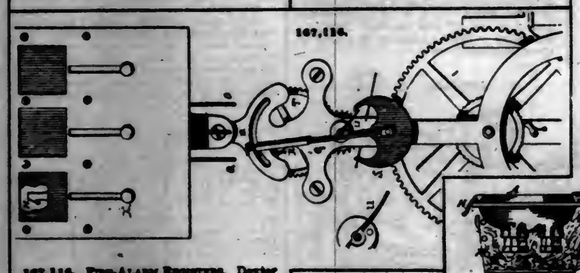


167,116. Pipe and Bolt Vises. George W. Milliner, Charlotte Town, Prince Edward Island. (Filed July 1, 1875.)

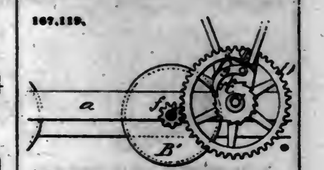
167,116.

A sectional tire-heating furnace, adapted to be built up around a tire, and composed of loose fire-boxes and a cap, having free inside circular edges *d* jointed together, substantially as specified.

167,117.



3. The roller-dies D, having each a gripping face, 4, arranged in pairs, to be operative simultaneously on joints on the opposite sides of a hollow post passing through between them, substantially as set forth.

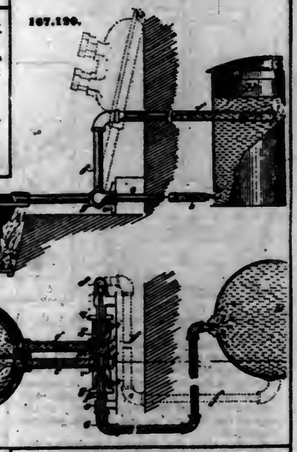


4. The roller-dies D, having each a gripping face, 4, arranged in pairs, to be operative simultaneously on joints on the opposite sides of a hollow post passing between them, each dies being movable vertically, and also longitudinally, on their shafts, substantially as set forth.

5. The combination of roller-dies and intermediate buttress-rolls, arranged for engaging simultaneously the different sides of a hollow post, substantially as and for the purposes set forth.

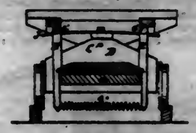
167,118.

167,119.



167,120. AIR AND WATER HEATING. Wm. H. Richardson, San Francisco, Cal. [Filed Apr. 5, 1875.]

1. The earthen-heater A A, provided with inner partition *p*, opening *q*, fired pipes *c c'*, and socket S attached thereto, operating with the fired pipe F, provided with outlets *r r'*, groove *m*, set-screw *t*, condensing-pipes *f f'*, and water or air supply B, substantially as and for the purposes herein set forth.



2. The vessel A A, provided with partition *p*, that divides it into unequal but communicating compartments *a* and *b*, whereby, through the indoct and educt pipes *c c'*, a current may be established, as described, substantially as and for the purposes specified.

167,120.

167,121. LUMBER-CART. J. L. Ridgely, Jr., Harrisonville, Md. [Filed July 17, 1875.]

Brief.—Frame supported on truck by perpendicular pieces, which may be forced from their rest by sliding bar. The load then dips and discharges on the heavier side.

1. The combination with a truck, running on a suitable track, of a load-receiving frame, B, having cross-bars B' B' B' that form the bearing of load and pivoted on a medius axis to said truck, as shown and described, whereby the lumber may be dumped by its own weight in the manner specified.

2. The combination, with truck and laterally-tilting frame, of arms E E, pivoted at *d*, having shoulder *e*, and connected at lower end by spring, as and for the purposes set forth.

3. The combination, with locking-arms E E of the spring-held slide-bar, having cam H movable at the time, in the manner and for the purposes specified.

167,118. JOINT-FASTENINGS FOR STAIR-RAILS. William H. Pritchett, Anacostia, D. C. [Filed Mar. 27, 1875.]

1. In combination with a jointed rail, having a round hole or mortise to inclose the nut and washer, the canal-cylindrical bearing-surfaces of the nut or washer adjusted on the joint-bolt to bear against the walls of the round hole or mortise in the rail, substantially as and for the purpose described.

2. The combination of the nut A, washer B, bolt D, and tightening-nut E, substantially as and for the purpose described.

167,119. HAND-CARS. Benjamin F. Hay, Baltimore, Md. [Filed July 3, 1875.]

The vibrating forked levers G G, ratchet-wheels *e*, pawls *g*, and spur-wheel D on shaft C, combined with the pinion *f* on axle *b'*, and sustained by the beams *a a* of the truck-frame A, as shown and described.

167,116. FIRE-ALARM REGISTERS. Dexter L. Pierce and Frank W. Griswold, Providence, R. I. [Filed July 29, 1875.]

Brief.—Striking mechanism, through medium of hook and rod, causes a lettered plate to fall every time a blow is given on the gong.

1. The three series of numbered plates G, sliding in suitable guides, and so operated as to designate the number of the box struck.

2. The levers K, having a cross-bar, J, and rack L, in combination with the lever M and rod O, the whole combined and operating together, in the manner substantially as described, for the purposes specified.

3. The hook S, actuated by the wheel E, in combination with the rod Q, for the purpose of raising the rod O, in the manner and for the purposes described.

4. The combination of the hook S, the rod Q, the wheel T, and the lever U, the whole arranged and operating together in the manner substantially as described.

167,117. MACHINES FOR CASTING THE JOINT-FLANGES OF HOLLOW COLUMNS AND CYLINDERS. J. L. Piper, Pittsburg, Pa. [Filed June 10, 1875.]

Brief.—The rails are designed to engage blocking-caps over and upon the abutting dovetailed flanges of the seven longitudinal sections of the column.

1. In a machine for compressing dovetail joints on hollow posts, a pair of roller-dies, D, having each a gripping-face, 4, for engaging the lips or sides of the female part of the dovetail, in combination with suitable guides, arranged to operate on the opposite side of the hollow post, and above and below the flanges thereof, substantially as set forth.

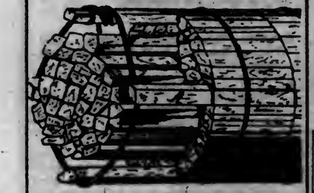
2. A pair of roller-dies, D, having each a gripping-face, 4, for producing the joint, and an extension, *b'*, which shall bear on the hollow post outside the joint, substantially as and for the purposes set forth.

167,122. PASSENGER-CARS. Mathias A. Bühl, Niederuzwyl, Switzerland. [Filed June 11, 1875.]

1. The combination of a series of adjoining compartments, A, with a passage, B, extending throughout the length of the car along one side of the same and having its doorways in line, as and for the purpose set forth.

2. The lamps *s*, arranged at the intersection of the compartment and passage partitions, as and for the purpose described.

167,122.

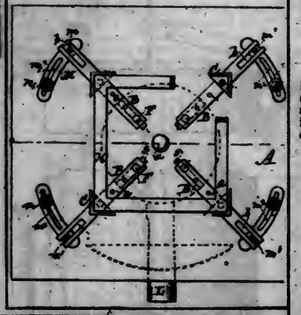


167,123. PROCESSES OF RETRACTING GELATINE FROM SALTED FISH-SKINS. John S. Rogers, Gloucester, Mass. [Filed Feb. 27, 1875.]

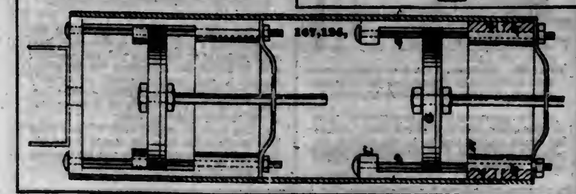
The process, substantially as described, of treating salted fish-skins for the procuring of their gelatine, such consisting in certain specified steps—to wit, soaking and agitating them in cool water, so as to desalt and decrude them, and afterward boiling them in fresh water and removing superfluous matters therefrom, and finally straining or filtering and evaporating to dryness the gelatinous solution, as set forth.

167,124. KINDLING-WOOD BALES. John Rowbotham, Philadelphia, Pa., assignor to William Rowbotham, same place. [Filed May 21, 1875.]

Brief.—Separate bundles, set end to end, are fastened together by long sticks partly severed at the divisions.



As a new article of merchandise, a bale of kindling-wood consisting of detachable bundles connected together so as to form the said bale, substantially as described.



167,125. LIFT-PUMP VALVES. F. A. Rehl, Stockton, Cal. [Filed June 12, 1875.]

Brief.—The rods on the side of the box serve as guides for the valve.

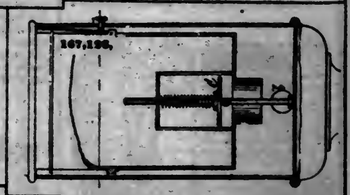
The part A, with its arms B and slotted legs C, the seat E, and the valve G, slotted at opposite sides, as shown, in combination with the bolts or rods D, when the latter serve to secure the parts together and guide the valve at the same time, substantially as herein described.

167,126.

167,126. GRATE-BARS. Henry Ryder, Somerville, Mass. [Filed Feb. 12, 1875.]

Brief.—The stationary bars have cast upon them end caps, which partially or wholly overlap the adjacent movable bars, and prevent them being clogged in their movements.

1. Each stationary grate-bar B, provided with the end caps or grids D D, as described, fastened to or cast in one piece with it, and to so project from it as when the bar is in place in the grate to either partially or wholly overlap the next adjacent movable grate-bars, all being substantially as set forth and represented.



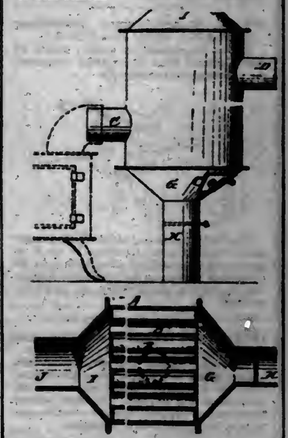
2. The movable grate-bars C, provided with the ends slots *b b* in each, in combination with the stationary bars B and their end caps or grids D, arranged to lap over the movable bars, and to have spaces a between the several grids of each range of them, all as specified.

3. Each movable grate-bar C, as provided with the two recesses or notches *d d*, and the straight friction-roller bearings *e e*, all being arranged as specified.

167,127. CLAMPS. Thos. Sandbach, South Bend, Ind. [Filed Feb. 2, 1875.]

Brief.—Picture-frames of various forms and different sizes are clamped upon the bed-plate by means of four adjustably-attached malleable discs of angular internal form, in connection with a similar number of sliding bars adjustable in slotted segmental plates, the whole being operated by a cam-lever.

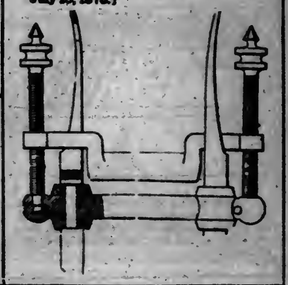
167,126.



The combination of the adjustable slotted bars M, provided with the studs *m'*, and the bars or rods B, having the slots *b*, constructed to operate substantially as and for the purpose shown and described.

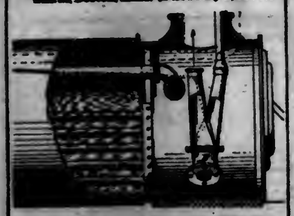
167,128. LAMPS. Bennett B. Schneider, New York, N. Y. [Filed Aug. 12, 1875.]

The combination of a catch applied to lock the reservoir when inserted to its place in the receiver, and a spring-valve applied to the bottom of the reservoir, substantially as specified.



167,129. DRUM-HEATERS. Curtis Skinner, Waterloo, Canada. [Filed Feb. 4, 1875.]

Brief.—Supplied with cold air from the room or from without.



In the suspendent and detachable drum-heater for stoves, shown and described, the shell A having tubes B B, chamber I, inlet and outlet pipes O D, cold-air chamber G having door *a*, and the cold-air duct H with damper X, all combined as set forth.

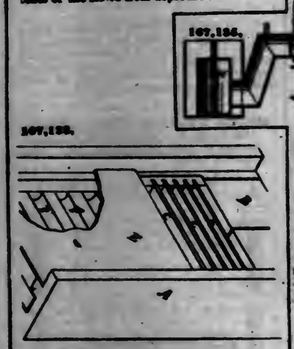
167,130. EXPANDING BITS FOR BORERS. John Smith, Jr., Gloucester, N. J., assignor to Geo. A. Hoyt, Philadelphia, Pa. [Filed July 10, 1875.]

The combination, in an expanding bit, of the cross-bar A and the parallel bar E, adjustable to and from the bar A, as set forth.

167,181. Exhaust Mechanism. Chas. D. Smith, Boston, Mass. [Filed July 6, 1875.]

In combination with the exhaust-pipe C a steam-engine, a bifurcated pipe, the branches of which extend from a common pipe connected with said exhaust-pipe, the upper end of one branch opening into the smoke-stack, and the other into the open atmosphere, or communicating with a pipe extending to the feed-water tank, or to the blast device, the device being provided with a valve at the junction of its two branches, by means of which the steam may be directed through either at will, substantially as described.

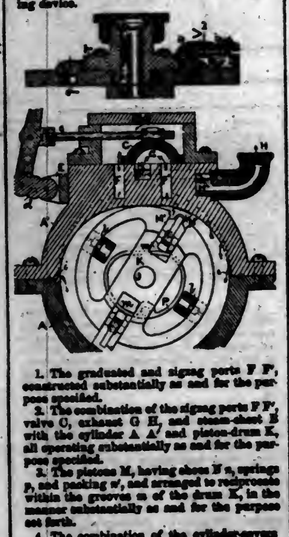
167,182. Wagon-Wheels. John Steiner, Manton, Cal. [Filed June 9, 1875.]



Brief.—Supplementary spokes drawn by screws toward fixed rim, thereby straightening spokes and stretching tire.

The device consisting of the supplementary arms or spokes D and the flange or rim F, together with the cutting screw-bolts *a*, for the purpose of tightening the tire and strengthening the wheel, substantially as herein described.

167,183. Gun-Washers. L. D. Stephens, Gold Run, Col. [Filed Feb. 10, 1875.]

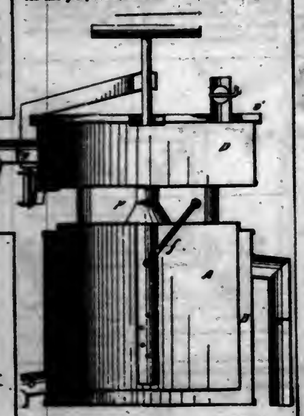


Brief.—A chimney provided with a false bottom, which is separated from the bottom proper by a grating, through which the finer particles of ore, &c., fall. The false bottom serves as a cover, protecting the valuable contents of the sluice from depredation.

A sluice having its bottom B at different levels, and provided with the gratings G, and the riffles F, protected by the plate E, substantially as and for the purpose herein described.

167,184. Rotary Engines. W. M. Stevenson, Sharon, Pa., assignor of one-half his right to W. McGilvray, same place. [Filed Apr. 20, 1876.]

Brief.—The tapering zigzag ports serve to diffuse the steam, and prevent it acting injuriously against any portion of the surface of the drum. The shaft is journaled in adjustable bearing-boxes attached to the cylinder-heads. Should the drum become worn, so as not to form a close connection with the abutment, it can be raised by means of the adjusting device.



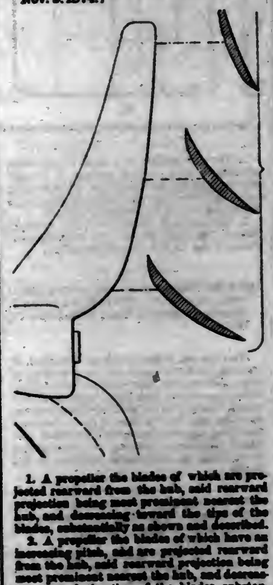
1. The graduated and zigzag ports F F', constructed substantially as and for the purpose specified.

2. The combination of the zigzag ports F F', valve G, exhaust G H, and steam-chest E with the cylinder A A' and piston-drum K, all operating substantially as and for the purpose specified.

3. The pistons M, having shoes N *n*, springs P, and packing *n'*, and arranged to reciprocate within the grooves *m* of the drum K, in the manner substantially as and for the purpose set forth.

4. The combination of the cylinder-covers Q, drum K, and cylinder A A' with the adjustable bearing-boxes T, substantially as and for the purpose specified.

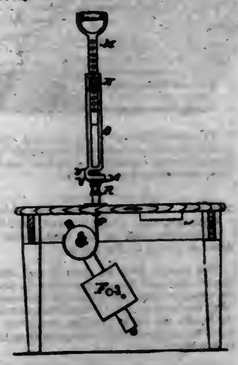
5. The combination of the cylinder-covers Q with the adjustable bearing-boxes T and the adjusting device V, substantially as and for the purpose specified.



167,185. Apparatus for Preserving Eggs. Frank D. Stone and W. Murray, Cleveland, Ohio. [Filed July 19, 1875.]

1. The apparatus for the treatment of eggs, or other substances to preserve them, consisting of the receptacles A D, the pipe F, air-pump E, and valves *g f*, substantially as and for the purpose described.

2. The combination, with the receptacles A D and the air-pump, of the steam-jacket B surrounding the said receptacle A, substantially as and for the purpose described.



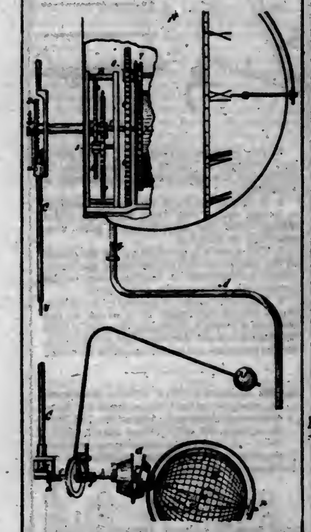
167,186. Screw-Propellers. J. I. Thornycroft, Chiswick, Great Britain. [Filed Nov. 9, 1874.]

1. A propeller the blades of which are projected rearward from the hub, said rearward projection being most prominent nearest the hub, and decreasing toward the tips of the blades, substantially as shown and described.

2. A propeller the blades of which have an increasing pitch, said are projected rearward from the hub, said rearward projection being most prominent nearest the hub, and decreasing toward the tips of the blades, substantially as shown and described.

167,187. Registering-Machines. John Tidmarsh, Brooklyn, N. Y. [Filed June 28, 1875.]

1. The combination, in an operating-machine having a platform, of a rock-shaft having a pulley at or near each end, and provided with an adjustable depending weight, straps secured to and passing around, or partially around, said pulleys, and lifting-handles connected with the said straps, all substantially as and for the object specified.



2. The hook D, spring-catch W, and block B, in combination with the straps P and lifting-handles, substantially as and for the purpose described.

3. The combination, with the weighted rock-shaft and the adjusting-screw, of the toothed dial K and nib *j*, substantially as and for the purpose described.

4. The combination of the weight F, constructed in sections, with the rock-shaft C and the device for turning it, substantially as and for the purpose described.

5. The handles constructed in parts M O, connected to each other by means of the guide N and set-screw, whereby the handles may be extended or contracted by a sliding connection, substantially as described.

167,188. Tellurians. Joseph Troll, Belleville, Ill. [Filed May 10, 1876.]

1. In a tellurian, the combination of the sun S, earth E, and connecting-rod C, carrying the earth globe, placed eccentrically to the sun's center, so that the earth in its revolutions around the sun will show its perihelion and aphelion, as described.

2. The combination of the shaft 1, wheel *a*, pinion *c*, connecting-rod and sleeve C, the wheel being made removable, so that the revolutions of the earth and moon around their own axis may be shown independently of the sun, substantially as shown.

3. The combination of the earth E, its connecting-sleeve C, and rod *p*, for attaching it to the sun, and a counter-balance, substantially as described.

4. In combination with the moon M, the independent ring H, provided with a suitable handle, for illustrating at the will of the operator the phases of the moon, substantially as shown.

5. The combination of the universal joint *g* and the ball-caps G, one of the caps being adjustable, so as to show different inclinations of the earth, substantially as specified.

6. In combination with the sun S, the joint *g* in the rod A, for giving the plane of the ecliptic different inclinations, substantially as described and shown.

7. In combination with the sun S, a curved or semicircular gas-pipe provided with a burner, the pipe being rigidly secured to the counter-balance-rod, and arranged so as to revolve around the sun and always keep the burner in the same relative position to the earth E, substantially as specified.

8. In a tellurian, the sun S, having a clock-work within it and a dial upon its face, for representing the hour of the day, substantially as shown and described.

167,189. Overcoats. A. R. Underdown, Philadelphia, Pa. [Filed May 21, 1875.]

An overcoat in which the front edges are inclined from top to bottom of the coat, and are combined with an overlapping flap, as and for the purpose herein set forth.

167,190. Slide-Valves. John W. Vermilion, Elkridge Landing, assignor to C. H. Brown, Baltimore, Md. [Filed July 12, 1876.]

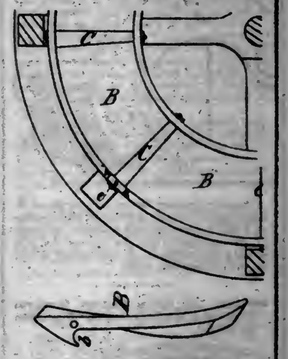
Brief.—When the main steam-port in the valve uncovers the corresponding port in the cylinder, the small opening in the opposite end of the valve registers with the channel in the valve-seat, thereby admitting two currents of steam to the cylinder. As the piston approaches the end of its stroke, steam from the chamber in the valve enters the cylinder and forms a cushion for the piston.

1. The valve H, having the passages *d e*, chamber *e*, openings *f g*, and main steam-ports *h i*, substantially as and for the purposes specified.

2. The valve H, having therein the passages *d e*, openings *f g*, and main steam-ports *h i*, in combination with the apertures *l* and recesses *b* in the chest, and the channels F G, arranged with reference to the cylinder steam-ports D E and recesses *b*, substantially as specified.

167,191. Bottle-Stoppers. W. Vom Hofe, New York, N. Y. [Filed July 30, 1875.]

Brief.—The lever is pivoted at the top of the standard. As the former is pressed down the ball is drawn up and slightly over the latter, thereby firmly pressing and holding the stopper in the bottle-neck.



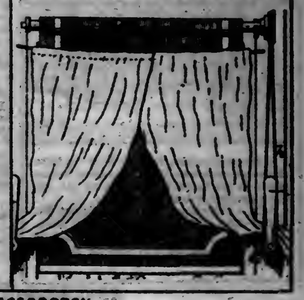
The lever C, provided with two round holes, one to receive the fixed pin *b*, and the other to receive the ball D, in combination with a plate A, which carries the stopper E, and is provided with legs *a*, supporting the pin *b*, and with a semi-head, B, provided with pivot *d*, on which the ball swings, all constructed and operating substantially in the manner herein described.

167,192. Processes of Curetting Calf-Skins. Preston Ware, Jr., Boston, Mass. [Filed June 15, 1874.]

As a new article of manufacture, leather curried, blackened, and finished without oil or other fatty stuffing, as and for the purposes herein set forth.

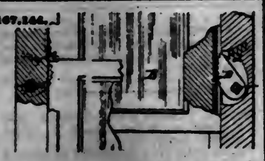
167,193. Turbine Water-Wheels. Milo B. Washburn, Indian Lake, N. Y. [Filed June 26, 1876.]

Brief.—The wheel is hastened or retarded by the exit of the water in accordance with the head of water, and the invention consists in combining with the buckets of a turbine pivoted gates, which are adjustable to or from the lower edge of the said buckets, whereby the discharge of water from the wheel may be regulated. The wheel has two concentric annuluses, to which are rigidly or detachably secured a number of buckets, which have warped surfaces, and fit snugly to the peripheries of annuluses, between which they are arranged at a suitable distance apart in an inclined position, and with their concaved surfaces upward. The gates are provided with journals, by means of which they are attached to annuluses, as also bolts to keep them in position.



1. The combination of the vibrating and adjustable gates C with a valve-wheel having inclined buckets B, and rings *a a'*, substantially as specified.

2. The clamping-bolts *d*, in combination with the rings *a a'*, buckets B, and vibrating gates C, substantially as specified.

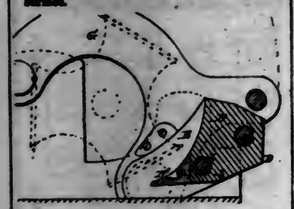


3. The buckets B, having shoulder *b*, and being a warped and concaved surface, in combination with the rings *a a'* and vibrating gate C, substantially as specified.

167,194. Combined Sash-Holders and Curtain-Fixtures. James Weathers, Greensburg, Ind. [Filed July 22, 1876.]

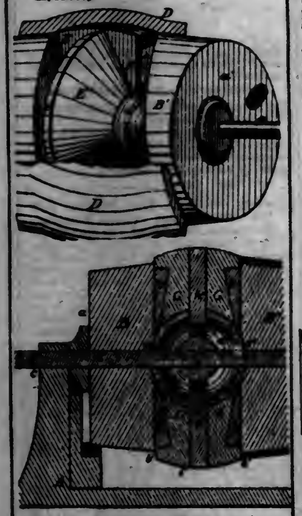
Brief.—A serrated cam operated by a crank-handle, and automatically held by a suitable spring, engages with a rubber strip inserted longitudinally in a groove of the sash, to hold the window in desired position. Combined with this sash-holder is a central pulley, so arranged upon the shaft, next the crank-handle, as to hold and tighten, or adjust, the curtain-cords, thus utilizing the same shaft for a support and cord-tightener in curtain-fixtures.

167,166. [illegible]



1. The combination, with a window-frame and sash, of the toothed or serrated cam D, spring d, and rubber strip e, substantially as and for the purposes herein set forth.

2. The combination of the cam D, shaft b, lever E, central pulley G, and curtain-cord A, substantially as and for the purposes herein set forth.



167,165. PLANING-MACHINES. Wm. Wells, Salem, Mass. (Filed June 10, 1875.)

Brief.—Each sectional chip-breaker has a pivoted toe-piece to allow for inequalities of surface.

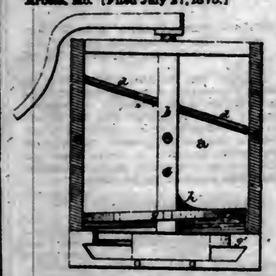
The chip-breaker, formed of a series of independently-moving sections D, each section of which is provided with a pivoted toe-piece, D', in combination with the spring-rod d, pivot-bar e, and levers G, all substantially as and for the purposes set forth.

167,164. DISK STEAM-ENGINES. Gustavus R. Winkler, Williamsport, Pa. (Filed June 21, 1875.)

1. In a disk-engine, the disk F, in the form of two obtuse cones with hemispherical bosses united at the bases, substantially as and for the purposes set forth.

2. In a disk-engine, the combination of the double-cone disk F and the diagonal abutments E F', the several parts constructed and arranged substantially as and for the purposes set forth.

3. In a disk-engine, the combination of the diagonal parallel plane heads b and the curved casing D, the whole inclosing a diagonal chamber, E, of the form of a central segment of a sphere, substantially as described.



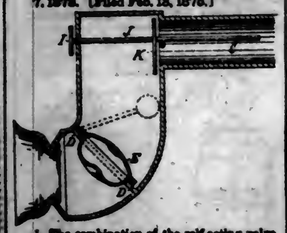
4. In a disk-engine, the combination of the pistons G, having rounded outer ends, and the diagonal disk-chamber E, with parallel plane sides, having the rounded casing D, substantially as and for the purposes set forth.

5. In a disk-engine, the combination, with the disk E', of the pistons G, the spring g', and cross-piece g, constructed and arranged substantially as and for the purposes set forth.

6. In a disk engine, in combination, the double-cone disk, having the pistons G and the diagonal disk-chambers E E, all constructed and arranged substantially as and for the purposes set forth.

7. In a disk-engine, the combination of the disk E', the disk-chamber E and the ports H I, adapted to admit and exhaust steam continuously upon each side of the disk, for the purpose of balancing the same, substantially as explained.

167,167. BRICK-MACHINES. Daniel Wood, Arbela, Mo. (Filed July 27, 1875.)

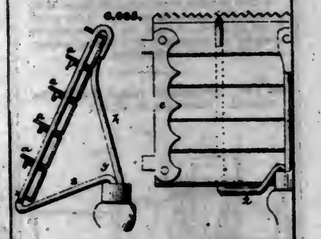


1. In a brick-machine, the false floor g, secured to the shaft b so as to revolve with it and close the opening through the floor over the molds when the molds are taken away, to prevent the clay from running out, as described.

2. The combination of the false floor g, secured to the revolving shaft b, carved plate h, for forcing the clay into the molds, and lever 4, for pushing the molds from the supporting-frame 1 3, as and for the purposes specified.

REISSUES.

6,606. STEAM-TRAPS. C. A. Frederickson, Brooklyn, N. Y. Patent No. 136,421, dated Feb. 4, 1873; reissue No. 6,606, dated Oct. 7, 1873. (Filed Feb. 13, 1875.)



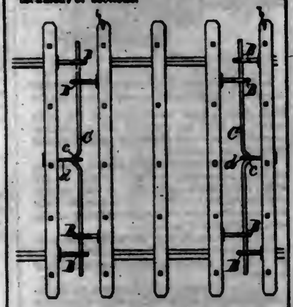
1. The combination of the self-acting valve E, closing by its own weight, the valve-seat D', and guards to prevent lateral movement of the valve, substantially as and for the object specified.

2. The indicator composed of the plate I, rods J J, and plate K, in combination with a sparking-tube, substantially as shown and described.

6,607. CURRY-COMBS. Wm. H. Lawrence, New York, N. Y., assignor to the Lawrence Curry-Comb Company. Patent No. 120,893, dated May 9, 1871. (Filed Mar. 29, 1875.)

Brief.—The teeth are formed on an edge or the edges of a series of trough-shaped plates, toothless edges of which brace the contiguous toothed plates. The handle is attached to the plates by wires passing through them and bent back at the end, and an inclined brace strengthens the connection.

1. The curry-comb containing comb-plates and contiguous plates without teeth, to strengthen the comb-plates, substantially as specified.



2. A comb-plate for a curry-comb, made in a trough shape, with teeth upon the wider flange a, and the other flange, b, plain, substantially as specified.

3. The wires 2 2, extending from the shank of the handle through the flanges of the comb-plates, and returned at the front edge of the curry-comb, substantially as set forth.

4. The combination, with a curry-comb having a handle connected by a shank to the comb, of a brace, h, extending diagonally from the handle toward the front edge of the comb, for the purposes and substantially as set forth.

6,608. HARROWS. W. S. O'Brien, Kewanee, Ill., assignor to the O'Brien Brothers' Manufacturing Company. Patent No. 156,643, dated Sept. 29, 1874. (Filed July 7, 1875.)

Brief.—A bend in the coupling-rod prevents it slipping out of place, and permits easy detachment of sections.

The coupling-rod C, having a crook or loop, c, arranged to operate with a hook, d, for securing said coupling-rod in the ears B B and the harrow sections to each other, substantially as described, and for the purpose specified.

6,609. MARKING' COMPASSES. H. S. Ritchie, Brookline, Mass. Patent No. 99,195, dated Apr. 7, 1869. (Filed July 27, 1875.)

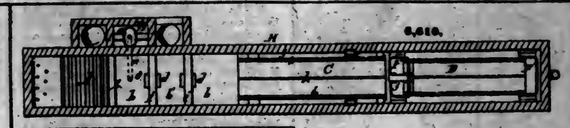
1. The combination of the auxiliary air-vessel or indicator E and the connecting-rod B with the magnet or magnets g, or the same and its or their air-tight or buoyant case D, the whole being arranged within the vessel or case A, to contain water or other proper fluid, and so as to operate together substantially as above specified.

2. The combination of either or both the buoyant air-vessels D E with their shaft or rod B by means of gimbals h, the shaft or rod B being arranged and supported within a case, A, substantially in manner and so as to operate as described.

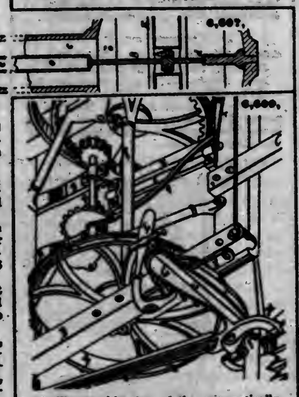
3. The combination of an auxiliary buoyant vessel, c, with the rod or connector B, the magnet, or the same and its buoyant case D, and the auxiliary case or vessel A, containing water or other suitable fluid, so as to operate therein substantially as hereinbefore specified.

4. The compass-card, having the cardinal divisions marked upon it, affixed to the external periphery of the float E, substantially as specified.

5. The combination of a hollow globe, b', open at top and bottom, and its supporting-gimbals, with the water case or vessel a, and the magnet buoyant air-vessel therein.



6. The magnet air-vessel, as made of an elongated form, and as having its magnet or magnets arranged lengthwise within it, substantially as represented in Figs. 6, 7, and 8 of Sheet 2, and as hereinbefore specified.



7. The combination of two or more buoyant radial floats or arms, a^1 a^2, with the elongated magnet-vessel, the said arms being for the purpose hereinbefore stated.

8. The combination of a graduating-ring, f', with the radial-armed float E, its connecting-rod B, and the magnet-float D, when arranged and combined within a water-vessel, A, in manner and so as to operate substantially as described.

9. In a mariner's liquid compass, the float which carries the indicating-card therefor, as made with one or more openings for the passage of the liquid through it, for the purpose specified.

6,610. [illegible]

1. The combination of the automatically-adjustable head-piece G, swivel or turn piece M, with the cutting apparatus, substantially as and for the purpose set forth.

2. The combination of the swivel-piece M, the shoe l, the flexible joints o e, and the head-piece G, so that the shoe and front part of the cutter-bar may have an automatic tilting motion independently of the up-and-down movement of said head-piece, substantially as specified.

3. In a two-wheel harvesting-machine, having an axle connecting the wheels, a support for the driving mechanism of the cutters, made in one piece, the weight of which and that of the driving mechanism of the cutters being arranged between the main wheels, and sustained by the axle thereof, substantially as described, and for the purpose set forth.

4. The piece D, which supports the intermediate shafts and gear-wheels, constructed substantially as described, to form a shield from the under side to the crank-shaft e, substantially as specified.

5. The slotted lever L, movable on its fulcrum-pin, in combination with the head-piece G and cutting apparatus, as and for the purpose set forth.

6. The adjustable rod or stop c, head-piece G, and swivel-piece M, in combination with a cutting apparatus that is flexible at its inner end and is automatically adjustable, substantially as described.

7. The inclined ratchet springs and pawls, arranged on the axle of the driving-wheel, in combination with the cams h, substantially as described, and for the purpose set forth.

6,611. FURNACES FOR REDUCING ORES OF PRECIOUS METALS. James H. Boyd, Chicago, Ill. Patent No. 144,184, dated Nov. 4, 1873. (Filed Jan. 9, 1875.)

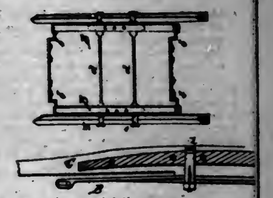
Brief.—Ore is pulverized, fed through hopper nearest the stack into the revolved desulphurizing-cylinder, passed through connecting-pipe into revolved roasting-cylinder, and onto the reducing-hearth. Hot air passes through the desulphurizing-chamber to oxygenize the agitated ore. Fluxes are introduced by the second funnel to the roasting-chamber. Slag runs continuously from the surface of metal in the reducing-chamber. Heavy metals are stirred in contact with lead. Bullion formed of lead and precious metals is withdrawn into the overflow-pot, which has a gate to regulate the height of metals in reducing-chamber. Iron, copper, &c., are raked off. Sections and condenser may be applied to air-outlet to save vaporized products. Products of combustion pass through reducing-chamber and through roasting-cylinder, and around the desulphurizing and oxygenizing cylinder. Cold air enters at the rear and bottom of the furnace, and passes forward to the grate.

1. The combination of the cylinder D, heated on the outside only, and the cylinder C, receiving the flames directly within, as specified.

2. The combination and arrangement, substantially as shown and described, of the inclined revolving ribbed cylinders C D, severally heated, as described, and reducing-chamber B, constructed and operating in the manner essentially as described.

3. The reducing-chamber B, provided with the hearths b b' b'', bridges c c' c'', and ducts d, substantially as specified.

4. The combination and arrangement of the fire-grate A, reducing-chamber B b b' b'', cylinder C, and cylinder D, all inclosed by the furnace-walls, substantially as specified.



5. The combination of the cylinder C, friction-rollers v v, cogged rim T, cog-wheel S, shaft g, spider r, cylinder D, worm P, shaft P, and screw Q, substantially as specified.

6. The arrangement and combination of the ingress k, air-space K, arches n n', compartment J, air-space M, and grate A with the reducing-chamber E, cylinders C and D, and compartment J', for the purpose of warming the air to supply the grate, substantially as specified.

7. The combination and arrangement, with relation to the cylinders C D and reducing-chamber B, of the funnel-pipes E E' E'', for feeding in at various points the pulverized ore and fluxes and reducing agents during the operation of the furnace, substantially as specified.

8. The combination of the reducing-chamber B, divided into the hearths b b' b'' at different levels, the ducts d, condenser-pipe e, and overflow-pot W, whereby the height and flow of the metals in the reducing-chamber may be regulated, substantially as specified.

6,612. VEHICLE-SPRINGS. Edwin Chamberlin, Troy, N. Y., assignor to himself, Leo Chamberlin, and Edwd. Chamberlin, same place. Patent No. 151,274, dated May 26, 1874. (Filed July 26, 1875.)

1. The side bars A and springs B, in combination with transverse bars d, forming a center bearing for the springs B, substantially as herein set forth.

2. The side bars A, cross-bars d, and springs B, either beneath or inside the side bars, in combination with the body D, the springs being connected to the side bars to form a center bearing for the springs, and the body being connected to the springs near their ends, substantially as and for the purposes herein set forth.

3. The body-loops b, provided with pivots c, in combination with springs B and bars A and d, substantially as and for the purpose set forth.

4. The plate C, in combination with the bar A, substantially as and for the purpose set forth.

6,613. GRAIN-PURERS. Charles Fitzhenry, Tiffin, Ohio. Patent No. 109,609, dated June 1, 1875. (Filed Aug. 11, 1875.)

Brief.—Slits the rubber radially to facilitate contraction and expansion of it.

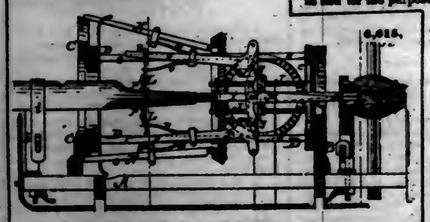
One or more radial slits, C, in the periphery of the rubber collar, substantially as described.

6,613. FLASKS AND BOTTLES. WM. T. FRY, Brooklyn, N. Y. Patent No. 40,269, dated Oct. 20, 1863. [Filed July 20, 1875.]

Brief.—A screw-collar fastened upon the neck in any suitable manner, adapted to receive a screw-cap, cork or rubber lined, and secure it upon the mouth of the bottle, so that the lining material shall form a tight and impervious joint with the edge of the neck of the bottle, so preventing access of the liquid to either the metal or the cement with which the collar may be secured to the neck.

The combination of the screw-collar C, fastened upon the glass neck A in any suitable manner, and the screw-cap B, provided with the cork or other elastic top-lining D, adapted to force and hold the lining D down upon the edge of the glass neck and form an impervious joint therewith, substantially as shown and described.

6,614. STRAINERS AND FUNNELS COMBINED. C. W. HEERMANCE and L. H. HEERMANCE, New York, N. Y. Patent No. 123,068, dated Nov. 12, 1872. [Filed July 3, 1875.]



Brief.—When not desirable to use the strainer and funnel together, the former may be swung up by the hinged device shown.

As a new article of manufacture, the strainer C D, funnel A B, and the hinged device E, constructed and combined, as and for the purposes described.

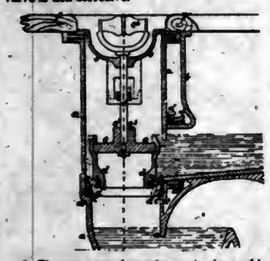
6,615. MACHINES FOR TURNING AXLES. W. H. Holley, Rochester, Ind., assignor, by mesne assignments, to Williams, White & Co., Moline, Ill. Patent No. 106,264, dated Aug. 16, 1870. [Filed May 21, 1875.]

Brief.—The cutter which shapes the axle is secured to one end of a lever, and this lever is pivoted to a revolving frame, which carries it and the cutter around the axle in its cutting operation. The action of the cutter is controlled by the bearing of the opposite end of the lever against the inner face of the thimble to which the axle is fitted.

1. A lever or series of levers carrying at one end a cutter arranged to operate on the axle, with its opposite end bearing against the inner surface of a thimble, in combination with mechanism, substantially such as described, for imparting to said lever a rotating and also a longitudinal movement, as set forth.

2. The combination and arrangement of the rotary frame D, longitudinally-sliding frame I, and transversely-sliding cutter-heads L, substantially as herein shown and described.

3. The combination, with the frame I, herein described, of the two sets of nuts n n, which can be adjusted to reverse the direction of the feed, as specified.



4. The cutter-heads L, levers r, links s, and the levers M, which revolve in the thimble, combined and arranged substantially as shown and described.

5. The combination of the pressure-levers N with the cutter-heads and the fixed cam P, substantially as and for the purpose herein shown and described.

6. The springs V V, combined with the levers r, links and levers M, to cause their simultaneous action, in the manner set forth.

6,616. WATER-CLOSETS. Josiah George Jennings, Palace Wharf, Stangate, England. Patent No. 127,062, dated Mar. 26, 1872. [Filed July 14, 1875.]

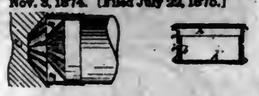
Brief.—The water-supply to the bowl is measured by means of the graduated opening in the retarding-piston. The seat of the pull-valve is non-corrosive.

1. The non-corrosive valve-seat c, in combination with the valve d, pan b, and siphon-trap e, substantially in the manner set forth.

2. The combination of a retarding-piston, f, and a graduated channel, l, with the supply-valve and with the pan of a water-closet, whereby the quantity of water admitted to the pan may be regulated substantially as described.

3. The siphon-trap e, with a side opening or socket, e', in the ascending limb thereof, to which a pan, b, is adapted, substantially as set forth.

6,617. HORSE HAY-RAKES. Benj. Owen, Dayton, Ohio. Patent No. 159,340, dated Feb. 2, 1875. [Filed Mar. 13, 1875.]



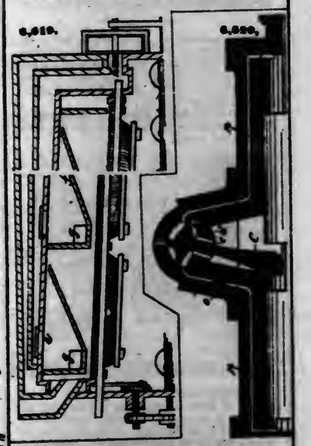
Brief.—The rake is operated by toggle-levers, and held in working position by a foot-lever.

1. The hand-lever M, having two arms joined at the outer ends, the upper of which serves as a bearing for the projecting end of the foot-lever G, and the lower comes in contact with the bar K of the shafts, substantially as described, and for the purpose specified.

2. The combination of the hand-lever M, constructed as described, with the foot-lever G, bars n, and the tilting head of a horse hay-rake, when the respective parts are arranged, as and for the purpose specified.

3. The bar D, having its forward edge rounded, as shown, and the slotted guide-bar E, forming a rigid portion of the rake-head, in combination with the teeth F, passed through the bar E, and the orifices in the vertical portion of the bar D, and secured to its rounded edge by means of the clips c, which allow them a slight vertical, but very little lateral, motion, substantially as described, and for the purpose specified.

6,618. PAPER BOXES. ANNE POWERS, New York, N. Y., executrix of TIMOTHY J. POWERS, deceased. Patent No. 156,591, dated Nov. 3, 1874. [Filed July 22, 1875.]



As a new manufacture, a paper box the body or cover of which is composed of a hollow cylinder, one end of which, to form the bottom or top, is folded inward and pressed without being cut, and covered with a disk of paper, as described.

6,619. FLOUR-BOLTS. George T. Smith, Minnesota City, and Aaron Smith, Hastings, Minn. Patent No. 126,406, dated Feb. 4, 1873; reissue No. 6,106, dated Dec. 29, 1874. [Filed Apr. 1, 1875.]

1. In combination with a flour-bolting surface having different numbers of cloth, adapted to deliver the material in different grades of fineness, a movable or traveling brush, or a series of movable or traveling brushes, below the bolt-cloth, and arranged on a line or lines parallel with the conveyer of the machine, and moving at right angles thereto, for cleaning the bolt-cloth without carrying material lengthwise of the machine, substantially as set forth.

2. In a flour-bolting machine having different numbers of cloth, adapted to deliver the material in different grades of fineness, and having an air-chamber divided into sections by means of transverse partitions or walls, a series of brushes, each shorter than the spaces between said walls or partitions, and so arranged that each brush shall traverse a section of cloth corresponding to a section of the air-chamber, substantially as set forth.

6,620. ROCK-DRILLS. Edwd. S. Winchester, Boston, Mass. Patent No. 165,045, dated July 13, 1875. [Filed Aug. 17, 1875.]

1. The solid plug-valve provided with the steam-passages c, less in diameter than the ports b, to prevent the entrance of fragments of rock or other foreign material.

2. The solid plug-valve provided with the ports b, with the steam-passages c arranged at right angles thereto, whereby elongated particles entering the passages c are prevented from passing through the ports b, as set forth.

3. In combination with the oscillating valve provided with the arm C, the inlet-passage O, arranged to deliver the inflowing steam or air directly against said arm, and thereby assist in completing the full movement of the valve, whereby the engine is prevented from stopping on its forward stroke when the piston stops short of its full movement, as set forth.

4. In combination with the spring-arms C of the valve, the rubber or other elastic filling F, substantially as and for the purpose set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 9. TUESDAY, AUGUST 31, 1875. PRICE { $4.00 per year—single. $4.00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF NEW YORK.

GEORGE E. KING *vs.* ROBERT WERNER.

[*In equity.—Before* BLATCHFORD, *J.—August*, 1874.]

The claim of reissued letters patent No. 3,001, for "Improvement in Fluted Puffing," granted Geo. E. King, June 23, 1868, (original February 26, 1867,) namely, "The within-described puffing as a new article of manufacture, the same being formed by crinkling, gathering, or irregularly waving one portion of the strip of muslin or other material simultaneously with fluting it along the edges of such portion, as at *g*, and forming flattened borders or portions *h* outside of the flutes, or between two next adjacent rows of them, to receive stitching, substantially as specified," claims the puffing without reference to whether it be made by hand, or by machinery, or how otherwise, and the claim held void in view of the prior existence of a puffing known as the Pipe puffing formed on a sewing-machine.

The only proper construction of the word "simultaneously" in this claim is merely that, in the finished article, one portion is seen to be crinkled, and at the same time the parts at the edges of each portion are seen to be fluted, and the portions outside of the flutes are seen to be flattened borders.

To regard the word as referring to the idea that, in any given cross-section, the crinkled portion, the fluted portions, and the flattened borders are formed at one and the same time, is to introduce an element which has regard to something beyond the conformation, shape, and structure of the puffing as an article of manufacture, and which has to do with the process of making it. This would make the claim repugnant to the subject-matter of the patent.

The fact that the flutes of the Pipe puffing being made by the process of gathering were not as regular and uniform as are flutes made by fluting-rollers, raises a question of degree and of appearance, and not of conformation.

The claim of reissued letters patent No. 3,000 for "Improvement in fluting-machines" granted to George E. King, June 23, 1868, (original February 26, 1867,) namely, "The guide E, constructed with one or more curved or arched portions, *c'*, in combination with suitable fluting-rollers, substantially as herein set forth, for the purpose specified," presents, as the main feature of the machine, the device for pulling away the fabric before the fluting-rollers grasp it too firmly, so as to get an increased width of fabric opposite the pair of plain rollers, such device being an arched guide, the arch of which raises up the fabric, so that the fabric rides over it, and so is pulled away from the fluted parts of the rollers.

The Werner machine uses a detent or finger and a platform opposite the plain rolls of the rollers, the fabric being held back from the fluting-rollers by the pressure of the detent upon the platform. The detent and the platform form the two surfaces of a guide, between which the fabric passes, and they divert the fabric from what would otherwise be its course, so as thereby to pull out an extra width. The variation of construction is merely mechanical and not substantial.

[*S. D. Law* and *Manuel A. Kurzheedt*, for complainant. *Orlando Dorsey* for defendant.]

BLATCHFORD, *J.*:

This suit is brought on two reissued letters patent granted to the plaintiff. One is No. 3,000 for an "improvement in fluting-machines." The other is No. 3,001 for an "improvement in fluted puffing." Both of them are dated June 23, 1868, and were issued on the surrender of original letters patent granted to the plaintiff, as inventor, February 26, 1867.

The specification of No. 3,001 says:

> My invention consists in the production, as a new article of manufacture, of a puffing applicable to shirt-bosoms, trimming, or other purposes of dress, in which the completed article, prior to laundering or washing, is made up of either a single row, or two or more parallel series of rows, each consisting of flattened borders with flutes running along their inner edges, and a puffed, or gathered, or crinkled surface or surfaces between the flutes.

It further says that the puffing represented in the drawing accompanying the patent consists of flattened portions with flutes arranged along the inside edges of such flattened parts or borders, and with a crinkled or gathered surface to the portions lying between the flutes, longitudinal rows of stitching being afterward, it may be, passed through the flattened borders, at, say, their edges "to render permanent the conformation of the puffing," and, if necessary, stripe or tapes basted on along such flattened parts. It further says:

> The mechanism, where machinery is used for the purpose necessary to produce a puffing of this character, may be varied, but

for the purpose of illustrating how, or one way in which the same may be done automatically, or by mechanism, it will suffice here to refer briefly to a machine for the purpose, which was secured to me by letters patent No. 62,492, of the United States, bearing date February 26, 1867, and which is now the subject of an application for reissue. Thus the piece of muslin or other fabric may be entered through a hollow inclined guide formed partly of an arched and partly of a straight form to or between rollers and pressers, the rollers being made with flattened ends or portions that act in concert with the pressers, to form the flat portions A of the puffing, and with grooves or flutes inside of such flattened ends, to establish the flutes g, while the intervening portions of the rollers opposite the arched portions or portions of the guide are further from each other, and simply serve to act in a light manner upon the curved surfaces of the puffed, gathered, or crinkled portions i of the material as produced by or through the arched portions of the guide, that give an irregular or wavy surface to such portions by reason of the width of the material passing out of or through the arched portions of the guide being greater than the distance between the fluted portions of the roller. The longitudinal rows of stitching e, in or along the flattened portions A, may either be put in by hand or by any suitable sewing-machine. A puffing is thus made having gathered, crinkled, or wavy portions i without having recourse to laundering or washing to effect such conformation, thereby economizing labor and material, and putting the article in a finished state on the market in that fresh condition which washed goods are devoid of.

The claim is in these words:

The within-described puffing, as a new article of manufacture, the same being formed by crinkling, gathering, or irregularly waving one portion of the strip of muslin or other material simultaneously with fluting it along the edges of such portion, as at g, and forming flattened borders or portions A outside of the flutes, or between two next adjacent rows of them, to receive stitching, substantially as specified.

The article of manufacture claimed, the patentee denominates, as a whole, a "puffing." As he describes it in the claim it consists of a crinkled, gathered, or irregularly-waved portion, of a fluted portion along each edge of such first-named portion, and of a flattened border or portion outside of each fluted portion, to receive stitching, to render permanent the conformation. The specification points out, as features of the article, that it presents the appearance it does without being washed or laundered, and that its gathered, crinkled, or wavy portion has such conformation given to it without having recourse to laundering or washing.

A patent had been granted to the plaintiff on the 23d of October, 1866, for an "improvement in fluted puffing for shirt bosoms," in which he claimed, as an article of manufacture, what he called a "fluted puffing," made by fluting, by mechanism, and in a regular manner, a strip of muslin or other material throughout its length, and compressing and flattening down the extremities of the flutes to form straight and regular borders on either and opposite sides of the flutes, and afterward machine-stitching said borders along and at the union of the borders with the flutes. It is manifest that this article, for the space between the flattened portions, consists, as made, and before being washed or laundered, wholly of flutes; that, in order to convert such fluted portion into a crinkled, gathered, or irregularly-waved portion it is necessary to launder or wash it, and that such conversion can be made by laundering or washing it. Figure 1 of the drawing represents a face view of the puffing "previously to its being washed," and represents it as wholly in flutes between the flattened portions. Figure 4 of the drawing represents a face view of the puffing "after having been washed and as sewed between the plaits of a shirt-bosom," and represents all the part that is in view, which is the part between the flattened portions, as being crinkled, gathered, or irregularly waved. In view of this patent of 1866, the reference in the specification of reissue No. 3,001 to the formation of the crinkled portion of the puffing, without recourse to washing or laundering, becomes intelligible.

The specification of No. 3,000 says:

This invention is designed for making puffing applicable to shirt-bosoms, trimming, or other purposes of dress, in which the article as it issues from the machine is (without having recourse to laundering) delivered in a complete form, either singly or in two or more series or rows, composed of flattened borders with flutes running along their inner edges and puffed or crinkled surfaces between the flutes. The invention consists in a guide constructed with one or more curved or arched portions, in combination with one or more suitable fluting-rollers, whereby the material, in passing through the machine, is fluted and contracted laterally as it were, or drawn up between the flutes, to produce the required crinkled surface or surfaces in the puffing."

Two fluting-rollers one above the other are placed in a frame with their ends projecting through large vertical slots formed in the ends of the frame. The lower roller is supported in semicircular bearings formed in the lower ends of the slots, and is furnished at one end with a crank. The upper roller works in semicircular bearings formed in sliding blocks placed upon the ends thereof, and pressed down upon the same by a spring, the tension of which may be regulated by means of a vertical screw situated centrally in the top of the frame.

When desired, the upper roller may be held within a given distance of the lower roller by vertical set-screws, situated one at each end of the top of the frame, and acting upon the sliding or adjustable bearings. The puffing is represented in one of the figures of the drawing, and is formed of strips of any suitable fabric, and of a width, when finished, nearly or quite equal to the length of the fluting-rollers, and is formed with longitudinal portions, which are fluted transversely to the length of the strip; also, with portions outside of the fluted portions, in which the fabric is pressed flat, and through which longitudinal rows of stitching are formed, to render permanent the conformation of the puffing; and, also, with portions between the fluted portions, which are intended to be wider than the parts just described, and which are puffed or crinkled in such manner as to possess an irregular wavy surface. In order to form these several portions of the puffing, each of the fluting-rollers is formed with as many annular or circumferential series of grooves and flutes as there are fluted portions upon the puffing, with as many plain narrow annular faces as there are flattened portions, and with as many plain and comparatively broad portions as there are puffed portions in the finished puffing, each of the said parts of the rollers being of the same width as that portion of the completed puffing which it is designed to shape, and the plain and comparatively broad circumferential faces or portions being of such diameter that, when the two rollers are in proper position, those upon one roller will be situated at such distance from those upon the other, that no considerable pressure will be exerted upon the fabric in passing between them, and the several series of grooves and flutes upon one roller gearing into those upon the other roller. There are pressers, the rearmost end of each one of which is curved downward and fitted upon the upper rearmost part of each of the plain narrow annular faces of the lower roller, while its forward end is curved upward in contact with the forward sides of the corresponding plain narrow annular face upon the upper roller, the rearmost ends of the pressers being pressed against the lower roller by set-screws passing through a horizontal bar or brace secured upon the rear of the frame. Fixed upon the forward side of the frame, in front of the lower roller, is a horizontal supporting-brace, which has fixed upon it an inclined plate, upon which is supported an inclined guide, E, which is composed of two pieces of sheet metal secured one over the other, at such a distance apart as to permit the passage of the cloth or fabric between them, and those parts of the guide in front of the plain and comparatively broad cylindrical portions of the rollers are curved up or arched transversely, as shown at a', in such manner that the width of the fabric passed between each pair of such plain and comparatively broad portions will be greater, if stretched out to its full extent, than the width of said portions, so that the fabric, by means of its increased width, will be crinkled or puffed in passing between said portions. The end of the strip of fabric from which the fluted puffing is to be formed, is passed into and through the guide, and between the rollers, and a rotary motion is communicated to the rollers. The fabric is drawn lengthwise between the rollers, those portions thereof which pass between the several opposite series of grooves and flutes in the two rollers being fluted, while those portions thereof which pass between the smooth annular faces of the rollers, being formed into gathers by the fluting of the fabric at the sides or edges thereof, are pressed flat by passing under the pressers, as the fabric is drawn along, at the same time that those portions of the fabric drawn through the curved or arched parts of the guide, being, if stretched to their full extent, of a width greater than that of the smooth and comparatively broad cylindrical portions, and being also gathered by the fluting formed at their sides or edges, are caused to assume a crinkled or puffed form, as they are passed between the said smooth and comparatively broad portions, the distance between such opposite portions being such that no pressure is exerted upon the fabric passing between them beyond that required to simply press the convex surfaces thereof downward to a sufficient degree to insure the shaping thereof into the puffed condition just described. The extent to which the material will be thus contracted laterally, as it were, or drawn up between the flutes, will be governed by the excess in length of the arched portions of the guide over a straight line or lines connecting such arched portions at their base. By these means the fluted puffing is brought into the form required in the finished article, without the necessity of washing the same in order to bring the puffing into such form. To complete the puffing, longitudinal rows of stitching are formed in the flat parts of the puffing to retain it in shape. The foregoing description is found in the specification. The claim is in these words:

The guide E, constructed with one or more curved or arched portions, a', in combination with suitable fluting-rollers, substantially as herein set forth, for the purpose specified.

In view of the prior existence of the puffing called the Pipo puffing, it is impossible to sustain reissue No. 3,001. The puffing claimed in that reissue is claimed as a new article of manufacture without reference to whether it be made by machinery or by hand, or how otherwise. Any prior article which had as its characteristic features, as an article of manufacture, the features set forth in that reissue as the characteristic features of the puffing claimed therein, is an anticipation of the patent. The Pipo puffing was made on a sewing-machine, but it was formed complete without laundering or washing, and it consisted of flattened borders, with flutes running along their inner edges, and a puffed or gathered or crinkled surface between the flutes, and longitudinal rows of stitching were passed through the flattened borders to render permanent the conformation. The flutes were formed by the process of gathering, and were not as regular and uniform, each flute with every other flute, as where flutes are made by fluting-rollers. But this is a question of degree and of appearance, and not of conformation.

The claim of reissue No. 3,001 speaks of forming the puffing by crinkling one portion of the strip "simultaneously" with fluting it along the edges of such portion, and forming flattened borders outside of the flutes. If the word "simultaneously" be construed as referring to the idea that, in any given cross-section of the strip, the crinkled portion, the fluted portions, and the flattened borders are formed at one and the same time, then an element is introduced which has regard to something beyond the conformation of the puffing as an article of manufacture and its shape and structure when completed—an element which has to do with the process of making it. The specification, in its descriptive part, in no manner makes any part of the invention to consist in any part of any process of making the puffing, or of any machinery or apparatus for making it, nor does it suggest that the parts embraced in any cross section are to be made simultaneously with each other, or that any peculiarity in conformation would result from so doing. Therefore, such a construction of the word "simultaneously" would make the claim repugnant to the subject-matter of the patent. The only proper construction, then, of the word is that it merely means, that, in the finished article, one portion is seen to be crinkled, and, at the same time, the parts at the edges of such portion are seen to be fluted, and the portions outside of the flutes are seen to be flattened borders.

We come now to the consideration of the machine used by the defendant, and alleged to infringe reissue No. 3,000 in making the puffing which is alleged to infringe reissue No. 3,001. The defendant's machine is described in letters patent granted to him January 7, 1873, for an "improvement in crimping and fluting machines." He uses, in connection with fluting-rollers, as the specification of his patent states—

a detent or finger, by which a portion of the fabric is held back, and thereby formed into V-shaped, but more or less irregular, lateral waves and crinkles.

Between the fluted portions of the fluting-rollers are plain zones. The free end of the detent bears against a platform midway of the plain zones. The fabric, in its passage to the rollers, passes over the platform and under the detent, which is a spring, and which so presses the fabric against the platform, while the rollers are drawing the fabric forward, as to detain or hold back that portion of the fabric which is so pressed by the detent, and cause it to be crinkled in the space between the inner edges of the flutes. This result is attained because the same thing is done as in the plaintiff's machine—that is, the width of the fabric passed between the pair of plain zones is greater than the width of such zones, and as the fluting gathers the

fabric, the portion of it which passes between the pair of plain zones is crinkled. The defendant's machine has pressers which make flattened borders along the outer edges of the fluted portions, through which stitching may be made.

The main feature of the plaintiff's machine is the device for pulling away the fabric before the fluting-rollers grasp it too firmly, so as to get the increased width of fabric opposite the pair of plain zones. The plaintiff shows how this is to be done by an arched guide. This arch raises up the fabric. The fabric rides over it, and so is pulled away from the fluted parts of the rollers. The obstacle interposed by the arched guide pushes up the fabric to an apex. There would be no difference in mode of operation if the fabric were pushed down to a given point by an arched guide. The defendant interposes an obstacle which pulls back the fabric from the fluted parts of the rollers. The mode of operation is the same as in the plaintiff's machine, and the result is the same. The only difference is that in one the center of the extra width moves upward as the pull is made, and in the other it does not; but, in each, the detaining instrument diverts the fabric from what would otherwise be its course, so as thereby to pull out the extra width. I think the variation is merely mechanical and not substantial, and that the defendant's machine is an infringement. The detent and the platform form the two surfaces of a guide between which the fabric passes, and these surfaces hold it so as to pull it away from the flutes. The two surfaces of the plaintiff's guide do the same thing.

Reissue No. 3,000 is not successfully attacked as to the novelty of its claim.

As to the Robjohn patent and Robjohn machine, and Robjohn guides 1 and 2, the machine was designed to make two double-fold ruffles at one and the same time. It has no provision for taking up an increased width of material, or for crinkling a central portion of the material. Nor could such guides, or the guides S and T, produce, in connection with the Robjohn machine, the results produced by the mechanism covered by the claim of reissue No. 3,000. The flat Muller guide No. 5 falls within the same category. The Muller guide No. 5, with the arched projection, has not two surfaces between which the material passes; and, used, as it always was, with the Muller rings Nos. 3 and 4, which were diamond embossing-rings, and made a diamond figure on the material, and occupied all the space not occupied by the fluting-rollers, it does not present the combination set forth in the claim of reissue No. 3,000 for the purpose specified in that reissue.

The Weitling machine and apparatus, whether as originally presented to the Patent Office, or as existing and used before King's invention, did not contain the combination of the claim of reissue No. 3,000. Moreover, such use as was made of it before King's invention was wholly experimental, and it was abandoned by its inventor as an abortive experiment.

There must be a decree for the plaintiff, as to reissue No. 3,000, for an account of profits and damages, with an injunction, with costs.

In the two suits brought against the vendors of puffing, on reissue No. 3,001, the bills must be dismissed, with costs.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date August 31, 1875.]

8,583.—Inkstand.—BLOOMFIELD BROWER, New York, N. Y. Application filed July 7, 1875. Term of patent 7 years.

8,584.—Silk Fabric.—JOSEPH COIGNET, New York, N. Y., assignor to HAMIL & BOOTH, same place. Application filed August 14, 1875. Term of patent 3½ years.

8,585.—Glass Fruit-Dish.—GEORGE E. HATCH, East Cambridge, Massachusetts, assignor to NEW ENGLAND GLASS COMPANY, same place. Application filed August 18, 1875. Term of patent 3½ years.

8,586 to 8,589 inclusive.—Carpet.—ALFRED HEALD, Philadelphia, Pa., assignor to HUGH MCCALLUM, ORLANDO CREASE, ANDREW J. SLOAN, and WILLIAM MCCALLUM, same place. Applications filed August 21, 1875. Cases E', F', G', and H'. Term of patents 3½ years.

8,590.—Carpet.—WILLIAM KERR, Philadelphia, Pa., assignor to JOHN GAY, same place. Application filed August 11, 1875. Term of patent 3½ years.

8,591.—Badge.—JOHN S. LITTELL, Newark, N. J. Application filed August 9, 1875. Term of patent 14 years.

8,592.—Fancy Cassimeres.—WILLIAM B. WEEDEN, Providence, R. I., assignor to the WEYBOSSET MILLS, same place. Application filed August 4, 1875. Term of patent 7 years.

8,593.—Flag.—JOSEPH C. DEMING, Norfolk, Va. Application filed August 26, 1875. Term of patent 3½ years.

2,891.—Flour.—THE EMPIRE MILL COMPANY, St. Louis, Mo. Application filed August 16, 1875.

"the words 'RIGHT BOWER.'"

2,892.—Combined Seed-Sowers and Cultivators.—VAN BRUNT & DAVIS, Horicon, Wis. Application filed July 12, 1875.

"the word 'MONITOR.'"

2,893.—Indelible Ink.—A. LYMAN WILLISTON, Northampton, Mass. Application filed January 29, 1872.

"the words 'Payson's Indelible Ink,' in connection with the fac-simile autograph 'J. Payson Williston.'"

2,894.—Blind-Hinge.—CLARK & Co., Buffalo, N. Y. Application filed July 30, 1875.

"the words and letters CLARK'S GRAVITY-LOCKING BLIND-HINGE."

2,895.—Tonics.—TRUMAN S. FOOTE, New Haven, Conn. Application filed July 19, 1875.

"the word 'WA-HOO.'"

2,896.—Medicine.—JOHN A. HOLMES, Boston, Mass. Application filed August 21, 1875.

"the words or name 'OLD MAN OF THE MOUNTAIN.'"

2,897.—Force-Pumps.—WILLIAM J. JOHNSON, Newton, Mass. Application filed July 29, 1875.

"the figure of a pump and a bucket or pail."

2,898.—Gloves.—WERTHEIMER & Co., New York, N. Y. Application filed August 11, 1875.

"the letters 'W. & Co.,' and the words 'Princess of Wales.'"

LABELS REGISTERED DURING THE WEEK.

[Each certificate bearing date September 1, 1875.]

314.—Title: "Corning's German Cologne."—WILLIAM O. CORNING, New Canaan, Conn. Application filed August 24, 1875.

315.—Title: "Delaware Oil."—PETER GERARD, Philadelphia, Pa. Application filed August 24, 1875.

316.—Title: "Olive Catarrh Remedy."—JOHN GREEN, Somerville, Mass. Application filed August 13, 1875.

317.—Title: "**Bailey's Patent Iron Block-Plane.**"—THE STANLEY RULE AND LEVEL COMPANY, New Britain, Conn. Application filed August 28, 1875.

318.—Title: "**Dr. Goldsmith's Celebrated Swiss Tonic.**"—G. F. WHITNEY, Boston, Mass. Application filed August 25, 1875.

INDEX OF INVENTIONS PATENTED AUGUST 31, 1875.

	Class No.	No. of Patent.
Air and gas or fluid regulator, B. Bates	64	167,212
Animal shearing machine, G. F. Evans, (reissue)	144	6,622
Auger, earth, D. L. Newcomb	51	167,353
Barrels, machine for chamfering and crozing, J. Greenwood	40	167,166
Barrels, machine for trussing and squaring, Naylor and Greenwood	40	167,190
Battery, galvanic, E. A. Hill	50	167,173
Bed sofa, A. Spiegel	62	167,279
Bee hive, S. Hixson	9	167,247
Bee hive, P. Honnoll	9	167,250
Berth, swinging, B. W. Brown	137	167,217
Bird cage, J. L. Fisher	170	167,325
Boat, collapsible, E. L. Berthon	13	167,214
Boat, life, L. F. Frazee	13	167,160
Boiler, sectional, B. T. Babbitt	148	167,292
Boiler tubes, device for securing, J. E. Jerrold	148	167,239
Boilers, bushing for fire tubes and flues of steam, H. Ducsh	148	167,157
Bolt, door, H. J. Iles	24	167,338
Bolting chest, Swisher and Campbell	57	167,362
Bone black revivifier, J. Gandolfo	155	167,235
Book rack, suspension, F. F. Hill	62	167,246
Boot calk, raftman's, R. D. Guilford	16	167,239
Bottle, toilet powder, Williams and Hillhouse	161	167,378
Bridle bit, S. H. Holm	72	167,248
Buckle, S. Wales	23	167,283
Buckle making machine, H. C. Hickox	23	167,245
Burner, vapor, C. E. Ball	90	167,150
Camera obscura, G. Raphael	111	167,271
Can, sheet metal, J. Herget	136	167,172
Cans, apparatus for facilitating the filling, soldering, and handling, G. H. Perkins	136	167,356
Car brake, pneumatic, H. F. Knapp	122	167,341
Car bumper, Griffith and Patterson	122	167,333
Car coupling, Hervey and Abrams	122	167,244
Car coupling, Mayes and Murphy	122	167,184
Car coupling, N. M. Spafford	122	167,278
Car door, grain, David and Wilding	121	167,223
Car starter, A. A. Jones	122	167,340
Car starter and brake, T. L. Webster	122	167,376
Car stock, W. W. Kerr	121	167,177
Car truck, E. Batholas	122	167,294
Car truck, C. H. Cox	122	167,307
Carbureter, T. H. Harrington	27	167,170
Card, direction, A. E. Thurber	146	167,204
Carpet sweeper, G. S. Gladding	62	167,164
Carriage jack, A. W. Field	79	167,232
Carriage top, G. E. Whitmore	31	167,373
China, glass, &c., ornamenting, S. M. Adams	115	167,299
Chuck for holding eccentrics while being turned, W. B. Smith	100	167,277
Churn cap, W. Mance	45	167,264
Cigar machine, W. E. Hennaman	160	167,243
Cigar maker's paste box, M. Wilhelm	160	167,376
Cistern valve and overflow pipe, combined, McGrann and Solis	167	167,265
Clamp, joiner's, W. J. Dooley	29	167,314
Clothes line fastener, H. Moss	91	167,350
Colter attachment, J. S. Johnston	114	167,256
Column, metallic, C. H. Leldy	21	167,179
Congealer or condenser, W. H. H. Mallory	58	167,182
Corn marker, W. F. Senter	133	167,275
Corn sheller, J. S. Foster	59	167,326
Counters to lasts, machine for fitting, L. Coté	16	167,306
Cultivator frame, W. M. Coston	43	167,226
Dental drill, S. S. White	46	167,208
Dental plates, manufacture of, F. and G. G. Hickman	46	167,336
Dental plugger, G. Rohfuss	46	167,197
Dental plugger, E. T. Starr	46	167,203
Diamonds in metallic holders, fitting, J. W. Branch	124	167,216
Die stock, J. J. Grant	14	167,165
Digger, potato, W. R. Babcock	114	167,148
Digger, potato, D. Botsford	114	167,296
Door spring, L. A. Warner	24	167,284
Drawers for invalids, rubber, M. Bradley	156	167,215
Drilling machine, rock, C. Ferroux	124	167,324
Dyeing and printing, Sellen and Pinkney	11	167,360
Engine governor, steam, Corbett and Campbell	69	167,225
Engine, locomotive, T. T. V. Smith	94	167,276
Engine, rotary, A. B. Vandemark	150	167,367
Engines, indicator for steam, J. W. Thompson	82	167,364
Engines, stop motion for steam, T. Evans	150	167,231
Envelopes, manufacture of, J. Ball, (reissue)	109	6,621
Equalizer, draft, Hunt and Butterfield	31	167,337
Fabric, felt, H. J. and W. D. Davies	76	167,310
Fence barb, wire, J. Haish	52	167,240
Fence post, A. Y. McDonald	52	167,185
Fertilizer distributer, planter, and cultivator, B. Scofield	133	167,274
Fire arm, breech loading, W. H. Baker	18	167,293
Fire arms, adjustable trigger for, H. Watkeys	55	167,285
Fire escape, S. Konz	30	167,178
Flask, molding, Bunnell and Hosley	33	167,298
Folding and perforating machine, W. Daniels	109	167,309
Furnace, B. T. Babbitt	149	167,291
Furnace door, E. H. Ashcroft	149	167,210
Furnace grate bar, E. M. Erdman	149	167,230
Furnaces, apparatus for preparing oil well gas for heating, W. S. Gillen	47	167,163
Furnaces, tilting and revolving puddling, G. W. Hall	85	167,241
Furniture drawers, anti-friction device for, J. D. Freese	62	167,161
Gas for heating furnaces, apparatus for preparing oil well, W. S. Gillen	47	167,163
Gas jets, protector for, J. W. Naramore	64	167,351
Gold, silver, &c., solution for cleaning, G. M. Norwood	35	167,192
Grain cleaner, T. Bühlmann	159	167,297
Grass seeds, machine for gathering, J. R. Symmes	75	169,380
Grate bar, T. Cain	149	167,153
Guns, adjustable rest for the arm while firing, R. T. Hare	55	167,169
Harness hame, J. P. Clopton	72	167,305
Hammer, claw, D. W. Parker, (reissue)	29	6,623
Harrow, W. S. Rowland	73	167,359
Harvester dropper, J. Bahruth	74	167,149
Heater, steam, J. F. McKenney	147	167,186
Heddle frame, E. S. Pike	95	167,357
Hitching post, T. Maguire	144	167,263
Hoe, weeding, A. S. Dunham	141	167,229
Hose coupling, M. M. Lewis	81	167,262
Hydrocarbons, apparatus for burning, J. Nelson	149	167,352
Ice machines, cleaning obstructions from pipes of, W. H. H. Mallory	83	167,181
Indicator for steam engines, J. W. Thompson	82	167,364
Inhaler, nasal, Yates and Treat	156	167,209
Key for locks, L. Griswold	93	167,168
Knife scouring machine, C. G. Singer	70	167,200
Knitting machine and knit fabric, F. Burns	89	167,301
Knob rose, J. Moore	93	167,266
Ladder, fireman's extension, S. Kons	30	167,342
Lamp, J. Mayer	90	167,348
Lamp attachment, L. Tobey	90	167,281
Lamp fount, C. F. Linsley	90	167,345
Lamp, miner's, Eynon and Cook	90	167,323
Lamp socket, W. N. Weeden	90	167,371
Lantern, T. B. Osborne	90	167,269
Lasts, machine for fitting counters to, L. Coté	16	167,306
Leather, composition for coating, H. Martyn	92	167,183
Letter box, De Barry and Lundqvist	146	167,312
Lid lifter, T. B. Carpenter	154	167,219
Lock, alarm, L. Griswold	93	167,167
Lock key, L. Griswold	93	167,168
Locomotives, pet cock for, F. A. Casey	94	167,302
Log turner, H. Knowlton	130	167,261
Loom for weaving piled fabrics, E. B. Bigelow	95	167,152
Loom shuttle motion, C. I. Kane	95	167,176
Maize, treating, L. Chiozza	58	167,224
Manures, apparatus for preparing and distributing liquid, E. H. Cummings	133	167,155
Mechanical movement, P. Bellinger	67	167,213
Mill, J. Aubin	57	167,290
Molding flask, Bunnell and Hosley	33	167,298
Molding machine, Bunnell and Hosley	33	167,299
Moldings, machine for making rope, H. Glans	173	167,329
Mop and brush holder, C. B. Clark	29	167,304
Motion, converting, J. M. Wilkinson	67	167,377
Muff, head, H. Fürst	33	167,234
Neck tie retainer, G. Burnham	38	167,300
Net, landing, C. F. Nason	143	167,189
Oil cup, J. Graham	87	167,332
Ore sizing machine, D. Nevin	3	167,191
Overalls, G. R. Eager	38	167,315
Overalls, G. R. Eager	38	167,316
Overalls, G. R. Eager	38	167,317
Overalls, G. R. Eager	38	167,318
Overalls, G. R. Eager	38	167,319
Overalls, G. R. Eager	38	167,320
Overalls, G. R. Eager	38	167,321
Packing for stuffing boxes, R. Greenaich	151	167,238
Paper, carbon, A. B. Simonds	108	167,361
Paper collars and cuffs, machine for cutting, C. H. Denison	109	167,156
Paper cutter and perforator, W. Daniels	109	167 308
Paper, safety, J. W. Casilear	108	167,223
Paper vessel, E. Waters, (reissue)	109	6 627
Pasteboard, machine for making, B. F. Field	109	167,233
Pier, cast iron, J. F. Hume	21	167,253
Pillow case frame, T. F. Walter	62	167,369
Pin, diaper, E. H. Gaylord	86	167,329
Pipes from freezing, protecting water, A. N. Rankin	167	167,195
Plane, bench, L. L. Davis	29	167,311
Planter, corn, S. Wright	133	167,287
Planter, hand, D. W. Hughes	133	167,251
Planter, seed, F. O. Wenell	133	167,206
Plow, sulky, R. R. Fenner	114	167,159
Press, baling, D. L. O'Connor	7	167,268
Press, combination cotton, J. F. Taylor	7	167,363
Press, hydraulic adjustable, M. Stannard	118	167,202
Printing machine, block, F. Walton	56	167,283
Printing, preparing plates for, A. F. Eckhardt	54	167,158
Printing press, C. B. Cottrell	117	167,227
Printing press, W. F. Wyman	117	167,379
Pruning implement, W. Carr	63	167,154
Pump, H. Tyler	118	167,366
Pump, chain, W. Webres	118	167,286
Pump, rotary, O. H. Whitney	118	167,374
Radiators, valve for steam, W. C. Baker	147	167,211
Railway rail joint fastening, P. F. and E. A. King	120	167,260
Railway switch, C. P. Deyoe	120	167,313
Rattan machines, measuring mechanism for, N. H. Richardson	132	167,358
Reflector, C. M. Murch	90	167,187
Reflector, C. M. Murch	90	167,188
Register, heating and ventilating, J. B. Oldershaw	154	167,355
Saw mill head block, G. M. Pelton	130	167,194
Shaft coupling, D. L. Newcomb	87	167,354
Shaft tip, S. H. Raymond	31	167,196
Sheave, P. Kavanagh	79	167,257
Shoe nails, metallic strip for, G. McKay	16	167,349
Show-case, R. H. Hasenritter	54	167,335
Shutter, fire proof, Pierce and Smith	4	167,270
Shutter worker, J. D. Hughson	24	167,252
Sifter, ash, W. Baumann	154	167,295
Sign and order slate, combined, J. S. Gold	146	167,330
Soap, transparent advertising, S. Struna, (reissue)	26	6,624
Solder, apparatus for melting, J. F. Hays	34	167,171
Spinning machinery, stop motion for cotton, O'Donnell and Walker	142	167,193
Sponge and pulp fabric, J. L. Kendall	108	167,259
Spooling and doubling machine, Wild and Hey	142	167,375
Spooling and guiding machines, guide for, G. Richardson	142	167,272
Still, E. D. Loveridge	47	167,346
Stock counting machine, Jeans and Bailey	42	167,254
Stone dressing machine, W. H. Thompson	153	167,365
Stove, magazine, J. A. Buckwalter	154	167,218
Stove, oil, F. Gates	65	167,236
Stove, oil, F. Gates	65	167,237
Stoves, fuel out off for magazine, D. Smith	154	167,201
Straw cutter, W. H. Hall	59	167,334
Table, extension, F. Goldbach	62	167,331
Telegraph apparatus, automatic, O. Heikel	158	167,242
Therapeutic appliances, electro, E. J. French	50	167,162
Thermometer, J. Gall	101	167,327
Thill coupling, J. B. Johnston	31	167,175
Tire tightening machine, J. Champlin	31	167,303
Tobacco cutter, Adams and Blondin	160	167,288
Toilet powder bottle, Williams and Hillhouse	161	167,378
Tool handle, W. E. Schwin	29	167,273
Truck for carrying rails, axles, &c., C. W. Carter	31	167,222
Truck for moving rails, &c., C. W. Carter	31	167,221
Truck, hand, H. H. Baltaly	31	167,151
Trunk, J. W. Kreppa	162	167,343
Tug slide, D. W. Leaks	72	167,344
Uterine supporter, J. S. Shannon	156	167,199
Valve, check, H. G. Johnson	152	167,255
Vehicle, C. J. Walser	31	167,205
Vehicle body corner iron, N. L. Holmes	31	167,249
Warp beam, O. D. Lombard	95	167,180
Washing machine, T. McG. Morris	91	167,267
Watch case tool, C. Hopkins	36	167,174
Watches, mainspring attachment for, M. Wheeler	36	167,372
Wheelbarrow, Rolland and Van Hoorde	31	167,198
Whiffletree and neck yoke, G. W. Eddy	31	167,322
Whip socket, D. A. Kelsey	31	167,258
Wind power, A. Lowe	118	167,347
Window bead fastener, A. F. Werner	34	167,207
Window screen, A. A. Carter	30	167,220
Wire cloth, machine for painting, C. H. Waters, (reissue)	170	6,625
Wire cloth, painting, C. H. Waters, (reissue)	170	6,626
Wrench, pipe, G. W. Waitt	100	167,368

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED AUGUST 31, 1875.

	Patent No.
Abrams and Hervey	167,244
Adams, J. L., and J. G. Blondin, Tobacco cutter	167,288
Adams, S. M., Ornamenting china, glass, &c	167,299
Alger, F., assignee	167,267
American Linoleum Manufacturing Company, assignee	167,253
Andrews, C. F., assignee	167,304
Ashcroft, E. H., Furnace door	167,210
Atlantic Refining Company, assignee	167,358
Aubery, A. C., assignee	167,292
Aubin, J., Mill	167,290
Babbitt, B. T., Furnace	167,291
Babbitt, B. T., Sectional boiler	167,292
Babcock, W. E., Potato digger	167,148
Bahrath, J., Dropper for harvesters	167,149
Bailey and Jeans	167,254
Baker, W. C., Valve for steam radiators	167,211
Baker, W. H., Breech loading fire arm	167,293
Ball, C. E., Vapor burner	167,150
Ball, J., Manufacture of envelopes, (reissue)	6,621
Baltaly, H. H., Hand truck	167,151
Batolas, E., Car truck	167,294
Bates, B., Air and gas or fluid regulator	167,212
Baumann, W., Ash sifter	167,295
Bearup, H., assignee	167,308
Bellinger, P., Mechanical movement	167,213
Benedict and Burnham Manufacturing Company, assignee	167,371
Bennett, J. G., assignee	167,310
Berthon, E. L., Collapsible boat	167,214
Bigelow, E. B., Loom for weaving piled fabrics	167,152
Blondin and Adams	167,288
Boal, J. D., assignee	167,163
Botsford, D., Potato digger	167,296
Bradley and Hubbard Manufacturing Company, assignee	167,345
Bradley, M., Rubber drawers for invalids	167,215
Branch, J. W., Fitting diamonds in metallic holders	167,216
Brown, R. W., Swinging berth	167,217
Buckeye Engine Company, assignee	167,264
Buckwalter, J. A., Magazine stove	167,218
Bühlmann, T., Grain cleaner	167,297
Bunnell, B. B., and G. T. B. Hosley, Molding flask	167,298
Bunnell, B. B., and G. T. B. Hosley, Molding machine	167,299
Burnham, G., Jr., Neck tie retainer	167,300
Barns, F., Knitting machine and knit fabric	167,301
Butterfield and Hunt	167,337
Cain, T. Grate bar	167,153
Caldwell, J. F., assignee	167,339
Campbell and Corbett	167,225
Campbell and Swisher	167,362
Carpenter, E. P., assignee	167,308
Carpenter, T. B., Lid lifter	167,219
Carr, W., Pruning implement	167,154
Carter, A. A., Window screen	167,220
Carter, C. W., Truck for moving rails, &c	167,221
Carter, C. W., Truck for carrying rails, axles, &c	167,222
Casey, F. A., Pet cock for locomotives	167,302
Casilear, G. W., Safety paper	167,223
Caulkings, F., assignee	167,296
Champlin, J., Tire tightening machine	167,303
Cheesebrough, J. F., assignee	167,340
Chiozza, L., Treating maize	167,224
Clark, C. B., Mop and brush holder	167,304
Clark, T. C., assignee	167,271
Clinton Wire Cloth Company, assignee, (reissue)	6,625 6,626
Clopton, J. P., Harness hame	167,305
Coe, F. W., assignee	167,228
Cook and Eynon	167,323
Corbett, T. M., and H. Campbell, Governor for steam engines	167,225
Coston, W. M., Cultivator frame	167,226
Coté, L., Machine for fitting counters to lasts	167,306
Cottrell, C. B., Printing press	167,227
Cox, C. H., Car truck	167,307
Crompton, G., assignee	167,357
Cummings, E. H., Apparatus for preparing and distributing liquid manures	167,155
Daniels, W., Cutter and perforator for paper	167,308
Daniels, W., Folding and perforating machine	167,309
David, G. F., and C. Wilding, Grain car doors	167,223
Davies, H. J. and W. D., Felt fabric	167,310
Davis, L. L., Bench plane	167,311
De Barry, J. J., and T. J. and A. T. Lundqvist, Letter box	167,312
Denison, C. H., Machine for cutting paper collars and cuffs	167,156
Deyoe, C. P., Railroad switch	167,313
Donley, W. J., Joiner's clamp	167,314
Ducsh, H., Bushing for fire tubes and flues of steam boilers	167,157
Dunham, A. S., Weeding hoe	167,229
Eager, G. R., Overalls	167,315
Eager, G. R., Overalls	167,316
Eager, G. R., Overalls	167,317
Eager, G. R., Overalls	167,318
Eager, G. R., Overalls	167,319
Eager, G. R., Overalls	167,320
Eager, G. R., Overalls	167,321
Eckhardt, A. F., Preparing plates for printing	167,156
Eddy, G. W., Whiffletree and neck yoke	167,322
Erdman, E. M., Furnace grate bar	167,230

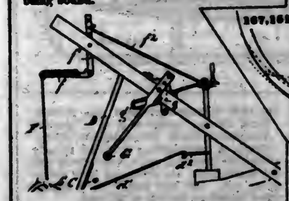
TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED AUG. 31, 1875

167,160. POTATO-DIGGER. Wm. H. Babcock, East Pembroke, N. Y. (Filed May 10, 1875.)

Brief.—The digger-blade is adjustably mounted on a pair of wheels, with a scraper jointed in rear and above the blade. The supporters consist of a series of rods linked to the share or blade, with raised fingers, and side guides that have both a vertical and horizontal motion.



1. The combination of the adjustable guiders *f f*, the clutches *h h*, the connecting-bar *J*, the pulley *k*, the lever *l*, the springs, and the curved piece E, substantially as described, and for the purpose set forth.

2. The piece F, the pins *e e*, the rods *d d*, the inclined projections *o o e*, the sides *r r*, the bolts *r r*, the hinges *t t*, the cross-bars *o o*, and the levelor *u*, substantially as described, and for the purpose hereinbefore set forth.

167,169. DROPPER FOR HARVESTERS. Jno. Babcock, Liberty Prairie, Ill. (Filed Apr. 10, 1875.)

Brief.—The platform, having received the grain, is swung around and tilted, depositing the grain crosswise, a position facilitating its being bound.

1. An improved dropper, consisting of the platform B, its slats *b* arranged crosswise to the cut grain, supporting bars C on a horizontal shaft, D, connected by arm *d*, connecting-rod *d'* to a power-shaft, E, all arranged in combination, by means whereof the dropper can be moved to one side out of the track of the reaper, substantially as and for the purpose set forth.

2. The dropper attachment consisting of the platform B, hinged to its supporting-bars C, the turn-shaft D, springs *c c'*, connecting-rod F, spring *f*, pivoted arm *f'*, connecting-rod *f''*, and power-shaft E, in combination, by means whereof the said platform after receiving the grain is tilted to facilitate dropping its grain, as herein set forth.

3. The grain-pole G, its crank attachment *g*, slotted bar *g'*, and connection to power-shaft E to operate as and for the purpose set forth.

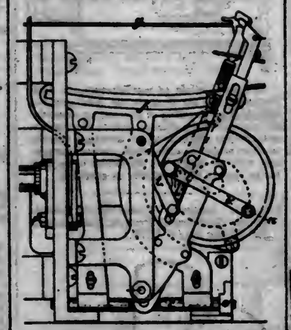
167,170. VAPOR-BURNER. Chas. H. Bell, Philadelphia, Pa. (Filed July 23, 1875.)

Brief.—The fluid from its vessel and the air to be mixed therewith are turned on through the same valve. The pipes for supplying the fluid are provided with a cotton packing interposed between them and an inner concentric wire-gauze cylinder.

1. The combination of the pipes H and C, and packing S, and wire-gauze cylinder E contained in them, substantially as and for the purpose described.

2. The combination of the valve D, the pipes A, L, and C, communicated and arranged substantially as and for the purpose described.

167,161. HAND-TRUCK. Henry H. Bailey, Assumption, Ill. (Filed Apr. 17, 1875.)



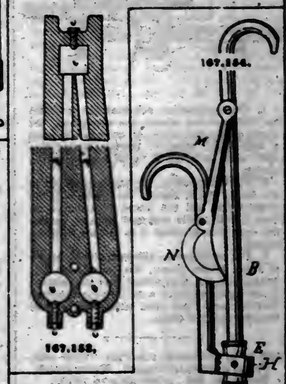
1. A vertically-adjustable platform for hand trucks, which, when not in use, lies flat upon the truck, but is elevated in the act of loading or transporting a load, and depressed in unloading the same.

2. A platform for a hand-truck, beveled from underneath at its outer end, so as more readily to get hold of the load to be lifted.

3. The combination of the platform B with the truck A, crank-arms *a a'*, and levers *d d'*, substantially as shown and described.

4. The combination of the handle and lever with the axle, at the center of the axle, whereby the lever applies power to the center of the platform, for the purpose specified.

167,162. LOCKS FOR WEAVING FILED FABRICS. Everton B. Bigelow, Boston, Mass. (Filed July 14, 1875.)

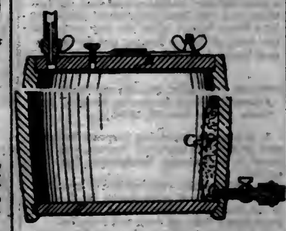


1. The combination of two oscillating shafts, constructed and operated substantially as herein described, one shaft being adapted to draw the pile-wires from the cloth, and the other to insert them in the shed of the warp, substantially as specified.

2. The inserting-carrier, adapted to receive an oscillating movement toward and from the loop, in addition to its usual movements, and irrespective of the direction of its movement toward and from the cloth, substantially as and for the purpose specified.

167,163. GRATE-BAR. Thomas Cain, Lake Douglas, Great Britain. (Filed Jan. 9, 1875.)

The herein described grate-bar, having horizontal water-passages *b b'* arranged longitudinally therein, and horizontal transverse chambers *d d'*, provided with plugs *e*, said passages and chambers being formed in the process of casting the said bar, substantially as and for the purpose set forth.



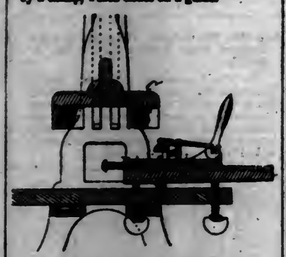
167,164. PRUNING IMPLEMENTS. William Carr, West Hayden, Ohio. (Filed May 10, 1875.)

Brief.—Upon an upright hooked standard a cutter slides freely and carries a curved blade. The cutting-blade is pivoted to the upper part of the standard, and again pivoted to the curved hook, which serves as a second blade. A direct downward pressure severs the limb operated upon.

The combination of the rod B, slide E, foot H, hook I, and bar M, having the knife N, substantially as specified.

167,165. APPARATUS FOR PREPARING AND DISTRIBUTING LIQUID MANURES. Ephraim H. Cummings, Chicago, Ill. (Filed July 31, 1875.)

Brief.—A cask having a removable head, into which coarse manure is placed, and provided with a supply and a discharge pipe. Before the discharge-pipe, on the inside of the cask, is a screen or filter, to prevent the material from entering and stopping the flow of liquid when the same is being drawn off.

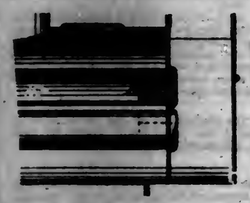


The combination of the manure-chamber A, the screened filter F G, the water-supply pipe K, and the discharge-hose L, for the purpose of connecting liquid manure and distributing the same, substantially as set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

167,154. Machines for Cutting Paper Collars and Cuffs. Chas. H. Dunham, New York, N. Y. [Filed Jan. 11, 1875.]

Brief.—The falling platen has a knife or die extending around three sides of the collar or cuff blanks, which are held to the cutting-bed by a clamp, which slides on a guide.



1. The combination, substantially as before set forth, of the clamp, the clamp-bed, the clamp-guide, and platen C, arranged to have a cutting-die attached thereto, having one open side, to adapt it to be used with the clamp.

2. The combination, substantially as before set forth, of the clamp, the clamp-bed, the clamp-ways, and the platen C, arranged to have a cutting-die attached thereto, having one open side, to adapt it to be used with the clamp.

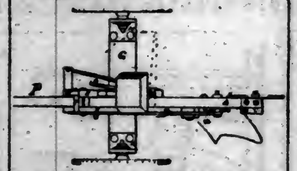
3. The combination, substantially as before set forth, of the clamp, the clamp-bed, the lamp-guide, the clamp-ways, and the platen C, arranged to have a cutting-die attached thereto, having one open side, to adapt it to be used with the clamp.

167,167. Bushings for Fire-Tubes and Flues of Steam-Boilers. Henry Deeds, Baltimore, Md. [Filed July 14, 1875.]

Brief.—Retains products of combustion within the tubes by means of burnt-clay thimbles inserted within the ends of the tubes.

A steam-boiler tube, constructed with one portion of its length of light tubular metal, and the other portion of heavy burnt clay, the burnt clay portion being constructed with a bore, which is of smaller diameter than the metal portion of the tube, and inserted into the discharge or other end of the metal portion a short distance, and supported upon the fire-sheet, and kept from longitudinal movement by a lange formed upon the clay portion of the tube, all in the manner and for the purpose herein described.

167,168. Preparing Plates for Printing. Albert Friedrich Rehberein, Munich, Bavaria. [Filed Dec. 30, 1874.]



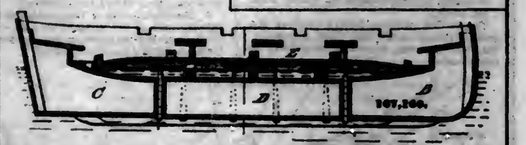
1. A plate for engraving purposes having a coat of soft lead deposited thereon, and prepared in the manner hereinbefore fully described.

2. A composition or compound of graphite, silver powder, and gutta-percha, in or about the proportions specified, as and for the purposes herein fully set forth and described.

3. The process of preparing negative plates for obtaining copper clamp-ways or plates for printing from, and other purposes, consisting of the employment of the coatings matter claimed in the first and second clauses, in the manner substantially as hereinbefore fully set forth.

167,169. Gulley-Plows. Robt. R. Penner, Urbana, Ill. [Filed Dec. 21, 1874.]

Brief.—Devices for changing the fulcrum-point of the lever, and for holding the plow in the ground or above it.



1. The lever D, provided with fulcrum-irons *d d'*, in combination with the fulcrum-post.

2. The combination of the following elements: the beam A, pivoted between the timbers B E, which may be adjusted to any desirable point upon the axle C, the lever D, provided with fulcrum-irons *d d'*, and the fulcrum-post T.

3. The combination of the following elements: the lever *d*, pivoted to one of the timbers B, timbers B E, plow-beam A, lever D, arm-bar *g*, and tongue F, as shown and described.

167,170. Life-Boats. Lawrence F. Frame, Jersey City, N. J., assignor to himself and Jos. J. Walton, New York, N. Y. [Filed Aug. 4, 1875.]

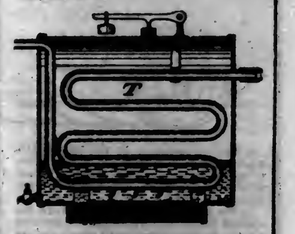
The protecting-desk E, in combination with the air-chambers A, A, B, and C, and with or without the center air-chamber D, substantially as herein set forth.

167,170.

167,171. Anti-Friction Devices for Furniture-Drawers. John D. Preese, Chicago, Ill. [Filed Feb. 18, 1876.]

As a new article of manufacture, an anti-friction device for drawers for furniture, the said device consisting of the casting *f* cast for attachment to the drawer, and to receive the anti-friction rollers O and *o*, arranged therein at right angles to each other, and set for attachment with the case when the device is applied to the drawer, substantially as specified.

167,172. Electro-Therapeutic Apparatus. Elizabeth J. French, Philadelphia, Pa. [Filed July 9, 1875.]

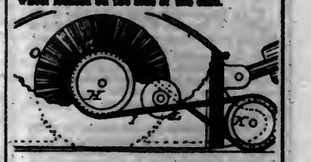


1. The galvanic element consisting of the triple strip A', formed of strips of zinc, copper, and brass, substantially as and for the purpose set forth.

2. The triple strip A', consisting of strips of zinc, copper, and brass, combined at one end, and formed into the shape of a horse-shoe-magnet at the other end, substantially as and for the purpose set forth.

3. The triple strip A', in combination with the eye B, substantially as and for the purpose set forth.

4. The triple strip A', consisting of strips of zinc, copper, and brass, one of the strips being formed with the laps or folds *a*, holding or securing together all the strips, substantially as and for the purpose set forth.



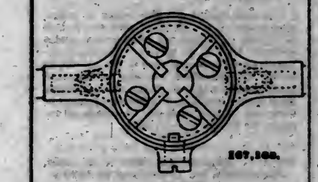
167,173. Apparatus for Preparing Oil-Well Gas for Heating Furnaces. Wm. S. Gillen, Pittsburg, Pa., assignor to himself and Jos. D. Beal, same place. [Filed May 22, 1874.]

The trap T, having oil-and-water pipe coil *c* partially immersed in water, and having perforations *y* in the immersed bottom of the coil for the escape of water therefrom, substantially as herein shown and described.

167,174. Car-Couplings. Geo. S. Gladding, Chester, assignor to C. B. Rogers, Deep River, Conn. [Filed Jan. 28, 1875.]

Brief.—A helical spring is wound spirally around the propelling-roller, which latter and the brush-roller are connected by a spiral-spring belt. The belt passes over a central wheel located on the side of the case.

1. A carpet-sweeping device in which the propelling-roller is provided with a helical spring coiled around it, for the uses and purposes substantially as described.



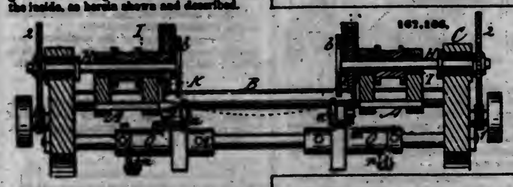
2. In combination, the brush O, provided with the wheel H, wheel I, and wheel K, and the spring-belt J, substantially as and for the purposes set forth.

3. In combination, the roller D, provided with the spiral spring E, wheel K, having its groove spirally indented, wheel L, brush O, having the wheel H, with its groove spirally indented, and spring-belt J, substantially as and for the purposes set forth.

167,175. Die-Stocks. John J. Grant, Hartford, Conn., assignor to the Pratt & Whitney Company, same place. [Filed June 4, 1875.]

1. The combination of the bolts *b* and the shoulder *b'* with a die-stock, for the purpose of securing the die in its place when in use, substantially as herein described.

2. A die-stock with a circular collet or disk, held in place by spring-bolts and slot and pin, substantially as herein described.



167,166.

167,176. Machines for Chamfering and Grooving Barrels. J. Greenwood, Rochester, N. Y. [Filed Mar. 10, 1875.]

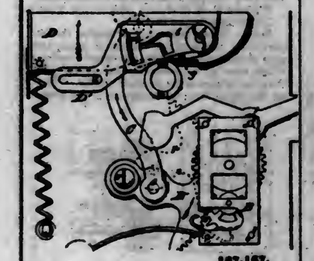
Brief.—The barrel is revolved by two friction-wheels acting upon the inside near each end.

1. In a machine for cutting and chamfering barrels, the combination, with the adjustable supporting-rollers *a a*, of the interior driving-rollers *b b*, situated upon the same axis with the cutters, and close thereto, and serving to give the revolving motion to the barrel from the inside, as herein shown and described.

167,166.

2. The interior driving-rollers *b b*, eccentrics K K, cams L L, and shafts H I, resting one within the other, on the same axial line, combined with the adjustable supporting-rollers *a a* and movable carriages A A, in the manner and for the purpose specified.

3. In a machine for cutting and chamfering barrels, the combination, with the carriages A A and cams G G, of the shafts B B, fixed longitudinally, but turning axially, and serving the double purpose of ways for the carriages and the bearing for the cams, and allowing the adjustment of said parts for different-sized barrels, as herein described.



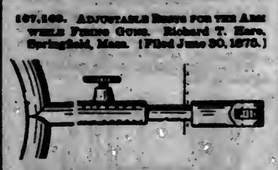
4. The combination, with the shaft B and carriage A, of the cam G, constructed with the segments *g g'*, resting in the lug *f* of the carriage, as shown and described.

5. The combination, with the cam G and cam-head E, of the crank *c*, connecting-rod E, and cam C, with arms *a a*, as and for the purpose specified.

6. The combination, with the cam L and cutter-head K, of the cap M, covering the said parts, and serving as a bearing to the inner shaft H, as described.

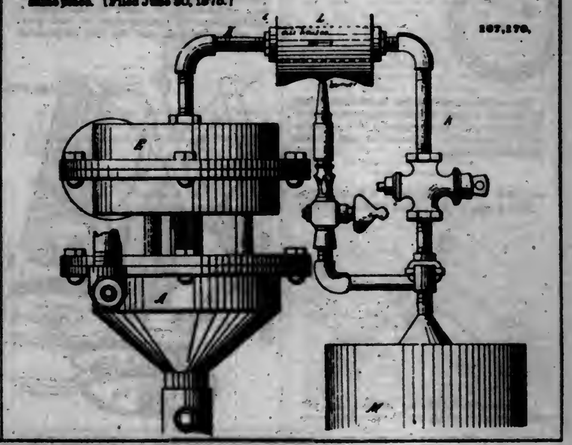
167,177. Alarm-Locks. Lev Griswold, Johnstown, N. Y., assignor to David Hays and Nathan P. Wells, same place. [Filed Feb. 2, 1875.]

Brief.—A lock-bolt having a vertical as well as a sliding motion is so connected with an alarm mechanism that when the bolt is forced up an alarm will be sounded.



167,177.

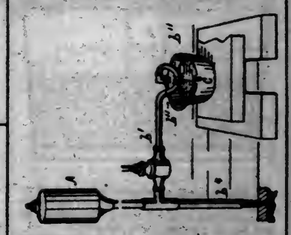
167,178. Keys for Locks. Lev Griswold, Johnstown, N. Y., assignor to David Hays and Nathan P. Wells, same place. [Filed Feb. 2, 1875.]



In combination with the barrel A, handle B, and bit *f*, the spring connecting-rod E, bent at *g*, as shown, whereby the bit is held in the closed or open position, substantially as described.

167,179. Adjustable Rests for the Arm while Firing Guns. Richard T. Hare, Springfield, Mass. [Filed June 30, 1875.]

An adjustable rest for supporting the arm in aiming and firing guns, constructed so as to receive the weight and support the arm at or near the elbow in a direct or straight line from the body, substantially as herein described.



167,180. Carpet-Sweepers. T. H. Herrington, Pittsburg, Pa., assignor to A. F. Keating, same place. [Filed June 30, 1875.]

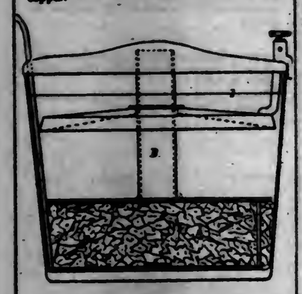
167,179.

167,181. Apparatus for Melting Solder. John P. Hayes, Philadelphia, Pa. [Filed Feb. 13, 1875.]

Brief.—To be carried about by workmen, and fixed in the door while used.

The apparatus consisting of the fountain A, tubes B and *b'*, with downward-projecting jet *b''* and the retort *b'''*, in combination with the solid gimlet-screwed extension *b'* of the vertical tube B, the whole being constructed and supported as and for the purposes hereinbefore set forth and described.

167,182. Sheet-Metal Cans. John Herget, St. Louis, Mo. [Filed May 1, 1875.]



167,173.

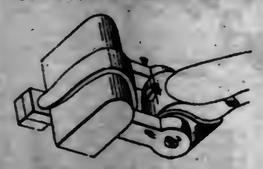
The beads *c* of cans formed to have an indenting edge, *b*, as herein shown and described, in combination with the body of cans formed with beads *a* and overlapping edge *a'*, by means whereof an air-tight and secure joint is had, substantially as described and shown.

167,174. Galvanic Batteries. Edward A. Hill, Chicago, Ill. [Filed July 20, 1875.]

Brief.—Prevents the flow of the sulphate of copper to the zinc by means of a tube and plate of lead suspended above the sulphate of copper. While furnishing a plate upon which the copper will be deposited if the sulphate-of-copper solution rises too high, the tube and plate present also a convenient means for the introduction of the fresh sulphate of copper.

1. The device B, constructed of lead or other insoluble metal, when supported above the bottom of the containing cell, substantially as and for the purpose herein specified.

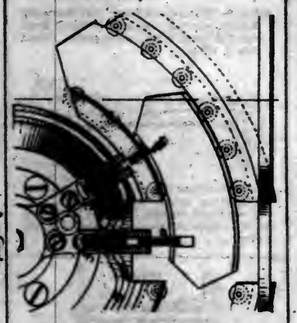
2. The combination of the device B with the copper or — plate, having supports fixed or resting thereon, substantially as and for the purpose specified.



167,175. Watch-Case Tools. C. Hopkins-Waltham, Mass. [Filed Jan. 2, 1875.]

Brief.—The tool is provided with cutting and burnishing edges, for fitting watch-cases.

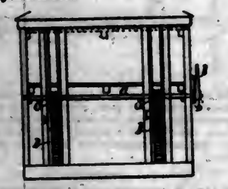
The teeth *a a*, across the lower curved face of the tool A, and the knife-edges *a' a'*, extending therefrom to the rounded end *d*, substantially as herein before described, and for the purposes set forth.



167,176. Table-Cover. J. B. Johnston, New York, N. Y. [Filed Nov. 20, 1874.]

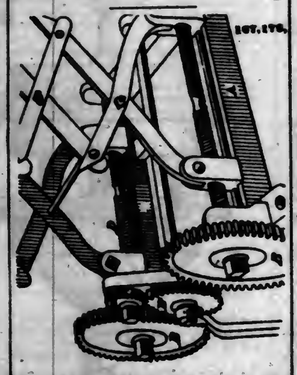
1. The center C, having orifice *c*, and pivoted between the legs *a a* of the clip, in combination with the thill-iron B, having the projection *b* and shoulder *b'*, substantially as set forth.

2. The combination of elastic socket C, pin *d*, the legs *a a* of the clip, and thill-iron B, the socket to operate as a support for the thill, substantially as set forth.



167,176. Shuttle-Motion for Looms. Chas. I. Kase, Milford, Conn. [Filed Jan. 12, 1875.]

The raceway, composed of or provided, both on its front and back edges, with flanged or grooved guide-rollers, in combination with a shuttle, having its bearing-edges constructed to correspond, whereby said shuttle is not only directed but supported by the rollers, substantially as specified.

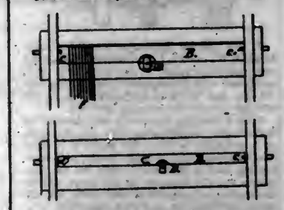


167,177. Stock-Cars. William W. Kerr, Chicago, Ill., assignor of two-thirds his right to I. L. Shroeder and J. C. Goodrich, same place. [Filed Jan. 20, 1875.]

Brief.—Apparatus for raising and lowering adjustable deck.

In stock-cars having adjustable decks, the combination of the shaft *a*, carrying the pinions *b'*, racks B, to work in the slides *b*, ratchet-lever D', ratchet-wheel *b'*, and pawl *d*, substantially as and for the purpose set forth.

167,178.



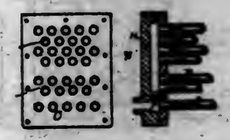
167,179. Metallic Columns. C. H. Leidy, Phœnixville, Pa. [Filed Aug. 12, 1875.]

1. In a metallic column, the wedge-shaped blocks *g*, substantially as shown.

2. The combination of the sections *a*, having the beveled flanges *h*, blocks *g*, clamps *k*, bolts *i*, and nuts *j*, substantially as set forth.

167,180. Wash-Boards. Oliver D. Longhead, Lowell, Mass., assignor of one-half his right to Hart Amzi Tidmarsh, same place. [Filed Mar. 17, 1875.]

The combination, in a wash-board, of the bar B, the studs C C, and the button D, substantially as and for the purpose described.



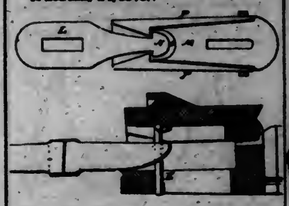
167,181. Cleaning Obstructions from Pipes of Ice-Machines. William H. H. Mallory, Cambridge, Mass. [Filed May 17, 1875.]

Brief.—Does it by introducing with other ammoniacal gas vapor of benzine.

In the process of manufacturing ice by the agency of ammoniacal gas, the combination of benzine vapor with the ammoniacal gas, for the purpose of preventing the formation of clogging deposits in the circulating-pipes, all substantially as described, and for the purpose set forth.

167,182. Congealers or Condensers. William H. H. Mallory, Cambridge, Mass. [Filed July 24, 1875.]

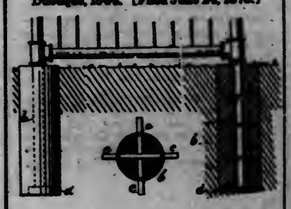
Brief.—When used in a congealer, the vapors enter the smallest cluster of pipes, and pass successively through the larger clusters. When used as a condenser, the vapors pass from the largest to the smallest cluster. Water on the plates form the chambers of the heads.



In a bank of pipes the tube-sheets of which are not connected to each other, except by the tubes themselves, whereby free expansion and contraction are allowed, the combination of the vertical heads H and H' and the respective tube-sheets, thus forming the chambers H N O P, with the clusters of pipes A, B, and C, all substantially as described, and for the purpose set forth.

167,183. Compositions for Coating Leather. Henry Morgan, Boston, Mass. [Filed Dec. 7, 1874.]

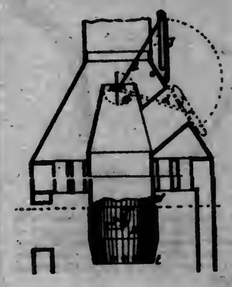
The improved leather dressing compound, consisting of an ammoniacal solution of shellac and the new aniline color of Fournier, compounded essentially as set forth.



167,184. Car-Couplings. Louis C. Mayne and James S. Murphy, Piney Creek, Pa. [Filed May 24, 1875.]

1. The draw-head, slotted on its lower face, and provided with the hinged lid A, having the swinging-pin E, substantially as described, and for the purpose set forth.

2. The joint L, provided with the coupler-head H, in combination with the joint M, having the center O and lateral springs P P, having recesses near their outer ends, substantially as described, and for the purpose set forth.

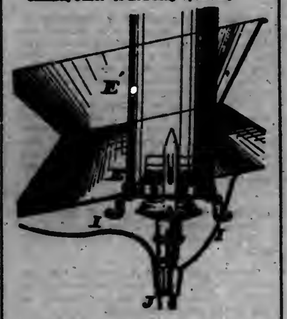


167,185. Fence-Posts. A. Y. McDonald, Dubuque, Iowa. [Filed June 24, 1875.]

The post *b*, cross-rods *c*, and nut *d*, held in position by a concrete material applied in a plastic condition, substantially as described.

167,186. Steam-Heaters. J. P. McKenney, Amsterdam, N. Y. [Filed June 30, 1875.]

Brief.—It is expected that the escape of gas from the central extension will precede, by a slight interval, the admission of air on opening the door.

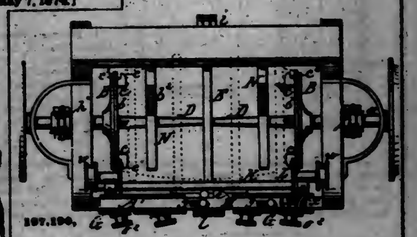


In a steam-generator, the gas-receiving chamber O, provided with the valve H in its upper end, and projected upward within the dome-chamber above the boiler proper and beneath the exit-flue, to be heated by the hot gases drawn from the fire-chamber through the boiler-flues, in combination with a fuel reservoir surrounded by a water-space, and provided with a lateral branch or chute conveyed by a door, whereby the gases generated from the fuel in the discharge end of the reservoir may be received and ravelled above the branch, and be there held by its combustion, for a ready discharge to the exit-flue above when the said valve is opened, substantially as and for the purpose set forth.

167,187. Reflectors. C. M. Marsh, Cincinnati, Ohio. [Filed May 7, 1875.]

The combination of the parabolic reflector R, capable of being placed on the chimney in either a nearly vertical or nearly horizontal position, the hook *p*, threaded wire P, and thumb-nut Q, all as herein shown and described.

167,188. Reflectors. C. M. Marsh, Cincinnati, Ohio. [Filed May 7, 1875.]



The combination of the connected reflectors R R', flexible wire supports I I, and clip J, all constructed as and for the purposes specified.

167,189. Lanterns Mica. Chas. F. Mason, Auburn, Me. [Filed July 30, 1875.]

Brief.—The flexible loop is easily detached and packed with the handle and fixing-rod.

167,190.

Machines for Threshing and Separating Rakings. James Naylor, Jr., and John Greenwood, Rochester, N. Y. [Filed May 24, 1875.]

Brief.—The barrel is revolved between two adjustable rotating heads, the staves being set to even length by two swinging circular saws, the hoops being forced onto the barrel by revolving disks placed diagonally to its axis.

1. The clamping-head B, provided with the packing *b*, to receive the ends of the staves and prevent vibration or breaking of the same, and having the sharp-edged dogs or spurs *c*, to hold the ends of the barrel while under action, as herein shown and described.

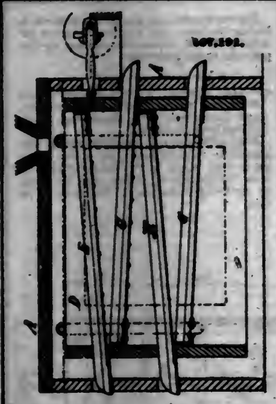
2. The spurs *c*, constructed with the sharp-edged projections *c'*, to cut into and hold the barrel, and provided with the square notches *c''*, to receive the saws in squaring the ends of the barrel, as herein shown and described.

3. The combination, with the rotary clamping-heads B B, of the two boxes or bearings G G and the two sets of trussing-rollers F H, set angularly, and capable of motion toward each other, to bear against the truss-hoops upon the opposite quarters of the barrel, as shown and described.

4. The combination, with the trussing-rollers F H and boxes G G, of the screw-bolts *e*, forming bearings for the rollers, and made adjustable longitudinally in the boxes by means of the shoulders *e' e''* and nuts *e'' e'''*, as and for the purpose specified.

5. The combination, with the trussing-rollers H H, screw I I, and treadle K, of the lever I, connecting-rods *c c*, slide M, and dog J, the whole arranged as described, so that the lower ends in succession upon the rollers, carry, and treadle, to truss the barrel, saw the ends, and then release the barrel from the clamping-heads, as herein shown and described.

6. The combination, with the clamping-heads B B, of the truss-bars F F, resting in line with the bottom of the clamping-heads, and concentric therewith, for the purpose of discharging the barrel by its own rotation when released, as herein shown and described.



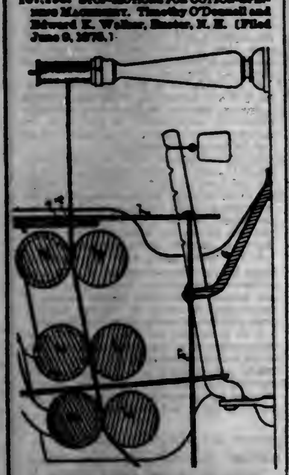
7. In a machine for trussing barrels, the combination, with the clamping-heads B B, of the saws L L, resting outside the clamping-heads, and attached to swinging or sliding bearings *c c*, whereby they may be brought into and out of contact with the ends of the barrel, as shown and described.

167,191. Ore-Sieves Machines. David Nevin, Georgetown, Colo., assignor to himself, Robert A. Nevin, and J. O. Stewart, same place. [Filed Aug. 2, 1875.]

Brief.—The ore, fed through the hopper, passes upon the first sieve, from which the coarser particles pass off through the outer frame, while the finer are sifted through to the sieve below, and pass out on the other side of the outer frame. This separation of the ore can be repeated by multiplying the number of sieves. The whole inner frame carrying the sieves is operated by the crank and shaft I, outside the outer supporting-frame. The meshes may be made smaller and smaller in the several sieves.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON

167,102.

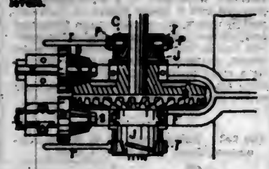


Two or more severally-inclined cut-sizing sieves, partly inclosed in frames A and D, one of which frames is stationary, and the other reciprocating, substantially as and for the purposes set forth.

167,103. SOLUTIONS FOR CLEANING GOLD, SILVER, &c. Granville M. Norwood, Beverly, Mass. [Filed July 9, 1875.]

The herein-described solution for cleaning gold, silver, &c., formed of water, cyanide of potassium, ammonia-water, cream of tartar, oil of anise-seed, or similar aromatic substance, and pea-nutshell shaft, substantially in the proportions set forth.

167,104. STOP-MOTION FOR COTTON-SPINNING MACHINERY. Timothy O'Donnell and Edward K. Walker, Baxter, N. H. [Filed June 9, 1875.]

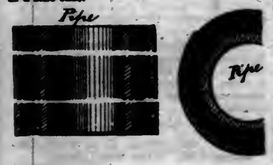


1. The combination of the series of plates I, with the intervening guide-bar J, and the levers F, adapted to be operated by the roving, as herein explained, whereby any undue slackening or tightening of a roving is communicated to the plates and thus certain motion, essentially as and for the purposes stated.

2. The plate I, provided with the eye b, through which the roving, when broken, passes without being acted upon, and with the shoulder c, the latter being of such character as to exert an intermittent motion upon the driver until the plate I is lowered to its quiescent limit by the continued drawing of the roving, substantially as and for the purpose stated.

167,105. HEAD-BLOCKS FOR SAW-MILLS. George M. Felton, Warren, Pa., assignor of one-fourth his right to F. B. Rice, same place. [Filed May 3, 1875.]

Brief.—The cutting-bars may be moved together or alternately by means of a system of bevel-gearing operated by rockers and pawl-levers.



1. The combination of the double-faced bevel-gear wheel B, the pinions D D', the shafts and rockers E E, and levers L L, and handle H, substantially as set forth.

2. The combination of the cylinders J J, the plate P P, rings and handles r r, and clutches O O, with the wheel B, and frame F, substantially as and for the purposes hereinbefore set forth.

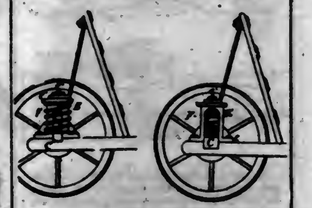
167,106. PROTECTING WATER-PIPES FROM FREEZING. Andrew M. Rankin, Nyack, N. Y. [Filed June 3, 1874.]

Brief.—Rendering water-pipes impervious to atmospheric action by enveloping or covering them with a layer of paper, then felt, and again with paper, and inclosing the whole in a zinc case.

1. The method of protecting water-pipes, or rendering them impervious to atmospheric action, consisting in enveloping or covering the pipe first with a layer of paper, then felt, then again with paper, and inclosing the whole in a zinc case, substantially as and for the purposes described.

2. The material or coating for rendering water-pipes impervious to the action of the atmosphere, consisting of one or more envelopes of paper, intermediate filling of felt, and inclosing metallic case, arranged and applied substantially in the manner herein shown and described.

167,107. DENTAL PLUGGERS. Geo. Bebbins, Philadelphia, Pa., assignor to S. S. White, same place. [Filed July 12, 1875.]



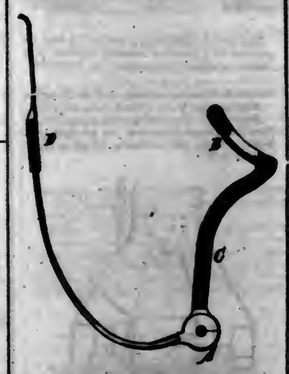
Brief.—By the same rotation of the crank, two pinions are operated to strike blows upon the head of a spring-plugger instead in the same case with them.

1. In a dental plugger, the combination, substantially as hereinbefore set forth, of the casing, the crank-shaft, its pinions, the mallets carried thereby, and the spring-plugger or tool-holder, whereby a series of positive blows may be given directly upon the tool.

2. The combination, substantially as set forth, of the casing, the head in which the crank-shaft is mounted carrying thereon, and the chuck-screw collar, whereby the distance between the crank-shaft and tool may be varied to regulate the force of the blow.

167,108. WHEELBARROWS. Nestor Rolland and Jean Francois Van Hoorde, Hamion, Belgium. [Filed Jan. 22, 1875.]

Brief.—The axle is journaled in a spring bearing



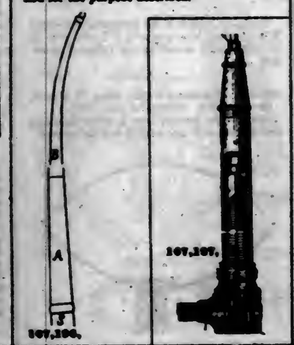
1. The combination, in a wheelbarrow having its wheel loosely mounted on the axle, as set forth, of the axle C with the spring-guide or barrel B and spring F, affixed outside or inclosed within the barrel B, substantially as set forth.

2. The combination of the barrow A, brace G, and spring barrel or guide B, substantially as specified.

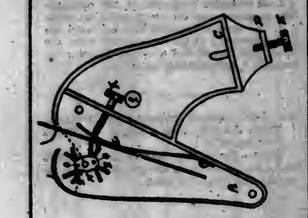
3. In a wheelbarrow having its wheel loosely mounted on the axle, the axle C, in combination with a spring, F, the frame L, guide-rods F F, and the brace G, substantially as and for the purposes shown and described.

167,109. UMBRELLA SUPPORTERS. J. B. Shannon, Chicago, Ill. [Filed July 26, 1875.]

Brief.—The usual hook stem with curved ring is reversibly hinged to the support, so that it may serve equally well for universities and reversities, without bending into different shapes.



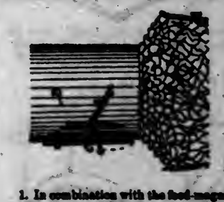
The arrangement of the hook stem C with the curved ring B and the hinge-piece A of the parasol-supporter D, said stem being reversible and adapted for use in either universities or universities, as and for the purpose described.



167,110. SHAFT-TIPS. Silas H. Raymond, Grand Rapids, Mich. [Filed July 26, 1875.]

Brief.—Metallic tip with wooden filling in end.

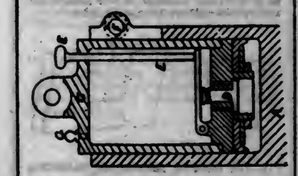
The metallic socket A, provided with the wooden filling B, in combination with the shaft S, when constructed substantially as and for the purpose described.



167,111. KNIFE-SCOURING MACHINES. C. G. Singer, Pennville, Pa. [Filed July 27, 1875.]

The combination of the flanged box A with the ratchet P in a slotted hub, N, pinion G, spring or bearing plate L, set-screw K, supported by the covering-plate B, which is provided with ledges C D and binding-screw E, gearing F G, the whole constructed and arranged as and for the purpose specified.

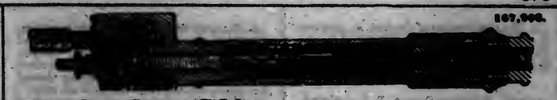
167,112. FUEL-CUT-OFFS FOR MAGAZINE-STOVES. D. Smith, Albany, N. Y. [Filed May 21, 1874.]



Brief.—When not in use the cut-off is supported at the side of the magazine upon the rest.

1. In combination with the feed-magazine of a stove the cut-off C, constructed as described, and connected with the said magazine by an arm, a, so as to be capable of being turned up against the breast or side of the magazine, or of being suspended beneath the discharge end of the same, substantially as and for the purposes set forth.

2. In combination with the feed-magazine B and the cut-off C the holding pin or projection c, whereby the said cut-off will be supported ready for use against the breast or side of the said feed-magazine, substantially in the manner set forth.



167,113. HYDRAULIC ADJUSTABLE PISTONS. Monroe Stannard, Hartford, Conn. [Filed June 26, 1875.]

1. A tightening or packing piece, the side of which is adjustable by means of a rock and pinion or its equivalents, and also by means of a hollow cylinder, receiving a hollow plunger containing a liquid, which may be allowed to flow into the hollow cylinder or head, into the hollow plunger by means of a valve changing their relative positions, and consequently raising the piston or die to any height required, substantially as described.

2. The combination of the devices A, B, C, D, and E, for the purpose of adjusting the relative positions of A and C, substantially as described.

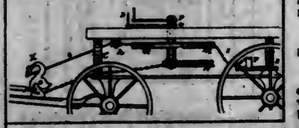
3. The clamping device F, in combination with A and C, and the devices by which they are set in position, substantially as described.

167,113.

167,114. DENTAL PLUGGERS. Eli T. Starr, Philadelphia, Pa., assignor to S. S. White, same place. [Filed July 12, 1875.]

Brief.—The spring-hook, which is operated by a viper-wheel, is held out of contact by means of a sliding sleeve, so that the operation of the mallet is stopped without stopping the rotating motor-power.

The combination, substantially as hereinbefore set forth, of the viper-wheel, the spring-hook on the mallet, the disengaging-incline, the mallet-spring, and the sliding sleeve, whereby the spring-hook is held out of contact with the viper when retracted by the slide, and automatically thrown into action by releasing it.

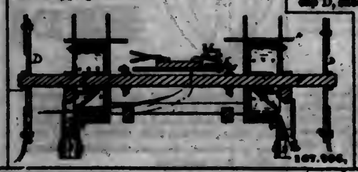


167,115. DIRECTION-CARDS. A. R. Thurber, Providence, R. I., assignor to Cyrus F. Andrews, same place. [Filed Mar. 24, 1875.]

As a new article of manufacture, a direction-card having attached to it any convenient number of fastenings, each consisting of a disk with a tongue to grasp the edge of the card, and a number of pointed shanks to be driven into the box or package to be addressed, the whole constructed in the manner and for the purpose specified.

167,116. VELOCIPEDE. Chas. J. Walter, Lancaster, Pa. [Filed June 1, 1875.]

Brief.—Device for detaching the horse guiding and stopping the vehicle in case of runaway or accident.



1. The combination of the foot-lever P Q and semicircular flanged wheels M N on a single shaft, V, constructed and arranged substantially as and for the purpose specified.

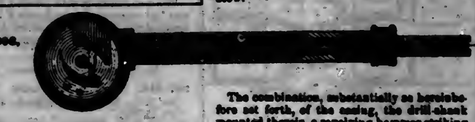
2. In combination with foot-lever Q and the segmental wheel M, the connections i, with the cross-bolster X at one end of said wheel and the connection I at the other end, with the brake arrangement F, G, and g, substantially arranged and operated as and for the purpose described.

3. In combination with foot-lever P and segmental wheel M, the connecting chain or chains J for guiding the vehicle, substantially as and for the purpose set forth.

167,117. GUM-PLASTERS. P. O. Wessell, Plainfield, Ill. [Filed Feb. 16, 1875.]

Brief.—Upon the axle of the bearing-wheels is a cog, with which a bevel-wheel on a vertical shaft gears, for correcting inaccuracies that may occur in placing, by the card not being deposited on a line with the previous lift, by retarding or accelerating the speed of the dropping-wheels.

167,118. WINDOW-BEAD FASTENERS. A. F. Werner, Rochester, N. Y. [Filed July 22, 1875.]



Brief.—The ordinary hook-and-eye fastener, for holding the window-bead stop at the sides, is combined with a pivoted button at the top of the window, swinging over the stop-bead, the construction rendering both the outer and inner stops readily removable.

In combination with the stops A B, the side fastenings, consisting of the inclined hooks and eyes b d, and the top fastening, consisting of the pivoted buttons f g, the whole constructed and arranged to operate in the manner and for the purpose specified.

167,119. DENTAL DRILLS. Samuel S. White, Philadelphia, Pa. [Filed July 9, 1875.]

Brief.—A pin upon a rotating wheel, which carries the spring-hammers, strikes a star-wheel, and rotates the drill slightly at each blow.

167,119.

The combination, substantially as hereinbefore set forth, of the casing, the drill-chuck mounted therein, a revolving hammer striking the drill-chuck, a retracting-spring, and a stud on the hammer, acting on the drill-chuck to turn it after each stroke of the hammer.

167,120. NASAL INHALERS. John H. Yates and Charles B. Trent, Sharon, Wis. [Filed Jan. 19, 1875.]

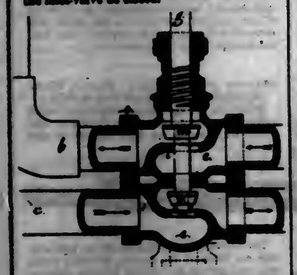
Brief.—The cone of an inhaler is divided by an inner partition, thus increasing the length of the air-passage without corresponding increase of length of cone. The closing-cap for the end is fitted with packing, and serves also to secure and close the lateral side opening for the admission of air.

1. The combination of the cone A, partition B, lateral aperture a in the side of the single outer tube near its open end, and cap D, substantially as hereinbefore set forth.

2. The combination of the cone A, partition B, lateral aperture a, cap D, packing c or its equivalent, and nozzle b, whereby both the aperture a and the nozzle b are opened and closed by the simple removal and replacement of the cap D, substantially as hereinbefore set forth.

2. The combination of the cone A, partition B, and lateral aperture *a* in the side of the single outer tube near its open end, as substantially as herein before set forth.

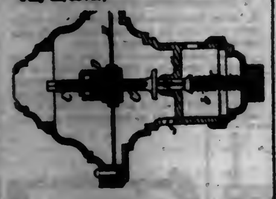
167,210. FURNACE-DOORS. R. H. Ashcroft, Boston, Mass. [Filed May 27, 1875.]



Brief.—An inside swinging flap allows the fuel to fall upon the grate from a hopper. Air is admitted to the surface of the fuel through an aperture at the bottom of the door, and deflected downward by a shield on the inside of the furnace-wall.

In combination with a steam-generator or other fire-front, an inwardly-swinging door, a fuel-hopper, and an air-passage, the parts being arranged substantially as and for the purposes specified.

167,211. VALVES FOR STEAM-RADIATORS. Wm. C. Baker, New York, N. Y. [Filed Mar. 31, 1875.]

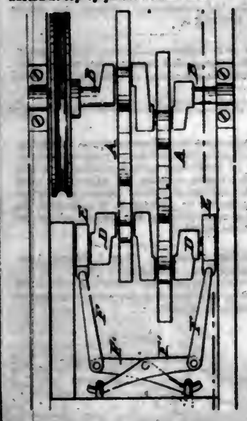


Brief.—The valves of the inlet and exit pipes are governed by a single stem. This obviates condensation of steam within the radiator in case the exit-valve alone be closed, or the back flow of steam from other parts of the apparatus, which is liable to take place if the inlet-valve be closed.

1. The valve-body *c*, provided with connections for the four pipes *a*, *b*, *d*, and *f*, and with the diaphragms *l* and *n* and valve-seats, in combination with the valves *m* and *o* upon the stem *p*, substantially as and for the purposes set forth.

2. The steam and water pipes of a steam-radiator, contiguous to each other and connected to one double-seating cock or valve, to open or close each pipe simultaneously by one movement, substantially as and for the purposes set forth.

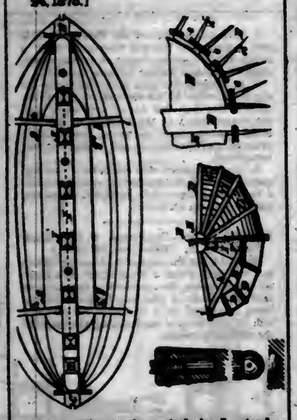
167,212. AIR AND GAS OR FLUID REGULATORS. Benj. Bates, Baltimore, Md. [Filed July 12, 1875.]



1. In an air or gas regulator, the combination of the expanding-cover cone C, the valve E, and spiral spring D, whereby said valve is raised and lowered to regulate the flow from the hole in the outlet, and preserve a uniform pressure, substantially as described.

2. The combination, in a pressure-regulator, of a pivoted bearing-point of the valve H, and a fixed bearing of the adjusting-stem, whereby the bearing of the valve is made coincident with its axis, and all lateral binding thereof prevented, substantially as herein set forth.

3. The combination, in a pressure-regulator, in which the valve and its adjusting-stem have a pivotal point of contact of the central post *c*, the under valve-stem *b*, and the valve-spring E, substantially as and for the purposes as herein set forth.

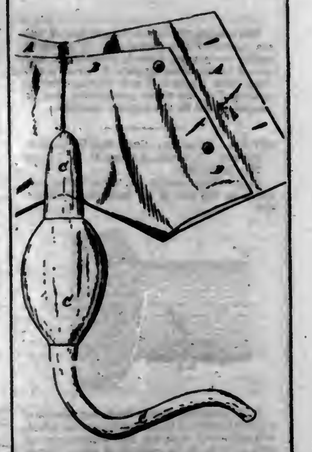


167,213. MECHANICAL MOVEMENTS. Philip Bellinger, Paoli, Ind. [Filed July 17, 1875.]

Brief.—Two parallel shafts, each having a pair of cranks, are connected by rods operated by hand and foot. The bearings of the front shaft are in posts pivoted below, and connected at top by pivoted cross-bars.

The combination, with pivoted standards E and link-connected cross-levers F F, of double crank-shafts B D and the levers A, whose fulcrums revolve around the crank-pins, as and for the purpose specified.

167,214. COLLAPSIBLE BOATS. Edward L. Berthon, Romsey, England. [Filed May 24, 1875.]

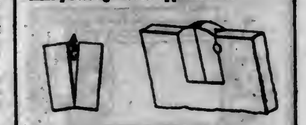


1. In a collapsing-boat, the keelson I, extending longitudinally and centrally, and covered at its ends to the stem and stern-posts in such manner as to curve on a beam or support thereto, when provided with hatches J J for storing provisions, &c., substantially as herein shown and described.

2. In a collapsing-boat, the combination of the side timbers D D, stem-post B, stern-post C, quadrant-blocks E E, links *e e*, and straps *d d*, all arranged to operate in the construction as shown, and for the purposes set forth.

3. The strut A, provided with a T-head adjusting-screw, *f*, at the top, to catch under the upper side timber, and a spherical lower extremity, *i*, substantially as shown.

167,215. RUBBER DRAWERS FOR INVALIDS. Maria Bradley, New York, N. Y. [Filed July 24, 1875.]

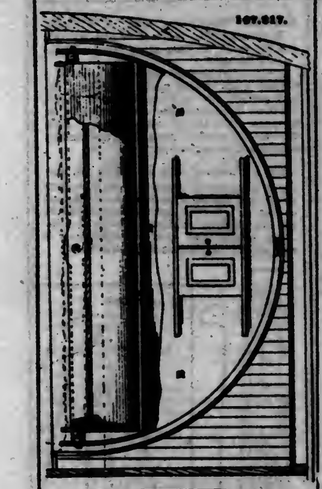


Brief.—The rubber drawers to be worn in bed have a pipe made integral with them, for conducting away the urine.

Improved rubber drawers for invalids formed of the body A B, open at the sides, and the tube C, formed integral with the drawers, substantially as herein shown and described.

167,216. PROCESSES OF MOUNTING OF FITTING DIAMONDS OR METALLIC HOLDERS. Joseph W. Branch, St. Louis, Mo. [Filed July 6, 1874.]

Brief.—The diamond is fastened by embedding it by the pressure of two heated metallic plates against its opposite sides.



1. The mode of inserting or embedding diamonds in metallic holders or tools solely by the agency of heat and pressure, substantially as and for the purpose shown and specified.

2. A metallic diamond holder or tool, having the diamond inserted or embedded solely by the agency of heat and pressure, substantially as and for the purpose shown and specified.

167,217. STEERING RUDDER. R. W. Brown, Galveston, Tex. [Filed July 10, 1875.]

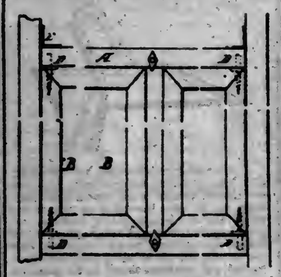
A bank of a steamer or other vessel, consisting of the two semi-cylinders *B* and C, hung in journals to right angles to each other, and each provided with openings for the introduction of baggage or other bulkhead, substantially as described.

167,217.

167,218. MALARIA-STOVES. Joseph A. Buckwalter, Boyer's Ford, Pa. [Filed July 20, 1875.]

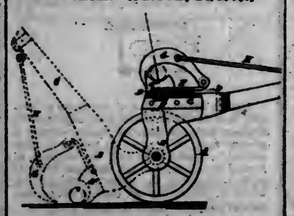
In a magazine-stove, the combination of the inclined smoke-flue A, constructed and arranged to operate below the mouth of the fire F, as described, with the annular space which is between the magazine C and the body B, substantially as and for the purposes herein before described.

167,219. LID-LIFTERS. T. B. Carpenter, New Haven, Conn. [Filed Aug. 9, 1875.]



Brief.—The hook is intended to engage with the rim of a pot or kettle, and then effect means for tipping.

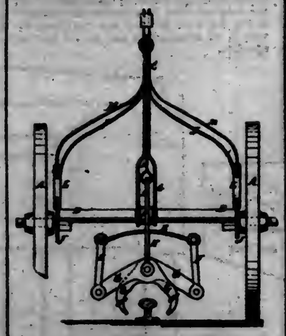
1. The lid-lifter A, made with the projection *b*, having the tipping-hook C pivoted to the same, and extending beyond the pivot, to operate in connection with the hook, all the said parts constructed and combined to operate in the manner described.



2. The tipping-hook C, made with the notch at the bottom of the shoe *c*, as described, pivoted to the projection *b*, and limited in its motion by the projection *b* and the handle of the lid-lifter A, all the said parts constructed and combined to operate in the manner described.

167,220. WINDOW-SCREENS. A. A. Carter, Philadelphia, Pa. [Filed Aug. 2, 1875.]

The combination of the frames B, formed of the molding described and shown, with the collar screw-pivots D, bar A, and angle-piece E, constructed as set forth and described.



167,221. TRUCKS FOR MOVING SAFES, &c. Charles W. Carter, Terre Haute, Ind., assignor to himself and Geo. W. Travis, Cape Girardeau, Mo. [Filed July 24, 1875.]

The combination of the swiveled heel-plate D F, the T-plate F, the pivoted hook G, and the rods H I with the widened lower end of the bar C, the axle B, and the wheels A, substantially as herein shown and described.

167,222. TRUCKS FOR CARRYING SAFES, AXLES, &c. Chas. W. Carter, Terre Haute, Ind., assignor to himself and G. W. Travis, Cape Girardeau, Mo. [Filed July 24, 1875.]

Brief.—Double set of grapples, one for operating near the ground, the other above, and both worked by a sliding rod.

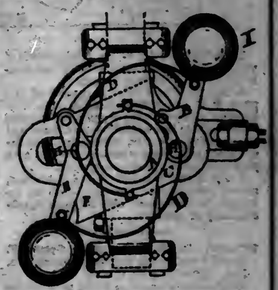
1. The combination of the collar or sleeve D, the cross-bar E, the links or bars F, the bent lever-hooks G *f*, the loop or U-bar H, and the sliding rod *f*, with the forked handle C, the bent axle B, and the wheels A, substantially as herein shown and described.

---

2. The combination of the triangular frames J, the connected cords K, the pivoted hooks L, the bail M, and the rod I with the handle C, the bent axle B, and the wheels A, substantially as herein shown and described.

167,223. SAFETY-PAPERS. G. W. Casilear, Washington, D. C. [Filed July 8, 1875.]

Brief.—Paper is adapted for revenue-stamps, &c., which are printed on the rear side of the paper.



As a new manufacture, a safety-paper having embedded in its fiber side a woven fabric or warp, in such manner that both the paper-stock and embedded fabric or warp shall lie, practically, in the same plane, exposed to view, and be capable of separation, in the manner and for the purposes herein before set forth.

167,224. PROCESSES OF TREATING MAIZE. Louis Chicoux, Corvignano, near Trieste, Austria. [Filed Aug. 27, 1875.]

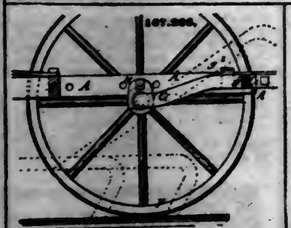
The process herein described of separating the oily from the farinaceous constituents of maize by first steeping the grain in a solution of sulphurous acid, then crushing it so as to leave the germs unbroken, and finally screening and drying, all substantially as specified.

167,225. GOVERNORS FOR STEAM-ENGINES. Thomas M. Corbett and Henry Campbell, Milwaukee, Wis.; said Corbett assignor to said Campbell. [Filed Mar. 10, 1875.]

Brief.—As the levers are thrown in or out by the rotation of the shaft and balls, the eccentric is forced to one side or the other by the inclined edge-plate.

1. Hub A, projection B, eccentric I, cross-bar K, and plate F, all in combination, substantially as set forth.

2. Collar C, springs D D, levers E E, and adjustable weights I I, in combination with plate F and cross-bar K, substantially as described.

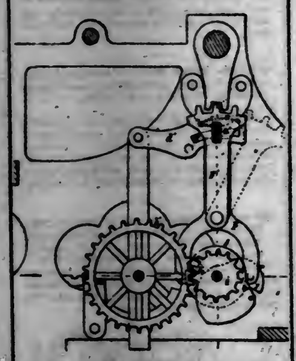


3. Hub A, projection B, cross-bar K, and eccentric I, all in combination, substantially as set forth.

4. Cross-bar K, with eccentric I, placed a little on one side of it, in combination with plate L, substantially as set forth.

167,226. CULTIVATOR-FRAMES. W. M. Conlan, Quitman, Mo. [Filed Apr. 17, 1875.]

Brief.—The central axle extends backward horizontally, bearing the seat, and is supported by levers upon the side bars of the frame. The axle and seat can be tilted forward to convert the machine into a walking-cultivator.

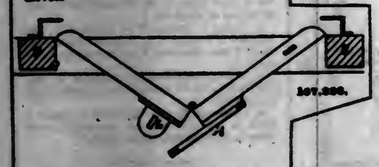


167,886.

The combination of the adjustable bearings H and axle G g', provided with a bar, I, to receive the cant, and with supporting-hooks g', with the perforated side bars A, the crossbars B C, the tongue D, the braces E, and the wheels F, substantially as herein shown and described.

167,887. PRINTING-PRESSES. C. B. Cottrell, Westerly, R. I. (Filed July 11, 1874.)

Brief.—The invention relates to the peculiar devices for stopping, locking, and starting the cylinder between the impressions.

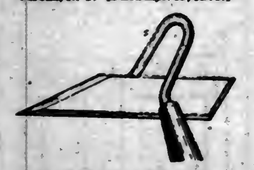


1. The combination of the locking-catch *c* with the divided segmental lever F F' and rock-lever *f*, substantially as specified.

2. The segmental lever composed of two parts, F F', and a locking-catch, *c*, in combination with rock-lever *f* and notched plate *f'*, arranged to lock and unlock said parts, and also to lock the part F, which gears with the cylinder, to the frame when disconnected from part F, all substantially as specified.

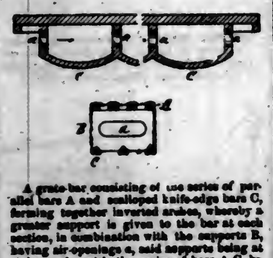
3. The slotted rock-lever *f* and the cam *f'*, geared relatively to the cam-shaft to be actuated, in combination with the catch *c'*, substantially as specified.

167,888. GRAIN-CAR DOORS. George F. David and Charles Wilding, Indianapolis, Ind. (Filed May 25, 1875.)



Brief.—Doors hinged on inside so as to open outward by pressure of grain when pin is removed.

167,889.



In combination with a grain-car, a door constructed in two equal halves, hinged together on the inside, so as to allow the doors to open outwardly, and secured together, when fastened in the door-frame, by a bar, E, having a pin, F, at one end, to receive the key-holder I, and key J, constructed and arranged to operate substantially as specified.

167,889. WEEDING-HOE. A. S. Dunham, Verona, N. Y. (Filed Apr. 19, 1875.)

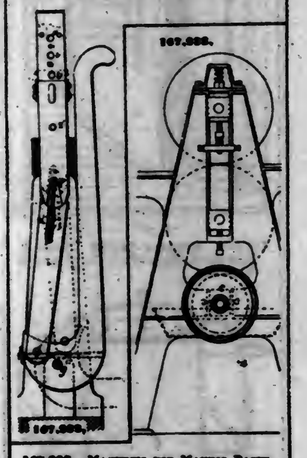
A cultivating and weeding hoe consisting of a long, straight, narrow blade, with one end thereof inclined to the principal working edge, and the edge beveled to an edge on the upper side, and having a long shank, *b*, projecting up therefrom, and reserved back to the line of the hoe-blade, where it is joined with the handle, the whole being constructed, arranged, and combined as and for the purposes above specified.

167,890. FURNACE GRATE-BARS. Edward Marion Hrdman, Lykens, Pa. (Filed Aug. 6, 1875.)

A grate-bar consisting of one series of parallel bars A and scalloped knife-edge bars C, forming together inverted arches, whereby a greater support is given to the bar at each section, in combination with the supports E, having air-openings *e*, said supports being at right angles with the series of bars A C, by which a greater cold-air surface is exposed, substantially as set forth.

167,891. STOP-MOTIONS FOR STRAIN-RECEIVERS. Thomas Byrom, South Manchester, Conn. (Filed Apr. 10, 1875.)

Brief.—When the engine runs at the great a degree of speed the centrifugal device opens the valve which supplies steam to the auxiliary cylinder. The piston thereof, being raised, opens the valve over the pipe leading to the condenser, and destroys the vacuum therein.



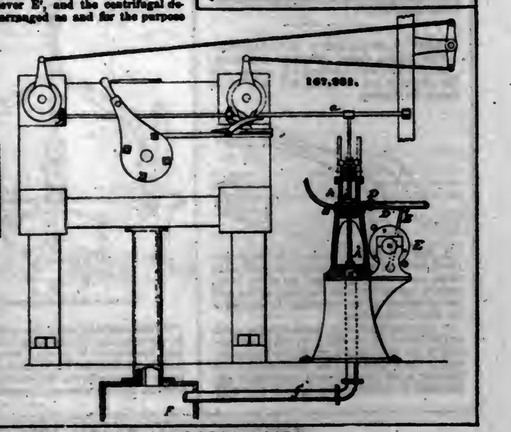
The combination of auxiliary steam-piston A, the steam-piston rod A', having piston A', air-valve *f*, and a connection with engine-rod *a*, the condenser F having connections *f' f²*, the weighted lever D supported on a suitable catch, the lever E', and the centrifugal device E, all arranged as and for the purpose specified.

167,892. CARRIAGE-JACKS. A. W. Field, Vergennes, Vt., assignor of one-half his right to F. W. Coe, same place. (Filed July 24, 1875.)

Brief.—The bearing-bar is composed of a central piece vertically adjustable by a pin and perforations between two other pieces. On these bar, perforations once and a half the distance apart of the others give to them the effect of a subdivision. It is operated by a lever and connecting-piece.

The combination, with the sliding bar, having at its upper end the adjusting-perforations *e e*, of the bearing-arms between which said sliding bar is carried, having the perforations *e' e'* spaced apart once and one-half the distance between two adjacent perforations of said sliding bar, substantially as specified.

167,893.

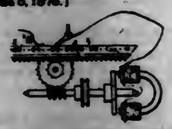


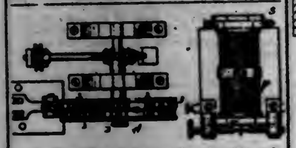
167,893. MACHINES FOR MAKING PASTE-BOARD. Benjamin F. Field, Lima, Ohio. (Filed Dec. 24, 1874.)

Brief.—Improvement on Patent No. 162,942. Sheets are pasted and pressed together by rolls, which yield to accommodate sheets of varying thickness.

The combination of the platform, the frame, the paste-box, the transferring-roll T, and the two large rolls P R, of equal size, the rolls T P, and the rolls P R, being, respectively, adjustable with relation to each other, and the roll R bearing against the roll P with a yielding pressure, substantially as and for the purposes set forth.

167,894.





In combination with the engine-frame, the steam-cylinder, the steam-piston and its rod, the cross-head, the pitman, the crank-shaft, the eccentric, the eccentric-rod, the valve-stem, and the valve, the governor-shaft, the governor-arms, the governor-balls, the bell-crank lever, the rod connecting the bell-crank lever with the valve-stem, the sliding sleeve, the rod connecting the sliding sleeve with the bell-crank lever, the lever, the rod connecting the lever with the sliding sleeve, the rock-shaft, the arm, the rod connecting the arm with the lever, the lever, the rod connecting the lever with the arm

4. The hooked rod J, pivoted into the wall of the furnace G, in combination with one or more hooks, a, on the basin A, substantially as described.

5. The vent c, having a perforation through its upper, combined with the basin A, hollow standard B, conduits b, and hollow rim a, substantially as described.

167,940. AUTOMATIC-TELEGRAPH APPARATUS. Otto Halbat, Jersey City, N. J. [Filed June 6, 1876.]

1. The rollers 3 3 upon the wires 2 2, and within the grooved wheel or bar, in combination with the cord d and circuit-closing mechanism, substantially as set forth.

2. The swinging circuit-changer or needle o within the helix p, and the permanent magnets r and s, arranged as set forth, in combination with the bar x, that connects the said magnets r s and the helix w, surrounding such bar, as set forth.

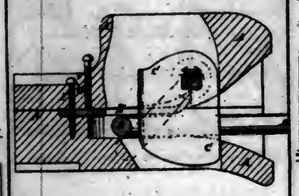
3. The pictorial lever I and ink-roller F, operated by the magnets s s' and electric circuits, in combination with the blade u and rollers u', for moving a strip of paper in contact with such blade and contiguous to the ink-roller, for the purposes set forth.

4. The combination, in a telegraph transmitting-instrument, of movable circuit-closing rollers or blocks, a key, a magneto-electric machine, and gearing connecting the parts, substantially as specified, for transmitting reverse currents alternately and at intervals, to form the message, as set forth.

167,942. CHAIR-MACHINES. Wm. Edward Hammond, Baltimore, Md. [Filed Jan. 10, 1876.]

Brief.—The frame that supports the usual roller is in this machine arched, and leaves a space under it and in the rear, so that a wrapper can be fed to it either from the right or left. The wrapper can be put on right or left handed, as upon opposite sides of the frame posts and supporting plates are automatically brought into position every time the frame is reciprocated. The bight of the belt is tightened and the wrinkles taken out of the wrapper by a roller under the belt.

1. In a cigar-machine, the combination of the apron C, the traveling roll or bar E, suspended with an open space beneath and behind both ends, and two projecting posts-plates, one on each side of the machine, substantially as and for the purposes set forth.

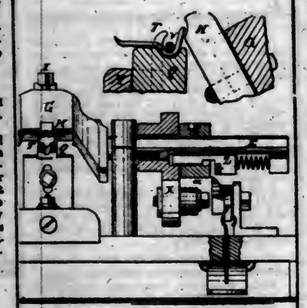


2. In a cigar-machine, the combination of the apron C, the traveling frame and roll or bar E, and the traveling smoothing bar or roll F, substantially as and for the purposes described.

3. In a cigar-machine, the combination of the apron C, the traveling frame and roll or bar E, and the automatically-adjustable posts or gage plates G G, substantially as and for the purposes described.

4. The telescopic or longitudinally-adjustable scrap-filler box H, adapted to be used in connection with the cigar-machine herein described, substantially in the manner and for the purposes set forth.

167,944. CAR-COUPLINGS. Henry C. Hervey and George H. Abrams, Athens, N. Y. [Filed July 3, 1875.]



Brief.—The bifurcated spring guides the dog and holds the link.

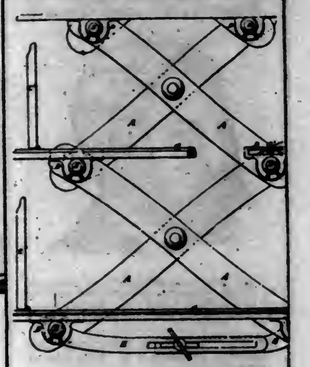
The combination, with a link, B, and pivoted dog C, of a bifurcated spring, E, to hold the one and guide the other, as and for the purpose set forth.

167,945. BUCKLE-MAKING MACHINES. H. C. Hickox, Philadelphia, Pa. [Filed May 10, 1876.]

Brief.—On the re-entering side of the rocking yoke is fixed adjustably a bar, that cooperates to bend the tongue of the buckle around its bar, with the upper end of a former or anvil, that has two horns, between which the tongue is placed. The crank turns free on the yoke-shaft, the clutch-slide being held, ordinarily, out of contact with the crank by a wedge on the end of foot-lever, that may at will be depressed to withdraw the wedge, and thus contact the vibratory crank with the yoke-shaft.

1. The combination of chambered bit H, set in a rocking yoke, G, with a grooved holder, G, having horns T T, as and for the purpose described.

2. The combination of spring-slide E, having bevel e, the shaft-collar c, the crank X, and the lever Y, having wedge d, as and for the purpose set forth.

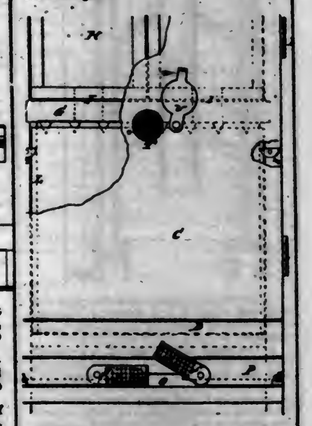


3. The combination, with rocking yoke G, of sliding stop g, as and for the purpose specified.

167,946. SUSPENSION BOOK-RACKS. F. F. Hill, Exeter, Conn. [Filed May 6, 1876.]

1. The metal plates D, having slots in the upper portion, in combination with the pegs B, shelves C, and pivoted bars A, said plates being secured to the shelves by the screws on which they slide, as shown and described.

2. The combination of the lock-bars E and hand-screw f with the pegs B, the pivoted bars A, and the shelves C, substantially as herein shown and described.

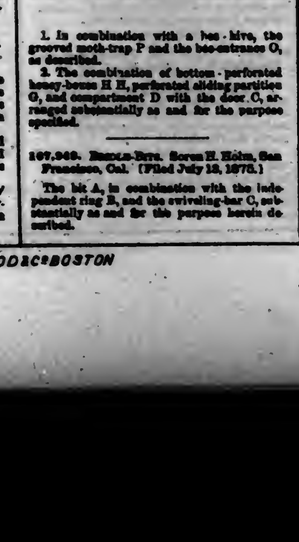


3. The combination of the hinged ends f with the shelves C, the pegs B, and the pivoted bars A, substantially as herein shown and described.

4. The combination, with the upper pivoted bars A, of a plate, F, pivoted to the rear bar, and having holes in its upper and lower ends to receive the suspending nails or screws, so that the nail or screw passing through the lower hole may project into the angle between the said bars A, substantially as herein shown and described.

167,947. BEE-HIVES. Samuel Hinson, West Newton, Pa. [Filed May 6, 1875.]

Brief.—The brood-chamber and honey-box above it are usually darkened by the large door forming the front of the whole box, there being inner walls of glass. The honey-boxes rest a partition, both having coincident openings, the partition adapted to slide out with the boxes. The entrance at the base is through a sliding bar having a channel toward its ends, for the escape of moths, which seek the light.



1. In combination with a bee-hive, the grooved moth-trap P and the bee-entrance O, as described.

2. The combination of bottom-perforated honey-boxes H H, perforated sliding partition G, and compartment D with the door C, arranged substantially as and for the purpose specified.

167,948. BEE-HIVES. Samuel Hinson, West Newton, Pa. [Filed May 6, 1875.]

Brief.—The brood-chamber and honey-box above it are usually darkened by the large door forming the front of the whole box, there being inner walls of glass. The honey-boxes rest a partition, both having coincident openings, the partition adapted to slide out with the boxes. The entrance at the base is through a sliding bar having a channel toward its ends, for the escape of moths, which seek the light.

1. In combination with a bee-hive, the grooved moth-trap P and the bee-entrance O, as described.

2. The combination of bottom-perforated honey-boxes H H, perforated sliding partition G, and compartment D with the door C, arranged substantially as and for the purpose specified.

167,949. BEE-HIVES. Samuel Hinson, West Newton, Pa. [Filed May 6, 1875.]

Brief.—The brood-chamber and honey-box above it are usually darkened by the large door forming the front of the whole box, there being inner walls of glass. The honey-boxes rest a partition, both having coincident openings, the partition adapted to slide out with the boxes. The entrance at the base is through a sliding bar having a channel toward its ends, for the escape of moths, which seek the light.

1. In combination with a bee-hive, the grooved moth-trap P and the bee-entrance O, as described.

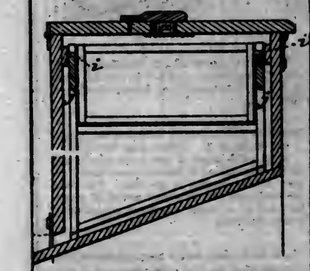
2. The combination of bottom-perforated honey-boxes H H, perforated sliding partition G, and compartment D with the door C, arranged substantially as and for the purpose specified.

167,950. SUSPENDER-BUTT. Soren H. Holm, San Francisco, Cal. [Filed July 12, 1875.]

The bit A, in combination with the independent ring B, and the swiveling-bar C, substantially as and for the purpose herein described.

167,948.

167,949.



167,950. VEHICLE-BODY CORNER-IRONS. Nathan L. Holmes, Racine, Wis. [Filed Apr. 3, 1875.]

In angle-irons for wagon-bodies, section B, having flanges b b and a T-shaped tenon, d, in combination with the section C, provided with flanges e and T-shaped mortise f, substantially as and for the purpose set forth.

167,950. BEE-HIVES. Peter Hommell, Marietta, assignor of two-thirds his right to J. W. Hommell, Dyberlle, and M. H. Hommell, Marietta, Miss. [Filed July 10, 1876.]

Brief.—The sides of the brood-frames are prolonged above the frames, notched to receive pins fixed in the comb-frames, thus forming supports for the comb-frames.

In a bee-hive, the bee-brood frames D, having the extensions f, cleft at their upper ends, in combination with the swinging honey-frames, with journals f, substantially as described.

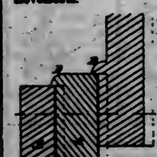
167,951. HAND-PLANTERS. D. W. Hughes, St. Louis, Mo. [Filed Jan. 20, 1876.

Brief.—Within the lateral edges of the pivoted blades is secured the flexible conical conductor for conducting the seed to the earth.

In a corn-planter, the combination, with the hinged blades A A', and the sliding dropper c, of the flexible conical seed-conduit D, substantially as specified.

167,952. SHUTTER-WORKERS. Jacob D. Bingham, Prairie City, Ill. [Filed July 24, 1876.]

Brief.—An elbow-lever pivoted on the window-sill inside the sash has its second joint so arranged as to throw one arm above and the other below the stop-plate. A link-connection with a T-shaped lever, one end of which is pivoted to the sill, and the other connected with the lower edge of the shutter, serves to actuate the devices; and there are also stops or upwardly-projecting lugs arranged on a stop-plate, which operate to fasten the shutter in open or closed position.

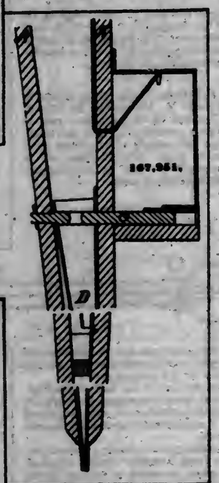


1. The combination of elbow-lever A B, having one arm above, the other below, the stop-plate C, pivot D, link F, T-shaped lever G, and link I, with a window-shutter, J, substantially as specified.

2. The combination of stops K, on the stop-plate C, with the elbow-lever A B, link F, T-shaped lever G, link I, and shutter J, substantially as specified.

167,953. CAST-IRON PILES. John F. Hinds, New York, N. Y. [Filed June 6, 1876.]

Brief.—Piles for foundations, &c., connected side by side by interlocking grooves and ribs, with spaces left in the grooves to allow of the displacement of the sediment. An overlapping flange on the top of the piles engages with next pile below it, and prevents vertical movements.



1. Piles connecting together, side by side, an interlocking groove in one and rib on the other, when the groove is arranged to afford space in addition to that required for the rib, in which to dispose of the sediment, substantially as specified.

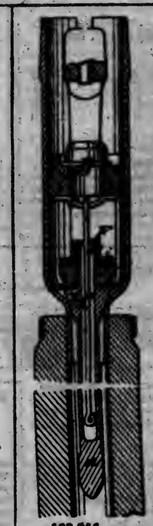
2. The combination of an overlapping flange, D, with a pile constructed to be connected to other piles side by side, substantially as specified.

167,954. MACHINES FOR COUNTING STOCK. Wm. P. Jeans and David H. Bailey, Ferndale, Cal. [Filed Oct. 15, 1874.]

Brief.—For counting live stock by causing the stock to pass through a narrow passage with a swinging side, a registering mechanism being connected with said swinging side by a suitable arrangement of levers.

1. The device consisting of the swinging side D of a passage, together with the lever-arm F, with its rods G and H, and the perforated wheel I and inclined plane J, the whole constructed to operate substantially as herein described.

2. The winged rods D, lever-arm F, rods G H, and perforated wheel I, having the lug f, in combination with the wheel a, with its pawls P or toothed wheel x, hammer-arm y, bell a, and counting-dials, as set forth.



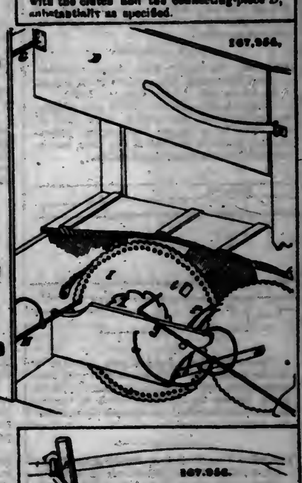
167,955. CULTUS ATTACHMENTS. John S. Johnston, Rockford, Ill. [Filed June 26, 1875.]

Brief.—Devices for adjusting and stop for limiting the motion of colters.

1. The clutch-block F, clutch-arms I, and colter M, combined with the connecting-piece D, substantially as specified.

2. The adjusting guard K K', combined with the clutch and the connecting-piece D, substantially as specified.

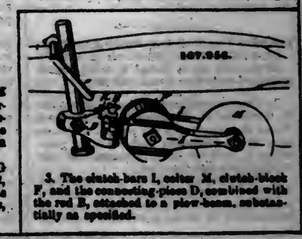
167,955.



1. In a metal coulter or check valve for wood or metallic pumps, the tubular valve-case A, having tapered conical collar b and flange c, substantially as shown and described.

2. The plunger and check valve a, having collar b, constructed with conical and adjustable weight D, cover-cap F, connecting and guiding rod E, and plunger B, substantially as specified.

167,956. ORGANS-VALVES. H. O. Johnson, Greencastle, Ind. [Filed July 3, 1876.]



Brief.—The plunger and check valve a, having collar b, constructed with conical and adjustable weight D, cover-cap F, connecting and guiding rod E, and plunger B, substantially as specified.

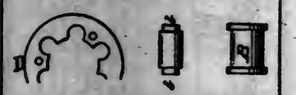
167,956.

167,957. CLOTHES-DRYERS. Jacob Bowers, Jr., Lancaster, Pa. [Filed Aug. 2, 1875.]

Brief.—The arms are pivoted to the post, and have a sliding motion, and are held in position by a set-screw. The arms are made of two pieces, and the ends are bent to form a hook.

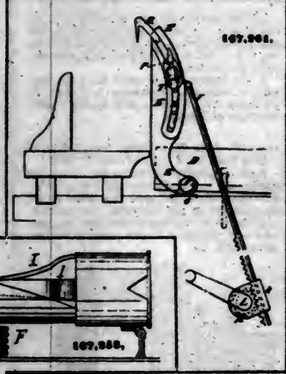
1. The arms B, pivoted to the post A, and provided with the hooks a, substantially as specified.

2. The arms B, pivoted to the post A, and provided with the hooks a, and set-screw b, substantially as specified.



167,958. CLOTHES-DRYERS. Jacob Bowers, Jr., Lancaster, Pa. [Filed Aug. 2, 1875.]

Brief.—The arms are pivoted to the post, and have a sliding motion, and are held in position by a set-screw. The arms are made of two pieces, and the ends are bent to form a hook.



1. The arms B, pivoted to the post A, and provided with the hooks a, substantially as specified.

2. The arms B, pivoted to the post A, and provided with the hooks a, and set-screw b, substantially as specified.

167,887. SEDAN'ES. Patrick Kavanagh, Comerio, N. Y. [Filed July 17, 1875.]

The intermediate rollers C C, made solid, with journals b b on their ends, in combination with the flanges, center spool B, side plates D D, and outside sheave A, all constructed substantially as and for the purposes herein set forth.

167,888.

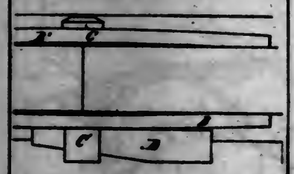
167,888.

167,889. WIRE-SOCKETS. D. A. Kelsey, Quincy, Ill. [Filed June 10, 1875.]

Brief.—The socket, being hinged and provided with a spring, is adapted to hold the rules.

1. The socket D, hinged as specified, and provided with the spring F, substantially as set forth.

2. The combination B and H, arranged and operating in the manner specified.



3. The combination of the socket D, spring F, and fingers I F, as described.

167,890. SPOKES AND FELLY FASTENER. J. L. Kendall, Pemberough, Mass. [Filed Feb. 9, 1875.]

An article of manufacture consisting of sponge and pulp filling, and a hooking-recessed thereto, substantially as and for the purposes specified.

167,891. RAILWAY-RAIL.—JOHN FAIRMAN, Tidioute, P., King and Edwin A. King, St. Louis, Mo. [Filed Mar. 11, 1875.]

Brief.—A rail-joint in which two elliptic spring fish-plates are secured at the joint of the rails by a square bolt, which passes through a slot in the end of the rails, and is secured in place by an upset wedge.

The combination of the elliptic fish-bars B B', the square bolt C, in connection with the slotted rails, and said parts fastened by a fastening device, D, all constructed as herein shown and described, to operate as and for the purpose set forth.

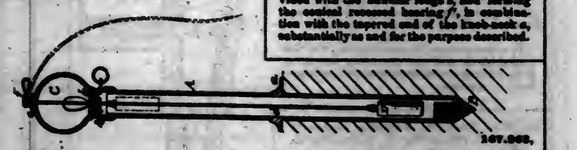
167,892. LOG-TURNERS. Henry Knowlton, Otter Lake, Mich. [Filed July 31, 1875.]

Brief.—The log is turned by a dog, which receives motion from a crank and pinion.

1. The combination of the eccentric plate O, the socket G, the hook-bar R, the spring S, and the stop T with the pivoted button or lever H, the connecting-rack J, the gear-wheel K, and the shaft L, substantially as herein shown and described.

2. The combination of the eccentric F and the spring I with the hinged cleat D, and with the button or lever H, that carries the hook R, substantially as herein shown and described.

167,893. HOSE-COUPLINGS. M. M. Lewis, New York, N. Y., assignor to himself and A. O. Aubery, same place. [Filed July 31, 1875.]



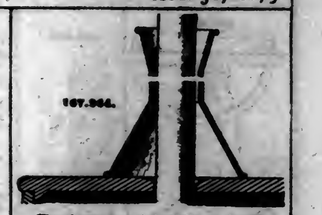
Brief.—The device consists of two pieces, substantially. The cylindrical piece that goes within the hose has a circumferential rib for passing the elastic substance into a groove in the outer clamping device, as shown. The external hinged coupling is brought closely about the hose by the thumb-screw, the rabbet allowing of close compression.

The hinged two-part tubular coupling B, provided with flanges b' b', groove b'', and rabbet b', as shown and described, to enable it to be used independently, or with a middle-ribbed inner coupling, as set forth.

167,894. HITCHING-POSTS. Thos. Maguire, Port Jervis, N. Y. [Filed July 24, 1875.]

Brief.—The bottom of the hollow post is provided with a pointed plug, with slot in its side, to allow the escape of any water that may get in the post. It is provided with a stopping arrangement near its top, to clamp the strap at any desired point.

167,894.

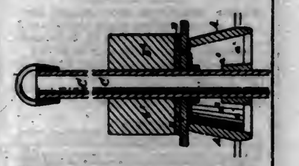


1. In a hitching-post, the combination of the hollow post A and pointed plug B, having slot a, as and for the purposes set forth.

2. The combination of the hollow hitching-post A, cap C, with diaphragm b, weight D, and rope, or its equivalent, E, with disk e and strap-hook f, substantially as and for the purpose set forth.

3. In a hitching-post having a hollow stationary post, with a weight therein attached to a rope, chain, or strap, a locking device arranged within the post for locking the rope at any desired point, as herein set forth.

167,895. GRAIN-GATE. Wesley Mason, Jefferson Township, Hillsdale county, Mich. [Filed Mar. 11, 1875.]

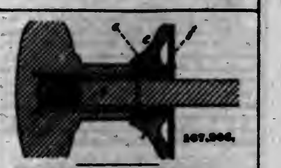


Brief.—The cap has a flaring bottom and top, the bottom being larger than the top. It is placed over the hole in the chute-cover, the slotter passing up through the cap, and prevents the splashing of the cream over the floor and the person operating the churn.

The churn-cap, substantially as described above.

167,896. COMBINED OVERFLOW-VALVE AND OVERFLOW-PIPE. Bernard McGrann and John Sohn, New York, N. Y. [Filed July 24, 1875.]

Brief.—When the weighted valve is lifted the water flows through the openings in the socket. Should the water rise above the central pipe it will waste and prevent overflow, as described.

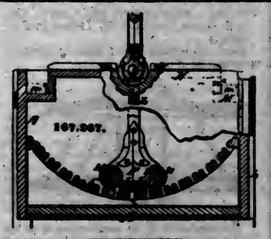


The combination of the overflow-pipe C with the weighted valve B b' b', and the socket A a' a', substantially as herein shown and described.

167,897. KNOB-ROSES. John Moore, Brooklyn, E. D., N. Y. [Filed Aug. 10, 1875.]

Brief.—The metal of the knob-spindle and all its connections is entirely concealed from view within a recess in the rose. The rose, the knob, and also its shank are all of porcelain, and as no metal is in sight, no polishing is ever required.

1. A back plate and a rose, against which the back plate rests, provided with an annular ledge within its central opening in combination with a thimble which moves into or upon the back plate, and is entirely within said central opening, and, by means of a flanged collar, rests upon the ledge in the rose, and secures the rose to the back plate.



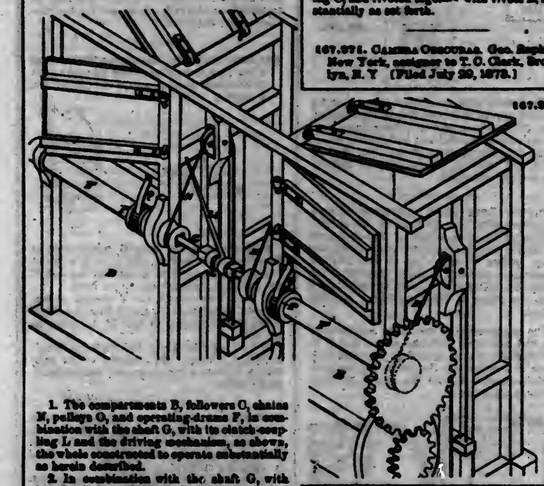
2. The hollow flanged thimble f, entirely within the central opening of the rose c, provided with the annular ledge e, and forming the central recessed bearing f', in combination with the tapered end of the knob-neck a, substantially as and for the purpose described.

167,897.

167,898. WASHING-MACHINES. Thomas McGuire Morris, Wabash, Ind., assignor to himself and Freeman Algar, same place. [Filed June 19, 1875.]

The combination of the grooved, slotted, and knobbed adjustment-heads b, and their locking-springs L, with the pivoting-rod J and the levers F of the oscillating rubber H I, and with the rods-bar A, substantially as herein shown and described.

167,897.

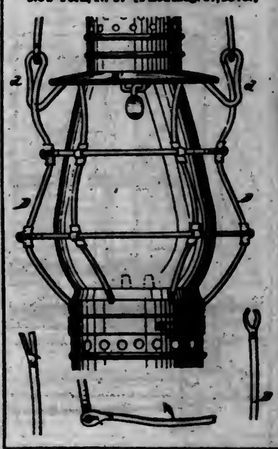


In a lantern, the guard-wires D upon opposite sides, extending above the reflector B', and having eyes d, in combination with the tail G, whereby the lantern is perfectly balanced, and the tail may be sufficiently large to be swung to the arm without swinging before the lantern, substantially as and for the purpose set forth.

167,899. FIRE-PROOF STRUCTURE. James D. Pierce and J. R. Smith, Milwaukee, Wis. [Filed Oct. 2, 1874.]

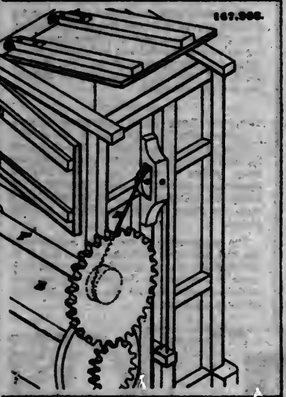
A fire-proof structure constructed with corrugated iron A, flat iron B, and fire-proof filling C, and riveted together with rivets E, substantially as set forth.

167,900. RAILING-FENCES. D. L. O'CONNOR, Covelo, Cal. [Filed June 28, 1875.]



167,900.

1. The compartments B, followers C, chains E, pulleys G, and operating-drums F, in combination with the shaft G, with its clutch-coupling I, and the driving mechanism, as shown, the whole constructed to operate substantially as herein described.



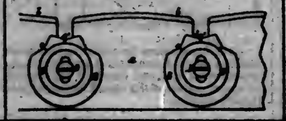
2. In combination with the shaft G, with its clutch I, and the independent rotating drums F, the ratchet-wheels P and pawls Q, substantially as and for the purpose herein described.

167,901. LANTERNS. Theodore B. Osborne, New York, N. Y. [Filed Aug. 17, 1875.]

167,901.

167,902. CAMERA OBSCURAS. Geo. Stephens, New York, assignor to T. C. Clark, Brooklyn, N. Y. [Filed July 20, 1875.]

167,902.



167,902.

The prism A, tube B, tube C, wheel F, pinion G, rod H, and sectional dark chamber K, all combined, arranged, and operating substantially as and for the purposes described.

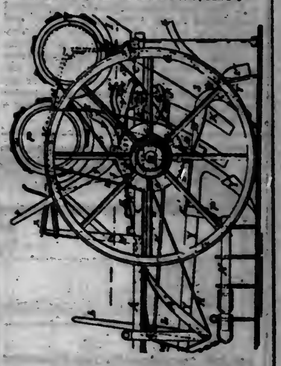
167,903. GUIDES FOR SPOOLING AND WINDING MACHINES. Geo. Richardson, Lowell, Mass. [Filed July 20, 1875.]

Brief.—The guide is made in the form of a rotary flat disk, provided with radial slits of varying widths for different-sized threads, and with tapering throats to guide the thread into the slits. A rotary adjustable yarn-rest, shorter in form, is secured to the rail by means of a screw-bolt passing through the guide, rest, and rail, and fastened by a nut.

167,903.

1. The rotary flat plate or disk yarn-guide B, provided with a series of radial slits, *c c'*, and a tapering throat, *d*, to each, all being as and for the purpose described.

2. The combination of the rotary adjustable yarn-rest C with a slitted guide and the guide-rail A, all being arranged as described.



167,904. TOOL-HANDLES. W. H. Schwin, Talladega, Ala. [Filed Jan. 26, 1875.]

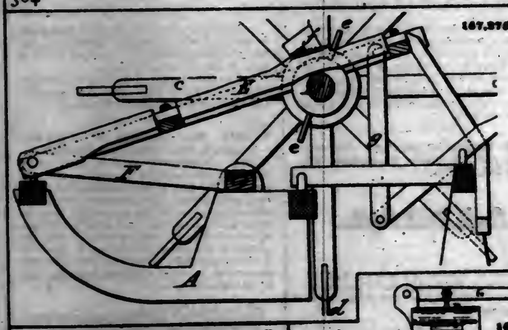
Brief.—Implements such as hoes, rakes, forks, &c., are attached to their handles by clamping the tang of the tool between a metal head, provided upon its rear part with a wedge-shaped rigid jaw, having projections upon its lower and inner surface, and a perforated jaw adjustable upon the head by a screw arranged exterior to and above that portion of the head in which said jaws move, and journaled in a shoulder on the head, and threaded in the heel of the movable jaw.

In a tool-handle, the combination, with the head *a*, provided with the shoulder *a'*, and projection *a''*, and the movable jaw *c*, of the adjusting-screw *d* arranged exteriorly to the shaft *a'*, and journaled in the shoulder *a'*, and threaded in the heel of the movable jaw *c*, substantially as and for the purpose shown.

167,905. FIRE-LIGHTERS—DISTRIBUTORS, PLANTERS, AND CULTIVATORS. Bolivar Bonfield, Cartersville, Ga. [Filed June 5, 1875.]

167,905.

1. The combination of the three plows Y B' D', the brackets A', the cross-bar C, the connecting-rod B'', the covering-plate T, and the weight U' with the tongue A and the distributing-spouts J K of the machine, substantially as herein shown and described.

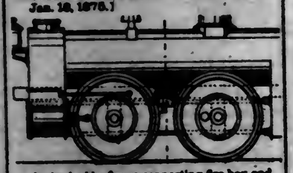


2. The combination of the fifth-rods D', the U-bar B', the rock-shaft B', the weighted cross-bar C', the cords H', the pulleys I', the rigid arm J', the rod K', and the lever L', with the plows Y B' D', and the frame-work of the machine, substantially as herein shown and described.

167,906. CORN-MACHINES. Wm. F. Sevier, Marshall, Mo. [Filed Apr. 17, 1875.]

Brief.—Mounted upon a shaft is a pivoted frame that carries an axle, on either end of which revolves marking-wheels. The axle, at about midway of its length, is provided with tappets, that strike projections on an oscillating bar for actuating the seed-slide.

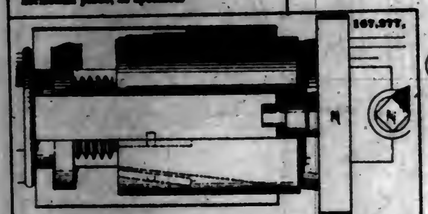
The vertically-moving frame F, pivoted to the shaft A, and carrying marking-wheels, in combination with the axle D, having tappets *a*, oscillating bar B, having arms *f f*, and the sliding bar G, substantially as described, and for the purpose set forth.



167,276.

167,278.

167,276. LOCOMOTIVE-ENGINES. Thos. T. V. Smith, Yarmouth, Nova Scotia. (Filed Jan. 16, 1875.)



1. An inside frame connecting fire-box and cylinders, as described, and provided with a bolster, D, in combination with an outside frame and pivoted bolster, H, substantially as described.

2. The inner frame composed of longitudinal bars bolted to rear overhanging fire-box, and connecting it with the cylinders and transverse bars in front, substantially as set forth.

3. The combination, with inner and outer curved bar frames, bolts, and overhanging fire-box, of the sliding stays, whereby the weight of overhanging fire-box is suspended on outer frame, while it is free to swivel or move in a horizontal plane, as specified.

167,277.

167,278.

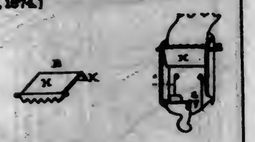
167,277. CHECKS FOR HOLDING BACK HORSES WHEN RIDING TURNING. W. Bell Smith, Charleston, S. C. (Filed July 17, 1875.)

Brief.—An expanding mandrel, which fits in the bore of the coupling, is used for centering the same in position. The flange upon the mandrel rides in a slot of the base-plate, and carries the nut with which the adjusting-screw engages.

The plate A, in combination with the movable expanding mandrel B and screw F, all constructed and operating substantially as and for the purpose described.

167,278. CAR-COUPLINGS. H. H. Spafford, Strongsville, Ohio. (Filed Nov. 24, 1875.)

Brief.—The rounded and curved shoulders of link and draw-head allow link to be set either horizontally or at any angle to enter opposite draw-head.



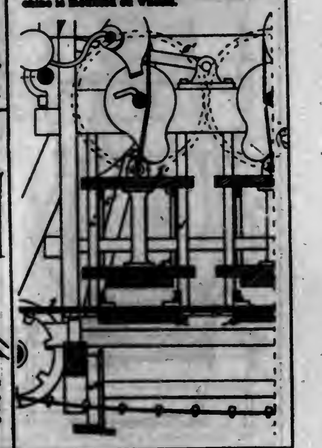
The link D, with shoulders *c* above, and *c'* below, curved and rounded, in combination with fulcrum-bearing *a* of a draw-head, having a shoulder curved and hollowed to correspond with the shoulder of the link, pearl E, pin F, and lever G, substantially as and for the purpose described.

167,279. SODA-BEDS. Augustus Spiegel, Indianapolis, Ind. (Filed Feb. 24, 1875.)

Brief.—The main section of the lounge can be drawn out horizontally, after which the lower section is drawn up on the inclined planes by means of the straps attached to the rollers, the rollers of the lower section resting upon the steps at the tops of the inclined planes.

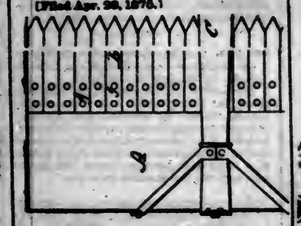
The combination of the lower section G of the bed, provided with the rollers E E E E, the inclined planes G G G G, provided with steps D D at the top, the straps J J, the roller F, the sheave K, and the cord L, substantially as specified.

167,280. BUCKLES. Sherwood Wales, New York, assignor of one-half his right to M. H. Parsons, Tarrytown, N. Y. (Filed Oct. 8, 1874.)



1. In a buckle, the lever B, constructed as described, with leaf H, and with or without fold K, as arranged so to conceal the end of the material, substantially as set forth.

2. In a lever-buckle, the V-shaped projections or indentations G, struck from the sheet-metal bed or tongue, as and for the purpose set forth.



3. In a lever-buckle, a bed-plate cut longitudinally without the removal of its substance, to form a spring-tongue, substantially as set forth.

167,281. BLOCK-PRINTING MACHINES. Frederick Walton, Staines, Great Britain, assignor to American Linoleum Manufacturing Company, New York, N. Y. (Filed Mar. 22, 1875.)

Brief.—Web of cloth is carried under plates by endless belts having pins extending upward into holes in the cloth. The printing blocks reciprocate at right angles to the direction of the cloth, and receive their color from a proper color-trough. The working faces of plates are as apart as the width of the blocks, so that the blocks register with every second fall of plates. The whole machine is mounted on wheels.

167,282. GATHERING MACHINES FOR GATHERING GRAIN-SHEAVES. Jos. R. Symmes, Hamilton, Ohio. (Filed Apr. 30, 1875.)

A hand-instrument for gathering bine-grass and red-top seed, composed of a receptacle, A, elastic teeth, B B, rod, handle C, constructed to operate substantially as and for the purposes herein specified.

167,281. BLOCK-PRINTING MACHINES. Frederick Walton, Staines, Great Britain, assignor to American Linoleum Manufacturing Company, New York, N. Y. (Filed Mar. 22, 1875.)

Brief.—Web of cloth is carried under plates by endless belts having pins extending upward into holes in the cloth. The printing blocks reciprocate at right angles to the direction of the cloth, and receive their color from a proper color-trough. The working faces of plates are as apart as the width of the blocks, so that the blocks register with every second fall of plates. The whole machine is mounted on wheels.

167,282. GATHERING MACHINES FOR GATHERING GRAIN-SHEAVES. Jos. R. Symmes, Hamilton, Ohio. (Filed Apr. 30, 1875.)

A hand-instrument for gathering bine-grass and red-top seed, composed of a receptacle, A, elastic teeth, B B, rod, handle C, constructed to operate substantially as and for the purposes herein specified.

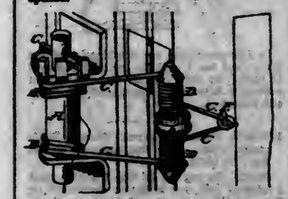
1. The combination, substantially as before set forth, of the endless carrying and supporting bands fitted with pegs projecting from their upper surfaces, (to enter holes punched in the margins of the fabrics,) the supporting-table, and the reciprocating platen for the color-block.

2. The combination, substantially as before set forth, of the endless carrying-bands fitted with pegs, the supporting-table, and the presser-roller for pressing the fabric upon the pegs of the supporting-bands.

3. The combination, substantially as before set forth, of the endless carrying-bands fitted with pegs, and the perforating apparatus, whereby the cloth may be punched in the same machine in which it is carried along.

4. The combination, substantially as before set forth, of the series of reciprocating platens for the color-blocks, the color-blocks supported by spaces, and the guide-bars for said platens arranged opposite the ends of the spaces between said color-blocks.

5. The combination, substantially as before set forth, of the cloth-moving mechanism, the supporting-table, the series of platens for the printing-blocks, and the series of color-tables arranged to reciprocate horizontally between the supporting-table and the platens.



6. The combination, substantially as before set forth, of the reciprocating color-table for the color-pad, the paint-trough, and the doctor.

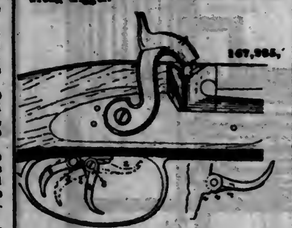
7. The combination, substantially as before set forth, of the supporting-table, the endless carrying-bands, the recessed rubber-wheel, and the pin-thrower.

8. The arrangement, substantially as before set forth, of the supporting-bed, the intermittent cloth-moving mechanism, the series of platens for the printing-blocks, the series of reciprocating color-tables for the color-pads, and the frame of the machine upon supporting-wheels, the whole constituting a locomotive block-printing machine for printing fabrics by means of a series of blocks.

167,283. DOOR-SPRINGS. Lemuel A. Warner, Prescott, Ill. (Filed Apr. 12, 1875.)

Brief.—A supplementary or intermediate coil-spring, formed from the same rod or wire in the form of the arms or levers of the main device, and having a suitable pin passing through it, constitutes an elastic silver-joint, there being a loop attachment to the door, and a short or its equivalent on the door-frame, for suitable fastenings for the ends of the arms; the construction being such that, by means of the silver-joint, the arm is folded up when the door is closed, and is allowed to open and lengthen out when the door is opened.

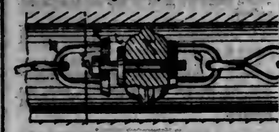
1. The coil-spring D composed of two equal parallel coils, formed in the two parts of the arm or lever C, with suitable fastenings for the ends of the arms, in the manner described and in connection with the pin *b*, constituting an elastic silver joint, whereby the arm is folded up when the door is closed, and is allowed to open and lengthen out when the door is opened, constructed and operating substantially as described and shown, for the purpose specified.



2. The improved door-spring, consisting of the shaft A, or its equivalent, the spring B, the arm or arms C C, the loop E, and the collar D, all substantially as described, and for the purpose specified.

167,284. ANTOMATIC TURNSTILE FOR FIRE-ARMS. Henry Wallbaum, Syracuse, N. Y. (Filed July 12, 1875.)

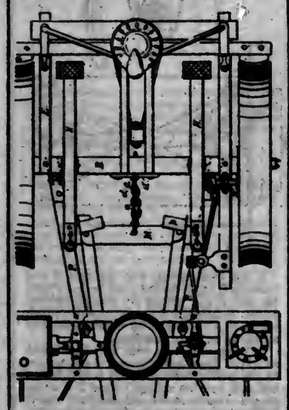
1. An adjustable trigger or fire-arms, to arranged as previously to regulate the length of stock to the person by acting the trigger forward or backward in a line with the trigger-guard.



2. In double-barrel guns, a front trigger pivoted or hinged onto the trigger-block, so that it can be turned up out of the way of the finger, for preventing mistakes in pulling the wrong trigger.

167,285.

167,285. CORN-PLANTER. William Wahrer, Evansville, Ind. (Filed July 10, 1875.)



Brief.—By unscrewing the binding-yoke a seed basket can be slipped on the bolt when desirable to renew. By screwing the set-yoke more or less tightly on the bolt, the basket is more or less compressed and expanded in a radial direction, admitting of an accurate fit of the same to the barrel. The basket has the top swivel, as described.

The combination basket A and set-yoke D, swivel-yoke E of a bolt, B, having head B', flange-plate C, and end screw working in a plate of set-yoke D, as and for the purpose specified.

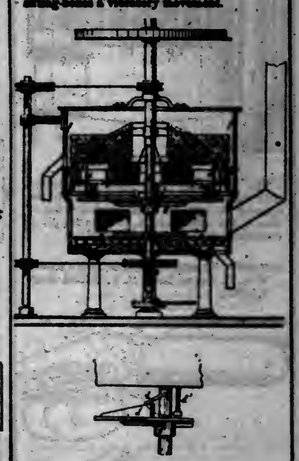
167,286. CORN-PLANTERS. Sumi. Wright, Troy, Ohio. (Filed May 3, 1875.)

Brief.—The wheel and runner frames are flexibly connected by bands hinged at one end, and by an eyebolt, forming a partial swivel at the opposite end. Attached to the runner-frame, and pivoted upon the wheel, are two independent foot-levers, for elevating either side of the runner-frame separately.

1. The combination and arrangement of the foot-levers H, axle B, pivoted beams F, and cross-bar M, substantially as described, and for the purposes specified.

2. The beams F, in combination with the forward and rear frames of a corn-planter, when hinged to the axle so as to allow of only a vertical motion, and united to the forward frame by means of eyebolts, forming a partial swivel, substantially as described, and for the purpose specified.

167,287. TOBACCO-CUTTERS. James L. Adams and J. G. Hondin, Montreal, Canada; said Hondin assignor to said Adams. (Filed May 20, 1875.)



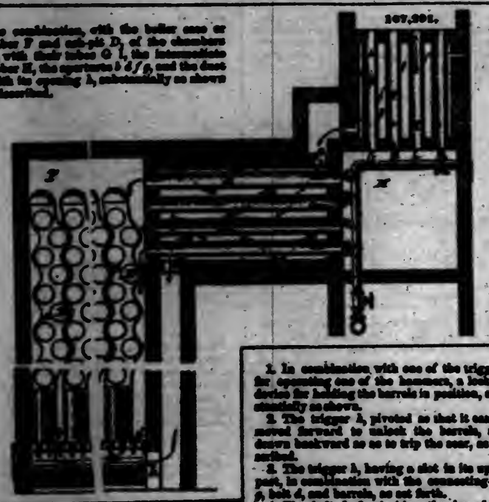
The described machine for shredding tobacco, in which are combined the feeding-plate G, shaft S, disks C, and knife H with the fixed curved plate D', and the knife-plate D, having journal-bearings in the disks, and adjustable by means of set-screw F to regulate the thickness of the cut, as set forth.

167,288. PROCESSES FOR ORNAMENTING CHINA, GLASS, &c. Samuel M. Adams, New York, N. Y. (Filed May 11, 1875.)

The method herein described of ornamenting china, glass, &c., by means of vitrifiable colors mixed with water, and applied to the object to be decorated in a coating of the desired thickness, a design being then printed on or otherwise applied to such coated surface with oil, and then such part of the coating not covered by the said design being brushed off or otherwise removed, the article so decorated being subsequently subjected to heat for the purpose of burning on or fixing the design upon the same, substantially as set forth.

167,289. MILLS. Jules Andre, Paris, France. (Filed Apr. 20, 1875.)

Brief.—Means for giving the cloths of the sifting-boxes a vibratory movement.



In combination with the sifting-boxes *a* in a millstone, the rod *f*, extending down from each box, the levers *d*, and revolving cams *j*, substantially as and for the purposes described.

167,290. FURNACES. Benjamin T. Babbitt, New York, N. Y. (Filed June 28, 1875.)

Brief.—Air to the fire-box is heated by being passed through chambers, inclosing the fire-holes.

The combination, with the boiler case or chamber F and ash-pit D, of the chambers B J, with their tubes C I, the intermediate chamber H, the apertures b f g, and the door L, with its opening k, substantially as shown and described.

167,891.

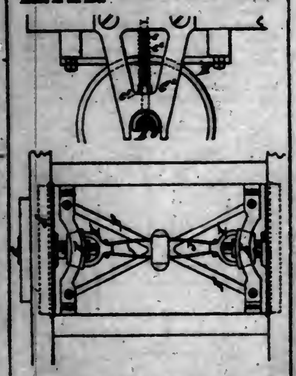
167,892. Smoke-Burning Range. Benjamin T. Babbitt, New York, N. Y. [Filed June 30, 1875.]

Brief.—Heated air is led into the fire-box through vertical tubes that pass through a heating-plate.

The air-heating tubes F, in combination with the smoke-jacket or return flue I, the cylinder E, with its direct smoke-tubes or flues C, the outer case A, and the ash-pit J, essentially as shown and described.

167,893. Breech-Loading Fire-Arms. Wm. H. Baker, Lisle, N. Y. [Filed Aug. 7, 1875.]

1. In combination with one of the triggers for operating one of the hammers, a locking device for holding the barrels in position, substantially as shown.



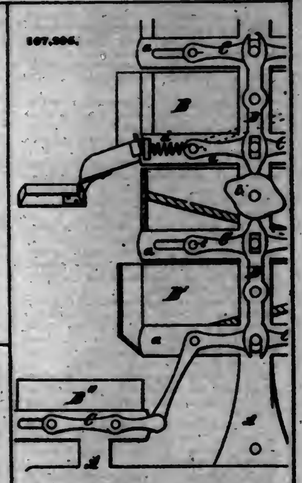
2. The trigger A, pivoted so that it can be moved forward to unlock the barrels, and drawn backward so as to trip the cock, as described.

3. The trigger A, having a slot in its upper part, in combination with the connecting-rod B, bolt d, and barrels, as set forth.

4. The bolt d, for locking the barrels in position, so connected to the hammer-trigger that the barrels cannot be fired until the bolt is forced forward to lock the barrels in position.

167,894. Gun-Trigger. Ramon Rueda, Madrid, Spain. [Filed June 11, 1875.]

Brief.—Each wheel is mounted upon short independent axle, having outside and inside bearing; said inside bearing being supported in a frame, and capable of horizontal movement in an arc.

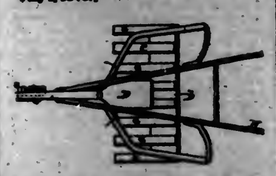


1. The combination, with the axle B and bearings C D, of the rod e and spring S, and the axle G and springs G², whereby vertical motion is allowed to the bearings, either simultaneously or independently of each other, substantially as herein described.

2. The combination, with the wheel A and axle B, of the exterior bearing C and hanger G², the interior bearing D, and slotted bar or frame E, and the springs I I and J J, all arranged as herein shown and described, whereby the wheel is enabled to adapt itself to different curves, and automatically resume its position after passing the same, substantially as set forth.

167,895. Axle-Skeins. William Hammon, Pittsburg, Pa. [Filed Apr. 20, 1875.]

Brief.—A series of graduated sleeves, supported by a vertical standard, are carried by a cam and crank, and made to deliver the material oiled in different places, according to size.



167,896.

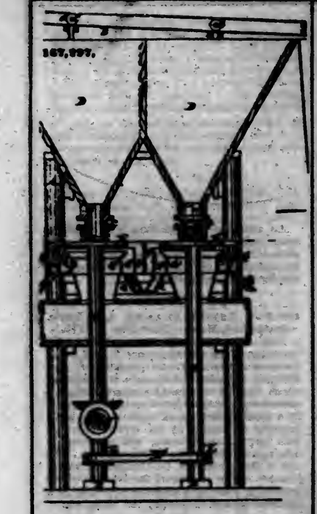
1. The combination, with the vertical series of vibrating screens B B B B, of the vibrating receptacles B² B², substantially as described.

2. The standards A, having the slotted arms a, supporting the beam B B and the vibrating mechanism thereof, substantially as and for the purposes specified.

167,897. Potato-Digger. David Botsford, Warsaw, N. Y., assignor of one-half his right to F. Cushings, same place. [Filed July 1, 1875.]

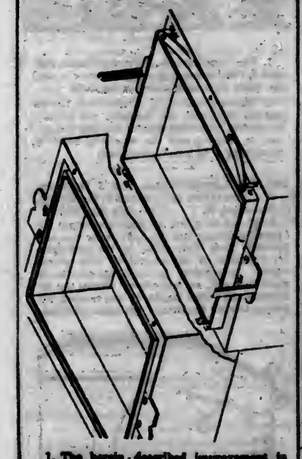
In a potato-digger, the combination of the teeth c and bar b with the removable shovel D, having its sides turned over so as to form a sleeve to fit the teeth, substantially as shown and described.

167,897. Grain-Cleaning. Theodor Bühlmann, Chiens-Zug, Switzerland. [Filed Apr. 26, 1875.]



Brief.—The grain is fed from a hopper upon a rotating disk, and is thrown thereby off by the centrifugal impulse derived therefrom, falling into a succession of receiving boxes. Blowers attached to and rotating with the disk breast the grain into discharge-spouts. A dust-chamber situated immediately below, and communicating with, a suction-fan receives the light impurities caught by the draft from the grain as it flies off the disk.

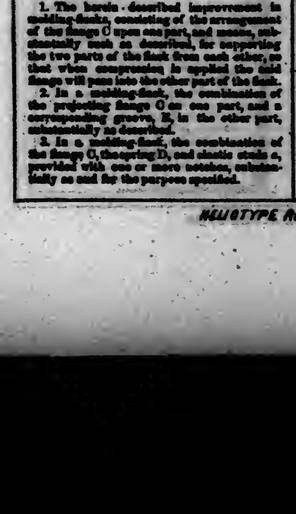
1. The combination, substantially as described, of the hopper D, the rotary disk R, and casing G, divided into a series of concentric annular compartments, as and for the object specified.



2. The combination of the rotary disks R, having the spherical R² attached thereto, with the casings G, divided into concentric annular compartments, and provided with spouts Q, substantially as and for the object hereinbefore described.

3. The combination of the horizontal rectangular supporting sieve-frame F, the sieve E, and the transverse cover cross-bars C, resting at their ends against the sides of the sieve-frame E, and constructed to be adjusted for varying the longitudinal play of the frame relative to or from each other, substantially as described.

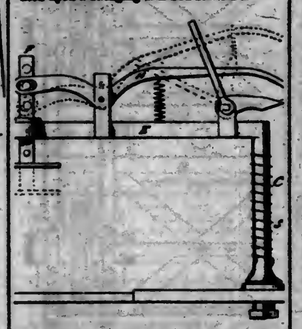
167,898.



167,898. Molding-Machine. Benjamin B. Bennett and Geo. T. B. Manley, Stamford, Conn. [Filed Apr. 27, 1875.]

4. The combination, with the rotary disks E and the casings G, constructed with a series of compartments, of the dust-box H, arranged below, and communicating with the said disks and casings, and the fan O, connected with the dust-box by the vertical flue N, substantially as and for the purposes described.

167,899. Molding-Flasks. Benjamin B. Bennett and Geo. T. B. Manley, Stamford, Conn. [Filed Apr. 27, 1875.]



1. The herein-described improvement in molding-flasks, consisting of the arrangement of the flanges C upon one part, and recess, substantially such as described, for supporting the two parts of the flask from each other, so that when compression is applied the said flange will pass into the other part of the flask.

2. In a molding-flask, the combination of the projecting flange C on one part, and a corresponding groove, E, in the other part, substantially as described.

3. In a molding-flask, the combination of the flange C, the spring D, and elastic studs a, provided with one or more notches, substantially as and for the purposes specified.

167,900. Molding-Machine. Benjamin B. Bennett and Geo. T. B. Manley, Stamford, Conn. [Filed May 4, 1875.]

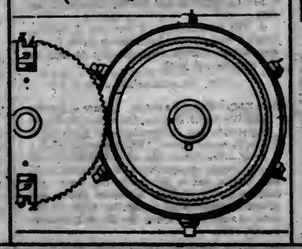
Brief.—A press-platen adjusted and operated upon a swinging arm and standard.

1. The combination of the arm E, the slide F, carrying the platen G, the lever H, cam I, and its lever P, substantially as described.

2. The combination of the post C, the arm E, platen G, and lever H, all substantially as set forth.

3. The combination of the arm E and the mechanism thereon, the pivoted post C, supporting said arm and mechanism, and the spring S, for automatically turning the apparatus, substantially as described.

4. The combination of the arm E, lever H, cam I, and its lever P, and the slide F, with the platen G hung to the said slide by a loose or universal joint, substantially as set forth.

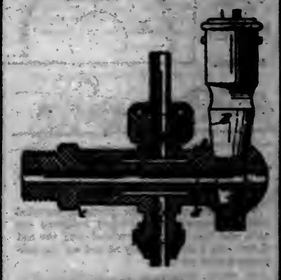


167,901. Hair-Tie Retainers. Geo. Burnham, Jr., Yardleyville, Pa. [Filed June 30, 1875.]

The within-described neck-tie retainer, consisting of the spring-arms b b' for grasping the fold of the collar, and the spring-tongue b for holding the tie, all constructed and arranged as set forth.

167,902. Knitting-Machine and Knit Fabrics. Frank Burns, Waltham, Mass. [Filed June 12, 1875.]

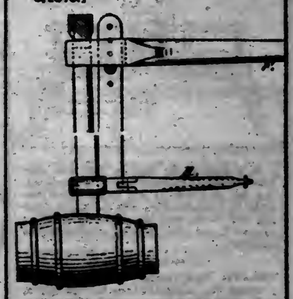
Brief.—A needle is taken out of one or more points in the circle, and the rotating rollers in the present operate to alternately press and raise the bands of two needles on each side of the space left by the needle which has been taken out. These two needles, therefore, form loops only at every alternate revolution of the machine, and these loops are twice the length of those in the body of the fabric.



1. In combination with a rotary knitting-machine, a rotating pressure-wheel, provided with one or more rollers, D, adapted to rotate intermittingly, and press alternately upon two needles on each side of the space left by the removal of one needle, substantially as and for the purposes herein set forth.

2. The rotary pressure-wheel U, provided with the rollers D, constructed as described, with notches *a a*, recess b, and tongue d, in combination with the hook h and spring f, substantially as and for the purposes herein set forth.

3. A knitted fabric, having one or more seams, c, and a rib, w, of long loops on each side of each seam, substantially as shown and described.

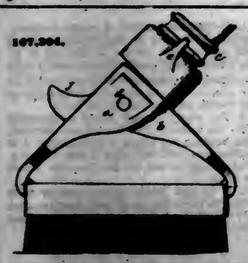


167,903. Pot-Cocks for Locomotives. Fred A. Casey, Elkhart, Ind., assignor of one-half his right to E. Bourge, same place. [Filed Feb. 24, 1875.]

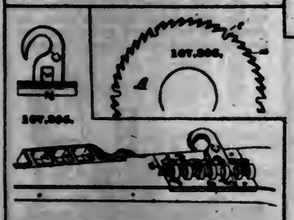
Brief.—For winter use the movable hollow plug is screwed against the seat in the body of the cock, when steam from the boiler will enter the chamber surrounding said plug and prevent freezing. Water from the cylinder and chamber passes out through the channels leading from the latter. For summer use the joint between the plug and its seat is broken, the channels for the escape of water closed, and the water in the steam-jacket pumped to the boiler.

The combination, with the barrel A and plug or key B of a pot-cock, of the hollow plug C, forming steam-tight joints at *c d*, the annular chamber *f*, inlet h, and outlet i, all substantially as and for the purposes herein set forth.

167,904. Tire-Tightening Machine. J. Champlin, Penn Yan, N. Y. [Filed Aug. 5, 1875.]



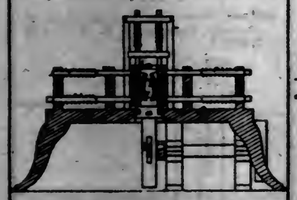
In a tire-tightener, the forked lever F, in combination with the fulcrum G and tongs H, all substantially as and for the purpose set forth.



167,905. Mop and Broom Holders. C. B. Clark, Buffalo, N. Y. [Filed Aug. 4, 1875.]

167,894.

The combination, with the fixed jaw *a*, having a slotted screw-threaded shank, *i*, and a thumb-nut, *c*, applied thereto, of the movable jaw *b*, pivoted within said slotted shank, and having its rear end constructed with a lever, *j*, on which the nut operates, so that said rear end is controlled by the nut, and formed to center the shank by tightening said nut, substantially as and for the object specified.



167,895. HARNESS-MAKERS' J. P. Clopton, Milan, Tenn. [Filed Mar. 6, 1875.]

The combination of the plate B, provided with the curved hooks *b b* and hollowed out at *a*, and the hook C, provided with the rod *d*, and slot *f*, substantially as and for the purpose herein set forth.

167,896. MACHINES FOR PITTING COATINGS TO LASTS. Louis Goin, St. Hyacinthe, Canada. [Filed Apr. 2, 1875.]

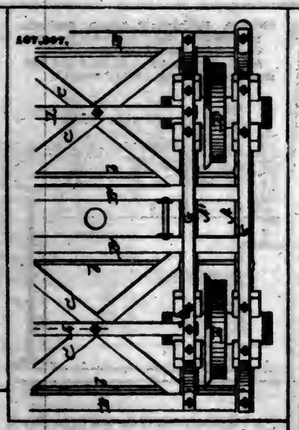
Brief.—The counter is pressed around the form by means of yielding jaws and rollers.

In a machine for shaping boot and shoe counters, with rollers to bend, as described, the last or former D and its operative carriage B, in combination with the lateral-yielding jaw E E, and the vertically-yielding presser F, and roller G, being substantially as specified.

167,897. GAS-TRAPPERS. C. H. Cox, Richmond, Va., assignor of one-half his right to Josiah I. Martin, same place. [Filed Aug. 14, 1875.]

Brief.—Peculiar frame-work of cross-pieces supporting independent small-sided vessels, on which rests operating-bar, containing springs and cut-body.

1. In a car-truck, the combination of the rectangular frame A B, interior beams A' A' and B' B', and cross-beams *c c*, as shown and described.



2. The combination of the hangers D, journal-boxes *d*, wheels E, with short axles *e*, strap-bars G, connecting-bars *f*, and springs H, all substantially as and for the purposes herein set forth.

167,898. MACHINES FOR PUNCHING AND PERFORATING PAPER. William Dunkin, Brooklyn, N. Y. [Filed June 26, 1875.]

The circular cutter A, having teeth upon its periphery, with bevel or knife edges *c*, and lantern *a* at suitable intervals, and of sufficient depth to extend below the cutting-surfaces of the teeth, substantially as and for the purpose specified.

167,899. FOLDING AND PERFORATING MACHINES. William Dunkin, Brooklyn, N. Y. [Filed Aug. 12, 1875.]

Brief.—The folding-arm has a perforating-blade, which perforates the sheets, and then turns back and permits the folding-blade to carry them between the rolls. A rotary cutter then makes a line of perforations on the line of the second fold, while the sheet is on the way to the second set of folding-rolls. The sheets, when folded, are perforated on the folds, so that they can be easily separated by tearing.

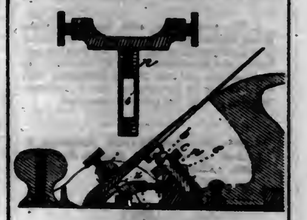
1. The combination, with a paper-folding mechanism, substantially as described, of a rotary perforator, whereby the sheets are folded and perforated on the line of the next fold, for the purpose set forth.

2. In a paper-folding machine, the combination of the rotary perforator B, clamping disks or plates *g*, and carriage *i*, arranged to slide endwise and vertically within a frame, *k*, substantially as and for the purpose specified.

3. The combination of the arm *f*, folding-blade *l*, and pivoted perforating-knife F, constructed to operate substantially as and for the purpose set forth.

167,900. PILE FABRICS. Henry J. Davies and Walter D. Davies, Brooklyn, N. Y., assignors to Jas. G. Bennett and Andrew H. Smith, same place. [Filed Mar. 6, 1875.]

Brief.—The fabric has curved form and serrations, which present area of different radii and length, and is set up in bat form by a carding-engine, having a conical doffer, and otherwise constructed to produce a curved bat, such as shown in Patent No. 155,393, September 29, 1874.

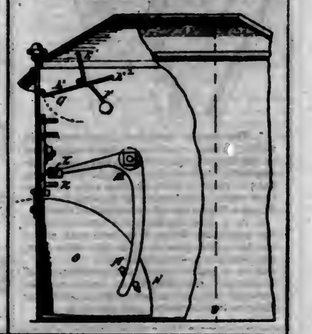


167,901.

An article of manufacture from which to make ladies' skirts, &c., consisting of a felt cloth of a curved form, having selvages which present area of different radius and length, as and for the object specified.

167,902. BENCH-PLANES. L. L. Davis, Springfield, Mass. [Filed Mar. 3, 1876.]

Brief.—The bit is adjustable longitudinally by means of an abutting piece formed upon the base of the stock, and provided with an obliquely-threaded socket, and a support upon which the bit rests, said support having a threaded pin upon its lower part, and operated by a thumb-screw turned upon it. The bit is laterally adjustable by set-screws provided with large flanged heads, and operating in bearings on either side of the support. The size of the throat can be changed by an adjustable wedge in rear of the bit, the whole secured in place by a set-screw operating in a cross-bar located in front of the plane-iron.

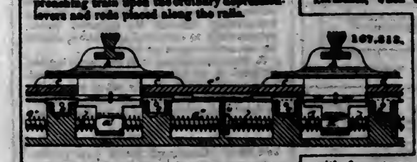


1. The combination of the adjustable support *b*, the lateral adjusting-screws *a a*, and the screw E, substantially as set forth.

2. The combination of abutment D, the adjustable support *b*, the threaded pin *n*, nut *o*, the lateral adjusting-screws *a a*, the wedge *f*, and its screw *p*, and the clamping-screw E, substantially as herein described.

167,903. LETTER-BOXES. Jas. J. De Barry, T. J. Lendqvist, and Almiras T. Lendqvist, Brooklyn, N. Y. [Filed July 30, 1875.]

Brief.—A weighted tilt-plate discharges the deposited letters into the body of the box, and prevents their abstraction by the particular arrangement of its serpentine wire guard-wings. In opening the discharge-door to remove the mail, an angle-lever raises the indicating-disk the length of one ratchet, exposing to view the time of the next collection.



1. The combination, substantially as described, of the mail-opening H, rock-shaft D, radial arms E E', weighted arms F, and drop-bar G, the whole constructed and arranged to operate substantially as described.

2. The combination, with a street letter-box, provided with an opening, I, the rotating ratchet-indicating-disk, provided with a series of pins on its rear face, the angle-lever M, and drop-door O, provided with the pins N N, for operating said lever and ratchet-disk, substantially as described.

167,904. RAILWAY-SWITCHES. Clifford P. Dayton, New York, N. Y., assignor of one-half his right to Henry B. Pratt, same place. [Filed May 10, 1875.]

Brief.—A railway-switch in which the movable rails are secured to chairs, which have a downward-projecting arm or flange, through which passes a rod carrying coiled springs, which act to keep the rails in proper alignment with the main line. Said chairs have overhanging guards, which slide upon curved seats on top of the box, which contains the operating mechanism. The rails are secured in position by spring-levers, which carry pins or lugs, which pass into holes in the operating-lever, and they are withdrawn and the rails released by the action of the wheels of an approaching train upon the ordinary depression-levers and rods placed along the rails.

1. The sliding plate A, with its projection *a'*, in combination with the spring-bar *a''*, switch-bar *c*, and box *b*, in the manner and for the purpose herein described.

2. The raised and curved plates *e e e*, formed upon the cover *d'* of the box *b*, in combination with the sliding plate A, in the manner and for the purpose herein described.

3. The bars *d d*, curved at or near their center, having formed upon them the projecting points or lugs *g'*, in combination with the switch-bar *a*, springs *d''*, follower *d'''*, and retracting-rods *m*, in the manner and for the purpose herein described.

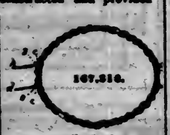
4. The recesses *g g*, formed within the box *b*, to receive the springs *d d*.

5. The box *b*, when constructed and arranged as herein described, so as to contain within the same the spring-bar *a''*, switch-bar *a*, bars *d d*, springs *d''' d'''*, and recesses *g g*, in the manner and for the purpose herein described.

The joiner's or carriage-maker's clamp herein described, comprising the clamp-arms A B, sliding metallic jaw or casting E, and the clamping-screw C, all constructed and combined substantially as herein set forth.

167,905. OVERALLS. George R. Hagar, Boston, Mass. [Filed Dec. 11, 1874.]

Brief.—Each section of the waistband may be adjusted independently of the other



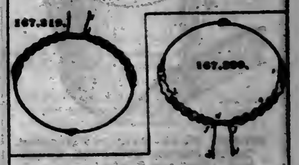
A pantaloon-garment provided with a bottom waistband, *a*, strap or straps C secured thereto, and with a pair of buckles, *b b*, the whole being arranged and constructed in the manner substantially as set forth.

167,906. OVERALLS. George R. Hagar, Boston, Mass. [Filed Mar. 10, 1875.]

1. A waistband for pantaloon and other garments, when constructed and provided with four straps, *d d'* and *b b'*, and their respective buckles *a*, *c*, *m*, and *e*, in the manner and for the purpose set forth.

2. A hollow waistband, provided with a strap and buckle, when the opening for the passage of the strap out of the waistband is lined with leather *d*, or its equivalent, for the purpose set forth.

167,907. OVERALLS. George R. Hagar, Boston, Mass. [Filed Aug. 27, 1875.]



A strap for a waistband for pantaloons and other garments, made partly of cord or other round and suitable material, and partly of cloth or other flat material, substantially as and for the purposes set forth.

A waistband for pantaloons and other garments, when provided and arranged with a strap or straps, and with two buckles, *a* and *a*, at the sides, and another, *p*, in the middle, in the manner substantially as and for the purpose set forth.

167,908. OVERALLS. George R. Hagar, Boston, Mass. [Filed Mar. 10, 1875.]

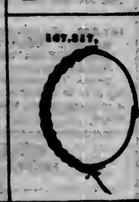
A hollow waistband for garments, when such is constructed and provided with two straps, *c c'*, attached to the waistband, two buckles, *f*, and two blank buckles, *b b'*, in the manner and for the purposes set forth.

167,909. OVERALLS. George R. Hagar, Boston, Mass. [Filed Mar. 10, 1875.]

An unattached strap, *d*, provided with two buckles, *f f*, in combination with a waistband made in two parts, *a* and *b*, each of which is provided with a loop or blank buckle, *c* or *c'*, in the manner and for the purpose set forth.

167,910. OVERALLS. George R. Hagar, Boston, Mass. [Filed Mar. 10, 1875.]

A waistband for garments, when constructed and provided with two straps *b b'*, and four loops or blank buckles, *c c'* and *d d'*, in the manner and for the purposes set forth.



167,911. WRISTLETS AND NECK-YOKES. Geo. W. Eddy, Waterford, N. Y., assignor to L. K. Eddy, Philadelphia, Pa. [Filed July 8, 1875.]

1. As an improvement in the construction of wristlets and neck-yokes the tubular body A and the central re-enforce or sleeve B, constructed substantially as described.

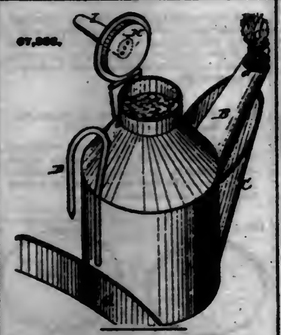
2. In combination with the tubular body A the wood filling applied therein, substantially as shown and described.

3. In combination with the tubular body A the terminal or caps D, constructed and applied substantially as set forth.

167,912. JOINTS OF CLAMPS. W. J. Dealey, Camden, N. J. [Filed July 7, 1875.]

Brief.—The space in the rear of the clamping-screw can be varied, to hold various-sized articles, by means of a longitudinally-adjustable jaw or metallic casting, composed of two side and two end connecting-plates, and provided with ribs, which hold it in place while sliding by bearing against the inner sides of the longitudinal bars.

167,913. OVERALLS. George R. Hagar, Boston, Mass. [Filed Mar. 10, 1875.]



167,914. MINERS' LAMPS. William Byron and Richd. C. Cook, Hyde Park, Pa. [Filed Mar. 17, 1875.]

Brief.—The lamp is provided with an oiling-spout.

1. In a miner's lamp having the oil-reservoir A and lid or cover B, the oiling-spout I, located in the cover and forming part of the lamp, substantially as and for the purpose herein set forth.

2. The combination, with a miner's lamp, of the stationary metallic cup-piece G and the stationary hook above the same, all substantially as set forth.

167,202.

167,204. Rock-Drilling Machine. Camille Fevrier, Gouvieux, Switzerland. [Filed Aug. 6, 1874.]

Brief.—A stationary cylinder is furnished with a hollow rod and piston, which carries the working-cylinder. Compressed air admitted back of the hollow piston feeds up the drill-cylinder, to which air is conducted through the hollow piston-rod. A pawl on the cylinder engages in a rack, and holds the cylinder stationary until the anvil advances sufficiently to raise the pawl.

167,204.

1. The rock-drilling machine, consisting of the pivoted bars B, the fixed cylinder A secured between the rear ends of the bars, and provided with the piston and piston-rod D, and the sliding cylinder K, supported by the bars, and provided with the piston-rod D, and containing the piston I, the drill-carrying rod M, all arranged and operating as shown and described.

2. In a rock-drilling machine, the combination of a sliding cylinder, K, provided with the drill-operating piston, and moved continuously forward by means of a cylinder and piston behind it, and a dog, T, attached to the sliding cylinder, engaging in a fixed rack, to prevent the advance of said cylinder, and arranged to be released by the piston when the latter is at full stroke, as shown and described, whereby the drilling-cylinder is advanced by the direct and instantaneous action of the rear piston in regular steps or stages, and automatically.

3. In combination with the stationary cylinder A, piston C, and sliding cylinder K, the hollow piston-rod D, serving both to communicate motion to the cylinder K and to conduct air or steam thereto.

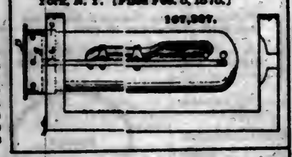
4. In combination with the cylinder K and the arm T pivoted thereto, the piston I, arranged and operating as shown and described.

5. In combination with the hollow piston-rod D, and the bars B having the teeth p, the small pinions r mounted in the rod D, and engaging in the teeth, as shown.

167,205. Bird-Cages. John L. Fisher, Buffalo, N. Y., assignor to Caroline Fisher, same place. [Filed Jan. 9, 1875.]

Brief.—The lower ends of the vertical wires are inserted in the tubular horizontal band, and bent at right angles and held by a key.

In a bird-cage, the combination, with the band B, of the vertical wires C, having right-angled hooks at their lower extremity, whereby they are locked within the said band by the circular wire F, substantially as described.



167,206. Cane-Shellers. Jos. S. Foster, Auburn, N. Y. [Filed July 30, 1875.]

Brief.—Special construction of casing, whereby the rub-iron and its adjusting-screw are secured or detached simultaneously with and by the same fastenings as the two parts of the casing.

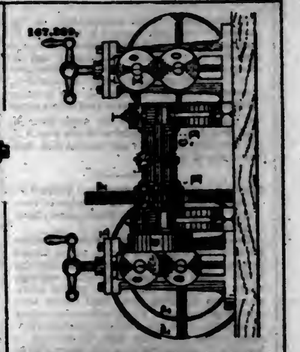
The combination of the case A B with spout C, having smooth and straight interior sides, the ribbed spring H, placed in the top of the spout, and the bolt I and set-screw f, passing through holes cast in the edges of the two halves of the spout, substantially as and for the purposes herein set forth.

167,207. Thermometers. Jos. Gall, New York, N. Y. [Filed Feb. 6, 1875.]

1. As a new article of manufacture, a transparent thermometer-case, perforated at its upper and lower ends, and closed at its upper end by a cap, within which is fitted a device wherein is received the upper end of an inclosed thermometer-scale, said scale being adjusted and held in position thereby, substantially as described.

2. The combination of a transparent thermometer-case, perforated at its two ends, with a thermometer and scale, substantially as and for the purposes described.

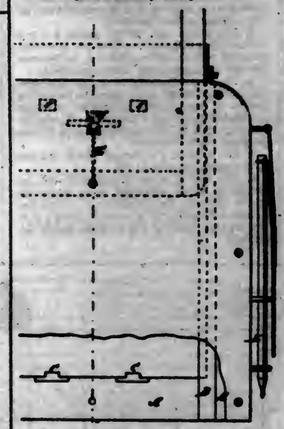
167,208. Diaper-Pins. Elam H. Gaylord, Waterbury, Conn. [Filed May 11, 1875.]



As a new article of manufacture, the herein-described diaper-pin, consisting of a single piece of wire, pointed at one end, and at the other bent into a transverse loop, and this loop doubled to form the hook or guard *d* for the point of the pin, and the wire bent or coiled to form the spring C, the point turned into the said loop, substantially as set forth.

167,209. Machines for Making Rope-Moldings. Henry Glass, Buffalo, N. Y., assignor of one-half his right to Peter C. Glass, same place. [Filed May 26, 1875.]

Brief.—The material from which the molding is to be formed is caused to pass through a rotating cutter, which gives it the desired shape.



1. The combination, with the frames I I, having the bearings for the cutter-head, and for the main shaft, of the shaft D, pinion E, spur-wheel F, cutter-head C, and the feeding device, consisting of the shoulders B B', provided with adjustable yielding bases, and the grooved friction-wheel G, the wheels arranged to operate substantially as described, and for the purposes set forth.

The combination, with the grooved frame A, having bottom cushions O and slots J, of the plate O, provided with cord E, as and for the purposes described.

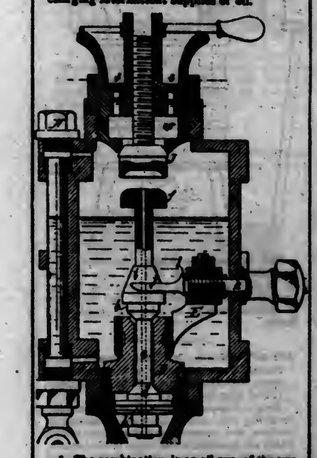
167,210. Combined Bolsa and Ottoman. Jos. S. Gold, Washington C. H., Ohio. [Filed Mar. 6, 1875.]

1. As a new article of manufacture, a bolsa and ottoman, combined substantially as described.

2. The combination, with the bolsa A, of the ottoman B, hinged thereto, substantially as described.

167,211. Extension-Tables. Ferdinand Goldmark, Williamsburg, Brooklyn, N. Y. [Filed Feb. 3, 1875.]

Brief.—The leg-frames are forced out by spiral springs, and support the hinged leaves in an extended position.



1. The combination, with the extension-leaves parts of the table, of springs applied to the said slides, substantially as described, for the purpose set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

2. The coiled springs *a c*, the guide-rods *b b'*, the bearing C, in combination with the slides B E and B' E', and the fall-leaves D D' of the table, all arranged and combined substantially as described, and for the purpose set forth.

167,212. Oil-Cups. John Graham, Philadelphia, Pa., assignor to George R. Kirk, same place. [Filed Apr. 7, 1875.]

Brief.—The oil-cup is secured to the cylinder of valve-chests of steam-engines, in which the valves are operated by the pressure of steam within the cylinder, for the purpose of discharging intermittent supplies of oil.

1. The combination, in an oil-cup, of the two valves *b* and *d*, with the conical valve *i* and forked arm *j*, all substantially as set forth.

2. The gage-tube K, contained within a recess in the side of the cup, across the front of which recess extends a rib, *y*, as and for the purpose set forth.

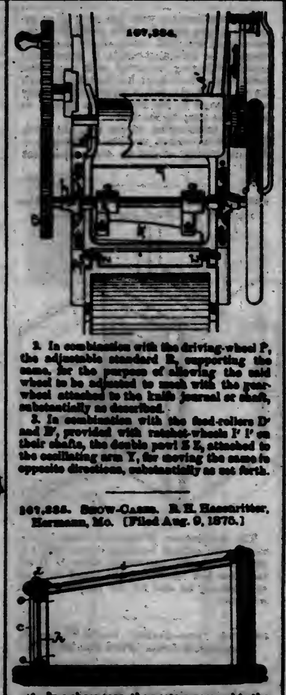
3. The combination of the sleeve *r* and its perforated flange *s*, with the passages *s* and chamber *w* in the plug P, and with the valve J, all substantially as and for the purposes set forth.

4. The combination of the hollow stem *e* and its head *f*, with the valve J, all substantially as set forth.

5. The combination of the sliding valve *d*, with the stem *e*, its fixed valve *h*, and ring *h*, all substantially as set forth.

167,213. Gas-Burners. Samuel Griffith and John H. Patterson, Cincinnati, Ohio. [Filed Mar. 22, 1875.]

Brief.—Pressure produced by crowding distributed by supporting-pieces throughout the trunk.



The slotted coupling-heads C *c* and C' *c*, in combination with the draw-bar N, bars b and *b*, springs B and B', fixed blocks F and F', cross-timbers D D, and extra dills *a a*, all arranged substantially as and for the purpose set forth.

167,214. Straw-Cutters. Wm. H. Hall, Tiffin, Ohio. [Filed July 22, 1875.]

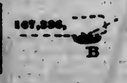
Brief.—The journal-boxes bearing the knife-shaft have a slight oscillating motion, to allow the adjustment of the knives to the cutter. The box bearing the driving-wheel is adjustable to regulate the mesh of the wheel in accordance with the adjustment of the knives. The feed-rollers are moved by a double pawl.

1. The journal-boxes F F, in which the knife-shaft has its bearings secured on the main frame C on opposite sides, and capable of a slight oscillating movement for adjusting the knives to the cutters, all substantially as set forth.

2. In combination with the driving-wheel P, the adjustable standard R, supporting the same, for the purpose of allowing the said wheel to be adjusted to mesh with the gear-wheel attached to the knife journal or shaft, substantially as described.

3. In combination with the feed-rollers D' and E', provided with ratchet-wheels F' F' on their shafts, the double pawl S S, attached to the oscillating arm Y, for moving the same in opposite directions, substantially as set forth.

167,215. Snow-Guard. B. H. Hasenritter, Hermann, Mo. [Filed Aug. 9, 1875.]

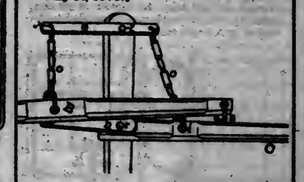


1. In a show-case, the posts *a*, secured to the base and top by means of the screws *d d'*, and braced in position at both ends by the strips *e*, the said strips also serving to hold the glass in position, substantially as shown.

2. The bottom *a*, posts *a*, and screws *d d'*, in combination with the doors *c*, glass *h*, top *i*, and strips *e*, as shown and described.

167,216. Manufacture of Dental Plates. Fred. Hohmann, Bowling, and Gilbert G. Hickman, Philadelphia, Pa. [Filed Apr. 17, 1875.]

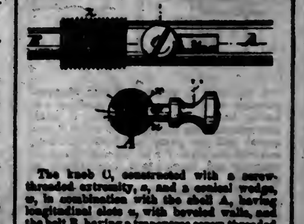
Brief.—In order to secure a piece of soft rubber to a dental base, a piece of metal with prongs on one side is inserted in the base in process of manufacture, with a piece of paper or like material placed between it and said plate. After the plate is prepared, the paper is removed, and in the hollow formed by it the soft rubber is placed.



167,216.

B

1. The combination, with the retaining or adjusting plate B, of the piece of material C, interposed between said plate and the dental base during attachment of the plate to said base, and subsequently removed for location of the rubber or other strip of the base, as set forth.



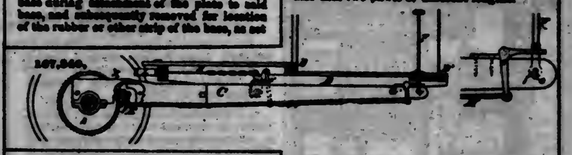
167,217. Draft-Equalizers. Almon Hunt and Benj. M. Butterfield, Macomb Ill., said Butterfield assignor to said Hunt. [Filed July 24, 1875.]

The lever C, arm *a*, lever *c*, and flexible chains *c c*, in combination with the double-tree B, as and for the purpose set forth.

167,218. Door-Bolts. Henry J. Ess, Seymour, assignor to himself and H. Maiden, Bridgeport, Conn. [Filed July 17, 1875.]

Brief.—A cylindrical shell, screw-threaded, and with driving-nick at one end for its more easy insertion into an auger-hole mortice, is provided with a detachable knob-screw, constructed with a conical wedge on its shank near the knob. One or more longitudinal slots in the body of the shell or bolt-case have beveled walls, with which the conical wedge of the knob engages, to lock the sliding bolt in desired position.

The knob C, constructed with a screw-threaded extremity, *a*, and a conical wedge, *c*, in combination with the shell A, having longitudinal slots *s*, with beveled walls, and the bolt B, having a transverse screw-threaded socket, *v*, substantially as and for the purpose specified.

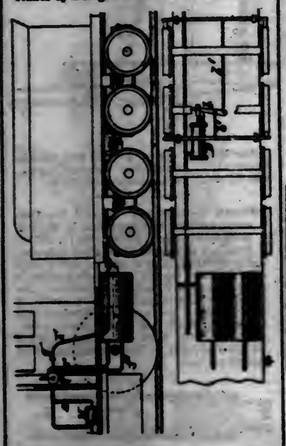


167,219. Device for Securing Rubber Tires. John Stewart Stewart, Memphis, Pa., assignor to himself, Orrin Luten, Wm. Newberry, and James F. Caldwell, same place. [Filed Mar. 30, 1875.]

As the improvement herein before described, the combination, with the tube, of the flange F turned inward or rolled over the flared end thereof, as set forth, for the purpose specified.

167,220. Car-Starters. Ashby A. Jones, Utica, N. Y., assignor to himself and J. F. Chamberlain, same place. [Filed Dec. 26, 1874.]

Brief.—Dispenses with tube heretofore used to limit play of trunk-rod in starting the pawl in position before operating the starting mechanism. Substitutes small pin and slot; also uses two parts of different lengths.

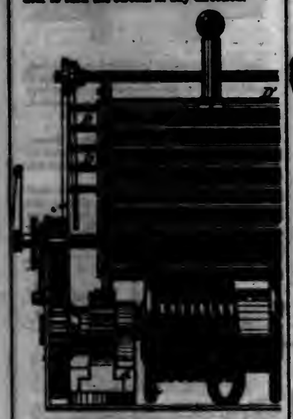


The combination, with the main lever C, having the vertical slot *c*, of the foot-rod F, having the yoke and bolt *f*, the elbow-lever G, rod H, a pawl, and a ratchet-wheel fast on the axle, as shown and described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

167,841. PNEUMATIC CAR-BRAKE. Henry F. Knapp, New York, N. Y. (Filed July 6, 1875.)

Brief.—There are two tanks—one for compressed air, the other to contain a vacuum, either or both of which may be applied to the brakes by a single cock.

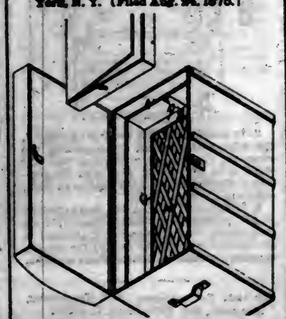


1. The cock G, constructed with diagonal passages *a a*, and transverse passages *c d*, having branches *e f*, for operation in alternate relation with the pipes *e F* and *f F*, connected with the pump and brake-cylinders, and with the pipes *f' e'* of the compressed-air reservoir and vacuum-tank, substantially as specified.

2. The combination of a vacuum-tank and compressed-air reservoir with the pump and brakes, substantially as and for the purposes described.

167,842. PASSENGER'S EXTENSION-LADDER. Sebastian Kern, Louisville, Ky. (Filed May 7, 1875.)

Brief.—The ladder-rounds are covered with tubes of india-rubber, to prevent the feet from slipping, and also to prevent the formation of ice. The ladder, as it is extended, carries with it a hook, which is secured to the upper end by an adjustable socket, which enables the operator to turn the steam in any direction.



1. In combination with the connecting-tube D D of an extension-ladder, the elastic tubes D', substantially as and for the purposes set forth.

2. In combination with the ring of an extension-ladder, the adjustable socket H O, the parts being arranged substantially as shown, whereby the discharge-nozzle M is rendered capable of having imparted to it a vertical movement, a movement horizontally through the arc of a circle, and of being placed at any required angle in the ring of the ladder, as and for the purposes set forth.

3. The combination of the rod, the hook, the adjustable socket, and the discharge-nozzle, substantially as and for the purposes set forth.

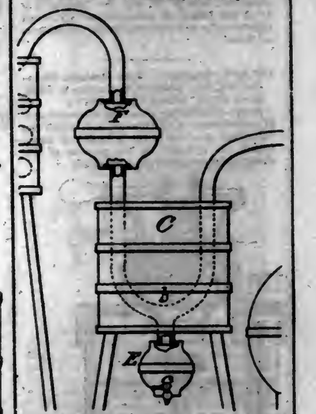
167,843. TROUSER. James W. Kroppe, New York, N. Y. (Filed Aug. 24, 1875.)

The combination of skeleton frame G, provided with central webbing H and bolts *b b*, with the convex perforated strips D D attached to the interior of the trunk-body, all substantially as and for the purposes herein set forth.

167,844. TUG-SLIDE. David W. Leahy, Pleasant Hollow, Iowa. (Filed Mar. 26, 1875.)

The combination of the bars A A, having slots *a a*, and bars *b b*, cross-bars D D, and central bent cross-bar B, all substantially as set forth.

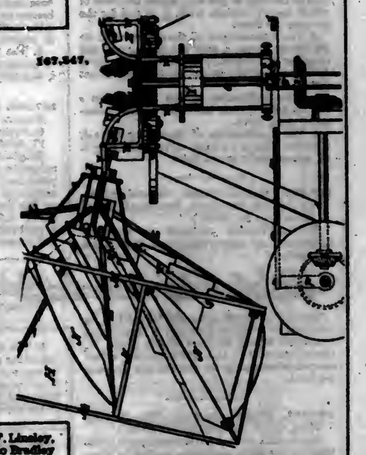
167,845.



167,846. LAMP-FOUNTS. Chas. F. Lindsey, West Meriden, Conn., assignor to Bradley & Hubbard Manufacturing Company. (Filed July 27, 1875.)

1. A lamp-fount constructed with a central socket, B, combined with a metallic bushing, *a*, substantially as and for the purpose specified.

2. In combination with a lamp-fount constructed with a central socket, B, the base D, constructed with a spindle, C, corresponding to said socket, and with the screw S as a means for attaching the said base to the fixture, substantially as described.

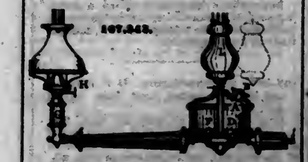


167,846. STILLS. Edwin D. Lovejoy, Buffalo, N. Y. (Filed May 1, 1875.)

The intermediate water-condenser C, in combination with the still A, pipe D, bent in U-shaped form in the condenser C, and provided with the bulbs B F, and the worm W, substantially as and for the purpose set forth.

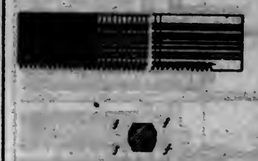
167,847. WIND-FOWER. Austin Lowe, Saline, Kans., assignor of two-thirds his right to D. C. Skinner and T. R. Skinner. (Filed May 10, 1875.)

Brief.—The combination of two horizontally-revolving wind-wheels turning in opposite directions, and mounted on independent shafts, which are arranged at an angle to the horizon, the wind-wheels being provided with pivoted self-feathering or adjusting sails, which are connected with a governing mechanism.



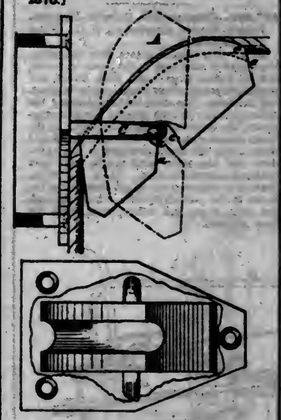
1. The combination of the horizontally and reversely revolving wind-wheels H I, having self-feathering or adjusting sails B', independent driving-shafts F, inclined bearings, blocks E, turn-table D, and central vertical power-transmitting shaft O, geared to the wheel-shafts, as and for the purposes set forth.

2. A wind-wheel of a conical or dished form, provided with a series of movable sails or blades, F', arranged and operating as set forth.



167,848. LAMPS. John Mayer, Buffalo, N. Y. (Filed Feb. 18, 1875.)

Brief.—The feed-tubes are supplied from the reservoir through apertures in the connecting-piece.



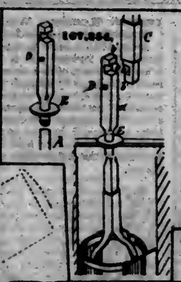
In a lamp constructed as herein described, the combination of the two branches E with the central supporting-piece D and the walls of the oil-tank A, for giving additional strength to the said branches, substantially as shown and described.

167,849. METALLIC STRIPS FOR SHOE-NAILS. Gordon McKay, Cambridge, Mass. (Filed July 15, 1875.)

A strip for shoe-nails, pointed and corrugated or grooved longitudinally, as described, to form bolding projections *b* on each nail, substantially as set forth.

167,850. CLOTHES-LINE FASTENERS. Henry Moss, Baltimore, Md. (Filed Mar. 29, 1875.)

In combination with the staple or axis C, the removable block A, constructed with the curved back, having a longitudinal groove, *d*, extending from the top of the block to the inclined biting-surface *f*, and the inclined surface *e*, enlarged recess E, and shoulder *b*, all substantially as shown and described.

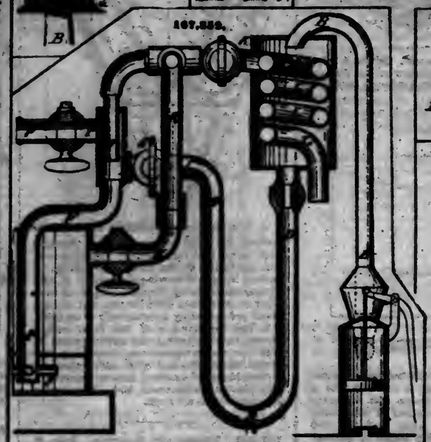


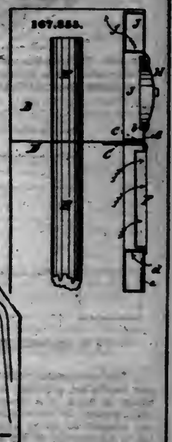
167,851. PROPELLERS FOR GAS-JETS. Jos. W. Mayhew, Ansonia, Conn. (Filed Aug. 16, 1875.)

The herein-described gas-jet protector, as an article of manufacture, consisting of the base A, provided with the socket B, and combined with the closed guard D hinged to the said base, substantially as specified.

167,852.

167,854.





1. A sectional shaft, having its ends formed square, said squared ends being recessed in such manner as to form a rectangular hook or hook coupling when two sections are joined or locked together, substantially as shown and described.

2. The combination of two sections of shafting, constructed substantially as shown and described, with the square coupling, sleeve C and the stud or pin D, as and for the purposes specified.

3. The supporting collar or disk E, in combination with a sectional shaft, constructed and arranged substantially as shown and described, and for the purposes set forth.

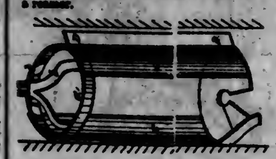
167,855. HEATING AND VENTILATING ROOMS. John S. Oldershaw, Baltimore, Md. (Filed Aug. 13, 1875.)

1. The combination of the front plate A, having flanges C C, with the flue-stopper plate D, as and for the purposes described.

2. The combination, with the flue-stopper plate D, of the front plate A, having the detachable register F, and the detachable cap H, as and for the purposes described.

3. The combination, with the flue-stopper plate D, of the front plate A, having the ventilating-flue J, opening into the chimney-flue above, and into the room below, substantially as described.

4. The combination, with the chimney-flue and register, of the flue-stopper plate, having an extensible and adjustable portion, G, to adapt it to different-sized flues, substantially as described.

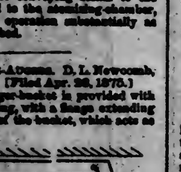


167,856. APPARATUS FOR BURNING HYDROCARBONS. John Nelson, Red Wing, Minn. (Filed Mar. 6, 1875.)

Brief.—A steam-pipe leading from the boiler supplies steam to the heating-tank and atomizer.

The combination of the tank C, containing the coil I, trap-pipe D, for conveying oil to the atomizing-chamber, steam-pipe O, located above the pipe D within the atomizing-chamber F, and steam-pipe E, which serves the double purpose of conveying steam to the heating-tank, and to the atomizing-chamber, all arranged for operation substantially as shown and described.

167,857. HARPS-ADJUSTER. D. L. Newcomb, Kenton, Ohio. (Filed Apr. 26, 1875.)

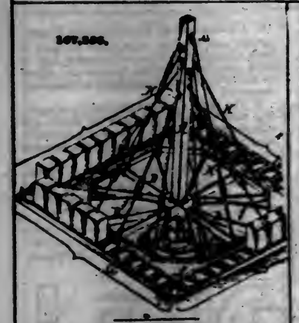


Brief.—The upper bracket is provided with a side piece or wing, with a flange extending the entire length of the bracket, which acts as a reamer.

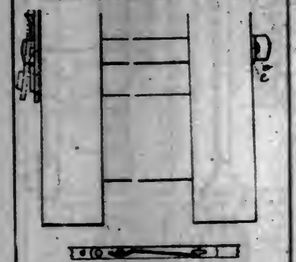
In an earth-auger constructed substantially as described, the combination of the side piece or wing *d* with the flange D, substantially as specified, and for the purposes set forth.

167,858. SHAFT-COUPLINGS. D. L. Newcomb, Kenton, Ohio. (Filed June 26, 1875.)

167,859.



1. A cam-filing and soldering machine in which a platform, C, having a number of straight sides, is provided, with cells arranged in said sides to receive and securely retain two or more series of cams, all as set forth.

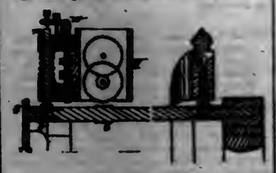


2. The within-described platform, consisting of four or other desired number of sides, connected to the vertical shaft A by arms D and adjustable tie-rods H, all substantially as set forth.

3. The shallow trough on the platform for receiving the drippings from the cams, in combination with the discharge-pipe *f* and the trough at the base of the shaft, all substantially as described.

167,856.

167,857. Heddle-Frames. Edwin S. Pike, Worcester, Mass., assignor to Geo. Crompton, same place. [Filed July 19, 1875.]

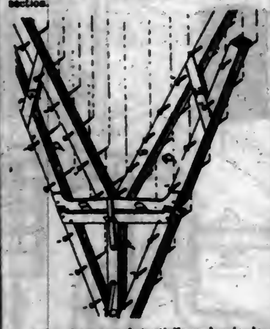


1. The combination, with the heddle-frame and heddle-bar, provided at one end with a holder or head, of a tongue and a spring-plate secured to the side bar of the frame, and adapted to spring away from the side bar in the direction of the length of the heddle-bar to hold the heddle-bar taut, substantially as described.

2. The combination of a movable hook with a spring-plate connected with the side bar of the heddle-frame, and interposed between one end bar of the frame and the head, and adapted to operate substantially as described.

3. The combination of the heddle-bar, slotted at a, with the holder c, constructed as described, and adapted to enter the slot in the bar, substantially as described.

167,858. Measuring Mechanism for Rattan-Machines. W. H. Richardson, Fitchburg, Mass. [Filed June 10, 1875.]



1. In a rattan-machine, the shaft h, provided with the worm-screw i, and hung to be thrown into and out of engagement with the register by the passage or non-passage of material, in combination with a reversing mechanism, substantially as and for the purpose set forth.

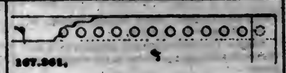
2. The registering mechanism H, in combination with the vertical bar n, provided with the pin k and the spring o', all constructed to operate substantially as and for the purpose set forth.

3. In combination with a rattan-machine, a registering mechanism arranged and applied to be automatically thrown into and out of action on the entrance and exit of a strand of cane, substantially as and for the purposes set forth.

167,859. Harrows. William S. Rowland, Plainville, Pa. [Filed July 14, 1875.]

Brief.—The harrow is made in three sections. The forward one is triangular. The other two consist of two converging bars, each secured together by suitable cross-pieces. The outer bars are hinged by hooks to the outer corners of the triangular section, and are upon a line of divergence with them. The rear sections are hooked together at the forward ends of the inner beams, and held down by a spring attached to the middle beam of the triangular section.

1. In a harrow, substantially as herein described, the front wedge-section A, provided with hinged and vertically-movable tongue C, and connected at the rear outer corners by hooked hinges with wing-sections B B, said wing-sections being likewise hinged to each other at their inner front corners, and all combined and operating substantially as set forth.

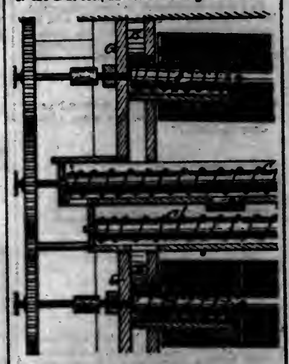


2. The combination of the front wedge-shaped section, having the stiffening-arm F, with the rear wing-sections, detachably connected therewith, and with each other, by hooked hinges, the several bars or beams suitably provided with teeth, and all operating substantially as set forth.

167,860. Dyeing and Printing. John S. Sellon and Robert Pinkney, London, England. [Filed July 12, 1875.]

Brief.—Uses a solution of chloride of vanadium, or of any vanadiate, in connection with an animal dye, such as cochineal.

A dyeing or printing compound consisting of the salts or compounds of vanadium and animal dyeing or printing materials.

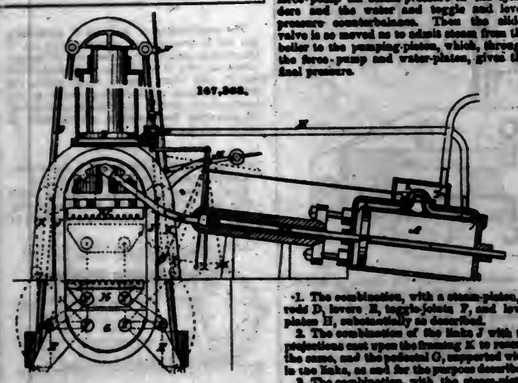


167,861.

Impression writing-sheets having a stiffening material, b, cemented upon the edge through perforations in the principal sheet A, substantially as herein specified.

167,862. Rolling-Ovens. D. N. Sprisler and Eli P. Campbell, Troy, Ohio. [Filed Apr. 15, 1875.]

Brief.—The rods all pitch one way. The "chop," having passed through the top reel of one compartment, is carried back to the head of the next reel, and so on through them all.



In a baking-chest, the combination of closing rods B B with ribs a a, conveyors C C C C, slides D D, gatherers E E, and fenders b b, all constructed and arranged as herein set forth.

167,863. Combination Cotton-Pressing. John F. Taylor, Charleston, S. C. [Filed June 12, 1875.]

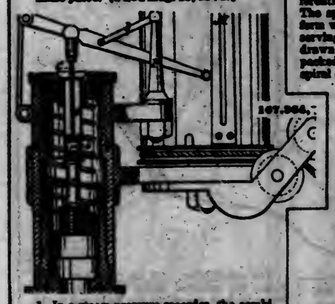
Brief.—The exhaust steam from the pumping-engine is admitted to the press-cylinder, and, by piston, cross-head, rods, levers, and toggles, raises the lower platen, partially pressing the bale. The slide-valve equalizing the steam-pressure on both sides of the pumping-piston, the latter is at liberty to recede by the water-pressure caused in the water-piston and force-pump till steam-pressure in the cylinders and the water and toggle and lever pressure counterbalances. Then the slide-valve is so moved as to admit steam from the boiler to the pumping-pistons, which, through the force-pump and water-piston, gives the final pressure.

167,864.

1. The combination, with a steam-piston, of rods D, levers B, toggle-joints F, and lever-platen H, substantially as described.

2. The combination of the links J with the projections cast upon the framing K to receive the cams, and the pedestal C, supported within the links, as and for the purposes described.

3. The combination with the steam-pistons P P and water-pistons Q, working in their respective cylinders A' B', of the valve E, constructed with a port, as shown and described, which adapts it to establish communication between the spaces in the steam-cylinder, on opposite sides of the pistons, as and for the purpose specified.



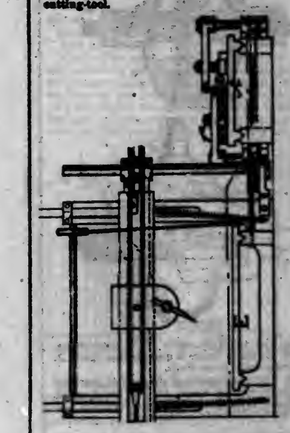
167,865. Garment-Form. A. B. Simonds, New York, N. Y. [Filed June 26, 1875.]

Brief.—The sheets have a clean border of white paper pasted to them, the paste passing through holes in the cotton sheet.

4. The combination of the valve E with the valve-gear M and the tappet F, operated by the piston B, as and for the purposes described.

5. The combination of the cylinder A', having an equalizing-valve, E, the cylinder and pistons A B, which operates the toggle-arms, the communicating pipe H', the water-piston and cylinder, the water-pipe and cylinder P' and P, and the pistons G' and B', upon one and the same rod, as and for the purpose set forth.

167,866. Indicators for Steam-Engines. Jos. W. Thompson, Salem, Ohio, assignor to himself and Buckeye Engine Company, same place. [Filed Aug. 19, 1875.]



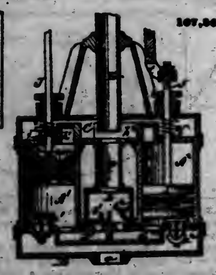
1. In a steam-pressure recorder, the combination, with the working-lever, carrying the marker, of a movable fulcrum, a fixed standard, P, and link b, connecting the lever directly to the standard, substantially as shown and described, for the purposes specified.

2. In a steam-pressure recorder, the combination with the reciprocating drum of the spring O, spring-case, the disk having hub c, and clamping screw-nut S, all as shown and described, to permit the spring-tension to be adjusted as desired.

3. The combination of rod C and stud d, having corresponding concavity and convexity, and the screw-socket for connecting said parts C d to the piston or movable part, to form a universal compensating joint, as shown and described.

167,867. Machines for Dressing Stone. William Henry Thompson, Islington, England. [Filed June 11, 1875.]

Brief.—The sectional outline of the molding, or other-shaped work required to be cut, is represented by surfaces upon a horizontal plane, to form a guiding or pattern surface, which acts by means of levers, quadrants, and chains, to govern the movements of the cutting-tool.

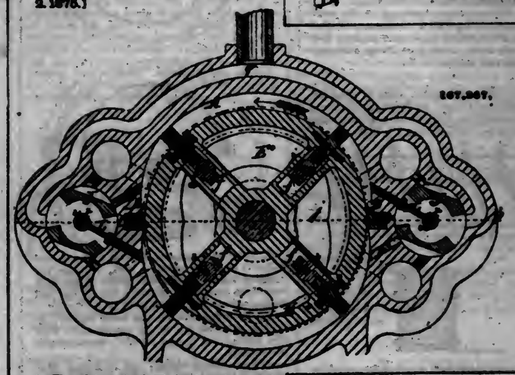


The combination, in a machine for cutting and working stone, &c., of a reciprocating work-carrying bed, a pattern, a tool-carrying cross-beam, a tool-holding saddle arranged as said cross-beam, and an intermediate mechanism, substantially as described, for imparting a rising and falling motion to the cross-beam, and a longitudinal movement to the tool-saddle, as and for the object specified.

167,868. Pumps. Hiram Tyler, Geneseo, N. Y. [Filed Feb. 6, 1875.]

Brief.—The pistons are constructed of two cups placed with their bottoms toward each other, and, having one or more rubber disks placed between them, each cup has a circumferential groove and an offset on its under side. The spaces between the disks and the cups form water-chambers, the water and the disks serving as packing. To prevent air being drawn in by the piston-rods, the latter are packed with rubber disks held in place by spiral springs.

167,869.



1. In combination with a pump, substantially as herein described, the piston-packing, consisting of the cups a a, provided with the grooves and shoulders, as described, and one or more rubber disks, a, placed between them, substantially as and for the purposes herein set forth.

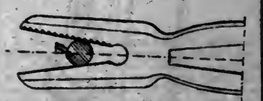
2. The combination, with the cylinders A' A² and chambers B C, of the valve-chambers L D D, cylinders P P' P², passages d d' and h' h², and the various valves, as described, substantially as and for the purposes herein set forth.

3. The packing-disks *a a* and spiral spring *w*, arranged around the piston-rod J within the chamber C, substantially as and for the purposes herein set forth.

167,870. Rotary Engines. Archibald R. Vondenark, New York, N. Y. [Filed June 2, 1875.]

1. The piston-wheel F, having the radial cavities f, in combination with the pistons E, having the anti-friction rollers g, and arranged in said radial cavities and gudgeons h, having rollers i working in anti-grooves in the cylinder-heads, substantially as described.

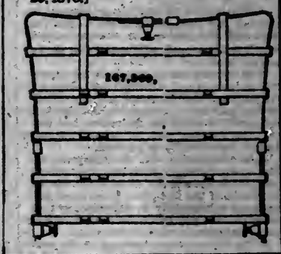
2. The combination of the radially-arranged pistons E, the packing-strips k, provided with inclined guide-recess fitting in recesses in the ends of the pistons, and springs *m* and *n*, for forcing the packing-pieces in a radial direction, and against the cylinder-heads, substantially as described.



3. The abutments D, provided with the packing-strips *o*, and springs *b*, for forcing the same outward, in combination with the piston-wheel B, and the cylinder-heads B', having the grooves *s* and bridges *c*, all substantially as described.

4. The combination of the reversing-valve J, with the oscillating supply-valve L, and mechanism for actuating said supply-valve, substantially as set forth.

5. The disks M' N', and intervening spring *s*, in combination with the cut-off valve L, with the shaft O of the engine, and with a shaft, O', transmitting motion to the working-mechism, substantially as shown and described.



6. The combination of a compound cam, M *b'*, with the cut-off valve L, substantially as shown and described.

167,871. Pipe-Wrenches. G. W. Weitt, Philadelphia, Pa., assignor to himself, H. P. Carpenter, and H. M. Shortridge, same place. [Filed June 16, 1875.]

The within-described wrench, having the inclined edge of one jaw plain, and that of the other with teeth inclined, as set forth.

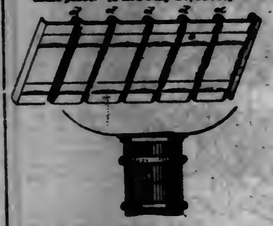
167,872. Pillow-Case Frames. Thomas E. Walter, Philadelphia, Pa. [Filed Jan. 29, 1875.]

A pillow-case frame consisting of a series of adjustable hoops, B, supported by a rectangular frame, A, capable of being enlarged and contracted, all as set forth.

167,870. CAR STARTING AND BRAKES. T. L. Webster, Brooklyn, N.Y. (Filed July 6, 1875.)

Brief.—The same pressure of treadle applies brakes and sets car-starting pawl. When released, retracting-spring causes pawl to turn ratchet-wheel, and removes brakes from wheels. Automatic spring-slides engage with rock on treadle-bar, holding it up or down. These slides may be removed from and held out of engagement.

167,870.

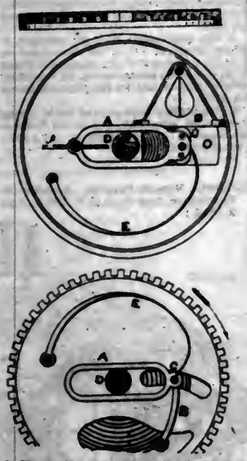


1. The pivoted vibratory lever, operated by hand or foot piece, as described, in combination with the brakes, the starting ratchet-wheel, and the pawl, substantially as shown and set forth.

2. In combination with the lever for operating the braking and starting mechanism, the vertically-movable foot-piece and the spring-locking mechanism, arranged substantially as described, to allow the depression, but prevent the rising of said foot-piece, whenever desired, substantially as set forth.

3. In combination with the foot-piece, the two spring-locking mechanisms, the one to prevent the rise and the other to prevent the depression of the foot-piece, constructed and arranged substantially as described, so that either or both may at will be thrown into or out of engagement with the foot-piece.

4. The brakes proper, mounted on the journals of, and moving with a cross-bar, provided with end slides, which take their bearing and move in the truck, bearing, or frame, substantially as shown and set forth.

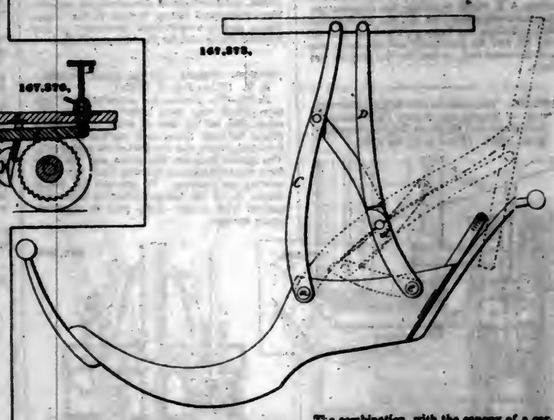


167,871. LAMP-SOCKETS. Wm. N. Weeden, Waterbury, Conn., assignor to the Benedict & Burnham Manufacturing Company, same place. (Filed July 27, 1875.)

The herein-described coupling for attaching lamp-sockets to their pedestals, consisting of a strip of sheet-metal with the vertical external corrugations *f* and transverse depressions or projections, substantially as and for the purpose specified.

167,872. MAINSPRING ATTACHMENTS FOR WATCHES. Marshal Wheeler, Big Rapids, Mich. (Filed July 9, 1875.)

Brief.—An attachment for equalizing the force of the mainspring by drawing its outer end nearer the center when the watch is wound up, and the force of the spring is greatest, and returning it toward the circumference as the spring is unwound and its power decreased.



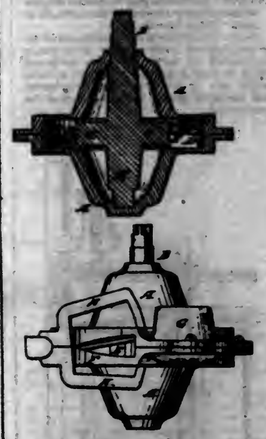
1. The combination of the sliding bar A and roller C with the scrolled disk, whereby the roller is drawn inward the center of the disk when the time-piece is being wound up, and forced outward in unwinding, as set forth.

2. The rod E, having the outer end of the spring attached thereto, in combination with the sliding bar A and roller C, substantially as set forth.

3. The slotted sliding bar A, fitting over the stem D, the stem serving as a guide to the bar, so as to keep it in position as it moves back and forth, substantially as specified.

4. The combination of the sliding slotted bar, stem D, and auxiliary spring E, substantially as shown.

167,873. CARRIAGE-TOPS. George R. Whitmore, New Haven, Conn., assignor to the New Haven Folding-Chair Company, same place. (Filed July 27, 1875.)

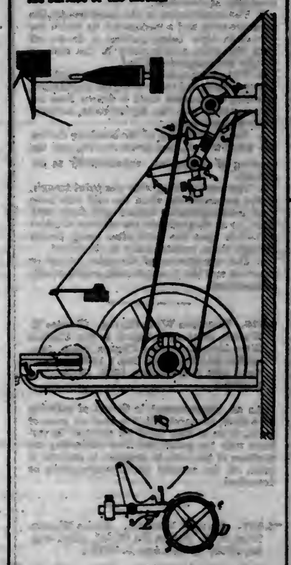


167,873.

The combination, with the canopy of a carriage, the principal brace C, the auxiliary brace D, both hinged to the body and to the top, the one jointed, and with an arm extending from said joint and hinged to the other brace above, substantially as described.

167,874. ROTARY PUMPS. O. H. Whitney, Waukegan, Ill. (Filed July 14, 1875.)

Brief.—Upon the edge of a central drum a flange follows a regular spiral one-half round the drum, and returns upon the other half to itself, following a like spiral in an opposite direction. This flange traverses an annular channel, the inner wall of which is formed by the edge of the drum. A double swinging valve or cut-off embraces the flange between its "fingers' ends," projecting, with adjacent inlet and outlet, a regular valve-action, and suction and discharge of water.

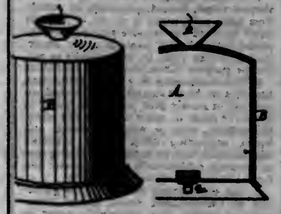


1. The swinging valve H, in combination with the spiral flange B and annular space D, substantially as set forth.

2. The combination of the case A, provided with an annular space, D, with the shaft B, cylinder C, spiral flange E, and swinging cut-off H, substantially as described.

167,875. SPOOLING AND DOUBLING MACHINE. James Wild, Springfield Township, Delaware County, and Emanuel Key, Philadelphia, Pa. (Filed Mar. 24, 1875.)

Brief.—The stopping device acts directly upon the driving mechanism, to arrest the motion of the machine. The spool or bobbin is driven by a revolving drum, which acts upon the surface of the thread.



1. The cylinder D, carried by a shaft, from which the spool is driven, and provided with one or more ribs, *c*, in combination with a series of fingers, E, each constructed to ride on the threads, and suspended adjacent to said cylinder, whereby each finger, when depressed, is struck by one of said ribs, all as and for the purpose set forth.

2. The combination of the spool or bobbin, resting with its covered portion on the driving-drum B, the fingers E, controlled by the threads passing to the spool, and the ribbed cylinder D, from which motion is communicated to the drum, all as set forth.

167,876. OMAR-MAKERS' PASTE-BOXES. Michael Wilhelmi, Chicago, Ill. (Filed July 22, 1875.)

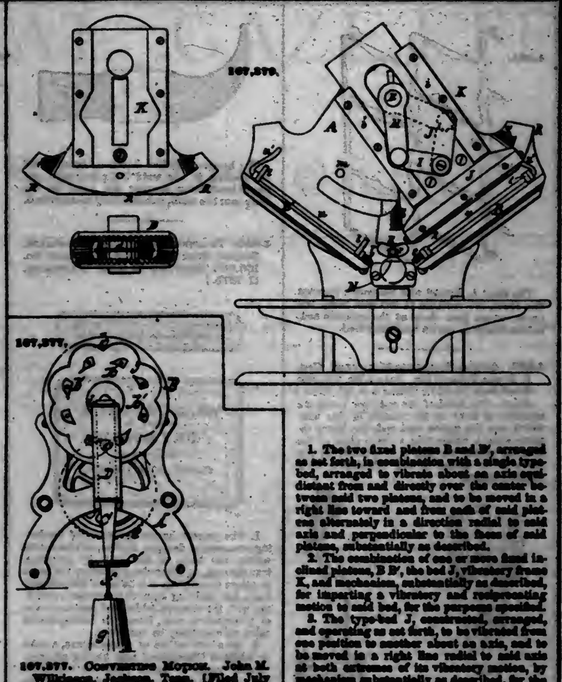
Brief.—The paste-receptacle or paste-reservoir has fitting into it at the bottom a plunger, for pressing the paste out, when desired, into a hopper at the top, for convenience in dipping the fingers into it. This plunger is hollow, and contains water for keeping the paste cool, and then prevent it from becoming sour.

The vessel A, fitted with the base-ring *c*, and the cap B, provided with the finger-cup *b*, constructed and combined in the manner and for the purpose set forth.

167,877. CONVERTIBLE MOPPER. John M. Wilkinson, Jackson, Tenn. (Filed July 19, 1875.)

The scalloped wheel B, having the cams *b' b'*, in combination with the supporting-frame A, perforated frame D, to receive the dasher-shaft C, gearing *d e*, chain or cord *f*, and weight *g*, substantially as and for the purpose set forth.

167,878. TOILET-POWDER BOTTLES. Chas. F. Williams and John T. Hilborne, Amesbury, Conn. (Filed Feb. 26, 1875.)



Brief.—This stopper has a head with a flange projecting downward, the outer surface of which fits the neck of the bottle, and an aperture, one or more, through said flange or neck of the bottle, which is closed by forcing the stopper down, but exposed by slightly raising, but without removing, the stopper, so that the contents of the bottle may be sprinkled from said aperture.

The herein-described toilet-powder bottle, consisting of the body C, stopper A, with its flange B, combined with one or more apertures exposed by raising said stopper, substantially as specified.

167,879. PRINTING-PRESSES. W. P. Wyman, Chelsea, Mass. (Filed July 6, 1875.)

Brief.—The press has two platens set at such an angle that the vibrating bed carrying type-form may swing from one to the other, and give the impression by complicating toggle-lever. Ink is applied to the type as it swings across a fountain between the platens.

167,879.

167,877.

1. The two fixed platens B and B', arranged as set forth, in combination with a single type-bed, arranged to vibrate about an axis equidistant from and directly over the center between said two platens, and to be moved in a right line toward and from each of said platens alternately in a direction radial to said axis and perpendicular to the faces of said platens, substantially as described.

2. The combination of one or more fixed inclined platens, B B', the bed J, vibratory frame K, and mechanism, substantially as described, for imparting a vibratory and reciprocating motion to said bed, for the purposes specified.

3. The type-bed J, constructed, arranged, and operating as set forth, to be vibrated from one position to another about an axis, and to be moved in a right line radial to said axis at both extremes of its vibratory motion, by mechanism automatically as described, for the purpose of giving an impression at two different points, as specified.

4. The combination of the bed J, frame K, rocker-shaft R, crank-arm M, and toggle-link I, all arranged to operate as and for the purposes described.

5. In combination with the bed J and frame K, the locking pin or bolt *j*, arranged to alternately lock the frame K to the frame A and to the bed J, as and for the purposes described.

6. In combination with a type-bed, arranged to vibrate from one position to another about an axis, and to reciprocate in each of said positions in a line radial to said axis, the rocker-shaft R, arm M, link I, bevel-pinion *d*, and bevel sector-gears D, all arranged to operate substantially as described.

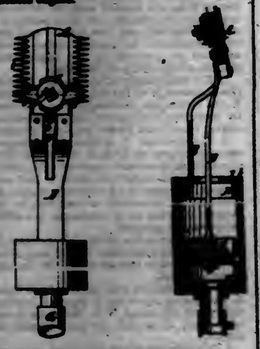
7. In combination with two fixed platens, inclined toward each other, and a type-bed, arranged to vibrate away from said platens in a direction nearly parallel to the line thereof and about an axis, and to reciprocate in a right line toward or from said platens in a direction radial to said axis, one or more inking-rollers, placed near the lower end of said platens, and mounted upon springs, in position to ink the face of the type while the type-bed is being vibrated from one position to the other, substantially as described.

8. The combination of the ink-cylinder N, spindle P, frame O, spring *n*, distributing-roll *o*, yokes *p p'*, and inking-rollers *r q*, all arranged and operating relative to the type-bed, substantially as described.

9. In combination with the inking-rollers *r q*, mounted in or on a yielding frame, the eccentrics E, formed upon or secured to the frame K, arranged and operating as and for the purposes described.

REISSUES.

6,661. MANUFACTURE OF BEVELGEARS. Jos. Ball, Brooklyn, N. Y., assignor, by mesne assignments, to Samuel Rayner & Co. and John G. Preble. Patent No. 106,451, dated Aug. 16, 1870. (Filed Apr. 2, 1875.)



6,664.

The sheet A, formed with recesses a b across the sheet, the recesses at one end being the exact reverse from those at the opposite end, substantially as shown and described.

6,665. ANGLE-GRINDING MACHINE. Geo. F. Bynon, Poland, Me. Patent No. 169,039, dated Sept. 28, 1871. [Filed Apr. 20, 1875.]

Brief.—The hand of the operator holds the machine to duty by the handle, in line with which are the pinion and rod, the latter reciprocating a cutter over a comb-plate at the end, the pinion moving in a cylinder by the power of air forced in and withdrawn by a suitable engine.

1. In combination with a shearing or clipping cutter, comb-plate, and handle, an air-engine, operated by a vibrating column of air connected in a tube which is between the said engine and the pump or power generator, substantially as and for the purpose described.

2. The removable screw-head J, with the rod D rigidly attached, in combination with the pinion connected to the cutter-head, substantially as and for the purpose described.

3. The casket moving supporting cutter, the comb-plate and its handle, the cylinder, the pinion and its pinion, and the pipe G, combined substantially as and for the purpose described.

4. The cutter-head and cutter, in combination with the longitudinally-grooved comb-plate, substantially as and for the purpose described.

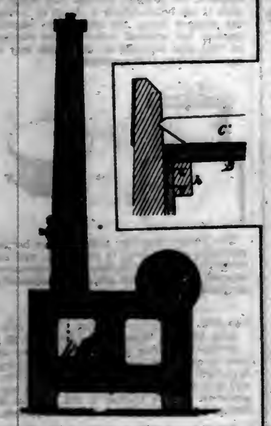
5. The cutter having an arching form in cross-section from its point to its heel, as shown, and made with two beveled horizontal cutting-edges on either side of the comb-plate, substantially as described.

6. The cutter having an arching form between its points, as shown in Fig. 5, and an arching form between its cutting-edges, as shown in Fig. 6, and beveled horizontal cutting-edges on its front and rear, and on both sides of the cutter-head, substantially as and for the purpose described.

6,666. CLAW-HAMMER. Dexter W. Parker, Meriden, Conn., assignor to Chas. Parker, same place. Patent No. 147,467, dated Feb. 10, 1874. [Filed Sept. 30, 1874.]

The handle-described hammer, constructed by placing in the mold the previously-prepared head, then pouring the metal for the body into the mold, substantially as described.

6,667. TRANSPARENT ADVERTISING-SOAPS. Stephen Stevens, Pittsburg, Pa. Patent No. 169,038, dated July 18, 1870. [Filed Aug. 11, 1870.]



1. The process herein described of producing ornamental designs, figures, or characters within the body of the soap, by printing, transferring, or otherwise producing the same in colors directly upon a tablet of transparent soap, and molding upon or otherwise combining with the same an additional tablet or cake of transparent soap, forming a homogeneous cake, substantially as described.

2. As a new article of manufacture, a cake or tablet of transparent soap having an ornamental design or figure produced within its body in pure colors, without the intervention of supporting materials for the same, substantially as described.

6,668. MACHINES FOR PAINTING WIRE-CLOTH. Chas. H. Waters, Groton, assignor to the Clinton Wire-Cloth Company, Clinton, Mass. Patent No. 94,880, dated Dec. 1, 1869; reissue No. 4,462, dated July 4, 1871. [Filed Jan. 17, 1870.]

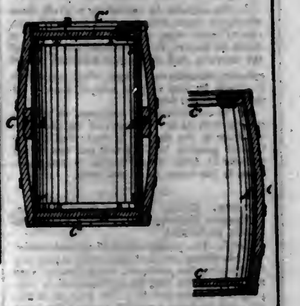
Brief.—The wire-cloth is drawn from a reel through a paint-trough, then through elastic pressure-rolls, and is brushed by a revolving brush, after which it is drawn off into the drying-room.

1. The combination of the wire-cloth beam, the paint-trough, and the pressure-rolls, substantially as described.

2. The combination of the paint-trough, the pressure-rolls, and a mechanism by which the wire-cloth, after being painted, is drawn off from the rolls, substantially in the manner and for the purpose specified.

3. The arrangement of the paint-trough, the pressure-rolls, and the drawing-off mechanism, whereby the painted cloth is drawn from the pressure-rolls into the drying-room, substantially as described.

4. The combination of the brushing device, the paint-trough, the pressure-rolls, and the drawing-off mechanism, substantially as described.



5. The combination, with the paint-trough, of the pressure-rolls when the said rolls have their axes adjustable toward and from each other, so as to graduate the amount of paint to be left upon the cloth after being drawn through the trough, substantially as described.

6. The combination of the paint trough or reservoir and the pressure-rolls, substantially as described.

6,669. PAINTING WIRE-CLOTH. Charles H. Waters, Groton, assignor to the Clinton Wire-Cloth Company, Clinton, Mass. Patent No. 94,880, dated Dec. 1, 1869; reissue No. 4,462, dated July 4, 1871. [Filed Jan. 7, 1870.]

As an improvement in the art of painting wire-cloth, immersing it in a bath or mass of paint, so as to fully cover all parts of its surfaces with the paint, and then subjecting the surfaces of the cloth to pressure to squeeze or press off the surplus paint, substantially as described.

6,670. PAPER VESSEL. Elisha Waters, Troy, N. Y. Patent No. 81,441, dated Aug. 25, 1868. [Filed Apr. 5, 1875.]

1. A closed cylindrical, tank-like, or barrel-shaped vessel, formed essentially or mainly from paper-pulp, paper in sheets, or paper or straw board of any suitable quality, and supported internally by hoops *h*, or by an extended wooden shell, D, substantially as and for the purpose herein shown and described.

2. The combination of a closed cylindrical, tank-like, or barrel-shaped vessel, formed essentially or mainly from paper-pulp, paper in sheets, or paper or straw board of any suitable quality, with or without internal end hoops, supporting-disks, or an extended wooden shell, with an exterior protecting case or covering, substantially in the manner and for the purpose herein set forth.

3. The combination of a cylindrical, tank-like, or barrel-shaped vessel, formed essentially or mainly from paper-pulp, paper in sheets, or paper or straw board of any suitable quality, and having interior end hoops *h h*, with the disks or heads B, resting upon and affixed to said hoops, substantially as and for the purpose herein shown and described.

AUTOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 10. TUESDAY, SEPTEMBER 7, 1875. PRICE { $3,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

ELISHA WATERS.—*Appeal.*

[*Appeal from the Principal Examiner in the matter of the application of Elisha Waters for reissue of Letters Patent No. 81,441 for* "IMPROVED VESSEL FOR HOLDING PETROLEUM AND OTHER LIQUIDS."—*Decided June 4, 1875.*]

Where a patent covered a hermetically-sealed vessel composed of two parts, the interior one of paper supported by internal hoops and the exterior one of wooden staves and heads, for the transportation of volatile liquids: *Held*, that the patentee could not lawfully modify his patent upon reissue by omitting the words "hermetically sealed," and dispensing with the exterior casing, and reforming his drawings accordingly.

A patent which covers merely the combination of a tight paper vessel and its casing cannot properly be expanded upon reissue to embrace paper barrels and vessels generally, with or without exterior coverings; nor can it be made to embrace paper packages "of any suitable shape or configuration."

The case of *Curtiss vs. Bobe* (17 Wall, 463) cited.

THACHER, *Commissioner:*

The applicant in his patent states his invention to be—

> A new and useful method of making hermetically-sealed packages suited to commercial purposes for holding and transporting petroleum and its products, spirits of turpentine, and other liquids of a volatile nature, by which all loss by leakage or evaporation, and its resultant dangers, is prevented.

Farther on, after enumerating the disadvantages of vessels made simply of wood, in respect to leakage caused by springing of the joints, &c., and the difficulty of curing these defects by any sort of lining, he proceeds to state how he proposes to remedy these evils by his invention. He describes his invention as consisting of two parts, as follows:

> Now, one part of my invention consists in forming, substantially or mainly from paper-pulp, paper in sheets, paper or straw board, or vegetable parchment of any suitable kind or quality, a cylindrical conical frustum or barrel-shaped closed vessel, supported internally by end hoops or a wooden shell, and so constructed as to be composed practically, and, as it were, of a single stave without any joint corresponding to those between ordinary wooden staves, through which the contents of the vessel can escape; and where such vessels are intended for liquids I coat, size, or cement the continuous inner surface, or permeate the whole fiber of the paper vessel with any known varnish, or other substance or compound insoluble in and suited to effectually resist the action and prevent the leakage of the particular liquid the vessel is prepared to contain, and, when desirable, I make the vessel so formed amply strong enough to sustain, without any change of form, leak or break, its full capacity of liquid.
>
> As the handling and transportation of heavy paper vessels necessarily wears and abrades the exposed parts, it becomes desirable to use some method of protecting them, which, while effectual and lasting, shall be as economical as possible. This I effect by another part of my invention, which consists in surrounding the paper vessel with stout but roughly-made wooden cask, barrel, or tank, as the case may be, so fitted to the outer surface of the paper vessel that while the latter cannot move within the wooden envelope it shall be independent of the casing along the edges or joints of its staves, so that whenever any one stave shall be sprung inward beyond the next one the interior paper vessel shall yield freely without injury to itself or the loss of any of its contents.

His claim reads:

> A closed cylindrical tank-like or barrel-shaped vessel, formed essentially or mainly from paper-pulp, paper in sheets, or paper or straw board of any suitable quality, and supported internally by disks or hoops at the ends, or an extended wooden shell, substantially as described herein.
>
> I also claim a closed cylindrical tank-like or barrel-shaped vessel, formed essentially or mainly from paper-pulp, paper in sheets, or paper or straw board, with or without internal end hoops, or an inner wooden shell, substantially as described, in combination with an exterior protecting-case formed of wooden staves and heading, and fitted or secured to the paper vessel, substantially as set forth, so that the paper vessel shall not turn within the wooden case, and yet shall be free or separable therefrom along the joints of the staves.

From the language of the patent already quoted, from the more detailed description of the method of constructing the several parts of the invention, and from the drawings and the model, only one conclusion can be arrived at as to the nature of the device set forth thereby, and that is that it is a perfectly close or hermetically sealed vessel for the transportation of volatile or other liquids constructed in two parts, viz: first, an inner compartment or vessel made of paper or similar material, supported internally by hoops or a wooden shell with its interior surface coated with a resisting composition; and, second, an outer protecting-case formed of wooden staves and heading, and so fitted and

secured to its paper vessel that while it affords the latter protection from outside pressure or abrasion leaves it entirely free from contact with the joints of the staves.

The applicant now seeks to *amend* his patent by striking out the words "hermetically sealed," dispensing with the exterior casing, "when desirable," reforming his drawings accordingly, and broadening his claims to meet the requirements of the new case.

In short, the patent being restricted to the combination of the paper vessel and its outer casing is now sought to be expanded to embrace paper barrels and vessels generally, with or without an exterior casing, when constructed with certain internal supports.

The claims of the reissue application are as follows:

1. In a barrel or vessel made of paper, substantially as described, the internal end supports or braces A, substantially as and for the purpose herein shown and specified.
2. In a barrel or vessel made of paper, substantially as described, the combination of the sides A, with the end supports or braces A, and heads B B, substantially as and for the purpose herein shown and specified.
3. The combination of a paper barrel or vessel, A, with or without the internal end supports or braces A with an exterior protecting case or envelope, C, substantially as and for the purpose shown and specified.

The third claim is substantially the same as the second of the patent.

The applicant, in reply to the objection that the patent was restricted to hermetically-sealed vessels, states that it is evident that he did not so limit himself, from the fact that on the second page of his patent he used the words "and where such vessels are intended for liquids," &c. The paragraph in which these words are used has already been quoted, and it will be seen that in addition to furnishing the inner paper vessel with an outer protective casing he therein proposes to coat the inner surface of said vessel with some insoluble compound to more effectually prevent leakage, &c., but there is no hint whatever as to his intention to construct the paper vessel without its being completely closed from the outer air, protected from leakage, and surrounded entirely by an exterior wooden vessel.

His mention, too, of the fact that the vessel so constructed may be used to contain pulverized material as well as liquids does not imply that its construction was to be changed when so employed.

Figures 1 and 2 in applicant's drawing represent the invention *without the exterior protecting-case*. No such drawings accompanied the original application, and they are entirely at variance with the model. So far, then, as the alterations already mentioned are concerned, I agree with the Examiner that this is an attempt to expand the patent so as to cover, broadly, paper barrels and similar paper vessels, which finds no justification in the original specification, drawings, or model.

The language used by the United States Supreme Court in the case of *Carlton* vs. *Bokee*, (17 Wall., 463,) in disapproving of just such attempts may be applied here:

> We think it proper to reiterate our disapprobation of these ingenious attempts to expand a simple invention of a distinct device into an all-embracing claim, calculated by its wide generalizations and ambiguous language to discourage further invention in the same department of industry, and to cover antecedent inventions.

The same objection applies, although in a less degree, to the effort of the applicant to broaden his specification and claim, so as to embrace within his method paper packages "of any suitable shape or configuration." He bases this correction on the fact of having used the words "tanks or cisterns" and "tank-like," but these words are invariably used in his patent in immediate connection with the word cylindrical, and all through his specification his illustrations and explanations are confined to cylindrical bodies, and the words mentioned appear to be used only in reference to casks or vessels that are not strictly cylindrical in shape, but nearly so.

Admitting that these words tank, tank-like, and cistern have a broader signification in the patent than I have here given, they are sufficiently ample and definite in scope to protect the applicant in all that legitimately belongs to him, and the substitution therefor of a general all-comprehensive term is unwarranted, although I do not see how the question of form is a material one in the construction of the vessel.

The action of the Examiner is affirmed.

ELLICOTT D. AVERELL.—*Appeal.*

[*Appeal from the Examiners-in-Chief in the matter of the application of Ellicott D. Averell for letters patent for* "METALLIC STITCH FOR BOOKS."—*Decided July* 9, 1875.]

A device used for fastening together sheets of paper, pamphlets, and other documents, is anticipation of a like device used for securing together the leaves of a book in lieu of the ordinary binders' stitching. The mere application of the device to books in the process of binding does not make it patentable.

THACHER, *Commissioner:*

Applicant claims—

> A folded book stitched by means of metallic-wire rivets inserted in the punctured fold of the back and clinched on the outside, substantially as herein shown and described.

The reference given is English patent of Frederick Gye, Jr., No. 9,399, 1842. Gye shows, describes, and claims pieces of wire pointed at each end, so as to readily penetrate papers, pamphlets, and other documents, and when passed through them the ends of the wires are folded down so as to bind or hold the papers together in substantially the same manner as applicant proposes to adopt the device in the binding of books. In addition, Gye shows loops or rings formed upon the back of the wire by giving it a single twist, for the purpose of connecting different documents together by a cord, or for hanging them up; but he says that these loops may be dispensed with, and then it is quite obvious that the only function of the wires is to take the place of thread-stitches in holding the series of sheets or folded leaves together.

Applicant, however, insists that there is nothing in Gye's case to show that he intended to substitute the wires for the ordinary thread-stitching in the binding of *books*. To be sure the word *books* is not mentioned by Gye, but as a book is nothing more than a collection of sheets of paper, with a sheet of the same or other material added for a cover, there is no force whatever in the objection. Neither does the manner of clinching the ends of the wires, whether on the inside or the outside, nor the length of the wires used by each, make any patentable difference between the two devices.

The decision of the Examiners-in-Chief is affirmed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, NORTHERN DISTRICT OF NEW YORK.

J. WINSLOW JONES *et al.* *vs.* G. LEWIS MERRILL AND OSCAR F. SOULE.
SAME *vs.* JOHN H. NOYES *et al.*
SAME *vs.* W. B. OSTRANDER *et al.*

[*In equity.—Before* WALLACE, *J.*]

An adjudication in favor of a patent at final hearing, and after full consideration of elaborate proofs touching the validity of the patent, must be held controlling upon an application for a preliminary injunction, unless cogent evidence is presented in addition to that which was found insufficient upon the final hearing.

While the fact that the defendant has obtained a patent for his process is not controlling in proceedings for an injunction, it is entitled to some weight.

The process covered by the patent of John W. Jones, assignee of Isaac Winslow, May 13, 1862, for preserving corn in its green state, involves three distinct features, each of which is essential to the result: First, separating the kernels from the cob; second, placing them in their natural juices in cans; third, sealing the cans hermetically and subjecting them to heat by water or steam until the kernels are thoroughly cooked.

This patent would not be infringed by a process in which the corn, whether on the ear or removed therefrom, is thoroughly cooked by the direct application of steam before it is canned.

Where it appeared that the defendants subjected their corn to the direct action of steam, or otherwise "cooked" it, before canning it, but heated it again in a steam-bath after canning, a preliminary injunction under the Winslow patent was denied, although grave doubts were entertained as to whether that part of the defendants' process which was adopted prior to the canning was anything more than a colorable departure from the patented process.

Where defendants claimed to cook their corn in the ear thoroughly before subjecting it to heat in the sealed cans, but the printed label on their cans, prepared when they had no interest to warp the facts, stated that the corn was "cut from the cob while fresh *and sealed at once*, and then prepared by an entirely new process," &c.: *Held*, that in proceedings for an injunction the defendants must be concluded by the statement they thus published to the world.

Where complainants were chargeable with knowledge of defendants' acts, but permitted them to continue their manufacture, and in response to an inquiry as to whether they regarded defendants' process to be an infringement, returned an answer that led defendants to believe that they did not, an injunction was refused.

It is a general principle of equity jurisprudence that the court will not lend its extraordinary aid, by way of preliminary injunction, to any claimant who has encouraged or acquiesced in an infringement of his right, or unreasonably delayed in prosecuting for its violation.

Compensation for damages accrued and protection from future damages is all such a complainant is entitled to. This provided for by a bond.

[Motions for preliminary injunctions to restrain alleged infringements of letters patent granted to John W. Jones April 8, 1862, and May 13, 1862, for certain inventions of Isaac Winslow, relating to a new and useful improvement whereby corn in its green state is preserved in hermetically-sealed cans. The first of the patents was for the product; the second, for the process.]

[*W. H. Bright, W. H. Clifford,* and *E. W. Fox,* for complainants.
Smith, Markham & Smith, for Merrill & Soule.
Tower & Joslyn, for Noyes *et al.*
Sedgwick, Kennedy & Tracy, for Ostrander *et al.*]

WALLACE, *J.*:

The defenses interposed in these actions to the validity of the complainants' patents must be regarded as unavailing to the defendants for the purposes of this motion, because of the decision of the court in the first circuit in the case of *J. Winslow Jones et al.* vs. *Sewall*. It was there adjudicated upon final hearing, after full consideration, that the defenses that Isaac Winslow was not the original discoverer of the improvement; that it had been patented abroad, and described in public works prior to his alleged discovery; that it had been in public use or on sale for more than two years before his application for a patent, and had been abandoned to the public use, were not sustained by the proofs. That adjudication must be held controlling upon an application for a preliminary injunction, unless cogent evidence is presented in addition to that which was found insufficient upon the final hearing. The new evidence which has been adduced here as to prior use, is far less satisfactory than that which was held insufficient there, and the additional proof on the subject of prior publication is open to the same objections which were regarded as fatal there to this branch of the defense.

Upon the final hearing of these cases they must be determined each upon its own merits, and the validity of the patents will be an open question; but for present purposes the only question for consideration must be whether or not the defendants have infringed. In determining this question it is first necessary to ascertain the scope and extent of the patents, because the result of the controversy may hinge entirely upon the conclusion whether the right covers a broad claim or a narrow one. It was not necessary in the case in the first circuit to give accurate consideration to this question, because the defense stood solely on the validity of the patents and conceded infringement if they were valid.

The construction which seems to be the reasonable one, according to the liberal interpretation now accorded to patents, and in view of the history of the art of preserving fruits and vegetables, is, that the process secured to complainants involves three distinct features, each of which is essential to the result he has produced. These consist in the preservation of the corn by first separating the kernels from the cob; second, placing them in their natural juices in cans; and, third, sealing the cans hermetically and subjecting them to heat by water or steam until the kernels are thoroughly cooked. Adherence to these three features in the process is deemed vital to the result which the specifications signify as the great advantage and the *sine qua non* of the discovery—viz., the preservation of the article in its natural juices so that the milk of the corn will not be evaporated, its flavor rendered insipid, or its aroma lost. If any one of these three features of the process is discarded in the process of the defendants, there is no infringement. (*Hill* vs. *Thompson*, Webs. Pat. Cases, 225.) They cannot escape liability, however, by the substitution of a feature which is but a colorable departure from either of those claimed by the patentees.

It seems not to be necessary to discuss the argument for the complainants by which a broader right is claimed under the patent for the product. The only product

which is secured to the patentees is the one derived from the process which alone gives vitality to the claim. The product patent is not one for corn preserved green, but for corn preserved green by the process particularly described.

Applying the rules adverted to as the test of infringement, it is quite apparent, so far as the facts now appear, that the defendants, Merrill & Soule, do not infringe by the process they adopt; because they discard one of the steps of complainants' process and substitute one in its place, which complainants very clearly repudiate as fatal to success. While complainants place their corn in hermetically-sealed cans, and cook it by the application of water or steam to the cans, in order, as they state, that the juices of the corn shall be coagulated without evaporation or dilution, these defendants apply steam directly to the corn. The complainants disclaim this method, on the theory that when thus cooked the corn is insipid and unpalatable. In order to obviate the escape of the aroma and the evaporation of the milk and juices of the corn, these defendants have invented an apparatus which seems to accomplish the desired result, for which a patent has been granted them. One test of infringement is whether or not the process adopted by the alleged infringer is a sufficient departure from that of the patentee to amount to a substantive invention sufficient to support a patent as for a new thing. (Curtis on patents, sec. 321.) While the fact that they have obtained a patent is not controlling, it is entitled to some weight. It would seem that their substitute is one differing in principle from complainants. Clearly this is so, if their corn is thoroughly cooked by the direct application of steam before it is canned. The fact that after canning their corn they heat it again in a steam bath, militates somewhat against this conclusion. If that part of their process which is adopted prior to canning is but a colorable device, without practical result, or the process is really accomplished by the steam bath subsequently applied, they cannot escape liability. But upon the evidence now presented they must prevail on this question, and as to them an injunction is therefore denied.

As to the defendants, John H. Noyes and others, (who constitute the "Oneida Community,") they claim to have used a different process from complainants, in that they cook their corn in an open vessel before canning it in a sirup, which they describe. The serious difficulty in the way of this defense lies in the doubt which the affidavits leave, as to whether or not this is anything more than a colorable departure from complainants' process. They cook their corn but a short time in the open vessel, and it is far from clear whether this part of the process has any material effect in the final result. It would be unjust, however, to determine this question adversely to them upon the affidavits used on this motion, and for this reason an injunction should be denied. Aside from this consideration, complainants, as to these defendants, are justly open to the imputation of laches. One of the assignors of the complainants visited defendants' manufactory in 1868, and saw their process, which, as then practiced, in the most adverse view to defendants, was not less an infringement than that now used by them. The complainants are chargeable with the knowledge of their co-owners of these facts, and from the time he became owner until the present, they have permitted these defendants to continue manufacturing. In addition to this, it appears that, in 1873, defendants sent a messenger to complainants for the express purpose of ascertaining if their process was considered by complainants a violation of the patents, and from information then received were evidently led to believe that it was not. They were not intentionally misled, doubtless, but complainants should have given them more explicit information, if they intended to treat them as infringers. These facts should shelter them upon this application.

As to these defendants the injunction is denied.

As to the defendants, Loomis, Allen & Co., they claim to use a different process from complainants, because they cook their corn in the ear thoroughly before subjecting it to heat in the sealed cans. But an exhibit of one of their cans of corn, as offered for sale by them, is produced, upon which is a printed label, which states—

> This corn is picked when at proper size for table use, and cut from the cob *while fresh and sealed at once*, and then prepared by an entirely new process, &c.

They also claim that their corn is cooked subsequently in the sealed cans, in a "liquid compound," but fail to describe this compound. They concede that they have contributed to a fund to contest the validity of complainants' patents. Affidavits on part of complainants present admissions of one of the defendants that the cooking of the corn before canning it is so slight as to produce no effect upon it; whereby a strong inference arises that this feature is merely an evasive departure from complainants' process. If their label truthfully advertises their process, the conclusion that they have infringed is no longer a matter of inference, but is clearly proved. It may be explained upon the final hearing, but as the case now stands they must be concluded by it. It is in direct conflict with the process which they now claim to have pursued. It was made when they had no interest to warp the facts. If untrue, it was a misrepresentation to their patrons, and until it is explained in some manner consistent with good faith, they must be held to the statement which they published to the world.

Notwithstanding the strong case made against these defendants, they are entitled to the benefit of other considerations, which render it inequitable to grant an injunction against them unconditionally. The complainants have to a certain extent slept upon their rights for many years, during which time a large amount of capital has been embarked in all parts of the country in the business of preserving corn by processes substantially similar to theirs, in ignorance of the right they now assert to the exclusive monopoly of such business. If these rights had been promptly asserted, many individuals would have been saved from the jeopardy which now menaces their investments, and among them are these defendants. It is a general principle of equity jurisprudence that the court will not lend its extraordinary aid to any claimant who has encouraged or acquiesced in an infringement of his right, or unreasonably delayed in prosecuting for its violation. Compensation for damages accrued, and protection from future damages, is all such a complainant is entitled to. An order to secure such remedy will be made in this case.

As to these defendants an injunction is granted, unless within thirty days they file with the clerk of this court a bond in the penalty of $20.000, with sufficient sureties conditioned for the payment of such sum, if any, as may be decreed in favor of complainants on the final hearing of the cause, to be approved in form and as to sufficiency of sureties by the clerk of this court. And defendants must file monthly statements, under oath, with the clerk, of the amount of their manufacture and sale of preserved corn during the pendency of this action.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date September 7, 1875.]

8,594 and 8,595.—Carpets.—THOMAS BARCLAY, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Applications filed August 25, 1875. Term of patents 3½ years.

8,596.—Band for Plated Ware.—RUDOLPH CHRISTESEN, West Meriden, Conn., assignor to the MERIDEN BRITANNIA COMPANY, same place. Application filed April 20, 1875. Term of patent 7 years.

8,597.—Coffee-Mills.—JOHN GIRARD, New Britain, Conn., assignor to LANDERS, FRARY & CLARKE, same place. Application filed July 6, 1875. Term of patent 7 years.

8,598.—Carpets.—HEINRICH F. GOETZE, Boston, Mass., assignor to ROXBURY CARPET COMPANY, same place. Application filed August 25, 1875. Term of patent 3½ years.

8,599 to 8,603, inclusive.—Carpets.—ETIENNE GUIRAUD, New York, N. Y., assignor to LOWELL MANUFACTURING COMPANY, Lowell, Mass. Applications filed August 25, 1875. Term of patents 3½ years.

8,604.—Match-Safes.—THOMAS B. HARKINS, Bristol, Pa. Application filed August 26, 1875. Term of patent 3½ years.

8,605.—Gasalier.—CHRISTIAN HERTER, New York, N. Y. Application filed August 27, 1875. Term of patent 3½ years.

8,606.—Carpets.—JUDSON E. HILL and WILLIAM H. DEACON, Philadelphia, Pa., assignors to JOHN BROMLEY & SONS, same place. Application filed August 25, 1875. Term of patent 3½ years.

8,607.—Carpets.—ALFRED LILLEY, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed August 25, 1875. Term of patent 3½ years.

8,608 and 8,609.—Carpets.—DAVID MCNAIR, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Applications filed August 25, 1875. Term of patents 3½ years.

8,610 to 8,613, inclusive.—Carpets.—JOSEPH M. CHRISTIE, Kidderminster, England, assignor to LOWELL MANUFACTURING COMPANY. Applications filed August 25, 1875. Term of patents 3½ years.

8,614 to 8,635, inclusive.—Carpets.—JOSEPH M. CHRISTIE, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Applications filed August 25, 1875. Term of patents 3½ years.

8,636.—Fabrics.—EDWARD C. CLARK, Rockville, Conn. Application filed August 30, 1875. Term of patent 3½ years.

8,637 to 8,642, inclusive.—Carpets.—CHARLES W. SWAPP, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Applications filed August 25, 1875. Term of patents 3½ years.

8,643.—Shawls.—HERRMANN BERG, Philadelphia, Pa. Application filed June 23, 1875. Term of patent 7 years.

8,644.—Printing-Types.—HERMAN IHLENBURG, Philadelphia, Pa., assignor to MACKELLAR, SMITHS & JORDAN, same place. Application filed August 25, 1875. Term of patent 14 years.

8,645.—Bed.—GILBERT H. PRINDLE, Philadelphia, Pa. Application filed August 28, 1875. Term of patent 7 years.

8,646.—Trimming.—GILBERT H. PRINDLE, Philadelphia, Pa. Application filed August 28, 1875. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date September 7, 1875.]

2,899.—Medical Preparation.—J. W. CAMPION & Co., Philadelphia, Pa. Application filed August 13, 1875.

"the figure of a circular band containing the word 'Wishart's,' and inclosing the words 'Pine Tree.' With the band there is entwined a scroll, whose ends project in opposite directions, in which ends are the words, respectively, 'Tar,' 'Cordial.' On the body of the scroll are the words 'For all Lung Diseases.' Pine trees flank the circular band, or are in the rear of the ends of the scroll."

2,900.—Soap.—ISAIAH WARREN, Wheeling, West Va. Case A. Application filed August 26, 1875.

"word 'Emerald.'"

2,901.—Soap.—ISAIAH WARREN, Wheeling, West Va. Case B. Application filed August 26, 1875.

"word CENTENNIAL."

2,902.—Toilet Preparations.—HERMON W. ATWOOD, New York, N. Y. Application filed July 31, 1875.

"a monogram formed of the letters 'H. W. A.'"

2,903.—Wood-Working Tools.—BAILEY TOOL COMPANY, Woonsocket, R. I. Application filed July 29, 1875.

"the figure of a battle-ax, surrounded by the words and letters 'Bailey Tool Co., Woonsocket, R. I.'"

2,904.—Shirts.—BLOOMER, KING & Co., New York, N. Y. Application filed August 10, 1875.

"the design shown in the accompanying fac-simile, which is composed of an arbitrary cipher on a scrolled escutcheon, arranged with reference to the words 'New York City Shirts,' the particular device upon the said escutcheon being the cipher B. K. & Co., arranged and depicted as shown."

2,905.—Combs.—BENJAMIN F. BRITTON, New York, N. Y. Case A. Application filed August 5, 1875.

"the representation of a human head having upon it a semi-circular comb or band, with a second comb or band extending back therefrom."

2,906.—Fertilizers.—LEMUEL L. CROCKER, Buffalo, N. Y. Application filed July 12, 1875.

"a heraldic emblem of a nearly square and shield like shape, having a cross thereon, and in central position, and at the junction of the two bars of the cross the picture of a buffalo in the act of leaping."

2,907.—Silk Goods.—WILLIAM H. DE FOREST, New York, N. Y. Application filed July 22, 1875.

"a female figure holding a rod with serpents coiled around it, a lion lying by her left side, and a portion of a shield and flags at her right side, with buildings and chimneys in the background at the left of the female figure. Above this female figure I place an eagle holding an olive-branch and the motto 'E Pluribus Unum.' Above this engraving, as described, I place the word 'Home,' and below the engraving the word 'Spun.'"

2,908.—Polishing-Powder.—DETROIT POLISH COMPANY, Detroit, Mich. Application filed August 18, 1875.

"words 'Diamond Polish,' and the representation of a diamond with divergent rays inclosed in a lozenge."

2,909.—Washing-Blue.—EASTMAN & BROOKE, Philadelphia, Pa. Application filed August 16, 1875.

"word 'Irish,' in conjunction with the representation of a dancing woman."

2,910.—Whisky.—FRIEBERG & WORKUM, Cincinnati, Ohio. (Re-registration.) Application filed August 24, 1870.

"words 'Cabinet Bourbon, Kentucky,' arranged in a triangle and inclosing the letters 'O K' in combination with our initials 'F. and W.,' and our autographic signature."

2,911.—Umbrellas and Parasols.—HEITER & GANS, New York, N. Y. Application filed August 6, 1875.

"a cross with an umbrella in the center, surrounded with the words 'Higgins Automatic.'"

2,912.—Redistilled Liquors.—HENRY W. SMITH & Co., Covington, Ky. Application filed August 16, 1875.

"a heraldic shield and the letters 'H. W. S. & Co.,' inscribed in it between two parallel lines."

2,913.—Bottled Wines.—I. H. SMITH'S SONS, New York, N. Y. Application filed June 12, 1875.

"the representation of the 'Mission San Gabriel' building."

2,914.—Ruches, Ruffings, and Collarettes.—JOEL THOMAS, Philadelphia, Pa. Case A. Application filed June 11, 1875.

"word 'Kuequenaka.'"

2,915.—Ruches, Ruffings, and Collarettes.—JOEL THOMAS, Philadelphia, Pa. Case B. Application filed June 11, 1875.

"a representation of a ship sailing close to the wooded bank

of a stream, while underneath the picture are described the words 'The ship Shield,' cruising before the present site of Phila. in 1678."

2,916.—Snuff.—WEYMAN & BROTHER, Pittsburg, Pa. Application filed July 28, 1875.

"a monogram, comprising the letters 'W. C.'"

2,917.—Sewing-Machines.—WILLCOX & GIBBS SEWING-MACHINE COMPANY, New York, N. Y. Application filed July 27, 1875.

"a monogram of the Roman capital letters 'W' and 'G.' The letter 'W' of said monogram is formed by a representation or drawing of four or more sewing-machine needles arranged at proper angles to form the letter; and the letter 'G' of said monogram is formed by a representation or drawing of the frame, needle bar, and cloth-table of a sewing-machine of the style made by said corporation."

2,918.—Sewing-Machine Needles and Attachments. WILLCOX AND GIBBS SEWING-MACHINE COMPANY, New York, N. Y. Case B. Application filed July 27, 1875.

"Roman capital letter 'W.,' followed by the mark or character '&,' signifying 'and,' and the Roman capital letter 'G.'"

2,919.—Smoked Meats and other Provisions.—J. P. WRIGHT & Co., Philadelphia, Pa. Application filed July 24, 1875.

"words 'QUAKER CITY.'"

2,920.—Combs.—BENJAMIN F. BRITTON, New York, N. Y. Case B. Application filed August 5, 1875.

"a pictorial representation of two semicircular combs, attached together at or near their ends."

2,921.—Cotton Fabrics.—GREENVILLE MANUFACTURING COMPANY, Providence, R. I. Application filed August 31, 1875.

"word 'Lily.'"

2,922.—Bread-Raising Material.—RUMFORD CHEMICAL WORKS, Providence, R. I. Application filed July 19, 1875.

"words 'Bread Preparation.'"

2,923.—Soap.—SCHULTZ & CO., Zanesville, Ohio. Application filed June 19, 1875.

"words or name 'Saint Patrick.'"

2,924.—Plows.—ALEXANDER SPEER & SONS, Pittsburg, Pa. Application filed July 13, 1875.

"word 'Lone' in connection with a star."

INDEX OF INVENTIONS PATENTED SEPTEMBER 7, 1875.

	Class No.	No. of Patent.
Air engine, A. K. Rider	2	167,568
Alarm, burglar, W. A. Parker	24	167,559
Amalgamator, C. H. Aaron	3	167,496
Anger, earth, W. Low	51	167,456
Barrel bung, W. E. White	40	167,419
Barrels, compound for lining oil, A. Rieder	35	167,569
Battery, galvanic, B. F. Dawson	50	167,510
Bell, door, F. G. Daniels	24	167,508
Billiard table, C. Joergens	143	167,540
Billiard table cushion, H. W. Collender	143	167,501
Blasting cartridge case for, P. A. Oliver	124	167,465
Boats, hinged mast for, Davenport and Porter	138	167,439
Boiler, cast iron sectional, J. F. Daniels	148	167,438
Boiler plates, machine for punching, J. Morgan	119	167,461
Boiler, steam, J. H. Wilkinson	149	167,595
Boiler, water tube, J. D. Pierce	148	167,562
Bolt and rivet machine, J. C. Geis	14	167,522
Book, copy, E. F. Goodman	146	167,447
Boot, H. Hall	16	167,450

Fire place grate, J. Bawden	154	167,496
Fire plug, J. A. Stacy	167	167,582
Fruit drier, Lowman and Crepe	48	167,549
Fruit jar, J. H. Cowl	58	167,437
Furnace, F. P. Dimpfel	154	167,441
Furnace, H. M. Smith	149	167,579
Furnace, locomotive boiler, W. F. Grassler	94	167,448
Furnaces, feeding air to, W. J. O'Neal	149	167,467
Gas, apparatus for manufacturing heating, J. M. Ayer	65	167,491
Gas light globe, T. Trudeau	64	167,417
Gas mains, dippipe of hydraulic, P. Munsinger	66	167,555
Gas regulator, J. Adams	64	167,488
Gas stove, J. J. West, (reissue)	65	6,636
Gate, Redmond and Rhodes	52	167,567
Gems, setting, H. G. Mackinney	86	167,457
Glass monument, A. Pfeiffer	54	167,470
Glazier's diamonds, P. Sines	68	167,575
Grain cleaning machine, G. E. Throop, (reissue)	57	6,629
Grate bar, E. N. Schmits	149	167,571
Grindstones, mold for forming artificial, G. Hart	153	167,527
Gunpowder, manufacture of, H. Courteille	35	167,503
Harness saddle, J. F. Knox	72	167,544
Harrow, J. B. Greene	73	167,449
Harvester, A. J. Cook	74	167,387
Harvester, J. S. Fowler	74	167,519
Hat and cap, Isidor and Hein	76	167,538
Hat pressing machine, M. A. Cuming	76	167,506
Hat stretching machine, R. Eickemeyer	76	167,391
Hats, stiffening, R. Eickemeyer	76	167,513
Heating buildings, C. Franke	154	167,395
Hinge, A. H. Isham	24	167,537
Hinge, D. Skidmore	24	167,576
Hook, snap, H. C. Goodrich	72	167,399
Horse power, O. O. Sterle, (reissue)	159	6,631
Ice cutting machine, J. Schster	58	167,413
Ironing apparatus, H. E. Smith	91	167,580
Keys, machine for making split, W. H. Fox	23	167,445
Knit goods, &c., uniting, H. A. Blanchard	89	167,492
Knitting stockings, &c., Polle and Kelsker	89	167,563
Lamps, funnel for filling, H. H. V. Lilley	90	167,548
Land roller, E. H. Adams	73	167,390
Lantern, pocket, J. Stevens	90	167,479
Lightning rod, H. W. Spang	50	167,415
Link, W. A. Ingalls	60	167,453
Locomotive boiler furnace, W. F. Grassler	94	167,448
Locomotives, reversing gear for, J. Ord	94	167,468
Loom for weaving matting, S. Kuh	95	167,545
Loom shuttle binder, J. H. Moore	95	167,460
Loom stop motion, B. F. Arnold	95	167,381
Looms, take up pawl for, S. S. Walker	95	167,418
Marking pot, W. H. Redden	146	167,473
Mast for boats, hinged, Davenport and Porter	138	167,439
Metallic vessel, E. T. Covell	136	167,504
Mill, grinding, G. Selser	57	167,573
Mirror, toilet, H. Palmieri	62	167,558
Miter, level, and plumb, combined, J. Murray	30	167,556
Monument, glass, A. Pfeiffer	54	167,470
Muff, head, L. B. Kleinert	38	167,543
Music leaf turner, F. G. Johnson	102	167,541
Nail cutting machine, W. Wickersham	103	167,420
Napkin holder, C. Rowland	88	167,411

	Class No.	No. of Patent.
Neck tie, A. P. Damon	38	167,507
Nozzles, joint for hydraulic, J. J. Crawford	167	167,505
Nut lock, J. G. Perry	14	167,469
Oar lock, G. H. Hurd	13	167,536
Organ reed board, A. W. Wilcox, (reissue)	106	6,637
Organ reed board, A. W. Wilcox, (reissue)	106	6,638
Ovals, machine for cutting, J. E. and C. E. Heward	175	167,534
Pantaloons former, C. Franke	38	167,393
Paper bag holder, G. H. Cleveland	148	167,434
Paper collar and cuff machine, E. Wilder	109	167,484
Paper making machines, cylinder for, S. Sellers	108	167,574
Pavement, Abbott and Cranford	110	167,423
Peat machine, C. H. Williams	61	167,596
Pen holder, D. M. Somers	146	167,581
Photographs, coloring enameled, W. W. Williams	111	167,485
Piano forte, G. C. Manner	112	167,463
Planing chuck, G. V. Seaver	100	167,572
Planter, corn, E. E. Matthews	133	167,552
Planter, cotton, J. B. Onan	133	167,466
Plow, side hill, R. I. Knapp	114	167,402
Plow, sulky, E. W. Russell	114	167,474
Portfolio stand, D. J. Steen	146	167,584
Power regulator, spring, O. Collier	67	167,435
Propeller for vessels, F. Jacob	139	167,539
Propelling machine, J. J. Flack	31	167,517
Propelling mechanism for canal boats, L. W. McKenney	139	167,553
Pump, force, F. W. Clarke	116	167,433
Pump valve, T. Maguire	118	167,550
Pumps, strainer for, L. Blass	118	167,427
Purifier, flour and middlings, A. M. Comstock	57	167,502
Railroad rail joint, S. H. Witmer	120	167,598
Railroad switch, C. C. Coats	120	167,499
Railway, elevated, W. H. Harrison	120	167,401
Railway signal, detonating, F. Hickman	120	167,532
Rake, horse hay, Downing and Van Campen	74	167,390
Rake, horse hay, J. Hollingsworth	74	167,533
Rattan, treating, C. Newman	169	167,469
Refrigerator, H. H. Barnes	58	167,425
Refrigerator, H. G. Gleyre	58	167,446
Register, hot air, E. A. Tuttle	154	167,480
Register, hot air, E. A. Tuttle	154	167,481
Rein holder, Porter, Hawes, and Page	31	167,564
Respirator and inhaler, combined, J. Carrick	156	167,496
Roller and harrow, A. P. Allen	73	167,490
Sad iron heater, G. W. Cottingham	91	167,3e9
Salt apparatus, removing calcareous deposits from the exterior of tubes in, W. C. Halliday	155	167,524
Seah pulley, J. Smith	24	167,478
Saw mill head block, Dilger and Dunn	130	167,511
Sawing machine, Pease and Whitacre	130	167,561
Scaffold, L. W. Swafford	30	167,588
Seal, metallic, F. C. Hamilton	146	167,525
Separator, grain, L. C. Boyer	159	167,570
Sewers and sinks, apparatus for emptying, R. Bookless	96	167,384
Sewers, manhole cover for, D. H. Fernald	4	167,444
Sewing cabinet, A. Tostevin	38	167,589
Sewing machine, W. G. Beckwith	134	167,3e8
Sewing machine, W. L. Fish	134	167,515
Sewing machine plaiting attachment, W. Walker, (reissue)	134	6,635
Sheet metal, machine for corrugating, W. B. and O. P. Scaife	136	167,412
Shoe pegs, manufacture of, F. D. Ballou	16	167,424
Shoemakers, combined cutter wheel and paneling device for, J. W. Carver	16	167,430
Soldering machine, L. P. Merriam	136	167,554
Sole channeling machine, L. Goddu	16	167,523
Sofa, T. Ramsden	69	167,565
Spinning ring, W. Jenckes, (reissue)	142	6,638
Spoke socket, A. Clist	31	167,498
Spoke tenoning machine, C. W. Latham	31	167,547
Square, W. H. Walker	97	167,482
Stove, gas, J. J. West, (reissue)	65	6,636
Stove, heating, M. C. C. Church	154	167,497
Stove, heating, Raymond and Campbell	154	167,566
Stove, heating, T. White	154	167,594
Stove polishing machine, P. H. Walsh	70	167,591
Table, ironing, Hughes and Lockard	91	167,535
Table slide, extension, Maxwell and Peester	62	167,404
Tar from sea weed, apparatus for obtaining, W. H. Reddick	47	167,410
Thill coupling, F. Chapman	31	167,431
Ticket case, I. White	146	167,593
Ticket reel, A. Stephenson	146	167,416
Tile, illuminating, T. Hyatt, (reissue)	110	6,630
Trap, fly, R. Nutting	143	167,464
Trap, hog, W. Deatherage	143	167,440
Tunneling machine, O. B. Dowd	51	167,444
Umbrella tip cup, F. S. Brown	165	167,439
Under garment, S. T. Converse	38	167,436
Valve, balanced, G. Mossop	152	167,462
Wagon, dumping, P., and J. Heilman, Jr	31	167,531
Wagon seat, S. R. Conover	31	167,388
Wagon spring, M. Feigel	31	167,443
Washing machine, D. Warnock	91	167,483
Watch regulator, R. S. Mershon	36	167,407
Wells, packer for shutting off water from oil, J. P. Gordon	134	167,400
Wheat steamer and equalizer, Sims and Hesick	57	167,414
Whip socket, H. E. Fowler	31	167,518
Windmill, S. M. Abbott	118	167,487
Window screen, J. E. Chase	30	167,386

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED SEPTEMBER 7, 1875.

	Patent No.
Aaron, C. H., Amalgamator	167,496
Abbott, J. P., Eaves trough hanger	167,422
Abbott, N. B., and J. P. Cranford, Pavement	167,423
Abbott, S. M., Windmill	167,487
Adams, E. H., Land roller	167,390
Adams, J., Gas regulator	167,488
Adams, L., Rotary engine	167,489
Allen, A. P., Roller and harrow	167,490
American Cable Screw Wire Company, assignee	167,523
Arnold, B. F., Stop motion for looms	167,381
Ayer, J. M., Apparatus for manufacturing heating gas	167,491
Ballou, F. D., Manufacture of shoe pegs	167,424
Barnes, H. H., Refrigerator	167,425
Bartlett, L. P., assignee	167,395
Bawden, J., Fire place grate	167,496
Beckwith, W. G., Sewing machine	167,382
Bell and Marsh	167,551
Bell, J. H., and J. H. Conrad, Composition for glazing roasted coffee	167,383
Bigelow, J., assignee	167,498
Blanchard, H. A., Uniting knit goods, &c	167,492
Blass, L., Strainer for pumps	167,427
Bliss, E. A., Clasp for ladies dress supporters	167,498
Boeklen, R., Apparatus for emptying sewers and sinks	167,384
Bolles, N. R., assignee	167,431
Bright, J. D., and J. N. De Guire, Churn dasher	167,493
Brill, G. M., Car platform	167,385
Brocket, A. E., assignee	167,536
Brown, F. S., Umbrella tip cup	167,439
Call, M., Cotton sweep	167,494
Campbell and Raymond	167,566
Carr, C. F., and S. S. Wilcox, File	167,495
Carrick, J., Combined respirator and inhaler	167,496
Carver, J. W., Combined cutter wheel and paneling device for shoemakers	167,430
Chapman, F., Thill coupling	167,431
Chase, J. E., Window screen	167,386
Chormann, E. G., Easel	167,432
Church, M. C. C., Heating stove	167,497
Clarke, F. W., Force pump	167,433
Cleveland, G. H., Paper bag holder	167,434
Clist, A., Spoke socket	167,498
Coats, C. C., Railroad switch	167,499
Coe, J. F., Churn	167,500
Collender, H. W., Billiard table cushion	167,501
Collier, O., Spring power regulator	167,435
Comstock, A. M., Flour and middlings purifier	167,502
Conover, S. B., Wagon seat	167,388
Conrad and Bell	167,383
Converse, S. T., Under garment	167,436
Cook, A. J., Harvester	167,387
Cottingham, G. W., Sad iron heater	167,389
Courteille, H., Manufacture of gunpowder	167,503
Covell, E. T., Metallic vessel	167,504
Cowl, J. H., Fruit jar	167,437
Cranford and Abbott	167,423
Crawford, J. J., Joint for hydraulic nozzles	167,505
Crepe and Lowman	167,549
Cross, L., assignee	167,484
Culp, J. A., assignee	167,550
Cuming, M. A., Machine for pressing hats	167,506
Damon, A. P., Neck tie	167,507
Damon, Temple & Co., assignees	167,507
Daniels, F. G., Door bell	167,508
Daniels, J. F., Cast iron sectional boiler	167,438
Davenport, C. E., and W. M. Porter, Hinged mast for boats	167,439
Davey, H., Steam engine	167,509
Dawson, B. F., Galvanic battery	167,510
Deatherage, W., Hog trap	167,440
De Guire and Bright	167,493
Denio, A. O., assignee	167,538
Dilger, T., and W. R. Dunn, Saw mill head block	167,511
Dimpfel, F. P., Furnace	167,441
Dowd, O. B., Tunneling machine	167,442
Downing, B. J., and H. D. Van Campen, Horse hay rake	167,390
Draper, G., & Son, assignees, (reissue)	6,633
Dunn and Dilger	167,511
Eichholtz, G. W., Churn dasher	167,512
Eickemeyer, R., Hat stretching machine	167,391
Eickemeyer, R., Stiffening hats	167,513
Emerson, R., assignee	167,387
English, H. C., Ratchet drill	167,392
Evans, A. H., assignee	167,507
Fawkes, J. W., Check row corn dropper	167,514
Feigel, M., Wagon spring	167,443
Fernald, D. H., Manhole cover for sewers	167,444
Fish, W. L., Sewing machine	167,515
Fisher, B., and W. Wickkiser, Feed cooker	167,516
Flack, J. J., Propelling machine	167,517
Fowler, H. E., Whip socket	167,518
Fowler, J. S., Harvester	167,519
Fox, W. H., Machine for making split keys	167,445

	Patent No.
Franke, C., Pantaloons former	167,393
Franke, C., Apparatus for shaping coats	167,394
Franke, C., Heating buildings	167,395
Franke, C., Cloth scouring machine	167,396
Franke, C., Stop cock	167,397
Frankfoder, D., Fire kindler	167,520
Frash, C. G., Preparing cork for stoppers	167,521
Freeman, B., Derrick	167,398
Getz, J. C., Bolt and rivet machine	167,522
Gleyre, H. G., Refrigerator	167,446
Goodu, L., Sole channeling machine	167,523
Goodman, E. F., Copy book	167,447
Goodrich, H. C., Snap hook	167,399
Gordon, J. P., Packer for shutting off water from oil wells	167,400
Grassler, W. F., Locomotive boiler furnace	167,448
Green, O. C., assignee	167,411
Greene, J. B., Harrow	167,449
Hall, H., Boot	167,450
Halliday, W. C., Removing calcareous deposits from the exterior tubes in salt apparatus	167,524
Hamilton, F. C., Metallic seal	167,525
Harrison, T. B., Cistern cut off	167,526
Harrison, W. H., Elevated railway	167,401
Hart, G., Mold for forming artificial grindstones	167,527
Hastings, R. E., and B. W. Naves, Car starter	167,528
Hatch, G. W., Fence post	167,529
Haury, F., Bottle stopper	167,530
Hawes, Page, and Porter	167,564
Heilman, P. and J., Jr., Dumping wagon	167,531
Hein and Isidor	167,532
Heibling, M., assignee	167,569
Hickman, F., Detonating railway signal	167,532
Hollingsworth, J., Horse hay rake	167,533
Horan, J. S., assignee	167,588
Hoelck and Sims	167,414
Howard, J. E. and C. E., Machine for cutting ovals	167,534
Hughes, W. J., and J. A. Lockhard, Ironing table	167,535
Humphrey, J. P., assignee	167,471
Hunt, D. W., Burial case	167,451
Hurd, G. H., Car lock	167,536
Hyatt, T., Illuminating tile, (reissue)	6,630
Iles, G., Mariner's compass	167,452
Ingalls, W. A., Link	167,453
Isham, A. H., Hinge	167,537
Isider, M., and F. Hein, Hat and cap	167,538
Jacob, F., Propeller for vessels	167,539
Jenckes, W., Spinning ring, (reissue)	6 628
Joergens, C., Billiard table	167,540
Johnson, F. G., Music leaf turner	167,541
Johnson, R. W., Engraving machine	167,542
Kelsker and Polle	167,563
Kleinert, I. B., Head muff	167,543
Knapp, R. L., Side hill plow	167,402
Knox, J. F., Harness saddle	167,544
Kuh, S., Loom for weaving matting	167,545
Lamb, D. M., Dental plate, (reissue)	6,633
Lamb, D. M., Dental plate, (reissue)	6,634
Latham, C. H., assignee, (reissue)	6,632
Latham, C. W., Machine for tenoning spokes	167,547
Lefferts, J. W., Submerged filter	167,546
Lewis, E., Car coupling	167,454
Lilley, H. H. V., Funnel for filling lamps	167,548
Lindley, W., assignee	167,419
Lobdell, G. G., assignee	167,529
Lockard and Hughes	167,535
Lockwood, R., India rubber eraser	167,455
Low, W., Earth auger	167,456
Lowman, D. S., and H. T. Crepe, Fruit drier	167,549
Mackinney, H. G., Setting gems	167,457
Maguire, T., Pump valve	167,550
Manner, G. C., Piano forte	167,403
Marsh, I. R., and I. Bell, Cattle stall	167,551
Matthews, E. E., Corn planter	167,552
Maxwell, G. H., and J. B. Peester, Extension table slide	167,404
McAnerney, J., assignee	167,398
McKenney, L. W., Propelling mechanism for canal boats	167,553
McKenney, S. S., assignee	167,598
McNiece, W., assignee	167,554
McNitt, M., Cultivator	167,458
McNulty, R., Car truck	167,405
McNulty, R., Car truck	167,406
Meriden Britannia Company, assignee	167,578
Merriam, L. P., Soldering machine	167,554
Morahon, R. S., Watch regulator	167,407
Moody, H. C., Child's carriage	167,459
Moore, J. H., Loom shuttle binder	167,460
Morgan, J., Machine for punching boiler plates	167,461
Morris, Tasker & Co., assignees	167,555
Morrison, G. H., assignee	167,430
Mossop, G., Balanced valve	167,462
Munzinger, P., Dip pipe of hydraulic gas mains	167,555
Murdock, C. F., Stop cock	167,463
Murray, J., Combined miter, level, and plumb	167,556
Naves and Hastings	167,598
Newman, C., Treating rattan	167,409
Nutting, E., Fly trap	167,464
Odell, L. J., Check rower	167,557
Oliver, P. A., Cartridge case for blasting	167,465
Onan, J. B., Cotton planter	167,466
O'Neal, W. J., Feeding air to furnaces	167,467
Ord, J., Reversing gear for locomotives	167,468
Overby, J. O., assignee, (reissue)	6,631
Paddock, J. R., Direct acting engine	167,408
Page, Porter, and Hawes	167,564
Palmieri, H., Toilet mirror	167,558
Parker, C. N., Jr., assignee	167,596
Parker, W. A., Burglar alarm	167,559
Pearce, H., Automatic brake for elevators	167,560
Pease, C., and G. W. Whitacre, Sawing machine	167,561
Peester and Maxwell	167,404
Peckinpaugh, A. N., assignee	167,511
Perry, J. G., Nut-lock	167,469
Pfeiffer, A., Glass monument	167,470
Pierce, J. D., Water tube boiler	167,562
Pike, R. W., assignee	167,453
Polle, F. W., L. Kelsker, and S. Polle, Knitting stockings, &c	167,563
Porter and Davenport	167,430
Porter, E. N., W. E. Hawes, and C. R. Page, Rein holder	167,564
Prentiss, C. H., Vapor burner	167,471
Ramsden, T., Sofa	167,565
Raymond, S., and J. Campbell, Heating stove	167,566
Redmond, C. C., and H. H. Rhodes, Gate	167,567
Reece, V. J., Die stock	167,472
Rhodes and Redmond	167,567
Rider, A. K., Air engine	167,568
Rider, [illegible]ster & Co., assignees	167,568
Rieder, A., Compound for lining oil barrels	167,569
Redden, W. H., Marking pot	167,473
Rowland, C., Napkin holder	167,411
Royer, L. C., Grain separator	167,570
Ruddick, W. H., Apparatus for obtaining tar from sea weed	167,410
Russell, E. W., Sulky plow	167,474
Scaife, W. B. and O. P., Machine for corrugating sheet metal	167,412
Schater, J., Ice cutting machine	167,413
Schmitz, E. N., Grate bar	167,571
Seaver, G. V., Planing chuck	167,572
Sellers, S., Cylinder for paper making machines	167,574
Selsor, G., Grinding mill	167,573
Shaw, P., Butter worker	167,475
Shaw, P., Butter mold	167,476
Sherwood and Woods, (reissue)	6,632
Sims, D., and J. Hoelck, Wheat steamer and equalizer	167,414
Sinas, P., Glasier's diamond	167,575
Skidmore, D., Hinge	167,576
Skidmore, W. D., Can opener	167,577
Smith, A., Car coupling	167,477
Smith, H. E., Ironing apparatus	167,580
Smith, H. M., Furnace	167,579
Smith, J., Sash pulley	167,478

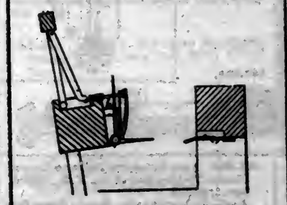
TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED SEPT. 7, 1875.



167,380. LAND-ROLLER. Ephraim H. Adams, Lykens Township, Crawford County, Ohio. [Filed Apr. 8, 1875.]

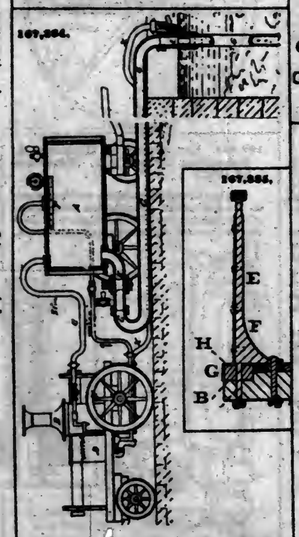
Brief.—There are three rollers—one in front and two in line in the rear. Each has an independent motion. This motion for the rear rollers is limited by a stop-plate, which is permanently attached to the bar that carries the roller-frame.

The stop-plates I I, in combination with the pivoted roller-frames F G and transverse bar D, as and for the purpose set forth.

167,381. STOP-MOTIONS FOR LOOMS. Benj. F. Arnold, Westerly, R. I. [Filed Feb. 24, 1875.]

In a weft-stop motion, a weft-feeler, consisting of a part or portion of the reed made movable, substantially as and for the purpose herein set forth.

167,382. SEWING-MACHINES. W. d. Brobwith, Newark, N. J. [Filed Jan. 30, 1875.]



1. The combination of the hook or under bastle secured to the shank D, pivoted directly to the bed-plate A on its under side, lever C, similarly pivoted and working in substantially the same plane with the shank D, and the link F, connecting the two, constructed and operating substantially in the manner described and specified.

2. The combination of the tension G and the slotted bar E, whereby the tension is rendered adjustable in its relative position to the hook or under needle, substantially in the manner described and specified.

167,383. COMPOSITIONS FOR GLAZING ROASTED COFFEE. Jas. H. Bell and John H. Conrad, Chicago, Ill. [Filed July 27, 1875.]

A composition for glazing roasted coffee, composed of pure water, molasses, turmeric, flour, alumbol, and gum arabic, substantially as herein before set forth.

167,384.

167,385.

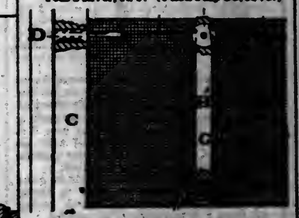
167,384. APPARATUS FOR HEATING SEWERS AND SEWER. Reinhold Boekius, Brooklyn, N. Y. [Filed July 13, 1875.]

Brief.—Improvement on Patent No. 142,308, August 26, 1873. Drives the steam through tank and suction-pipe, and out through a pipe having a stop-cock, either through the furnace fire or other decoctions. Condenses by water making vacuum in both tank and suction-pipe. The soil may rise immediately, or by a stop-cock in suction-pipe, may be held back, and admitted at will.

1. The combination of the tank A, hose C, and cock or valve J, whereby the vacuum is caused in said tank and hose, in order to operate upon the soil instantaneously, substantially as herein set forth.

2. The combination of the tank A, and boiler B, with the hose C, cocks or valves J L, and steam-pipe O, substantially as and for the purposes herein set forth.

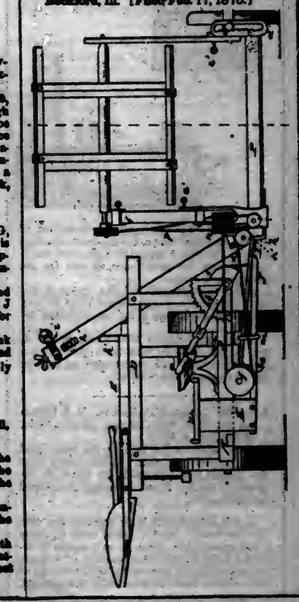
3. The combination of the boiler B, tank A, sprinkler F, valve or cock J, pipe K, and hose C, to operate upon the soil, substantially as herein set forth.



167,385. CAR-PLATFORMS. Geo. M. Brill, Philadelphia, Pa. [Filed July 9, 1875.]

1. The metallic sheathe G, encircling the fronts, sides, and backs of the ends of the platform-sill B, substantially as and for the purposes set forth.

2. The lower plate H, formed with the encircling sheath G, substantially as and for the purposes set forth.



3. The sheathing H, in combination with the bracket F, formed therewith, and operating substantially as and for the purposes set forth.

167,386. WINDOW-SCREENS. J. R. Chase, Tom's River, N. J. [Filed July 30, 1875.]

The gauze-frame C, in combination with the spring-spars D, connections E, rotating disk or arm F, and operating-cord H or J, as substantially as and for the purpose set forth.

167,387. HARVESTERS. Andrew J. Cook, Wichita, Kans., assignee of one-fourth his right to Ralph Emerson and W. A. Talcott, Rockford, Ill. [Filed Feb. 17, 1875.]

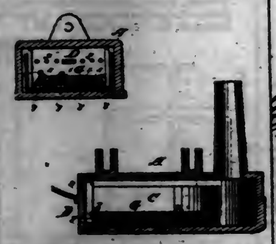
1. The combination of the hinged bars I I with the segments c, chains d, rack h, and lever e, for raising, lowering, and holding the inner ends of the cutter-bar and carrier-frame F, substantially as specified.

2. The combination of the bars or levers J with the hinged bars I, stirrups w, and blades w' stand, with its supports K, substantially as described.

3. The coupling-frame, consisting of the hinged bars I and cross-bracer r, substantially as set forth.

4. The combination of the pulleys or wheels k l j with the belt or chain p, arranged as described, whereby the elevator is held against the table B, substantially as specified.

167,889. WAGON-SEAT. S. B. Conover, Jersey City, N. J. [Filed Aug. 12, 1875.]



Brief.—The plate of the top plate slides in the tubes of the bottom, and are guided by the guide-rod moving in a groove.

1. The combination of the supporting-frame A, which is made in one piece with the two parallel tubes *b b* that are partly closed at the bottom, with the top plate B made in one piece with the two pendent pins *d d*, having enlarged heads *e e*, and with the springs *f f*, all combined to operate substantially as herein shown and described.

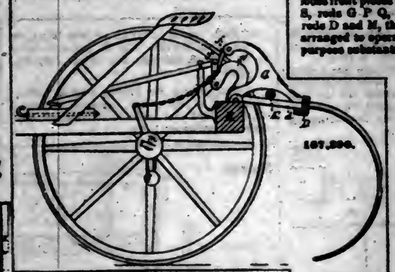
2. The combination of the guide-rib *g* and guide-groove *i*, with the plate B, having the pins *d d*, and with the frame A, having the tubes *b b*, substantially as specified.

167,890. SAD-IRON HEATER. Gideon W. Cottingham, Rockport, Tex., assignor to himself and James P. Cottingham, same place. [Filed Aug. 12, 1875.]

1. The grate G, constructed as described, of the longitudinal bars *a*, having draft-openings *c* near the upper edge, and grooved longitudinally on the under side, as and for the purposes set forth.

2. The combination of the grooved and perforated grate G, and the end plate D, with lower draft-openings *p*, for the purposes set forth.

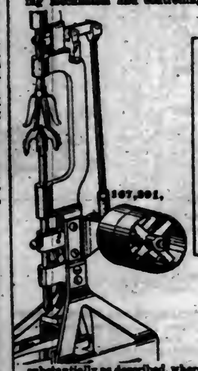
3. The combination of the hollow iron A, pan G, and plate D, with draft-openings *p i*, and the grate G, all constructed as and for the purposes herein set forth.



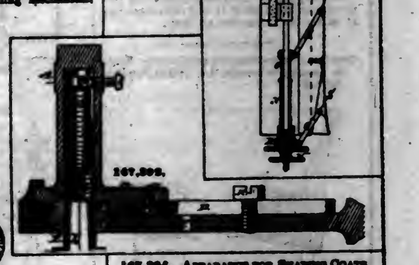
167,892. HORSE HAY-RAKES. R. J. Downing and H. D. Van Compen, Dayton, Ohio. [Filed Feb. 6, 1875.]

Brief.—Device for locking the rake-head automatically on its rise. Called spring upon the pressure-bar, adjustable by screw, to depress the teeth. Teeth fastenings shortened for lubrication.

1. The hinged rack H, in combination with the foot-lever I, pawl *f*, forked lever G, chain A, and spring-latch *m*, as a means of temporarily locking the lifting devices of a horse hay-rake without preventing the discharge of the collected loads, substantially as described.



2. The adjustable coiled springs *b'*, in combination with the rake-teeth, the pressure-bar E, and screw *s* for adjusting the springs upon said bar, substantially as described.

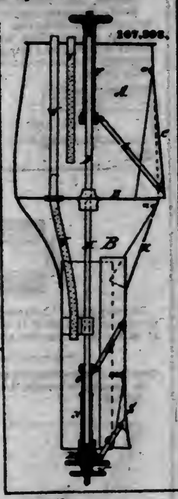


3. The thimbles C, provided with the chamber *b'* and dowel-pins, substantially as described, and for the purpose specified.

167,891. HAT-STRETCHING MACHINES. R. Bolsinger, Yonkers, N. Y. [Filed June 25, 1875.]

In a hat-stretching machine which operates on the corrugation principle, the combination of co-operating stretching devices with driving mechanism and controlling mechanism, substantially as described, whereby one of said devices is properly driven with a reciprocating movement, and the two devices gradually brought into working communication with each other for stretching a hat, and separated when the hat is to be removed, as set forth.

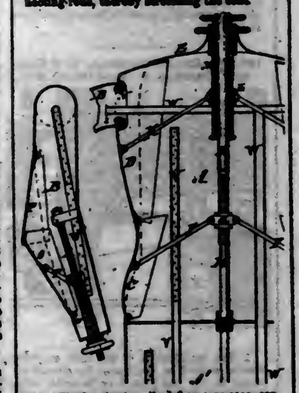
167,893. RATCHET-DRILLS. H. C. English, Wilmington, Del. [Filed May 4, 1875.]



Brief.—A wheel with two grooves in it receives the tool-holder. Two levers—one a short arm pivoted to the cap, and having a segment of gear at its lower end, which meshes with a segmental piece carrying a pawl, and the other a long arm, fitted also with a pawl at its lower end. The pawls alternately wedge and loosen in the grooves of the wheel, so that the drill is turned continuously in the same direction by opposite motions of the operating-lever. The hole for the reception of the steel carrier is eccentric, in virtue of which the toothed upper end of the said carrier is made to engage with a regulating-bolt, which holds it for a long or short interval, according to the depth to which it (the bolt) is inserted.

1. The combination, substantially as herein shown and described, of the hand-lever F, slotted lever D, toothed at its lower end, geared pinion J, grooved wheel B, and tool-holding spindle B.

2. The combination, substantially as herein shown and described, of the grooved wheel B, pawls K K', geared pinion J, levers F D, spindle B, with the hole for the reception of the steel-carrier out of center, steel-carrier C, provided with toothed head E, regulating-bolt G, and cap A.

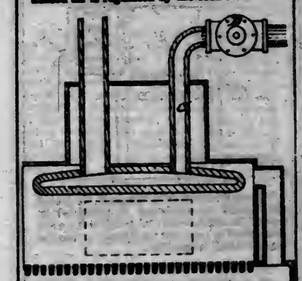


167,894. PANTALOONS-FUSEERS. Charles Franke, New York, N. Y. [Filed Jan. 18, 1875.]

The herein-described pantaloons-fuseer, consisting of the chambers A and B B, provided with hinged parts or sections C and K, loose front pieces I, with hinged bottom pieces S, rods G F Q, sleeves or nuts P N E, and rods D and M, the whole being combined and arranged to operate in the manner and for the purpose substantially as set forth.

167,895. APPARATUS FOR SHAPING COATS. Charles Franke, New York, N. Y. [Filed Apr. 1, 1875.]

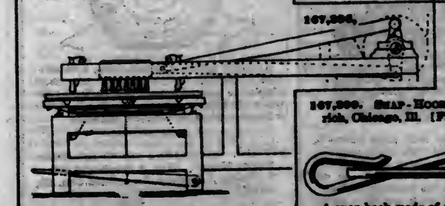
Brief.—By turning the thumb-pieces the hinged sections are moved outward by the connecting-rods, thereby stretching the coat.



1. The herein-described frame or case, consisting of the chambers or casings A' A and B B, of the proper form for shaping a coat, and provided with hinged sections C, D, O and F, in combination with rods P, K, and T, operated by spindles H R and sleeve M, together with suitable steam-pipes V, W, X, and W', the whole being arranged to operate together in the manner and for the purpose substantially as set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

2. The sleeve-casings B B, attached to the hinged sections D by means of a ball or socket joint, H, substantially as and for the purpose described.



167,896. METHOD OF PROCESSING OF HEATING BUILDINGS. Chas. Franke, New York, N. Y. [Filed May 26, 1875.]

Brief.—The flow of water for hydrating the heated air is regulated by the cock D.

The within-described method or process of heating buildings, consisting in combining with the hot air produced in a furnace steam generated in a dry chamber, B, into which the steam-producing water is admitted in regulated quantity only as fast as required for generating the desired proportion of steam, supplying the said combined hot air and steam to the several apartments to be heated, substantially as and for the purpose herein specified.

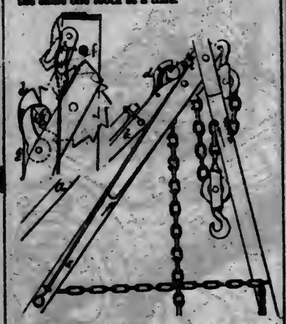
167,897. CLOTH-SCOURING MACHINES. Charles Franke, New York, N. Y. [Filed June 2, 1875.]

1. The combination, in a cloth or clothes scouring machine having reciprocating brushes, of a supporting-frame, a platform to sustain the cloth or clothes, and pressure-holders (, constructed and operating substantially as described, to hold the cloth or clothes to the platform against the lateral action of the brushes.

2. The combination, in a cloth or clothes scouring machine, the reciprocating brushes, the pressure-holders (, constructed and operating substantially as described, and a laterally-moving or removable platform.

3. The combination, in a cloth or clothes scouring machine, of the pressure-holders (, constructed and operating substantially as described, and a platform mounted on springs, for the purpose specified.

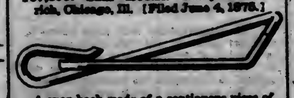
4. The combination, in a cloth or clothes scouring machine, of two platforms, having anti-friction bearings interposed between them, for the purpose set forth.



5. The combination, in a cloth or clothes scouring machine, of two platforms on springs, a treadle, K, and a cam, O.

167,897. SHAFT-COUPLING. Charles Franke, New York, N. Y. [Filed Apr. 6, 1875.]

In a shaft-coupling a valve-chamber, A, with the inlet B and outlet C on a straight line with each other, the combination of the valve-stem G, with slotted arm A extending therefrom at right angles, and the valve B, adjustable on said arm, substantially as and for the purpose herein set forth.



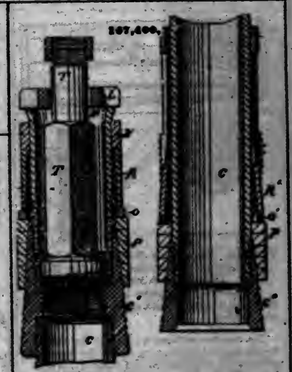
167,898. DRESSERS. Burton Freeman, East Attleborough, Mass., assignor of one-half his right to J. McAnerney, Attleborough, Pa. [Filed May 6, 1875.]

Brief.—By the change in the position of the spring attached to the movable rod, the lever-arm may be operated to raise a weight or lower the same one tooth at a time.

The combination, in a derrick, of the lever A, the curved lever *b*, the pawl *d*, check-pawl B, and ratchet-wheel C with the springs *g* and *f* and rod K, the whole operating together substantially as and for the purpose set forth.

167,899. SNAP-HOOKS. Harry C. Goodrich, Chicago, Ill. [Filed June 4, 1875.]

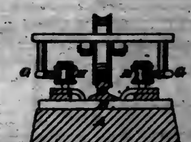
A snap-hook made of a continuous piece of spring-wire bent into form, as described, so that the ends pass each other in parallel planes, and having the outer end adapted to facilitate the attachment of a ring, as substantially as specified.



167,900. PACKING FOR STUFFING-BOX OF WATER-PRESS OIL-WELLS. James P. Gordon, Karn's City, Pa. [Filed Apr. 22, 1875.]

Brief.—Elastic ring-shaped packing is wedged outward between the ridged outer surface of hollow cones attached to the ends of the tube-section, and the walls of the well—the lower one by lifting the section and cone with it, (the packing being prevented from rising by barbed rings and a conical ring above it,) the upper one by rings and a nipple, which screws downward into the cone.

1. The combination, with the lower end of a joint of well-casing, C, of the cone C', packer P', open ring O, loose conical ring R', barbed wedges W, and ring Y, all constructed, arranged, and operating substantially in the manner and for the purpose described.



2. The combination, with the upper end of a joint of well-casing, of the cone C, packer P', open ring O, loose ring R, nipple N, bush I, and cap T, all constructed, arranged, and operating in the manner and for the purpose specified.

3. In combination with any required length of well-casing, devices, constructed and operating substantially in the manner hereinbefore specified, attached to the upper and lower ends of the same, whereby said casing may be made self-sustaining at any desired point in an oil

or artesian well, and have a water-tight packing inserted and fixed between its ends and the well-walls, for the purpose of shutting off a water-course or vein, substantially in the manner set forth.

167,901. RECEIVING RAILWAYS. William H. Harrison, Livermore, Cal. [Filed July 29, 1875.]

The improvement on single-track railways, the same consisting of the guiding-rails G, when secured to the car, in combination with the pulleys H, when secured upon each side of the rail, substantially as herein described.

167,902. SIDE-HILL PLOWS. R. I. Knapp, Half-Moon Bay, Cal. [Filed Aug. 12, 1874.]

Brief.—An elbow lever or rod, extending downward from between the handles, carries a double hook, which can be turned from side to side to secure the plow in position.

In a side-hill plow, constructed as described, the mother J, provided with the rod K and handle M, all arranged to operate substantially as and for the purpose set forth.

167,903. PIANO-FORTES. Geo. C. Mosmer, Mott Haven, N. Y. [Filed Mar. 30, 1875.]

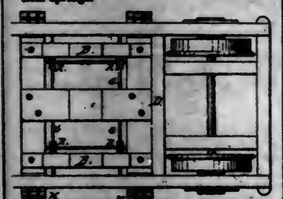
1. In combination with the bridge B, applied in front of and above the wrest-plank C, the perforated wrest-plank and the fillers b b, extending through the perforations of said wrest-plank and behind said bridge, all being so arranged that the strings pass beneath the bridge and above the wrest-plank, and that the fillers extend between the said bridge and the tuning-pins which project above the face of the wrest-plank, substantially as herein shown and described, and for the purpose specified.

2. The piano-bridge B, combined with the hard-rubber inlay *c*, cast or molded in the bridge, substantially as herein shown and described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

167,402.

167,403.

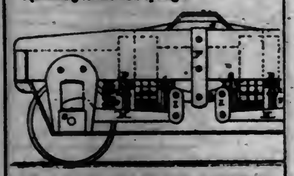


167,404. RECEIPT-TABLE SLIDES. Geo. H. Maxwell and James B. Forster, Delhi, N. Y. [Filed Jan. 6, 1875.]

Brief.—Central wooden slides, the tongues of which project to both edges of the outer or main slides.

The wooden sections A, having the continuously-separating tongues B, and notches and grooves *a b*, and groove and stops *d e*, in combination with the sections C, having the tongues and grooves *a b* and projections *c*, in the manner and for the purpose herein specified.

167,405. CAR-TRUCKS. Richard McNulty, Nashville, Tenn. [Filed Mar. 6, 1875.]



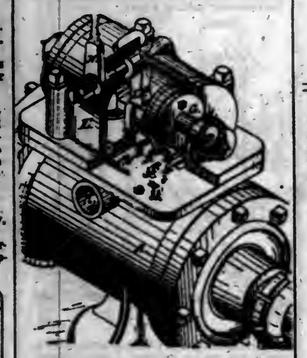
Brief.—Car-body supported on bolster-frames, which rest on necks of suspended elliptical springs.

The combination of a four-wheeled truck, center bolster-frame, elliptical springs K K K, supports G G and D D, straps E E, and supporting-pieces B B, all substantially as and for the purpose set forth.

167,406. CAR-TRUCKS. Richard McNulty, Nashville, Tenn. [Filed Nov. 4, 1874.]

Brief.—Car-truck supported on system of equalizing levers and springs.

The combination, with a four-wheel truck, of the springs F F, spring-levers H H, straps I I, lever G, and stirrup F, substantially as and for the purposes set forth.

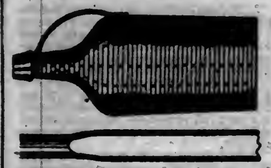


167,407. WAGON-REGULATOR. Ralph S. Morehen, Zanesville, Ohio. [Filed July 8, 1875.]

As an improvement in regulating mechanism for thills-pieces, the bridge A, constructed with projection or cleat A' and curled edge or tongue *a*, in combination with the equalizing-lever F, and G, and balance-spring C, all permanently united to or formed a part or fixture of the balance-bridge, whereby the bridge containing the entire regulating device may be readily removed or secured in place in a one-piece without alteration of the parts, substantially as and for the purposes described.

167,408. DEMOIT-ACTING ENGINES. James B. Paddock, Chicago, Ill. [Filed July 27, 1875.]

Brief.—The auxiliary valve is started by steam from main cylinder, and carries the remaining portion of its stroke by steam admitted from the steam-chest. The main valve contains a supplemental exhaust-valve, which governs the exhaust from either end of the auxiliary piston-valve.

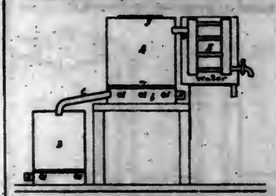


1. The combination, with main piston B, auxiliary piston G, and main steam-valve H, of a system of ports composed of *ae'* and *ae*, *bf* and *bf'*, arranged substantially as described, to accomplish the results specified.

2. The combination, with auxiliary piston G and main steam-valve H, of an exhaust-valve, I, and a system of ports composed of *ae'*, *c'*, and *d*—*bf*, *b'* and *d*, arranged substantially as described, to accomplish the result specified.

3. The combination, with auxiliary cylinder F, auxiliary piston G, and combining-cylinder O, of channel *e*, and auxiliary exhaust-valve I, arranged substantially as described, to accomplish the result specified.

167,409. PROCESSES OF TREATING RATTAN. Carlton Newman, San Francisco, Cal. [Filed May 11, 1875.]

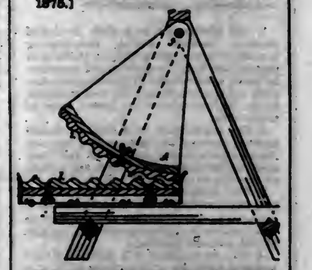


Brief.—Strips of rattan are flattened by being passed between two pressing-rollers, which are gaged to the desired thickness, for the purpose of preparing them for weaving into rattan-ware or wicker-ware.

The process of flattening strips of rattan by compression previous to weaving them into rattan-ware or wicker-work, substantially as and for the purpose above described.

167,410. APPARATUS FOR OBTAINING TAR FROM SEA-WEED. William H. Braddick, Boston, Mass. [Filed July 20, 1870.]

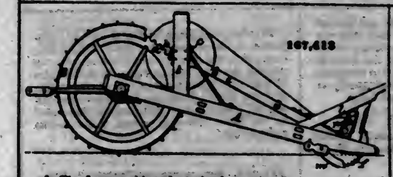
Brief.—Passes products of combustion from a furnace through sea-weed in a kiln, and the products from the kiln through a condenser. Applies air-blast to both furnace and kiln. May omit furnace. Lixiviates ashes of the weed to get iodine, &c.



The combination of the furnace B, the grated kiln A, and the condenser E, connected by pipes C D, and furnished with one or more air-blast pipes to lead into the furnace or into the kiln, or both, as specified.

167,411. NAPKIN-HOLDERS. Charles Rowland, New York, N. Y., assignor to Cassels C. Green, Washington, D. C. [Filed Aug. 17, 1875.]

As a new article of manufacture, a napkin-holder provided with a suitable receptacle adapted to hold a bouquet, and having a suitable containing-base for maintaining the holder in position, as hereinbefore set forth.



167,412. MACHINES FOR COMBINATING SHEET METAL. Wm. B. Smith and Oliver P. Smith, Allegheny, Pa. [Filed Jan. 28, 1875.]

In a machine for corrugating sheet metal, the combination of the oscillating segmental section *f*, with the reciprocating bars G, the same being provided with detachable corrugated face-pieces *i* and *i*, respectively, substantially as and for the purpose hereinbefore described and set forth.

167,413. ICE-CUTTING MACHINES. Joseph Schuster, Syracuse, N. Y. [Filed June 9, 1875.]

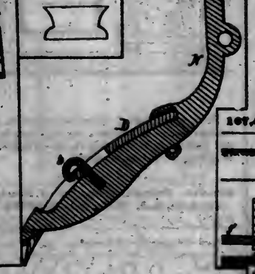
Brief.—Fore part of main frame rests on axis of driving-wheel; rear end rests on ice, carries the markers, and has guiding-handles. Fore end of said frame rests on uprights from main frame; rear end adjustable vertically. Toothed flange of driving-wheel operates gearing which revolves the saw.

167,413

167,414.

1. The frame *c*, hinged at the forward end on the counter-shaft, which has its bearings in standards *f f*, back of the traction-wheel, and suspended at the rear and from the adjustable cross-bar *r*, and carrying thereat the pulley *s* and saw *f*, in combination with the carriage A, mounted at the front on the axle of the traction-wheel B, and resting on the ice at the rear, and provided with handles *l* and standards *i*, constructed substantially as described and shown, for the purpose set forth.

2. The combination of the pendent saw-frame *c*, herein described, cross-bar *r*, provided with springs at the ends, slotted guides *a a*, having notches for supporting the said bar *r*, and carriage A, all constructed and operating substantially as herein described, for the purpose set forth.



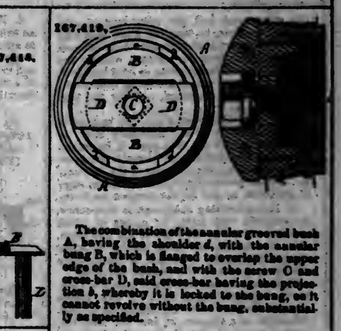
3. The ice-cutting machine herein described, consisting of the carriage A, mounted at the forward end on the axle of the traction-wheel, and resting on the ice at the rear, the traction-wheel B, having gear *a* attached to its side, pinion *b*, and pulley *s* on the counter-shaft, having its bearings in standards *f f*, back of the traction-wheel, the frame *c*, hinged at the forward end on said counter-shaft, and carrying the saw *f* and pulley *s* at the rear end, and suspended thereat from the cross-bar *r*, which latter is supported by notches in slotted guides *a a*, and held thereon by springs on the ends of said bar, and the adjustable gages *n n*, all constructed and combined to operate substantially as described, for the purpose specified.

167,414. WHEAT SCREENING AND SCALPING. David Sims and John Hostek, Leavenworth, Kans. [Filed Nov. 6, 1874.]

Brief.—The grain is subjected to the action of steam in the upper part of the revolving cylinder, falls through the perforations at its lower end into the hopper, whence it is directed by the wing-valve into one of the two equal compartments of the drying-bin. It is claimed that in grinding grain thus prepared the bran separates cleanly and in mass from the flour.

167,414.

167,415.



1. The outer and stationary cylinder A, provided with the closing heads B and the outlet *b*, in combination with the inclosed revolving, perforated, and scanner-headed cylinder D, the grain-pipe *c*, and the steam-pipe *f*, substantially as and for the purposes specified.

2. The partitioned bin C, in combination with the hopper-bottomed cylinder A, and the handled wing-valve *m*, substantially as and for the purposes specified.

167,415. LIGHTNING-RODS. F. W. Spang, Reading, Pa. [Filed Oct. 20, 1874.]

Brief.—For purpose of making good earth-connection.

The combination of pipe A with drain or gutter B and perforated pipe D, all electrically connected, and forming a lightning-conductor, substantially as described.

167,416.

167,416. TICKET-HOLDER. Albert Stephenson, St. Louis, Mo. [Filed May 10, 1875.]

A ticket holder or case, having a slit, *a*, for the entrance as well as delivery of the tickets, in combination with a revolving spindle, B, having slits *b'*, by means whereof the turning of said shaft coils, as well as uncoils, said tickets, substantially in the manner herein shown and described.

167,417. GLOBES FOR GAS-LIGHTS. Townsend Trudeau, Ottawa, Canada. [Filed Jan. 24, 1872.]

A gas globe or shade, having its lower opening from two and a half to five inches, height from three to six inches, and its upper opening from six to nine and a half inches diameter, the said dimensions being proportioned to each other in the various sized globes, substantially as herein set forth, the globe to be arranged with the narrowest part of the lower opening on or nearly on a level with the top of the burner, substantially as described.

167,414.

167,417.

167,418.

167,418. TAKE-UP PAWLS FOR LOOMS. S. S. Walker, Crompton, R. I. [Filed July 24, 1875.]

The wire hook *b*, in combination with the pawl D and lever E, substantially as and for the purpose specified.

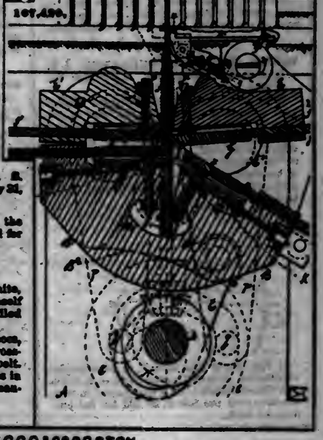
167,419. RAIL-JOINTS. Wm. B. White, Birmingham, Conn., assignor to himself and William Lindley, same place. [Filed July 23, 1875.]

Brief.—The bung consists of two pieces, the top overlapping flange-plate and the cross-bar, the two being united by the screw-bolt. By turning the bung the cross-bar moves in the annular groove of the bush in such a manner as to prevent the bung falling out.

167,419.

The combination of the annular grooved bush A, having the shoulder *d*, with the annular bung B, which is flanged to overlap the upper edge of the bush, and with the screw C and cross-bar D, said cross-bar having the projection *b*, whereby it is locked to the bung, so it cannot revolve without the bung, substantially as specified.

167,420. NAIL-CUTTING MACHINES. Wm. Westerman, Boston, Mass. [Filed July 29, 1875.]



Brief.—An oscillating double cutter-stock, carrying two series of cutters, to act in conjunction with two single cutter-stocks placed above, each carrying a single series of cutters. A rack, (placed above the machine and carrying, vertically, a series of nail-sheets,) provided with mechanism by which it is alternately progressed to bring each sheet successively over the space between the cutters. A feed-screw on each side of the machine, provided with partially-straight and partially-inclined threads, (the upper threads being notched, forming teeth which cut notches in the edges of the sheet,) to take into notches in the sheet, and feed it down by means of the inclined portions, and hold it while being cut, by means of the straight portions.

1. In nail-cutting machines, the double cutter-stock herein described, made of one single casting, having a space for the nails to fall through, with one or more ribs connecting the two sides to each other, and constructed to hold a series of cutters on each side, substantially as and for the purpose set forth.

2. In nail-cutting machines, the two single cutter-stocks, each holding a series of cutters, in combination with the double cutter-stock holding two series of cutters, substantially as and for the purpose set forth.

3. In nail-cutting machines, the combination of a single cutter-stock and a series of cutters on each side, and a double cutter-stock and two series of cutters thereon, with mechanism for holding the single cutter-stock in a state of rest while the cutting is done, and to raise it up out of the way at other times, substantially as described, and for the purpose set forth.

4. In nail-cutting machines, a feed-screw, constructed to work in notches in the edge of the nail-sheet, with threads inclined part of

167,420.

the way round, and the other part of said threads straight, to feed the sheet down by the inclined part of the threads while the sheet is disengaged from the cutters, and by the straight part of the threads to hold the sheet at rest while the cutters are doing their work, substantially as described, and for the purpose set forth.

5. In nail-cutting machines, the cutters G G', having spaces F and adjoining spur, in combination with the feed-screw S, by means of which the nail-sheet can be and is fed down to the operative cutting-edges of the said cutter, thereby preventing waste at the last edge of the sheet, as and for the purpose set forth.

6. In nail-cutting machines, a rotating screw, constructed with heads, by means of which notches are cut in the edge of the nail-sheet, the screw at the same time feeding the sheet toward the cutter by means of the notches thus cut, as and for the purpose set forth.

7. In nail-cutting machines, a supply-rack, *b'*, having grooves in its sides and spaces through the bottom for the nail-sheets to pass, arranged on a support, *a*, over the machine with a space or slot, *a'*, through which the nail-sheets can pass from the rack to the cutters, combined with mechanism by which said rack can be intermittingly moved along, successively delivering the nail-sheets therein contained to the cutters through the slot *a'*, substantially as described, and for the purpose set forth.

8. The device for moving the rack in such manner as to deliver each sheet in it successively into the nail-machine as it is cut into nails, consisting of the hook *e* and the vibrating arm *p'*, in combination with the spring *s'*, all constructed and arranged, as described, so that the hook will be moved with a positive motion in the direction the rack is to move, but by a yielding motion in the opposite direction, so that when a sheet is passing down it will limit the motion of said hook in the direction of the sheet, and so that when the sheet has passed down out of the way said hook will pass back to another notch, *e'*, and at next forward movement will move the rack far enough for the delivery of another sheet, as and for the purpose set forth.

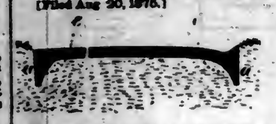
9. The tilting cover *M*, in combination with the cover I, the wedge K, the cutters F, and the center-stock B therewith connected, as and for the purpose set forth.

167,491. CAR-REPLACERS. O. J. Williams, Buffalo, N. Y. [Filed June 5, 1874.]

The inclined rail D, pivoted to and in combination with the clamp C, having a hook, *c*, and a vertical arm, *a*, which rests upon the base of the rail, all substantially as set forth.

167,492. HAYER-TROUGH HANGERS. J. P. Allcock, Cleveland, Ohio. [Filed Mar. 30, 1875.]

Brief.—The cross-bar is provided with a hook at one end for changing the hand on the trough. The other end of the bar is bent at a right angle, and the bent portion is provided with a short stud, which penetrates the side of the trough. A wire is secured to the cover of the roof, and bent around over the suspension-strap, to prevent any lateral sway of the trough.



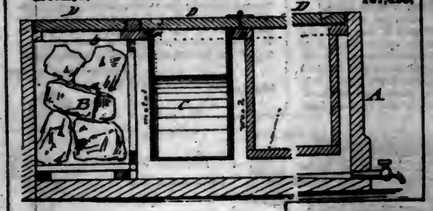
1. The arm G and hook F, in combination with the bar B, as and for the purposes set forth.

2. The standard I, pin *i*, and plate J, in combination with the bar B, as and for the purpose set forth.

3. The clamp K, having in the end thereof an eye, *d*, for the admission of a nail, whereby to secure the upper end of the clamp to the roof, and arranged in relation to the strap H and in combination therewith, and to the eaves of a building, in the manner substantially as described, and for the purpose set forth.

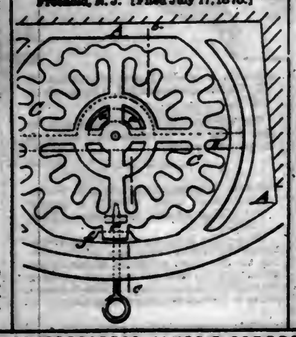
167,493. PAVEMENTS. Nathan B. Abbott and John P. Cranford, Brooklyn, N. Y. [Filed Aug. 20, 1875.]

The skirt or dike *c* beneath the edge of the bituminous or other concrete pavement, as and for the purposes set forth.



167,494. MANUFACTURE OF SHOE-PEGS. Francis D. Ballou, Abington, Mass. [Filed June 26, 1875.]

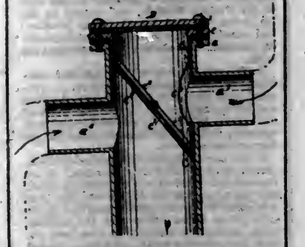
1. The process of forming peg-wood, consisting in first grooving or recessing the strip on the edge destined to furnish the point of the peg, and then bending or inclining the walls of the recess to form the point, substantially as described.



2. As a new article of manufacture, a shoe-peg, having the construction, substantially as described.

167,495. REFRIGERATORS. H. H. Barnes, Brooklyn, N. Y. [Filed Aug. 14, 1875.]

The combination of the casing or box A, and ice-receptacle B, pendent cooling-vessels C, and separately-hinged lids D, all arranged as set forth, for the object stated.

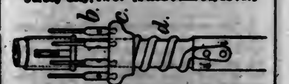


167,496. FIRE-PLACE GRATES. J. Bowden, Freehold, N. J. [Filed July 17, 1875.]

In a fire-place grate having the central projection *a*, to prevent the grate from being dumped at the rear, the combination, with the pivoted grate C, having recesses at the sides of part *a*, of the grate-frame A, having recess at either side of projection *f*, as shown and described, whereby said grate may be depressed at the front whenever moved either to the right or left.

167,497. STRAINERS FOR PUMPS. L. Blum, Germantown, N. Y. [Filed Aug. 14, 1875.]

Brief.—The strainer is arranged directly in the path of the supply-stream. The sediment falls to the bottom, and may be removed, when desired, by unscrewing the lower cap.

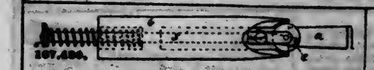


The combination of the cylinder A, having a cap, B, screwed upon its lower end, and a cap-plate, D, bolted to its flanged upper end, and provided with an inlet-pipe, *a'*, and an outlet-pipe, *a''*, and the tube C having a flange formed upon its upper end, a wire-gauze plate, *c'*, attached to its beveled lower end, and a hole, *c''*, formed in its side, with each other, to adapt the device to be attached to a pump-pipe, substantially as herein shown and described.

167,498. CLAMPS FOR LADIES' DRESS-SUPPORTERS. Hyacinth A. Stier, Jersey City, N. J. [Filed Apr. 10, 1875.]

The drum-bar for clamp C, having arms *g' g'*, held at the crossing by band *g''*, and inwardly bent to form hooks *g' g'*, all being in the same plane with shank, as shown and described.

167,499. UMBRELLA-TIP CUPS. F. B. Brown, Jersey City, N. J. [Filed June 14, 1875.]



1. The combination of the tip-cup *c* and spiral spring *d*, when constructed and arranged to operate substantially as and for the purposes set forth.

2. The spring *d* surrounding the handle loosely, and connected at one end to said handle, in combination with the tip-cup sliding upon the handle, and against which the spring acts, as set forth.

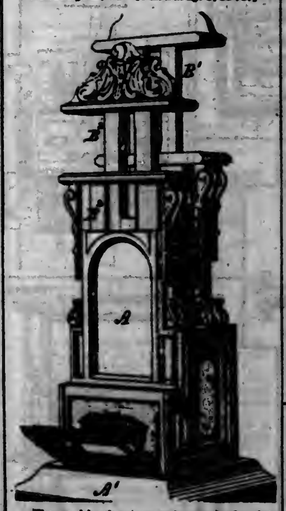
167,500. CORRUGD OUTSIDE-WHEELS AND FASTENING DEVICES FOR SAME. J. W. Carver, Lynn, assignor to himself and G. E. Morrison, East Boston, Mass. [Filed June 29, 1875.]

167,490.

1. A shoemaker's tool composed of the paneling-tool *a*, handle *b*, sliding shank *c*, marking-wheel *d*, and cutter *e*, the said parts being constructed and arranged substantially as shown and described.

2. The combination of the marking-wheel *d* and cutter *e*, attached to the sliding shank *c*, substantially as and for the purposes described.

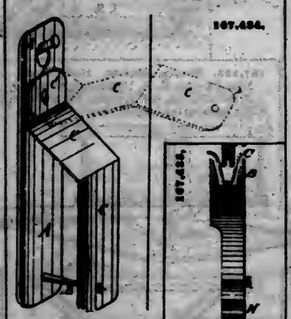
3. The combination of the marking-wheel *d* and cutter *e*, adjustably connected with each other, and arranged for joint and simultaneous operation, as set forth.



4. The combination of the shoulder *i* of the paneling-tool *a*, acting as a guide, with the marking-wheel *d* and cutter *e*, one or both, as shown and described.

167,491. TELL-COUPLINGS. Frank Chapman, Auroraville, Wis., assignor of one-half his right to N. R. Rollen, same place. [Filed Feb. 1, 1875.]

In combination with a wagon-slip, the bolt D, having the head *c* and pivoted button H, and the loose collar F, having the inwardly-projecting flange *f*, and provided with the yielding spring G, operating substantially as and for the purpose set forth.



167,492. PARLOR-BASES. R. G. Chestnutt, Philadelphia, Pa. [Filed Aug. 6, 1875.]

The combination, in a parlor-stand, of an inclosing case or stand, A, and extensible sliding frames B B', arranged to operate substantially as set forth.

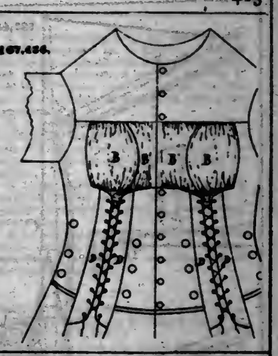
167,493. PAPER-BAG HOLDERS. George E. Cleveland, Camden, Me. [Filed July 3, 1875.]

The end-perforated angle-plate C, swiveled to turn laterally on plate A, and made elastic to spring over or off a pin, B, as and for the purpose specified.

167,494.

167,495. SPRING-POWER REGULATORS. Orrin Collier, Sacramento, Cal. [Filed June 5, 1875.]

Brief.—The spring-brake is adapted to the form of the lever, and avoids the groove and head.



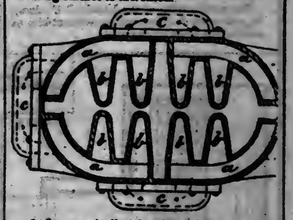
The combination, with wheel A, of a lever, B E H, forked at the upper end, and having between the forks a spring, C, constructed as shown, and for the purpose specified.

167,496. UMBRELLA-GARNITURE. Susan Taylor Converse, Woburn, Mass. [Filed Apr. 24, 1876.]

1. In a stanchion, the gores C and lining-flaps D D, combined and arranged substantially as described, with those parts of the garment which extend below and around the abdomen and hips, as and for the purposes specified.

2. The pieces B and D', combined and arranged together and with the garment, substantially as shown described.

167,497.



1. The clamp C, constructed with the enlarged central slotted portion *c*, and inclined or bevel under portion *b'*, substantially as and for the purposes described.

2. In combination with the clamp C C', constructed as described, the lid B, constructed with the central projecting portion B' B', and bevel-edged portion *b*, substantially as and for the purposes described.

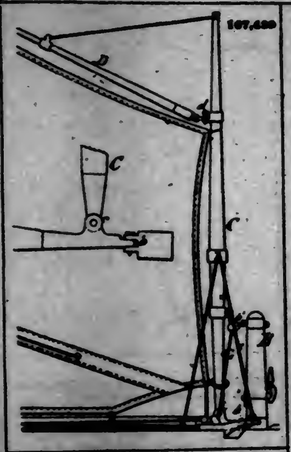
3. The combination of jar A, lid B, constructed with the projecting bevel-edged portion B' *b* and center-pin B', and clamp C C', constructed with the enlarged slotted central portion *c*, and inclined or bevel faces *b'*, as and for the purposes described.

167,498. CAST-IRON SECTIONAL BOILERS. John F. Daniels, Boston, Mass. [Filed Feb. 11, 1875.]

Brief.—The vertical sections have hollow inward projections cast thereon, whereby the heating-surface is increased.

1. In a vertically-jointed cast-iron sectional boiler, as herein shown, the hollow vertical projections *b b b b*, cast to the shell, substantially as and for the purpose set forth.

2. The sectional cast-iron boiler as herein shown, consisting of two or more hollow sections, *c c c c*, hollow projections *b b b b*, and the circulating-pipes *d d d d*, as and for the purpose set forth.



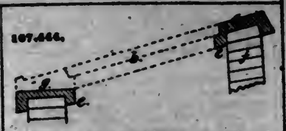
167,499. HINGED MASTS FOR BOATS. Chas. H. Davenport and Wm. M. Porter, Washington, D. C. [Filed Feb. 16, 1876.]

1. The falling mast C, stayed, as shown, to the sill F, in combination with the standing mast B, substantially as shown and described.

2. The standing mast B, stayed, as shown, in combination with the falling mast C and halliard G, when the mast C, gaff D, boom E, and sail F are made permanently in one, as shown and specified.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

167,439



The supplemental bed B, for holding the supply-fuel for the fire, constructed and applied to have the fuel exposed to the direct action of the fire without having the draft pass through the supply-fuel previous to its being placed upon the fire-bed proper.

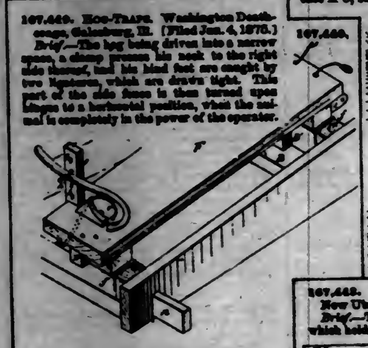
167,442. TUNNELING-MACHINES. Olney B. Dowd, New York, N. Y. [Filed Aug. 6, 1875.]

Brief.—The cone of the tunneling-machine has a central hollow shaft, provided with a revolving arm, with passages to conduct water or air to the arm, so as to thin and loosen the earth. One or more tubes in the bottom of the cone can be projected through to loosen boulders, &c. The loosened earth is conducted into the cone by a receiving-pipe, and passed out of the top by a discharge-pipe.

1. The combination of tubes A C, shaft E, and arm F, substantially as described.
2. The combination, with cone A C and revolving arm F, of passages J K, by which to conduct water or air to the arm, substantially as specified.
3. The shaft E and arm F, having water-passages J, as described.
4. The combination of one or more tubes W with the cone A C, substantially as specified.
5. The combination of receiving-pipe P, water-pipe H, and discharge-pipe I with the cone A C, substantially as specified.

167,444.

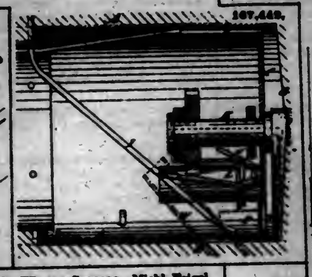
The cover for sewer-chimneys, consisting of the circular cover *a*, provided with flanges *d e*, and the channel *g*, substantially as set forth and shown.



167,445. MACHINES FOR MAKING SPLIT KEYS. Willard H. Parr, New Haven, Conn. [Filed Aug. 14, 1875.]

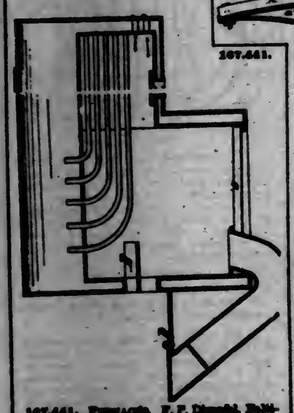
Brief.—Two sets of cutters for severing the wires into blanks, and two sets of dies, pushers, and formers, for bending said blanks to the desired configuration.

1. A die, G, constructed and arranged substantially as specified.
2. The combination of a former, F or F', and a pusher, E, with a die, G, substantially as specified.
3. The combination of way D and cutters A C with the pusher E, former F, and die G, substantially as specified.
4. Two sets of cutters, A C, pushers E, formers F, and dies G, arranged and organized in one machine with one crank-shaft, J, substantially as specified.



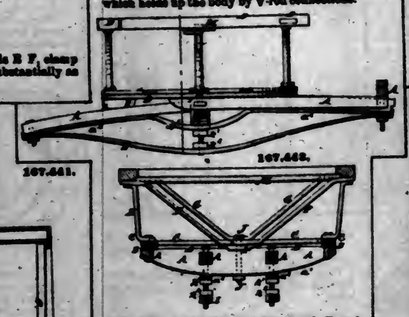
167,439. HOG-TRAPS. Washington Deatherage, Shineburg, Ill. [Filed Jan. 4, 1875.]

Brief.—The hog being driven into a narrow space, a clamp presses his neck to the right side thereof, and his hind feet are caught by two fingers, which are drawn tight. The part of the side frame to them bend upon hinges to a horizontal position, when the animal is completely in the power of the operator.



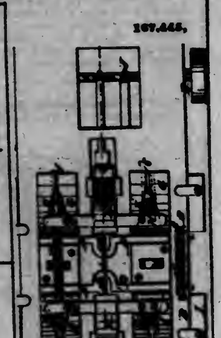
The combination of the beams E F, clamp G, and cords J J, operating substantially as and for the purpose specified.

167,440.



167,441.

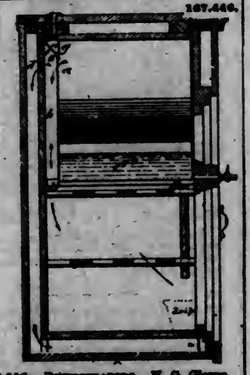
167,441. FURNACES. F. P. Dimpfel, Baltimore, Md. [Filed July 1, 1875.]



167,442. WAGON-SPRINGS. Michl. Feigel, New Utrecht, N. Y. [Filed Aug. 6, 1875.]

Brief.—The tie-rod supports the platform which holds up the body by V-rod connections.

1. The combination of the V-rod F and tie-rod M, with the body D, the platform A, and the king-bolt J, substantially as herein shown and described.
2. The combination of the tie-rods L with the platform A, the bars or plates *a'*, the bolts K, and the rods M, substantially as herein shown and described.

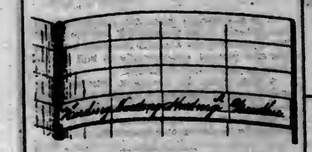


167,443.

167,443. MAN-HOLE COVERS FOR SEWERS. Daniel H. Furnald, Bangor, Me. [Filed Mar. 6, 1875.]

Brief.—An annular cover with flanges for embracing the masonry, upon which it rests in an inclined position, having a central opening covered by a grating, and a channel at one side for the admission of water.

167,446.

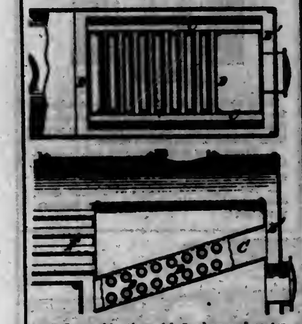


167,446. REFRIGERATORS. E. G. Glover, Glasgow, Mo. [Filed July 24, 1875.]

Brief.—Cold air from ice-box into food-chamber, and between walls of refrigerator; also, warm air passing up and out is prevented from entering ice-box by a flange depending from the cover.

The combination of ice-receptacle, having inclined perforated rear flange, and forming with rear walls, an intermediate ventilating-flue, with a perforated cover, having a pendent flange that cuts off direct air communication between ice-receptacle and ventilating-outlet for the passage of air outside of the refrigerator, all as and for the purpose specified.

167,447. COPY-BOOKS. R. P. Goodman, Clinton, Iowa. [Filed July 9, 1875.]

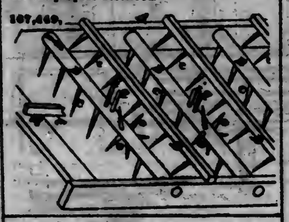


Brief.—The copy moves up and down on the cord, then being brought immediately above the line to be written upon, and covering the line previously written upon.

In a copy-book, the cord B, in combination with the sliding and reversible slip A, having a copy on each side, capable of being used on either one of the two adjacent pages of the book, substantially in the manner and for the purpose set forth.

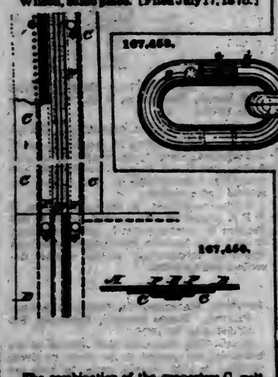
167,448. LOCOMOTIVE-BOILER FURNACES. Wm. F. Granzier, Muncy, Pa. [Filed Aug. 16, 1875.]

Brief.—A series of longitudinal and transverse pipes forms an interposed diaphragm across the furnace, by means of which the products of combustion are impeded, and an additional water-heating surface exposed to the fire.



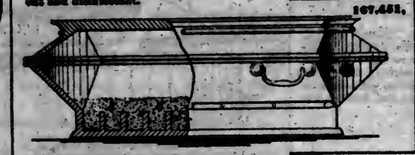
1. In combination with fire-box and water-legs, the tubes C, and transverse tubes D, substantially as set forth.
2. In combination with the fire-box of a locomotive-boiler, a transverse water-bridge formed by the pipes C and D, when the latter are placed in front of the fire-box, and arranged so as to impede the circulation only in that part of the box, the space at E being left open, substantially as set forth.

167,449. HARROWS. Jos. B. Greene, Elliott, Cal. [Filed May 17, 1875.]



Brief.—A series of journaled bars are mounted in a rectangular frame. Each bar is furnished with a row of teeth for cultivation, and a radial cut for causing rotation. A set of bars are hinged upon the top of the harrow, provided with stops and lifters, so that the teeth-bars, in succession will make one turn. Stationary shares are secured above each teeth-bar, and as the bars rotate the teeth are freed from weeds and other obstructions.

The rotating shafts B B, with their radial spikes c c and harrowing-teeth c c a, step-pins f, and lifting-pins g, in combination with the levers F loosely attached to the frame A at one end, and provided with the pins or projections h and lifting projection p, all combined and arranged to operate substantially as and for the purpose described.



167,450. HOOPS. Harry Hall, Fenton, Mich., assignor to Maunsell and Harry E. Wilson, same place. [Filed July 17, 1875.]

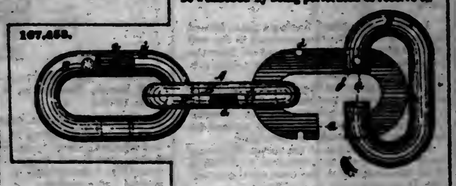
The combination of the supporters C, rail B, and flat wires or wheelbarrow F with the front A, hook B, and counter D, substantially as and for the purpose set forth.

167,451. BURIAL-CASES. David W. Hunt, San Francisco, Cal. [Filed May 6, 1875.]

Brief.—The bottom of the coffin is furnished with coils to contain dry earth as an absorbent and disinfectant.

A coffin furnished upon its bottom with coils for retaining dirt, or an equivalent absorbent beneath the body, as and for the purpose specified.

167,452. MANUFURS' COMPASSES. Geo. Ban, Montreal, Canada. [Filed July 26, 1875.]

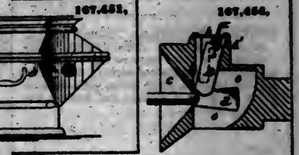


1. In combination with any magnetic needle the transverse bar D, carrying many minute magnets placed with like poles one way, and being practically a magnet, pointing E. and W., attracted toward a piece of iron like an ordinary magnetic needle, as shown and described.
2. In combination with any compass the longitudinal bar carrying many minute magnets of like poles pointing one way, and acting as a magnetic needle, as shown and described.
3. In any compass the combination of the longitudinal bar A and transverse bar D equally attracted by any object, substantially as described.
4. In combination with the magnetic needle A and bar D, a compensator, of iron or steel, operating in the manner described, and for the purposes set forth.

167,453. LOCKS. William A. Ingalls, Alton, assignor to Rushven W. Files, Chicago, Ill. [Filed Apr. 6, 1875.]

Brief.—The rivet that unites the parts is made homogeneous with one of the sections, and is located near the opening, so that the ends of the link in the line of strain may not be weakened by being perforated to receive it.

167,453.



The link A, made in two parts, B B', each part provided with the opening a to admit the adjacent link, and connected, one to the other by the lug *f*, located at the side of the part B', and made as a homogeneous part of the same, and adapted to pass through the part B near opening c, forming a pivot on which the latter can freely turn, as specified.

167,454. CAR-COUPLINGS. Edward Lewis, Dover, Del. [Filed July 30, 1875.]

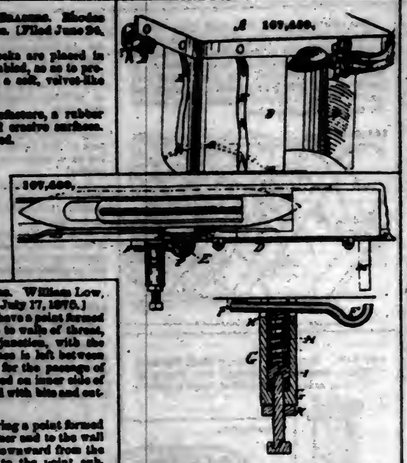
Brief.—The coupling-pin, having a swinging and vertical movement, runs with its side pins into grooves, and rests upon the shoulder.

1. The combination of the grooves a and shoulders *g*, formed into an elevated extension, A', of the draw-head A, with the pins *b* of the coupling-pin B, and plate A to retain the coupling-pin in position, substantially as shown and described.

167,454.

2. The combination of the groove a, having its forward end opened at *c*, and its rear portion enlarged, with the coupling-pin B capable of a vertical and a rocking motion, substantially as and for the purposes described.
3. The combination of the draw-head A A', groove a, and plate A with the flat coupling-pin B, having its point made angular fore and aft, substantially as and for the purposes set forth.

107,456. INDIA-RUBBER ERASER. Nicolas Lockwood, Boston, Mass. [Filed June 24, 1875.]



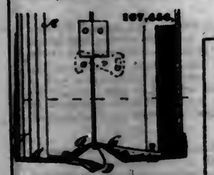
Brief.—A number of blocks are placed in a revolving vessel and tumbled, so as to produce by frictional contact a soft, velvet-like finish upon their surfaces.

As a new article of manufacture, a rubber eraser, having soft finished erasive surfaces, all substantially as described.

107,456.

107,456.

107,457. RABBET-ADJUSTER. William Low, Webster, Mich. [Filed July 17, 1875.]



Brief.—The cutting-bits have a point formed by a curve from inner ends to walls of throat, and downward from the junction, with the bottom to the points. Space is left between the bits on opposite sides for the passage of stems. Valves are arranged on inner ends of bottom curve, to correspond with bits and cutters.

1. The cutting-bits D having a point formed by the curve F from the inner end to the wall of the throat, and curved downward from the junction with the bottom to the point, substantially as specified.

2. Two pointed cutting-bits, D, arranged at opposite sides of the center with space between for the passage of stems, in combination with the bottoms G, spirally molded for clearance, substantially as specified.

3. The combination of the valves G, having inner ends curved to correspond with curves F of the throats with the bottoms G and cutters D, substantially as specified.

107,456.

107,457.

107,457. SETTING GUAGE. Herbert G. Mackinney, North Attleborough, Mass. [Filed June 10, 1875.]

The polished stellated and slotted reflector C, as described, in combination with the open-ank jewel A and its series of supporting-standards d of the frame E, all being arranged and applied substantially as specified.

107,458. CULTIVATORS. Martin McNitt, Mound Station, Ill. [Filed July 10, 1875.]

Brief.—The teeth upon rolling cross-bars are turned to any desired angle by manipulating the handles, which latter also serve as pawls engaging a ratchet, and locking the bars in position.

The combination, with the ratchet-bars F and the rock-bars C, carrying teeth E, of the combined handles and pawl K, pivoted in supports I, and arranged to operate in the manner shown and described.

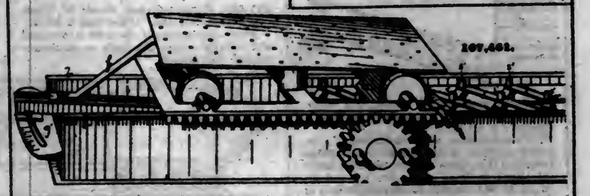
107,459. CHILDREN'S CARRIAGES. Henry C. Mosely, Corunna, N. Y. [Filed June 28, 1875.]

Brief.—The hood rod is fastened in the curtain, and enables it to be more readily folded.

The combination of the hood rod G, with curtain D and square top A, as shown and described.

107,460.

107,460. LOOM SHUTTLE-BOXES. John H. Moore, Fisherville, N. H. [Filed July 10, 1875.]



1. The spring device, consisting of the cylinder or post G, spring H, crooked lever F, and adjusting-screw J, combined with the protection-rod D and finger E, constructed and operating substantially in the manner described and specified.

2. The combination of the spring device G H F J, protection-rod D, with finger E, and dagger M, shuttle-binder L, and a projection or stop, c, on the loom-frame, constructed and operating substantially in the manner described and specified.

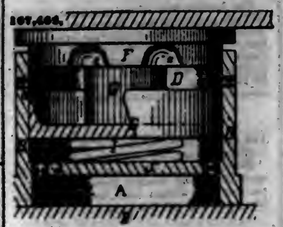
107,461. MACHINES FOR PUNCHING BOILER-PLATES. James Morgan, Pittsburg, Pa. [Filed Aug. 19, 1875.]

Brief.—The extensible rack secured to the bed-plate, and guided in its travel by rivets working in slots therein, serves to vary the distance between the holes as punched. The rivets at the joints form the ratchet-teeth. The pawl is suspended from the carriage, and is raised from the rack by means of a slide provided with a wedge-shaped projection.

107,461.

1. The combination of traversing carriage, a table pivoted thereon, a rigid bar extending from the table and engaging an adjustable guide-bar, substantially as and for the purposes set forth.

2. An extensible rack, a, in combination with a feed-carriage and pawl, substantially as and for the purposes described.



3. An extensible rack, a, fastened to the frame at one point of its length, as at *d*, and guided in its extensible movement by one or more projections and slots, substantially as and for the purpose set forth.

4. In combination with the adjustable guide-bar *g*, a graduated fastening-plate, *g'*, substantially as set forth.

5. The slide *i*, having an inclined or wedge-shaped projection, *f*, in combination with the pawl *n*, having an arm, *n'*, substantially as set forth.

107,462. BALANCED VALVES. Geo. Mesmer, Philadelphia, Pa. [Filed June 28, 1875.]

107,462.

1. In a balanced valve, the combination of the cylinder D, the pistons E F, and apertures for conducting the steam to the space between the said pistons, substantially as and for the purpose shown and described.

2. The piston E, having a thin tapering shell, *c*, in combination with the cylinder D, said shell being forced, by the action of the steam, steam-tight against the piston D, substantially as shown and described.

107,463. STOP-COCKS. Chas. F. Murdock, Detroit, Mich. [Filed Aug. 26, 1875.]

1. A stop-cock or valve having an adjustable valve-seat as constructed and arranged in combination to the gate or valve-seat as to adjust itself thereto as the gate is closed.

2. The case or shell having its side in which the opening *a* made inclined, substantially as and for the purpose set forth.

3. The plate O, arranged within the shell, so as to hold the self-adjusting seat in position, as set forth.

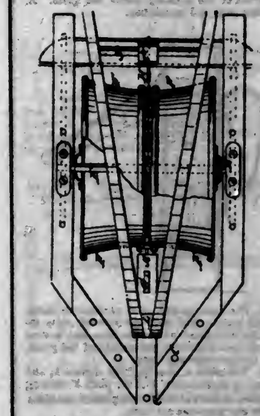
107,464. FLY-TRAPS. Rufus Nutting, Wheaton, Ill. [Filed Sept. 13, 1874.]

Brief.—An oblong trap provided at one end with a death-hole and a wire-gauze stopper. A fastening device to connect the body and bottom, and spurs projecting upward from the bottom for bait-holders.

1. A fly-trap prison having the death-hole H and guard-stopper I in the end C, constructed and combined substantially as and for the purposes described.

2. The footboard balconies J, having the grooves L, in combination with the strips G, attached to the prisons A B, substantially as described.

3. A trap for flies, consisting of the frame A B C, covered with suitable material, having a death-hole, I, provided with the bottom G, sliding between the balconies J, and provided with upright spurs to receive the bait.



107,465. CARTRIDGE-CASES FOR BLASTING. Paul A. Oliver, Williamsburg, Pa. [Filed Aug. 21, 1875.]

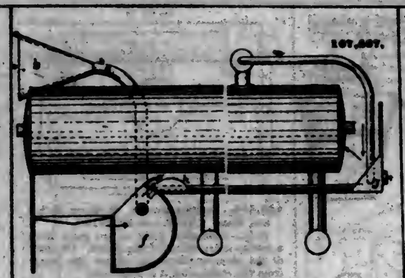
A telescopic cartridge-shell for blasting purposes, made of a main shell, with one or more tubular pieces or sections jointed thereto, to adjust the shell to any required length, substantially as specified.

107,466. COTTON-PLANTERS. Jas. R. Oates, Pecan Point, Ark. [Filed June 28, 1875.]

Brief.—Attached to a branch of the opener, and extending rearwardly, is a chain which works in the central seed-discharge opening formed for drawing out the cotton-seed. The chain is secured at the rear to the opener.

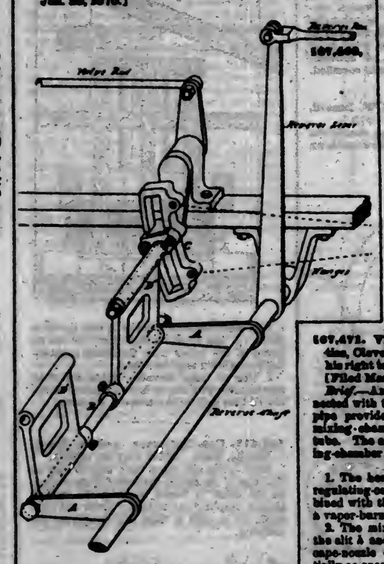
The combination of the seed-distributing chain H with the opener G, and with the seed-dropping cylinder F, substantially as herein shown and described.

107,467. FEEDING AIR TO FURNACES. W. J. O'Neil, Newport, Ky. [Filed Jan. 7, 1875.]



Brief.—The air from an enlarged hollow bridge-wall, in which it is heated, is deflected against a second bridge-wall, where it is made to commingle with the products of combustion issuing from the throat of the furnace, by which means the smoke and gases are said to be consumed.

1. The above-described smoke-consuming device, consisting of pipe *h*, air-chamber *f*, deflecting-plate *g*, the second bridge-wall *h*, pipe *i*, heat air-chamber *j*, and pipe *d*, combined and operated substantially as and for the purposes set forth.



2. The deflecting-plate *g*, in combination with second bridge-wall *h*, air-chamber *f*, pipe *i*, and heat air-chamber *j*, combined and operated substantially as and for the purposes set forth.

3. The bridge-wall *h*, in combination with deflecting-plate *g*, and air-chamber *f*, combined and operated substantially as and for the purposes set forth.

107,467.

107,468. REVERSING-GEARS FOR LOCOMOTIVES. Jonathan Ord, Pittsburg, Pa. [Filed Jan. 22, 1875.]

The connecting-rod B, in combination with the lifting-arms A A, carriers D' D'', and radial link C, as and for the purposes set forth.

107,469. NUT-LOCKS. John G. Perry, Kingston, R. I. [Filed Mar. 29, 1875.]

Brief.—The double locks are united by their raised locking parts. In the single lock the locking part surrounds a loose circular washer.

1. The double locking device C C, united by the raised portions, substantially as described.

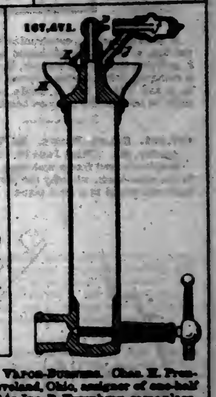
2. The combination of the locking device *f* and the circular washer E, substantially as described.

107,470. GLASS MOUTHPIECES. A. Phillips, New York, N. Y. [Filed July 24, 1875.]

The ornament herein described, comprising the cone A, body B, cap C, and pipe cone D, all constructed substantially as herein set forth.

107,470.

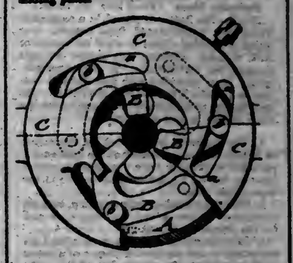
107,471. VAPOR-BURNERS. Chas. E. Frentzen, Cleveland, Ohio, assignor of one-half his right to Jno. P. Humphrey, same place. [Filed Mar. 2, 1875.]



Brief.—An annular heating-chamber connected with the mixing-chamber by a supply-pipe provided with a regulating-cock; the mixing-chamber provided with an internal tube. The air needed is forced into the mixing-chamber by the vapor.

1. The heating-burner E, provided with a regulating-cock, *g*, in the supply-pipe, and combined with the mixing-chamber and burner of a vapor-burner, substantially as specified.

2. The mixing-chamber F, provided with the slit *h* and tube *f*, combined with the escape-nozzle of a vapor-generator, substantially as specified.



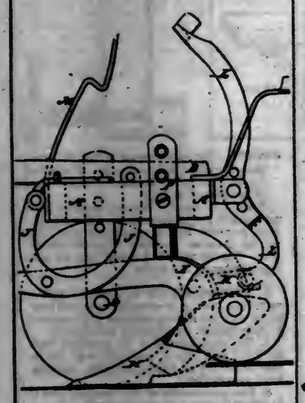
3. The combination of the escape-nozzle C D, mixer F, heater H, and burner E, substantially as and for the purpose described.

107,471.

107,472. DIE-STOCKS. Virginius J. Reese, Greenfield, Mass. [Filed July 2, 1875.]

Brief.—The guide-jaws are elbow-levers pivoted to the stock at one end, and provided with pins to work in eccentric grooves in a sliding plate.

The improved die-stock A, provided with adjustable end-pivoted guides B B B, having leg *b*, and the slide-plate C, having slots *a*, curved eccentrically, as shown and described.



167,473. MARKING-POT. Wm. H. Bodden, Toronto, Canada. [Filed Feb. 20 1875.]

A marking-pot, A, constructed with a cover top, c, and a funnel-shaped mouth-tube, b, and provided with a stopper, B, attached to a swinging yoke, d, with a spring brush-holder, f, and with a ball, h, inside, all substantially as and for the purpose herein specified.

167,474. SULKY-PLOWS. Eli W. Russell, Ashley, Mo. [Filed June 10, 1875.]

Brief.—Curved frame and lever connection to the plow-beam, whereby the plow is drawn back and raised in a level plane.

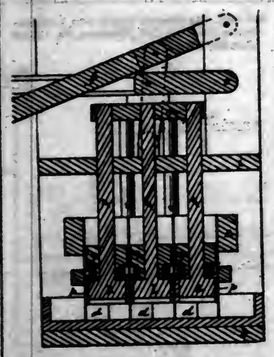
The combination of the adjustable beam G, the pivoted curved bars J, the rigid arm K, and the lever L with the frame A B and the plow H I, substantially as herein shown and described.

167,475. BUTTER-WORKERS. P. Shaw, Salisbury, Mass. [Filed Mar. 20, 1875.]

Brief.—The butter is placed in a receptacle which has a perforated false bottom, over which are placed cloths to allow the escape of milk without allowing any butter to pass through the perforations. A hollow reciprocating head provided with a perforated bottom and cloths is used to beat the butter. Ice may be put in the hollow head, and under the false bottom to cool the butter.

1. The improved butter-working apparatus, as herein shown, consisting of the frame a b c, portable work-table f m n o p, and the reciprocating head g h i, for the purposes and in the manner set forth.

2. The reciprocating hollow head g, with its perforated bottom k and covering i, as and for the purposes set forth.

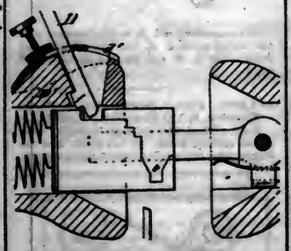


3. In combination with the work-table f, the reciprocating and perforated plate s of a lower cloth attached to the outer edge of the plate e and an upper cloth, p, secured to or near the center of the said lower cloth, substantially as and for the purposes described.

167,476.

167,476. BOTTOM-MOLDS. P. Shaw, Salisbury, Mass. [Filed Apr. 19, 1875.]

Brief.—Stampers made in two parts have a motion independent of the molds. One part of the stamper serves to release the butter from the other after it is stamped.

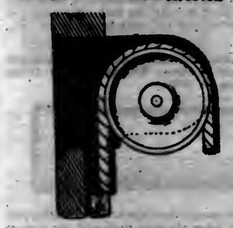


1. A butter-stamper, made in two movable parts, i p, one of which shall serve for the removal of the butter from the other, substantially as shown and described.

2. One or more movably molds, d d d, in combination with one or more movable stampers, i i i, as and for the purpose set forth.

167,477. CAR-COUPLINGS. Archibald Smith, Omaha, Nebr. [Filed July 31, 1875.]

Brief.—The pin drops from step to step on the edge of the spring-cushioned friction-plate on the latter is forced inward by the wedge-shaped coupling-bar, entering blunt end first-most, till at last it falls, and completes the coupling.

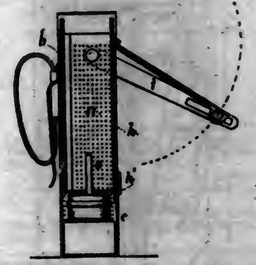


1. The combination of a draw-head, having a sliding, wedge-shaped, and spring-cushioned friction-piece, with a wedge-shaped link-bar and a locking lever-pin for automatically coupling, substantially in the manner and for the purposes set forth.

2. The combination of the draw-head with a swinging wedge-shaped link-bar that is pivoted to a lateral detachable pivot-pin locked securely to the draw-head, and cushioned by a supporting-spring, substantially as and for the purposes set forth.

3. The sliding friction-plate constructed with outer step-shaped recesses, in combination with swinging lever-pin, dropping therein for retaining friction-plate in draw-head, substantially in the manner described.

4. The combination of swinging lever-pin, sliding in a closed arc plate applied thereto, with the recessed top guide part of draw-head, and a fastening clamp-screw for locking rigidly lever-pin and friction-plate for positive coupling of link-bar, substantially as shown and described.

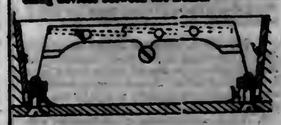


167,478. HAME-PULLETS. Jacob Smith, Chicago, Ill. [Filed Mar. 20, 1875.]

As an improved article of manufacture the herein-described sash-pulley, formed with a solid plate face, c, and frame or pulley-case, having a solid shoulder, e, whereby the sash-pulley is let in flush with the window-frame, projecting the cords forward and concealing them from view, substantially as set forth.

167,479. POCKET-LANTERNS. J. Stevens, Orange, N. J. [Filed Feb. 24, 1875.]

Brief.—Air-space between perforated sheet-metal case and glass reflector. A guard-plate in front of the opening below the glass. A leather case and match-box.

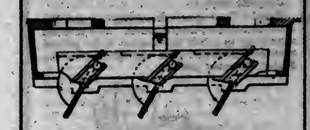


1. The combination of a perforated sheet-metal lantern-case with the silvered glass reflector introduced within the case, and having an air-space between the metal and the glass, for the purposes set forth.

2. The arms e, bent A, front c, glass h, and lamp, in combination with the plate F forming a guard in front of the opening below the glass h, for the purposes set forth.

3. A case, made of leather or similar material, adapted to receive a lantern, in combination with a match-box, with a swinging cover inserted at the bottom of such case, for the purposes set forth.

167,480. HOT-AIR REGISTERS. Edward A. Tuttle, New York, N. Y. [Filed June 30, 1875.]

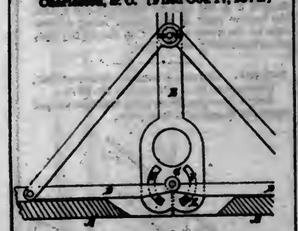


Brief.—The wall-frame is a fixture. The register-frame extends backwardly at a different angle, and opens is adapted for the fastening devices between the frames

The combination of wall-frame and register-frame, fitting closely together in front, and having lugs for fastening-screws in a different angle between said frames, as and for the purposes specified.

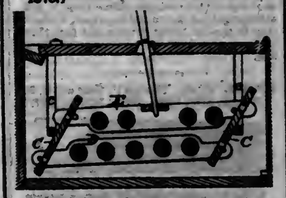
HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

167,481. HOT-AIR REGISTERS. Edward A. Tuttle, New York, N. Y. [Filed May 28, 1875.]



1. The segmental roller for carrying the slide and the slot and pin for working the fan, arranged on opposite sides of the slide, substantially as specified.

2. The pin for working the fan, arranged half the length of the throw of the slide from the pivot of the fan, in combination with a groove or slot of forty-five degrees of inclination in the slide, substantially as specified.

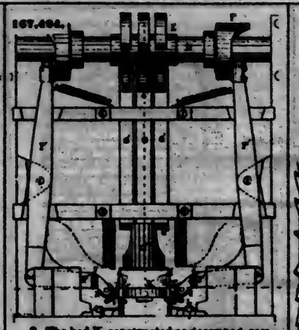


3. The notch N of the fan and the stop-projection O of the frame, combined and arranged as and for the purpose specified.

167,482. SQUARES. William H. Walker, Charleston, S. C. [Filed Oct. 17, 1874.]

The straps D D, made fast to arms A at one end, pivoted at the other on pin G of the tongue B, and held to said tongue by pins E E traveling in the arc-slots F F, as and for the purpose specified.

167,483. WASHING-MACHINES. David Warnock, Percival, Iowa. [Filed June 24, 1875.]



1. In combination with the body A the two slotted washing-boards C, the roller-frames D and E, having their ends mounted in the bar-rods, and the hand-lever B, arranged substantially as shown.

2. The washing-machine, consisting of the body A, provided with the vertical grooves c, the boards C, provided with journals and slots, the roller-frames D and E, and the hand-lever B mounted in the top of the body, all arranged to operate as shown.

167,484. PAPER COLLAR AND CUFF MACHINES. Elbert Wilder, Manchester, N. H., assignor to Ira Green, same place. [Filed Mar. 10, 1875.]

Brief.—A three-part plunger, actuated by cams, bills upon the fabric when laid upon its mold-bed. The central plunger is withdrawn, while side rollers advance and turn over the edges of the fabric, after which the end plungers rise. The blank is pasted and held upon its bed by feeding-points at the corners, which rise and fall automatically.

1. The bed K, having a concave surface longitudinally, bottom-bed formers, and edge-creasers F', combined with the former f, composed of a middle plate, f', and end plates f², substantially as and for the purpose described.

2. The bed K, constructed as described, combined with the standard gage-rods d, operated substantially, substantially as and for the purpose described.

3. The combination of the cams F F' F², levers F³, plungers G G', carrying the formers f f', and levers F⁴ carrying rollers H H, substantially as and for the purpose described.

4. The combination of the cams F' F², with the flanges G G', carrying independently the plates f f', for the purpose of folding and folding the blanks at the same time.

5. The combination, in a paper collar and cuff machine, of the shaft carrying the cams F F' F², plungers G G', which operate independently the former-plates f f', levers F⁴, which operate the rollers H, the bed K, with gage-rods d, having the automatically-reciprocating vertical movement, all substantially as and for the purpose described.

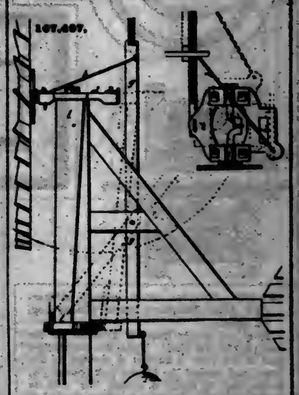
167,485. PROCESSES OF COLORING ENAMELED PHOTOGRAPHS. Wm. W. Williams, Houston, Tex. [Filed June 19, 1875.]

The process herein described of coloring enameled photographs, consisting in first passing on a glass plate coated with dry layers of collodion and gelatine, a transparent photograph, then backing it with one or more layers of transparent paper, and then laying colors thereon in the usual manner, substantially as and for the purpose set forth.

167,486. AMALGAMATORS. Chas. H. Aaron, San Francisco, Cal. [Filed Feb. 25, 1875.]

Brief.—The pulp is drawn by the oblique paddles into the revolving cylinder, and ejected through the end openings. Inner surfaces of paddles are faced with copper. Oval vessel holds bath of mercury. Pulp flows continuously through inlet and outlet in cover.

1. A closed case or vessel, A, containing hollow rotating wheel B, with its oblique floats or buckets c c c and end openings d d, substantially as and for the purpose above described.



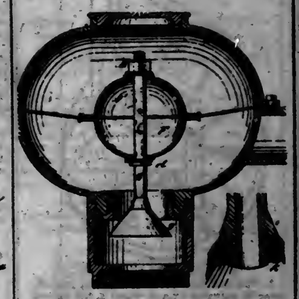
2. In combination with the horizontally-divided vessel A, the hinged frame F for supporting and raising the wheel B without interfering with its continued rotation, substantially as and for the purpose described.

167,487. WHEELBARROWS. Samuel M. Abbott, Wilmington, Ill. [Filed Mar. 6, 1875.]

Brief.—The turn-table is pivoted to one side of the mast, and is upheld at its outer side by a support, of which the lower end extends down to the collar, which is loosely clasps.

Pivoted to the frame of the tail-vane is the small vertical vane, which is connected to the outer edge of the turn-table by means of a rod, so that when the wind blows violently the vane is forced backward, so as to draw the turn-table and wheel around toward the tail-vane out of the wind. A weight is attached to the lower end of the vertical vane, which draws it back to a vertical position when the wind moderates.

167,487.



1. The yielding turn-table d, pivoted to one side of the mast and upheld at its outer side by a support, l, substantially as shown.

2. The combination of the yielding turn-table, support l, rod k, vertical vane j, tail-vane and mast, substantially as set forth.

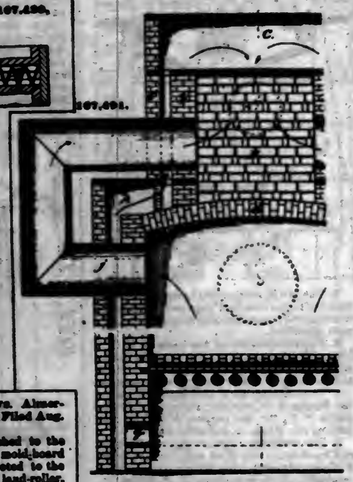
167,488. GAS-REGULATORS. Jos. Adams, Washington, D. C. [Filed Apr. 27, 1875.]

Brief.—Improvements on Patent No. 159,202, May 4, 1874. The hemispheres of the balloon grasp the diaphragm loosely. The valve is covered with an elastic material, which is, with the valve, held to the stem by means of a nut.

1. The combination, with the valve-stem, having shoulders i, of the pieces k and j, the flexible covering m, and the nut h, substantially as and for the purpose described.

2. The hollow stem O, having perforation f and a flange, d, in combination with the nut H, and the two hemispheres of the balloon, substantially as and for the purpose specified.

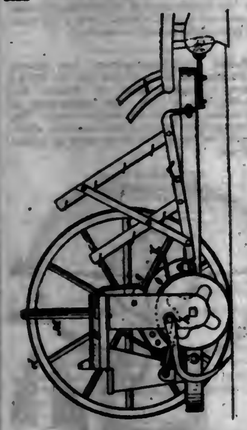
167,489. ROTARY ENGINES. Luther Adams, Manteno, Ill. [Filed Aug. 14, 1875.]



A rotary engine or pump, consisting of a cylindrical casing, provided with sliding valves, and having an oval rotary plunger adapted to move therein, mounted eccentrically upon a journal passing through the heads, and channeled, as described, said channels opening respectively into annular grooves in the opposite heads communicating with the induction and eduction ports, substantially as described and shown.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

167,490.



167,491.

167,490. ROLLERS AND HARROWS. Almerin P. Allen, Denmark, Iowa. [Filed Aug. 31, 1874.]

Brief.—A center-beam is attached to the rear part of the plow. Upon the mold-board side of the plow a harrow is pivoted to the beam, and behind the harrow is a land-roller, in the rear of which is a seed-box with its seed-distributing appendages. The rear end of the beam is supported upon an adjustable wheel, and forms a support for the driver's seat.

1. The combination of the spring pawl N, lever M, carrying-axle of wheel J, the curved perforated bar O rigidly attached to the frame Q, and the roller and plow, as shown and described, whereby the roller may be adjusted relative to said wheel, corresponding to the depth of furrow, as set forth.

2. The improved cultivating and seed-dropping attachment for plows, formed by the combination of the seed-hopper, the harrow, and the roller, said parts being arranged as shown and described, to operate as specified.

167,492. APPARATUS FOR MANUFACTURING BRASS.—Asa. John M. Ayer, Chicago, Ill. [Filed Aug. 28, 1875.]

Brief.—Air passes from the ash-pit beneath the grate-bars up through the hollow walls into chambers above, whereby it is highly heated. The gases from the furnace pass through a regenerator located above it. The grate-bars are cast round, and are provided with a barrel in the end for inserting a turning-bar.

1. The combination of a generating-chamber and a regenerator, located above and heated by the same, as set forth.

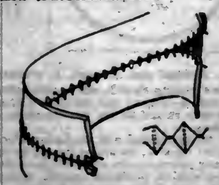
2. The combination of chambers A, flues *f*, regenerator B, and exit-pipe N, as as and for the purpose described.

3. The air-flues, located immediately below the grate, in combination with the hollow wall and chamber C, as and for the purpose described.

4. In combination with the generating-chamber A, the chambers *p* C, and intermediate passages between the side and back walls for heating the air, as described.

5. In combination with the chamber A, the *f*, regenerator B, and exit-flue *n*, the air-heating system described, and exit-flue S.

6. The grate-bars *i i*, cast round and with a square barrel, whereby each bar may be turned completely around, as and for the purpose described.

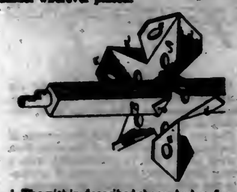


7. The combination of the grate-bars *i i*, the heating-bar *i*, and the heat-plate K, as set forth.

8. The combination of the grate-bars *i*, the heating, and the inclined shield or plate *m*, for the purpose described.

9. A gas-generating apparatus, in which the products of combustion are regenerated, and the air to form a combustible gas with them is heated directly by means of the generating-chamber, all as described.

10. The generating-furnace, having hollow or double walls and chambers, whereby the heat of the furnace is utilized to heat air in its passage between the walls, as set forth.

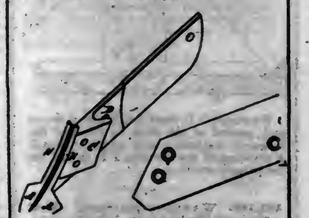


167,493. METHODS OF UNITING KNIT GOODS, &c. Helen A. Blanchard, Boston, Mass., assignor to John Bigelow, trustee, same place. [Filed Mar. 11, 1876.]

The described improvement in the art of uniting the edges of knit goods and hosiery by an elastic seam, which consists in sewing the two thicknesses of goods directly together in the manner and by the means specified, with the diamond overstitch-seam formed by stitches passing alternately directly through the goods and outside of the same, as set forth.

167,494. CHURN-DASHERS. John D. Bright and J. H. De Guire, Terrell, Tex. [Filed July 26, 1875.]

Brief.—The dasher is formed by being struck up from a single piece of metal. The portions struck up to allow the dasher to be passed over the dasher-rod form springs to hold the dasher wherever placed.



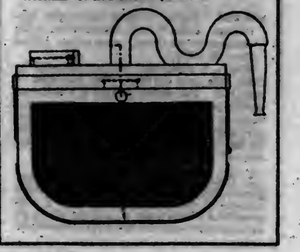
1. The within-described churn-dasher, formed of a single sheet of metal and in star-shape, with alternating upward and downward flanges *a a*, and with central spring-lips *b b*, all substantially as set forth.

2. The combination of the perforated sheet-metal plate A with alternating up-and-down flanges *a a*, the central spring-lips *b b*, and the hollow shaft B, the dasher being adjustable on the shaft and held by the spring-lips, all substantially as set forth.

167,495. CUTTER-SUPPORTS. Manfred Coll, Richmond, Va. [Filed Oct. 19, 1874.]

Brief.—Devices for carrying a double scraper upon the frame of a turn-plow.

The center piece or axle D, provided with shovel-point A, overlapping nose-piece E, and side flanges C, as shown and described, to adapt it to be applied to the clevises of a turn-plow in connection with the two wings, as specified.

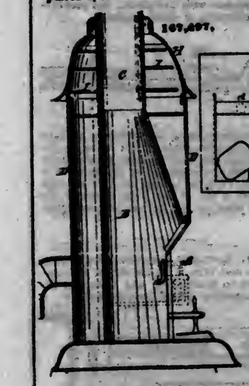


167,496. FILES. Charles F. Carr and S. S. Wilson, Adel, Iowa. [Filed July 31, 1876.]

1. As an improvement in files, alternate sections of coarse and single cuts *a* and *a'*, respectively, substantially as and for the purpose specified.

2. As an improvement in files, a series of diagonal grooves or channels, *a'*, extending across the face of the same, substantially as and for the purpose shown.

167,496. CONDENSED RESPIRATORS AND INHALERS. James Carrick, Glasgow, North Britain. [Filed Oct. 20, 1874.]



1. The general combination and arrangement of parts constituting the herein-before-described respiratory and inhaling apparatus—that is to say, a case formed, as described, in two compartments, the one to contain medicated matter, the other a filtering medium, which latter compartment is provided with means for keeping said filtering medium moist, in combination with a tube terminating in a mouth-piece, and inlet and outlet valves, by which communication of said tube with the atmosphere and the case is regulated, substantially as shown and set forth.

2. The mouth-piece for respirators and inhalers, consisting of the mouth-piece *h*, valves *h'*, *h''*, and flange *h*, constructed, arranged together, and applied substantially as described, and shown in Figs. 6 and 7.

167,497. HEATING-STOVES. MATTHIAS C. O Church, Petersburg, W. Va. [Filed July 15, 1876.]

Brief.—The cover being raised, vessels of water for hydrating the atmosphere may be placed upon the shelves.

1. The detachable hook B, having flanges *a a*, in combination with the outer casing D, having guideways *b b*, as and for the purpose described.

2. In a heating-stove, the smoke-pipe C, ascending vertically from the heating-chamber, and having the partition-plates I attached thereto, in combination with the detachable cover H having a hole therein of greater diameter than the smoke-pipe, so as to leave, when placed around the latter, an annular outlet, *c*, as and for the purpose described.

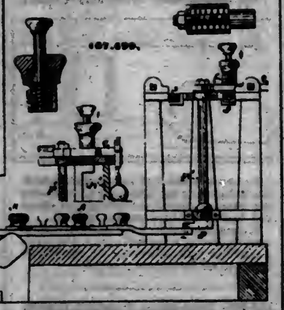
3. The combination of the detachable hook B having flanges *a a*, the outer casing D having guideways *b b*, the perforated partitions I, the smoke-pipe C, and the detachable cover H having an annular outlet, *c*, substantially as described, and for the purpose specified.

167,498. STOVE-SHELVES. Albert Olin, Deal, N. Y. [Filed July 1, 1876.]

Brief.—The spoke-tenon is elliptical in form.

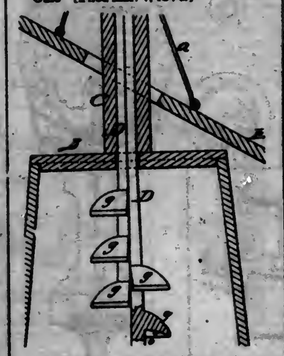
A spoke having an end which is elliptical in cross-section, and provided with a flanged metallic tip, fitted thereon and resting against the outside of the felly, and having a small stem projecting from it and extending into the felly, whereby increased strength in the end of the spoke is secured, and the weakening of the felly by a large cavity therein is avoided, all substantially as set forth.

167,499. RAILROAD-SWITCHES. G. G. Coats, Newark, N. J. [Filed Aug. 26, 1876.]



Brief.—The switch-rails, when moved for a side track, are retained automatically in the main track, and retained firmly in position until again changed by the switch-bar.

1. In a railway-switch, the combination, with the rails A, of the bar C, having the legs *d*, the weighted arms or levers K pivoted to suitable supports K', when operating substantially as and for the purposes set forth and shown.



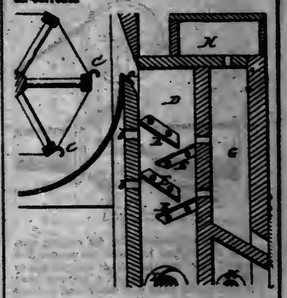
2. The combination, with the rails A, of the rod or bar B, crank F, shaft F', lever G, bar-fans *e*, and springs *f'*, when operating substantially as and for the purposes set forth and shown.

3. The combination of the lever G, stop-pin *f* actuated by spring *f'*, and friction-rollers *g*, arranged and operating substantially as and for the purposes set forth and shown.

167,499.

167,500. CRUSHER. James F. Coe, Raleigh, Ohio. [Filed Mar. 7, 1874.]

The concave-cover semicircular imperforate dashers *f f*, and vertically-reciprocating rods D D, in combination with the rods *a a*, lever E, top B, and tubular standard, embracing the dash-rods, constructed and arranged substantially as shown and described.



167,501. BILLIARD-TABLE CUSHIONS. Hugh W. Callender, New York, N. Y. [Filed July 20, 1875.]

A billiard-table cushion or cushion-strip composed of India-rubber, with two or more layers of canvas, or other material that will not stretch readily, interposed therein, and having a metal strip arranged in the rubber and interposition to two of the said layers of canvas, the whole, constructed and arranged to operate in the manner described.

167,502. FLOUR AND MIDDLINGS PURIFIER. Austin M. Comstock, Battle Creek, Mich. [Filed Feb. 24, 1876.]

Brief.—After the material is bolted through the reel it is taken up by the cup-shaped troughs on the reel, and delivered through suitable openings into an exhaust chamber or chambers, in which the light impurities are separated and carried off by the ascending air-currents.

1. The combination of the belt A, provided with an exterior cup-shaped trough, C, on each longitudinal rib, the opening *c*, the chamber or chambers D, and a fan for creating air-currents through said chamber or chambers, all substantially as set forth.

2. The combination of the belt A, having cup-shaped troughs C, as described, the openings *c*, the chamber or chambers D, the inclined shelves E E, arranged to overlap one another, and alternately on opposite sides, and a fan for creating air-currents through said chamber or chambers, substantially as set forth.

3. The combination of the belt A with troughs C C, and the chambers D and G, arranged with their respective conveyers I and K, and fan L, substantially as and for the purposes herein set forth.

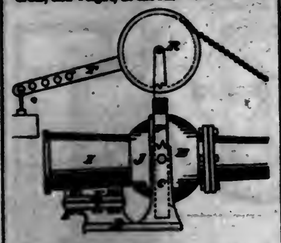
4. The combination of the belt A with troughs C C, chambers D, with shelves E, chambers G, conveyers I K, vacuum-chamber H, and fan L, all constructed and arranged to operate substantially as and for the purposes herein set forth

---

167,503. MANUFACTURE OF GUNPOWDER. Hermanus Courtenille, New York, N. Y., assignor, by mesne assignments, to Triumph Safety Powder Company, Baltimore, Md. [Filed Feb. 27, 1875.]

The process of manufacturing powder by compounding, under treatment of direct and externally-applied steam, of metallic sulphates, peat, charcoal, and nitr or fats with nitrates and sulphur, in the manner and in the proportions substantially as herein set forth, whereby the product is made complete while under treatment in mass.

167,504. METALLIC VESSELS. R. T. Orvell, New Bedford, Mass. [Filed Aug. 10, 1876.]

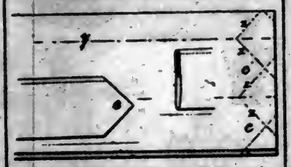


1. In a metallic vessel, the combination of a center metallic head or end, an outer head or filling piece, and projecting edges formed by the can body and center head, and internally bent down upon the outer head or filling piece, as and for the purpose described.

2. The combination, in a metallic can or vessel, of the following elements, namely: a center metallic head or end, an outer wooden head or filling piece, an external covering metallic plate, and projecting edges inwardly bent upon said covering-plate, substantially as shown and described.

107,505. JAMES VON HUTHMANN NOEHLER, J. J. Crawford, San Francisco, Cal. [Filed Aug. 10, 1875.]

Brief.—The nozzle is joined to the water-pipe by a ball-and-socket joint, thus allowing easy movement under pressure. The nozzle-lug is pivoted to the standards. The elevation of the nozzle is effected by the chain, drum, and weight, as shown.

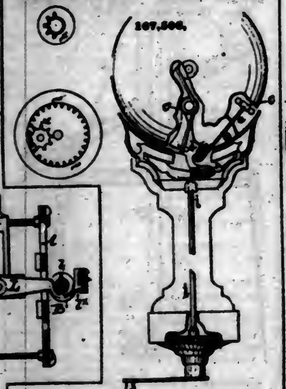


1. A ball-and-socket joint for uniting nozzles to water-pipes, to which the socket B is connected upon or forms part of the pintle or universal joint, while the ball or globular head J is arranged to enter said socket and be fixed in position, substantially as shown described.

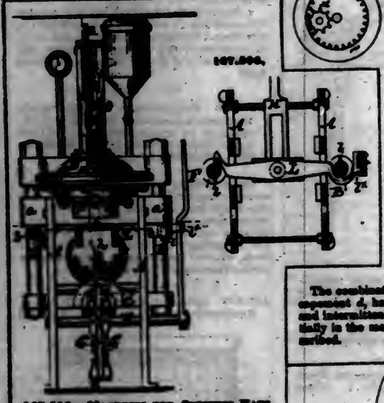
2. The nozzle D, with its socket B, mounted between standards G G inside of the journaled ring F, in combination with the pipe I, with its globular head J connected upon the lugs h and removable casing K, substantially as and for the purposes described.

3. In combination with the pipe I and nozzle D, united by a ball-and-socket joint, the diaphragm or extinguishing pipe, composed of the overlapping circular blades or coils l l, substantially as and for the purposes described.

4. The drum R, fixed to the shaft q and connected with the nozzle D by means of the chain or rope S, in combination with the lever or pendent drum T and adjustable weight U, substantially as and for the purposes described.

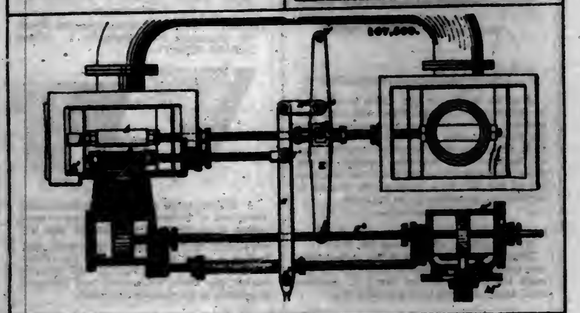


107,507. HOOP-TIES. Albert P. Dumont, Reading, assignor to Dumont, Temple & Co. Boston, Mass. [Filed July 6, 1875.]



1. As a new article of manufacture, a metallic tie folded along the lines *y y*, *x x*, and having the loosened edge *h*, substantially as shown and described, for the purposes specified.

2. As a new article of manufacture, a folded metallic tie, having a loosened edge, *h*, and points *c c* alike on both sides of the tie, substantially as and for the purposes specified.



107,508. DOOR-SPRING. Frederic G. Daniels, Portsmouth, R. I. [Filed Feb. 20, 1875.]

107,508.

107,508.

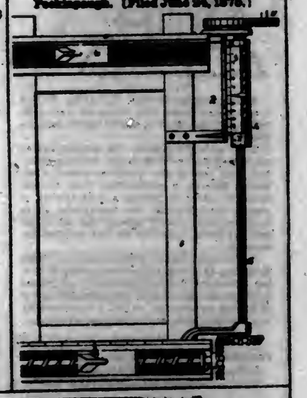
The combination of the rervsiving rod *i*, escapement *d*, hammer and rod *c e*, spring *o*, and intermittent or escaped gear *A*, substantially in the manner and for the purposes described.

107,509. STEAM-ENGINE. Henry Dewey, Leeds, England. [Filed Aug. 1, 1874.]

Brief.—The main piston moves the main valve through a part of its stroke, and also moves the valve of the subsidiary cylinder. The admission of the steam to the main valve is effected by the movement of the piston of said subsidiary cylinder.

1. The combination, with the main valve and of the lever E, one end of which is connected by intermediate mechanism with the main piston, and the other end with the piston-rod of the subsidiary cylinder, substantially as and for the purposes described.

2. The combination of the lever E, connected to the main piston, the rod C, piston C, valve E, lever E, link E', and the subsidiary cylinder M', substantially as and for the purposes described.



107,510. GALVANIC BATTERIES. Benjamin F. Dawson, New York, N. Y. [Filed July 24, 1875.]

Brief.—For the purpose of keeping fresh acid in contact with the plates, and preventing the collection of effete matter.

The combination of the perforated positive plate A, negative plate B, and agitating device arranged between the same, substantially as described, whereby, when the agitator is operated, it will act to draw the fluid through and force it out of the perforations in the positive plate, as and for the purpose specified.

107,511. SAW-MILL HEAD-BLOCKS. Theo. Dilger and Wm. B. Dunn, Alton, Ind., assignees to themselves and Abraham H. Pottsgrough. [Filed June 24, 1875.]

107,512. SAW-MILL HEAD-BLOCKS. Theo. Dilger and Wm. B. Dunn, Alton, Ind., assignees to themselves and Abraham H. Pottsgrough. [Filed June 24, 1875.]

Brief.—The dogs are made to slide in the head-block, and when they are moved in one direction they are caused to engage with the log, and when moved in the opposite direction they are caused to disengage from the log, by means of the lever and connecting-rod.

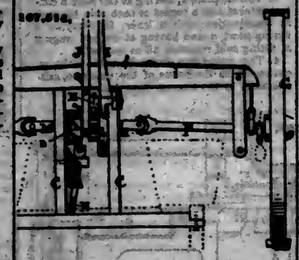
1. The combination, with the head-block and the dogs *d d'*, of the lever *f*, connecting-rod *g*, and the lever *h*, substantially as and for the purposes described.

2. The combination, with the head-block and the dogs *d d'*, of the lever *f*, connecting-rod *g*, and the lever *h*, provided with the fulcrum-pin *i*, substantially as and for the purposes described.

107,513. FEEDING OR SUPPORTING RAIL. Ezekiel Sweitzer, Valparaiso, N. Y. [Filed Nov. 30, 1875.]

1. The novel process of stiffening hats and other felted articles, which consists in subjecting them to a steam-bath after they have been shaped on a blocking-block, and while they are retained on blocks, which prevent them from shrinking out of shape, substantially as described.

2. The improvement in the art of stiffening hats and other felted fabrics, which consists in applying thereto the stiffening matter after they have been properly shaped and dried on a shaping-block, and subjecting them to a steam-bath, while retained on blocks which retain them in the shape imparted by the shaping-block, substantially as described.



3. An apparatus for stiffening hats, composed of a steam-tight chamber, provided with a suitable valve-door, a shaping-block adapted to form a steam-tight joint, with an opening in the chamber, and a locking device for securely holding the block when forced against the chamber, substantially as described.

4. The combination, with a steam-chamber, of a shaping-head, neck, conical shank, locking-cam, and locking-shank-rod, substantially as described.

5. The combination of the curved block, the block, and curved clamp, substantially as described.

107,514. CHURN-BOW CLIP-DEVICE. Jos. W. Fenton, Moore, Ill. [Filed Aug. 14, 1875.]

Brief.—Recess on the side of the bearing, which is closed by a plate on one side and formed a shutter. In making the combination the wheels sometimes slip, and would pass irregularly, but for the notches and lever which is used to force the wheels forward after being elevated. The draw with the clamp-bands is for connecting the pole by indirect movement of the wheels. Motion is imparted to the slide by a forked lever working on the flange of the nut-wheel on the axle.

In a corn-planter, the combination of the frame B, provided with marked-wheel d, crank-lever f, guard i, lever J, vibrating lever N, and rear E, provided with sub-cutter s, substantially as and for the purposes set forth.

107,515. SEWING-MACHINES. Warren L. Fish, Norwalk, N. J. [Filed May 5, 1875.]

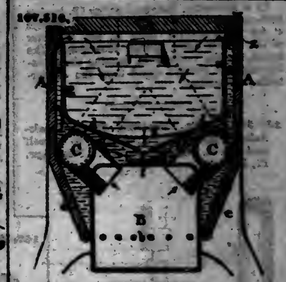
Brief.—A collar provided with a sleeve is rigidly attached to the driving-shaft of a sewing-machine. The fly-wheel, provided with a hub, is mounted loosely upon the sleeve. The connection of the fly-wheel to the collar is effected by locking the fly-wheel to the collar. When the fly-wheel is disconnected it may be used to operate a bobbin-winder by contact with its driving-wheel, while the sewing-machine is at rest. The details of the locking device are described in the claim and clearly shown in the drawings.

107,515.

107,515.

In a sewing-machine, the combination, with the main or driving shaft C, and fly-wheel A, having a head recess, *a*, of the collar E, provided with the sleeve *b*, the recessed pin *c*, having the head *e*, and the hub or post *f*, the several parts being arranged and operating substantially as shown and described, and for the purposes set forth.

107,516. FLUE-CLEANER. Bedford Fisher and Wm. Whitaker, Mt. Pleas. Ill. [Filed June 28, 1875.]

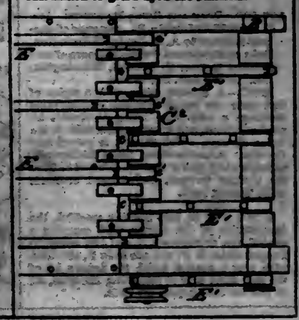


Brief.—Water circulates through the partitions in the bottom. These are made portable, and discharge water at bottom when raised from their seat in the apparatus.

1. The combination of the boiler A, having dotted sides or bottom *f* corresponding upon the inside and from B O O, shown by *r r r o o o*, respectively, the removable partitions, shown O O, forming the spaces *s* and the flues *t*, shown, and the portable fly-brush sweeps, substantially as described.

2. The removable fuel and ash holes, composed of the boiler A, holes shown O O, sleeves B, substantially as shown D E F, cover G, and clamp-plate H, constructed, arranged, and operating as and for the purposes set forth.

3. In combination, the bottle B, having dotted or outlined holes d d, with openings *i i*, and screws *j j* or screw-shank *k*, as shown and described, arranged, and operated.



107,517. PROPELLING-MACHINES. John F. Finch, Joliet, Ill. [Filed Aug. 14, 1875.]

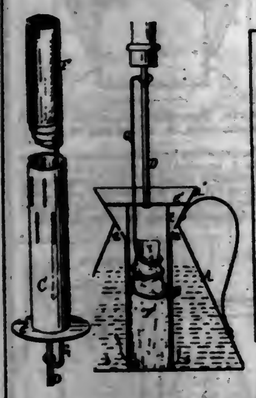
The propelling apparatus, consisting of the frame A, mounted upon wheels B B and C C, the pulleys or drums I I', and the sweep-bearing K, E, and K, with the pulleys E and E, and driving-wheels D D, the whole being arranged to operate substantially as herein set forth.

107,518. WIRE-STRETCHER. Samuel H. Fowler, Davenport, Iowa. [Filed June 30, 1875.]

Brief.—The stretching screw moves at a speed greater than the rotation given, thereby causing the pinchers, preventing undue accumulation of grain upon the cylinders.

107,519. WIRE-STRETCHER. E. S. Fowler, New Haven, Conn. [Filed Nov. 30, 1875.]

As an article of manufacture, the knife-bar, with the socket D on its lower end, the fixed jaw E at its upper end, and the movable arm F, and its one piece, combined with a correspondingly-shaped jaw, H, and screw to draw the said shaped jaw, substantially as specified.



107,520. HARVESTERS. James H. Fowler, Davenport, Iowa. [Filed June 30, 1875.]

Brief.—The elevating screw moves at a speed greater than the endless apron conveying the platform, preventing undue accumulation of grain upon the platform.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

In a harvester, the spool-pulley C, having pulleys *a* for the elevator-belts D, and pulleys *b* for the conveyer-belts E, the diameter of the former being greater than that of the latter, for the purpose of running the elevator-belts at greater speed than the carrier-belts, as specified.

167,580. FIRE-KINDLERS. David Frankfeldter, Wabaunsee, Ind., assignor to himself and Jos. A. Culp, same place. [Filed Apr. 17, 1875.]

1. The combination of the torch-tube C D, rod D, handle E, wire G, and wick-roll F, the said torch being adapted to enter the tube B of a can, A, in the manner and for the purpose set forth.

2. The can A, having the flaring top A', perforations *a*, and socket B, provided with the openings *b* at the lower end, in combination with a torch, C, substantially as and for the purpose specified.

3. The combination of the can A, having the flaring top A', openings *a*, and socket B, provided with the openings *b*, with the torch C, provided with the head C', and wick-roll F substantially as described and shown.

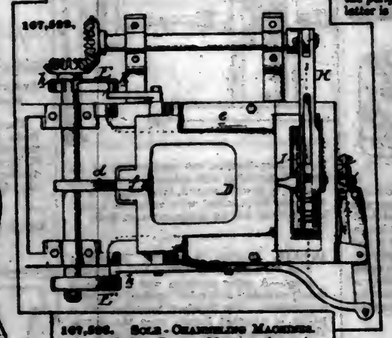
167,581. PREPARED CORKS FOR STOPPERS. C. G. Frueh, New York, N. Y. [Filed Feb. 24, 1875.]

Brief.—Cork stoppers are impregnated with albumen, and then exposed to the action of steam or heated air, which makes them fast in the neck thereby, and will resist to boiling containing different liquids, as they become impermeable to both liquids and gases.

1. A cork-stopper, impregnated with albumen.

2. The process of treating cork-stoppers by first impregnating them with albumen, and then exposing the same to the action of steam or heated air, substantially as set forth.

167,582. BOLT AND RIVET MACHINES. John G. Gote, Philadelphia, Pa., assignor of one-half interest to A. G. Dodds, Wilmington, Del.; said Gote and Dodds assignors of part interest to Geo. G. Lobdell, Wilmington, Del. [Filed Apr. 30, 1875.]



Brief.—A circular plate, with a series of dies near its margin, formed of removable inclosed in a frame, and plate being revolvable by part in the lever, and an adjustable tube in the frame, through which the rod is passed into the dies. A header-frame and a former-rod, through which power is communicated to force the plunger forward, and flanged connecting-disks drive it back.

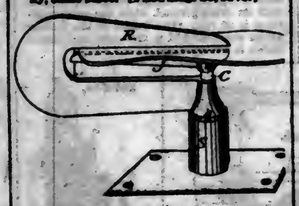
1. In a rivet or bolt heading machine, the combination of the driving-shaft carrying a central cam or eccentric, A, and two eccentric flanged disks, B B', and the slide D, provided with pins *c* against which the flanges *b b* of the said disks bear in reversing the slide, all as and for the purposes set forth.

2. The combination of the cutting-tube to, secured in a stationary position on the frame of the machine, and the die-plate I, provided with a series of detachable tubular dies, *g*, each extending completely through the plate, and having a collar at the front end, between which and the end of the tube *o* the bar is received, all as set forth.

3. The die-plate I, having at the edge a central rotation and a recess at each side thereof, in combination with a lever, H, carrying a spring-pawl, *n*, and having at the end rings *s s*, fixing said recesses, all as set forth.

4. The removable and adjustable tube *o*, connected to the frame of the machine, substantially in the manner described.

167,583. METALLIC SEALS. F. G. Hopkins, New York, N. Y. [Filed June 10, 1875.]

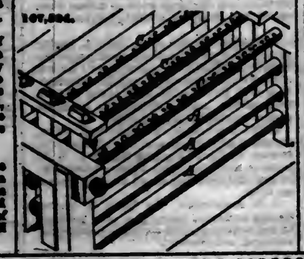


Brief.—The locking-pieces cross the closing-wire at an angle thereto, and extend beyond the periphery of the seal, to indicate that the latter is provided with the same.

A wire and lead seal, constructed as herein described, with one or more locking-pieces of hard metal, applied transversely to the seal-body which receives the wire bow or shackle, and with their ends projecting beyond the periphery of the disk, to show the existence and position of the locking-pieces.

167,584. CHEESE CUT-OFFS. Thomas B. Harrison, Quincy, Ill., assignor of one-half his right to Sylvester F. Burdett, same place. [Filed July 16, 1875.]

Brief.—All form the water common by the waste-pipes giving time for the damming of the road. When the water-chamber becomes sufficiently full its weight counterbalances the other weight above, and brings the end down in position to discharge water into the cistern. The rain ceasing, the position of the waste-water chute is restored.



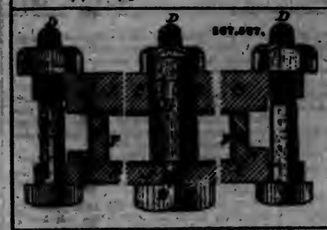
1. A pivoted goose-neck holder and clamping device for holding, supporting, and turning the soles of boots and shoes during the channeling process, substantially as herein set forth.

2. The combination, with the pivoted goose-neck, of an intermediate vertically movable clamping-jaw J adapted to clamp and support the sole, so as to admit of the circuit of a channeling-tool, substantially as described.

3. The combination, with a rotary clamping sole-holder having a fixed and movable jaw, B J, of a pendent support, S, upon which the sole-holder rests and turns, substantially as herein set forth.

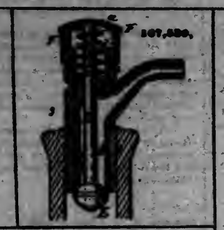
4. The combination, with the vertically-movable clamp-jaw J, of the stem C, and the spiral spring 2, whereby the clamp-jaw is constantly pressed upward, and the sole clamped between the jaws.

5. The jaw E, having an open face, D, and provided with removable clamping-plates *c c'*, for the purposes set forth.



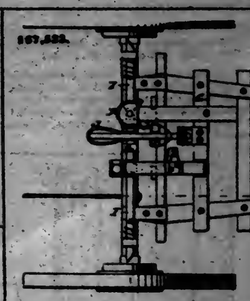
A cut-off, consisting of two water-ways, divided by the plate F and F', the chamber H, and pivot F', with the pipes U and W, and partition-plate D, the whole combined, arranged, and operating substantially as described.

167,585. MOLDS FOR FORMING ARTIFICIAL GRANITE. William Hart, Detroit, Mich. [Filed Mar. 15, 1875.]



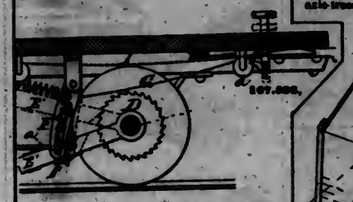
1. In combination with the mold A, B, and C, constructed as shown, the detachable lining F, fitted to and caused to cover the entire inner surface of the said mold, substantially as and for the purpose specified.

2. The herein-described mold, consisting of the bottom plate A, removable flanges B, cover C, sweeping-bolts D and D, and centre-pin H, all constructed to operate in the manner and for the purpose substantially as shown.



HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

167,587.



167,588.

167,589.

167,586. GAS-REGULATORS. Robert H. Hutchinson and Benj. W. Nevell, Philadelphia, Pa. [Filed Aug. 14, 1875.]

Brief.—Pressure on the treadle draws forward the vertical guides, and so pulls the pawl into engagement with the ratchet on the axle. Then the draft of the horses elevates the outer end of the horizontal guide-lever, and so starts the car.

167,586.

1. The combination of an end-wise-movable pawl, E, vertically-vibrating guide-lever F, and slotted vibrating hanger F' with chain G, pulley *d*, and treadle-pin H, for throwing the pawl in contact with the rack-wheel and shackle I L, pulley J A, lever J, and end-wise-movable draw-bar K, substantially as specified.

2. The combination, with a pawl, E, having lugs *a*, of a vibrating guiding-lever, F, having slots *b*, and vibrating hangers F, having slots *c*, substantially as specified.

167,587. PIPING-POSTS. George W. Hatch, Fortman, Ohio. [Filed July 28, 1875.]

In a fence consisting of the uprights B B and the horizontal rails A A passed between the uprights, the combination of the L-shaped perforated steps D attached to the uprights, and the rods G G connected directly to the uprights and passed through the perforations in the steps, and extended into the earth for supporting the fence above the ground, all substantially as set forth.

167,588. DUMPING-WAGONS. Philipp Hartman and Joseph Hartman, Jr., Tiffin, Ohio. [Filed May 24, 1875.]

Brief.—The body is supported at the front and rear by removable bars.

The combination, in a dumping-wagon, of the box A, hung on transoms B, with the side or bed-frame timbers C C, the bars D and E in the front and rear ends, with the straight axle-tree, all as and for the purposes set forth.

167,588.

167,589. BOTTLE-STOPPERS. P. Henry, New York, N. Y. [Filed July 2, 1875.]

Brief.—The air-inlet hole shown allows the air to be admitted to the bottle while the stream is flowing, making it uniform and solid. The device shown is designed to fit into the aperture in a cylindrical stopple.

The combination of the tube B, having the air-opening *g* and the tubular extension A, with the valve-rod D, valve E, spring *d*, and thumb-piece F, substantially as herein shown and described, the whole being adapted to use as an ornate stopple, A, as specified.

167,590. DEPOT-PLATFORM RAILWAY-SIGNALS. Francis Hartman, Reading, Pa. [Filed Aug. 30, 1875.]

167,590.

1. In a torpedo for railroads, the ductile metal strip C, when passed into or through the bottom or sides of the metallic case or cap, substantially for the purposes herein set forth.

2. The combination, with the case or pellet A and cap B of the ductile metal strip C, passed through the same, and perforated, as described, and the rivets D D, substantially as and for the purposes herein set forth.

167,591. HOOKS FOR HAT-RACKS. J. Hollingsworth, Chicago, Ill. [Filed Mar. 6, 1875.]

Brief.—The teeth are raised to clamp the hat by means of bars sliding on the rods, retracted by springs, and caused at will to engage with notched bars on the driving-wheels by means of a sliding wedge-shaped bar passing between the adjacent ends of the pairs-bars, and operated by a foot-lever.

The wedge-shaped bar J, connected to the foot-lever, and provided with a retracting-spring, in combination with the sliding bars I I and sustaining rods-board A, substantially as and for the purposes herein set forth.

167,592. BUTTER-TABLES. W. J. Hughes and J. A. Lenhard, Clyde, Ohio. [Filed July 14, 1875.]

1. In combination with the large board A the small board A', hinged to the rear end, and adapted to be folded down out of the way, substantially as and for the purposes described.

2. In combination with the small board A' the spring-clamp D *d*, secured in the end thereof, and adapted to be used either with the large or small board, substantially as and for the purposes described.

3. In combination with the large board A the bench-legs B, and clamp C *c'*, provided with rubber cushions or feet *b a*, as and for the purposes described.

4. The treading-board, composed of large board A, supported upon bracket-feet, and clamp B C, small board A' hinged to the larger board, provided in its end with a spring-catch, D *d*, and adapted to be folded or dropped down out of position when desired, and iron-rest E, all constructed, arranged, and operating substantially as described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

167,580. GAS-LOCKER. George E. Hurd, Clinton, assignor to A. E. Brainard, Brainard, Conn. [Filed May 20, 1875.]

The herein-described rowlock, consisting of the two arms A A, mounted on the jointed spindle B, and arranged in the cast C, substantially as described, and so as to be folded, or turned below the edge of the boat, without removal from the cast.

167,580.

167,587.

167,587. HARROW. Alfred H. Isham, Lawrence, Kans. [Filed Mar. 29, 1875.]

Brief.—The pintle has a double-barbed lug near its upper end, and this fits into a corresponding recess in the bar of the hinge. The design of the barbs of the hinge tends to crowd down the pintle and keep it in position.

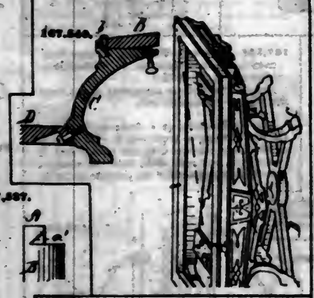
The combination, with a hook-hinge, A B, having a spindle, C, with head D, of the triangular projection c, having both sides inclined, forward on or with the head D, and the recesses *d d*, formed in the leaves of the hinge, substantially as and for the purposes herein set forth.

167,588. HATS AND CAPS. Martin Isidor, New York, and Ferdinand Isidor, Brooklyn, N. Y. [Filed July 3, 1875.]

As a new article of manufacture, a hat or cap the crown of which is made up in sections from plush or napped goods, and has its crown surface broken up by lines of ornamentation, and lines of ornamentation partially connecting the crown which unite the sections together, substantially as herein shown and described.

167,589. PROPELLERS FOR VESSELS. Fredericks Jacob Hoesch, N. J. [Filed Aug. 30, 1875.]

In a propeller, the automatically-adjustable paddles A, when constructed and arranged to operate substantially as and for the purpose set forth and shown.



167,590. BELLOWS-TABLES. Clemens Joerguns, Chicago, Ill. [Filed July 6, 1875.]

1. A cast-metal supporting-frame for a billiard-table, consisting of the legs C and connecting-frame D, substantially as described.

2. In a billiard-table having a metallic supporting-frame, substantially as described, the carrying-girts B, set inwardly away from the ends of the main frame, substantially as shown and set forth.

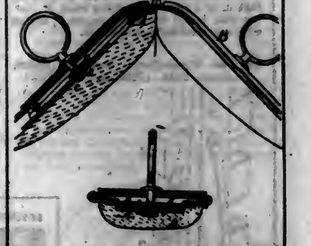
3. The bolts b, arranged to secure the main frame to the supporting-frame, and the set-screws tapped through the latter for leveling the table, all combined and arranged substantially as described.

167,640.

167,641. MUSIC-LEAF TURNERS. Frank G. Johnson, Chicago, Ill. [Filed June 12, 1875.]

1. The combination, with the plate D, having the four studs d, of the cords f, hooks i, and springs h, for turning said wheel, substantially as described and shown.

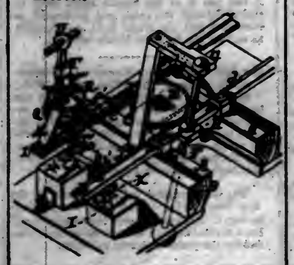
2. The combination of the plate D, provided in the ears C, and provided with the guard segments *c' c' c' c'*, and the studs *d*, the arms F, each having a guard center, f, at its lower end, the levers H H', cords f, hooks i, and springs h, substantially as described and shown.



3. The combination, with the plate D, having notches in its periphery, of the springs h, substantially as and for the purposes set forth.

167,642. HEAD-MUFFS. James R. Elsbree, New York, N. Y. [Filed July 21, 1875.]

As a new article of manufacture, the herein-before described protector, consisting of the body A, provided with the button-hole a and *a*, and buttons B and *b*, the elastic bands C and C, the nose-band D *d*, and the openings E and E, substantially as and for the purpose specified.

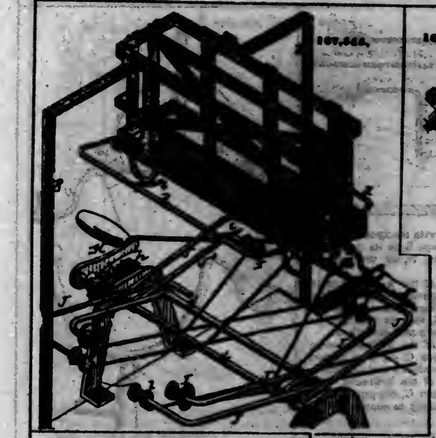


167,643. HARNESS-SADDLES. J. F. Ebner, Orange, N. J. [Filed Apr. 17, 1875.]

1. The turret-bars *d*, arranged in recesses *e* formed in the metallic frame A, in combination with the bars *a*, having openings for the passage of the shanks *c* of the turrets, and constructed to retain and hold the turret-bars in place, as set forth.

2. In a pig-saddle, metallic jockeys made in two detached sections, each section being provided with a pin and with a hole to fit corresponding holes and pins in the tree, substantially as described.

167,644. LOOMS FOR WEAVING MATTING. Sui Kuh, Grand Junction, Iowa. [Filed Aug. 11, 1875.]

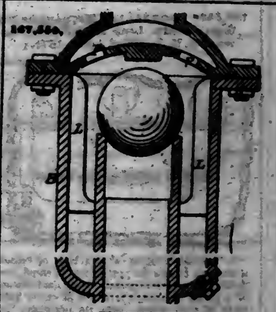


1. In a machine for weaving matting, the basket C, divided into two compartments, and provided with the sliding bottom D, having rods *d*, with fingers *e*, substantially as and for the purposes herein set forth.

2. The combination of the horizontal shafts G, geared together as described, and each provided with one or more sets of L-shaped arms, J, with spools I, constructed and arranged to operate substantially as and for the purposes herein set forth.

3. The combination of the horizontal shafts G, with their sets of L-shaped arms and spools, and winding-roller K, all substantially as and for the purposes herein set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON



167,645.

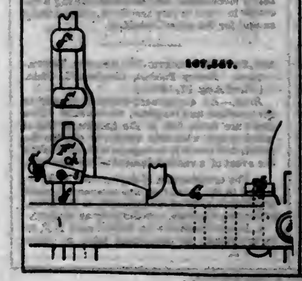
167,645.

167,646.

167,646. SUPPORTS FOR FLYING LAMPS. Hugh H. V. Lilley, Milford, Mass., assignor to himself and Thos. Lilley, same place. [Filed Dec. 21, 1874.]

Brief.—The edge of the neck of the funnel is turned inward, to prevent the edge from choking against the wick when the neck is inserted in a lamp. A spring attached to the body of the funnel forces the side of the funnel against the wick, and thus holds it and the burner securely while the lamp is being filled.

1. A funnel of ordinary construction, with the edge of the neck beveled inward, as specified.



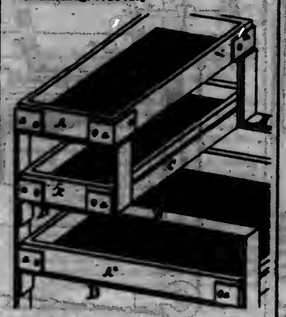
2. A spring attached to a funnel, in combination with the neck of the lamp-filler, for the purpose of securing the wick and burner of a lamp, substantially as specified.

167,647. MACHINES FOR TURNING SPOKES. Charles W. Lothian, Groton, assignor to Lemuel B. Frost, Orange, Conn. [Filed Jan. 26, 1875.]

Brief.—The cutting-tool is adjusted by a screw, the head of which bears against the tool.

The combination, with the detachable cutter-plate *f*, clamped in place by set-screw *e*, of the screw *f'*, applied to cutter-holder F, with its head over the upper edge of the said plate for the purpose of holding it against end-wise displacement, substantially as specified.

167,647.



167,648. FURNACE FOR FELTING LAMPS. Hugh H. V. Lilley, Milford, Mass., assignor to himself and Thos. Lilley, same place. [Filed Dec. 21, 1874.]

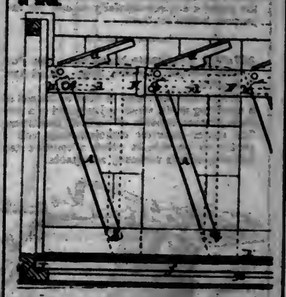
Brief.—The sides of the furnace are made to incline toward each other, and the bottom is made with a double curve, and is constructed with a view to the more perfect distribution of heat.

1. The combination, with the furnace B, of the inclined sides *a a*, substantially as and for the purpose set forth.

2. The combination, with the furnace B, of the curved bottom *b*, substantially as and for the purpose set forth.

167,649. PIPE-UNIONS. Daniel S. Lowman and Henry T. Owen, Lebanon, Md. [Filed Aug. 6, 1875.]

The combination, with the frame B C D, having the tray-racks in different horizontal planes and in the relative position shown, so as to occupy the space below the oven and fire-box of a cooking-stove, of the removable trays A A' A', substantially as and for the purpose set forth.



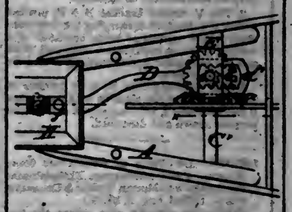
167,650. PIPE-VALVES. Thomas Maguire, Port Jervis, N. Y. [Filed July 24, 1875.]

Brief.—The inner tube, forming a valve-seat, is rigidly secured to the walls forming the outer chamber by the ears shown.

The valve, substantially as described, having the external wall B and central tube C, connected at their upper ends by the ribs L, as and for the purpose set forth.

167,651. CATTLE-STALLS. James R. Marsh and Ira Bell, Brother Falls, N. Y. [Filed July 21, 1875.]

Brief.—The stanchions are so arranged that any number of cattle can be secured at once, or they can be secured one by one. The floor is arranged to allow an increase or decrease of area.



1. The combination, substantially as shown and described, of the fixed stanchions B, the stanchions A, pivoted at their lower ends, the rail C, having the slots *c*, and arranged at the sides of the upper ends of the pivoted stanchions, and the longitudinally-moving slide F, having the laterally-projecting pins *f* passing through the slots in the rail C, as and for the object specified.

2. The sections I F and the guides L, so arranged relatively to each other as to admit of changing the area of the said floor, substantially as described.

3. The sections I F and their projecting joists *f*, in combination with the recesses J, of the beams K, substantially as described.

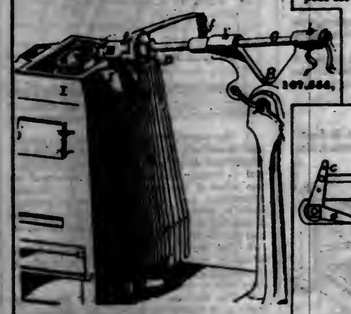
167,652. CORN-PLANTERS. R. H. Matthews, Muncie, Ind. [Filed Jan. 6, 1875.]

Brief.—The seed-slide is made with a double rack, and is reciprocated by a segmental pinion on the journal of the bevel-wheel, which gears with a shorter wheel secured to and revolving with the bearing-wheel.

The dropping-slide D, having the double rack *d* at one end and perforations *f f* at the other end, in combination with the hopper H, bevel-wheels *a b*, and toothed segments *a a*, substantially as and for the purpose set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

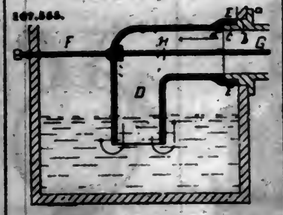
167,548. PROPELLING MECHANISMS FOR CANAL-BOATS. Louis W. McKenney, Jersey City, N. J. [Filed Apr. 3, 1875.]



1. The combination, with a boat or vessel, a chain or chains for propelling the same, and pulleys for supporting and driving said chain, of a pulley or pulleys arranged at one or both ends of such vessel, with its periphery, or their peripheries, below the bottom of said vessel, substantially as herein set forth.

2. The combination, with the boat A and pulley G, of the frame H, carrying the latter and secured to the former, and adjustable vertically with reference to the same, substantially as herein set forth.

3. The combination, with the pulley G, of the guard *a a* A, substantially as and for the purpose herein set forth.



167,549. SCRIBING-MACHINES. Levi Pearson Morrison, London, Eng. [Filed Apr. 2, 1875.]

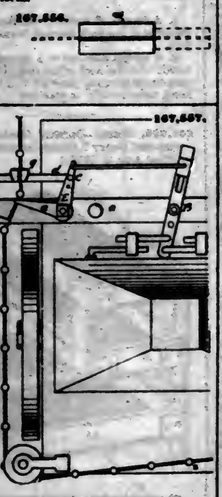
Brief.—The saw-clamp is fixed to the end of a reversing shaft, which is journaled in a pivoted headstock capable of vertical oscillation. The rubber-reservoir communicates with a pencil on its side, in which a transverse top sobbing-bar is vertically adjustable.

167,550. DIP-PIPES OF HYDRAULIC GRAIN-MAINS. Peter Ellenberger, Philadelphia, Pa., assignor to Morris, Tasker & Co., same place. [Filed Aug. 2, 1875.]

Brief.—The movable pipe passes the hydraulic main at the side, and the dip-pipe, extending within, is joined to it by a cone and socket joint. A rod is secured to the vertical side of the dip-pipe, whereby it is turned into or out of the moving liquid.

1. The combination, with the hydraulic main A and the ascension-pipe B, or its extension C, of a rotary dip-pipe, D, for the purpose shown and described.

2. The combination of the hydraulic main A, straddle-pipe or transverse extension C of the ascension-pipe, its flange *c* and extension *b a*, and the dip-pipe D, with its enlargement E, substantially as shown and described.



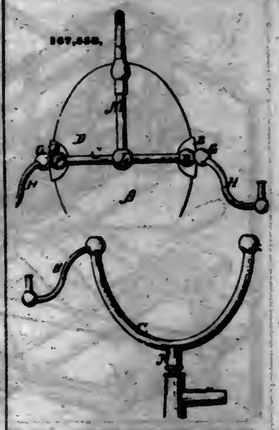
3. The combination of the hydraulic main A, straddle or extension C, dip-pipe D, and bolt F, substantially as shown and described.

4. The combination of the hydraulic main A, straddle or extension C, dip-pipe D, bolt F, and rod O, substantially as shown and described.

167,552. CORNERED MITERS, LEVELS, AND PLUMBS. John Murray, Cumberhedon, assignee of one-half his right to William McKeon, Philadelphia, Pa. [Filed Feb. 12, 1875.]

Brief.—Designed for use with an ordinary try-square, the slit receiving the blade, and the base resting upon the stock of the square.

The level-stock A, having water-ends B, and channels D, substantially as and for the purpose set forth.

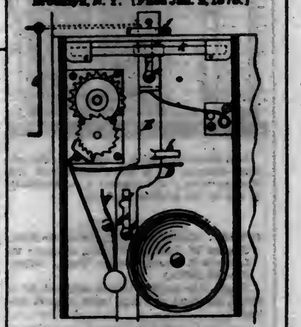


167,553. CHECK-ROWERS. Levi J. Odell, Fairbury, Ill. [Filed July 24, 1875.]

Brief.—Forked angular levers are centered upon a transverse beam, and connected together. Passing through the end of first one and then the other lever is a heated rod, that imparts a vibrating motion to them and to the seed-slide by a connecting-bar.

In a check-rower for planters, the combination, with a pair of forked stock or angle-bars, *c c*, of the connecting-bar *d* and its loop or eye *g* for the passage of the operating-rod, substantially as specified.

167,554. TOILET-MIRRORS. Henry Felsted, New York, N. Y. [Filed Feb. 26, 1875.]

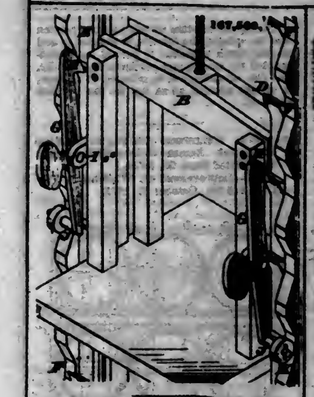


1. In combination with a mirror-glass, a gas-conveying tube and suitable bracket-arms or bearers, substantially as and for the purposes described.

2. In combination with the glass A, the arm B, arms E, bearings D, tube C, and set-screw F, whereby the glass may be adjusted relatively to the tube C, substantially as and for the purposes described.

3. The tubular frame C and bracket-arms H, in combination with the handle O, adapted to be secured to the frame C, substantially as and for the purposes set forth.

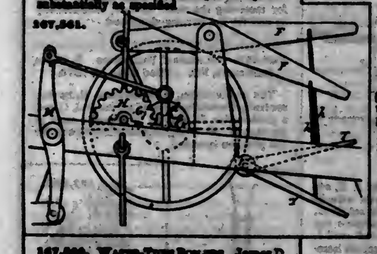
167,555. DOUBLE-ACTION. W. A. Parker, Brooklyn, N. Y. [Filed Jan. 2, 1875.]



The vertical slide B, provided with the notched guide-slot *f* and lug A, in combination with a suitable stop for holding the slide until released, and a spring, *i*, for elevating the slide, a spring, *j*, for engaging the notched slot with the lever *k* when the slide is depressed, and a lever, D, connected with the alarm mechanism, and on which the lug A operates in order to stop the alarm, substantially as and for the object specified.

167,556. AUTOMATIC BRAKES FOR RAILWAYS. Henry Tuerck, Cleveland, Ohio. [Filed Aug. 27, 1875.]

Brief.—An escapement-pallet is pivoted to the platform and weighted on one side. Two pawls are made fast in the headway, one of which comes with side weight to vibrate the pallet, and comes it to engage with the rack in the event of a sudden descent of the platform.



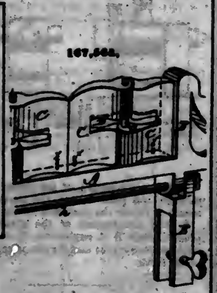
1. The combination of duplex rack D F, established in the headway, and escapement-lever or pallet G, pivoted concentrically to the latter, or their equivalents, substantially as set forth.

2. In combination, with duplex rack D F, or its equivalent, the overpoised latch or pallet G H I J.

167,560. SEWING-MACHINES. Cornelius Pease and Geo. W. Whitacre, Huntington, Ind. [Filed July 24, 1875.]

The sewing-machine, having the levers F and treadles T connected by rods A, and the quarter-crank shaft G, saw-crank, shaft, pitman, and saw-lever M, arranged to operate substantially as specified.

167,561. WAGON-TONGUE SUPPORTS. James D. Pierce, Rhinebeck, Wis., assignor of one-half his right to John B. Smith, same place. [Filed Dec. 29, 1874.]



1. In a steam-boiler the shell A, coil B, inverted or embedded half-way in said shell, and chimney I, all arranged and combined substantially as set forth.

2. Inside shell A, coil B, embedded as described, combustion-shell E, collar and bolt C and D, steam and water spaces F and G, grate H, and chimney I, all in combination arranged substantially as described.

167,562. ART OF KNITTING SUCCESSIVE AND OTHER ARTICLES. Frederick W. Pelle, Lorden Kelsher, and Hollis Pelle, Fort Gibson, Miss. [Filed Oct. 24, 1874.]

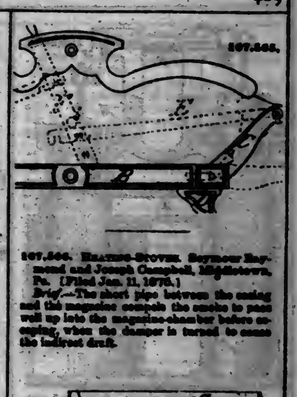
The improvement in the art of knitting two or more garments at the same time upon the same set of needles, the same consisting in setting up on the needles the loops of each garment, so that they alternate one with the other, and in removing them in the same order, substantially as described.

167,563. RAKE-HOLDERS. Edwd. H. Porter, William H. Reeves, and Charles B. Page, Morrisville, Vt. [Filed Feb. 10, 1875.]

1. The cams O O, pivoted on the rod *a*, in combination with the spring D, passed in front of the rod, and the rods resting in grooves on the rear sides of the cams, substantially as set forth.

2. The combination of the bar A, having standards B B formed in one piece, and rods *a a* with two grooved cams, O O, pivoted on said rods, and spring D, substantially as and for the purposes set forth.

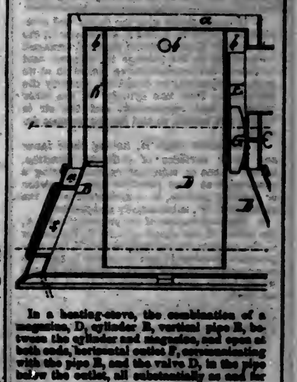
3. The combination, with a rake-holder having downward-projecting ears or lugs *c c* on its heel, of the bars F E, pivoted at their lower ends, and provided with shoulders *d* at their upper ends, the set-screws h, rod A, and rod *i*, all substantially as and for the purposes set forth.



4. The combination, with arms temporarily attached to the dash-board, of a rake-holder adjustable rotatively on said arms, whereby the rake-holder may be set in proper position, no matter what the angle of the dash-board, substantially as set forth.

167,564. SUPPER, Thomas Samuelson, Philadelphia, Pa. [Filed June 10, 1875.]

1. In a sash, having hinged arms O O, the combination of the vertically-sliding lever E and the rods E F, substantially as specified.



2. The lever F, having studs *a a'*, and the rods E E, having notches *a* in combination with the hinged arms O O of a sash, substantially as specified.

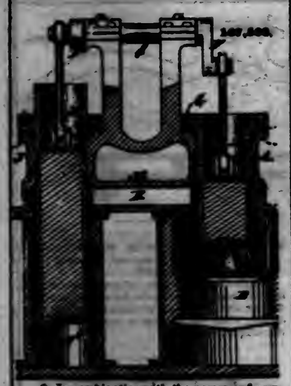
3. The stop S, in combination with lever F, connecting-rods E F, and hinged arms O O, substantially as specified.

167,566. HEATING-STOVES. Seymour Raymond and Joseph Campbell, Mifflintown, Pa. [Filed Jan. 11, 1875.]

Brief.—The short pipe between the casing and the magazine connects the smoke to pass well up into the magazine-chamber before escaping, when the damper is turned to cause the indirect draft.

In a heating-stove, the combination of a magazine, D, cylinder B, vertical pipe E, between the cylinder and magazine, and open at both ends, horizontal outlet F, communicating with the pipe E, and the valve D, in the pipe below the outlet, all substantially as and for the purposes set forth.

167,567. GATES. Charles C. Redmond and Henry H. Rhodes, San Jose, Cal., assignees of one-half their right to A. H. Evans, Washington, D. C. [Filed Aug. 7, 1875.]



1. A gate or door, constructed as shown, in which the entire gate swinging horizontally on side hinges can be opened on either side, but in opposite directions, substantially as and for the purpose set forth.

2. The gate or door E, in combination with the hooks *c c* and catches G, substantially as and for the purpose set forth.

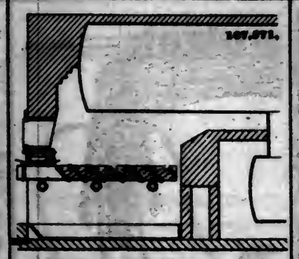
167,568. AIR-BRAKES. Alex. K. Esler, Walton, N. Y., assignor to Esler, Wooster & Co., same place. [Filed Aug. 2, 1875.]

1. The compression-chamber F, with its cocks I, arranged below the air-passage M, which connects said chamber with the lower O of the engine, whereby the lubricating material is restrained from clogging the passage M and other parts connected therewith, and is collected in the bottom of said chamber, substantially as specified.

107,569.

2. In combination with the power and compression cylinders A and J, and heater C, the regenerator E, composed of plates d, arranged horizontally in the passage M, between said cylinders, and communicating therewith at its ends, substantially as described, whereby the air passing from one cylinder to the other traverses said regenerator, and the air is heated and cooled, as and for the purposes described.

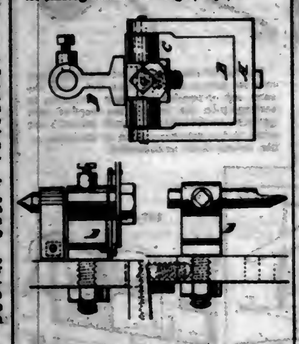
3. The relief-flaps H, having their inner and outer surfaces of different breadths, edged by one or more curves, and having a sharp edge at their junction with the plates or curving surface, in combination with the passage G, substantially as specified.



4. The combination of the power-cylinder A, the piston B, the shield or table D, the heater C, the passage M, and regenerator E, the compression-chamber J, and its piston L, and the compression-cylinder J, and its piston K, the whole being arranged essentially as herein set forth.

107,570. CHILLED-IRON FOR LAUNDRY OR RAILROAD. Albert Holden, Allegheny, Pa., assignor to himself, Richard Holden, and Edward S. Heffernan, same place. [Filed July 10, 1875.]

Claim.—A compound combining resin, glue, caustic soda, and salt-soda, substantially as and for the purposes specified.



107,571. GRAIN-SEPARATOR. I. G. Boyer, Boyerton, Md. [Filed Feb. 25, 1875.]

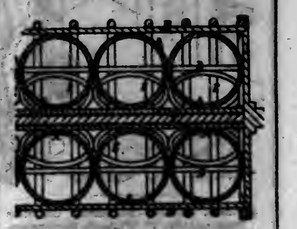
Brief.—Improvements upon Patent No. 114,658. Construction and arrangement of devices for removing the straw.

107,572. PLANING-CUTTER. G. V. Garver, Huntington, W. Va. [Filed July 30, 1875.]

Brief.—A pivoted top plate with adjustable center attachments, dogs, angle-iron, and stud, for planing locomotive-wedges, keys, &c.

1. The combination of the frame A B, adjustable top plate C, and the center attachments D D, for the purposes herein set forth.

2. The combination of the adjustable top plate C, dogs E E, angle-iron H, and stud I, with nut-screw b, as and for the purposes herein set forth.



107,573. GRINDING-MILLS. George Sidney, Philadelphia, Pa. [Filed Mar. 24, 1875.]

Brief.—The work interposed between the adjusting-cone and the bearings of the spindle, turns with the latter, but slides freely upon it to permit adjustment.

The upper or other suitably shaped portion s of the spindle, the thimble w, adapted to and having depth sufficient to permit the adjustment of the said upper portion of the spindle, and the adjusting-nut v, adapted to o screw, s, on the spindle, all as and for the purposes set forth.

107,574. CYLINDERS FOR PAPER-MAKING MACHINES. Samuel Sellers, Philadelphia, Pa. [Filed Sept. 23, 1874.]

Brief.—Improvement on Whitcomb's Patent No. 143,501, October 21, 1873.

A cylinder for paper-making machinery and other purposes, constructed with bent or ring-shaped wires for supports between the axis and the surface to please united to the axis, and having independent outer rings or bands for receiving the outer surface, substantially as and for the purposes described.

107,575. GLASSES' DIAMONDS. F. Sipes, Baltimore, Md. [Filed June 14, 1875.]

The combination, with the head B, having centrally-located recesses, of a diamond, C, and a guide-roller, D, located at opposite ends of the face of the head, substantially as and for the purposes specified.

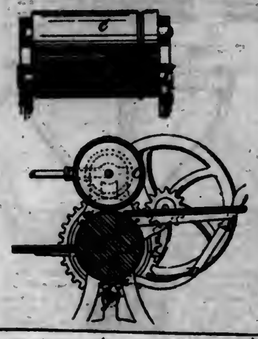
107,576.

107,576.

107,577. CHIMNEY-CAP. Wm. M. Smith, West Meriden, Conn., assignor to the Meriden Britannia Company, same place. [Filed Aug. 10, 1875.]

The herein-described coiled cover, consisting of the cap A, constructed with a recess upon its under side to produce an overhanging edge, and with a cover, B, attached thereto, combined with a separate body, D, inclosed by the rim of the cap, substantially as described.

107,578. FURNACE. Horatio M. Smith, Chicago, Ill. [Filed July 6, 1875.]



1. In a furnace, the combination, with the rear grate-surface and its supporting-wall, a descending partition arranged to form a throat or chamber at the junction of the grate and wall, the same adapted to be partially banked up with fuel, as set forth.

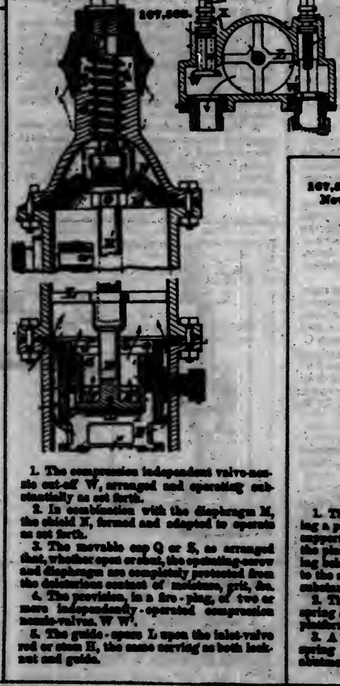
2. In a furnace, the combination, with the rear grate-surface and its supporting-wall, a descending partition arranged to form a throat or chamber at the junction of the grate and wall, and air-supply pipes or openings debouching at the crown, or in front of said arch, as set forth.

3. The grate G, partition F, and dead-plate f combined with the bridge-wall D, for the purpose described.

107,579. ROOFING APPARATUS. H. H. Smith, New York, N. Y. [Filed Aug. 6, 1875.]

Brief.—A calendering-roller that may be heated inwardly, and a cloth-covered roller geared together, so that they move with different velocities. The calendering-roller has a circumferential groove, and the covered roller has a corresponding projection.

107,580. PEN-HOLDERS. Daniel M. Sweeny, New York, N. Y. [Filed Aug. 20, 1875.]



1. A pen-holder, the barrel or tip of which is formed of a metal tube having a corrugated or fluted base, substantially as shown, and for the purposes described.

2. A pen-holder, the barrel or tip of which is formed of a metal tube having a corrugated or fluted base, and which is provided with a pen-retaining nib, substantially as shown and described.

107,581. FIRE-PLUGS. John A. Stacy, Cincinnati, Ohio. [Filed July 13, 1875.]

Brief.—The hydrant has compression-section, each independently movable by separate valves, which caps protect the operating-screw, carrying an arbors for turning wrenches. The rod has a guide, which also acts as a lock-nut.

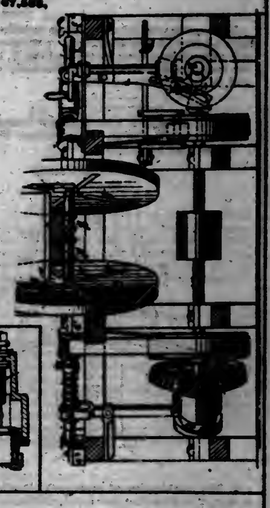
1. The compression independent valve-seats cut-off W, arranged and operating substantially as set forth.

2. In combination with the diaphragm M, the shield N, formed and adapted to operate as set forth.

3. The movable cap Q or S, as arranged and shown, whether open or closed, the operating-screw and diaphragm are completely protected from the deleterious contact of moisture, grit, &c.

4. The provision, in a fire-plug, of two or more independently-operated compression-seats-valves, W W.

5. The guide-spoke L upon the inlet-valve rod or stem H, the same serving as both lock-nut and guide.



107,582. MACHINES FOR TRIMMING BOOTS. Albert Sheeran, Brooklyn, N. Y. [Filed June 30, 1875.]

Brief.—Two revolving disks, provided with cutters, are placed at an angle to each other, with a table between them, upon which the last is placed while the ends are being trimmed.

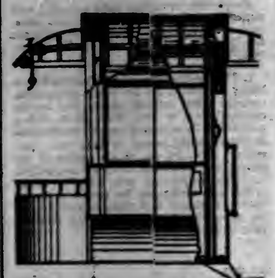
1. The combination, substantially as hereinbefore set forth, of the two rotary cutter-disks, mounted upon suitable shafts, and having cutting-knives on their inner faces, with a mechanism for adjusting the said cutter-disks and their shafts toward or from each other without affecting the rotary motion of the same, in the manner and for the object specified.

2. The combination, with the cutter-disks, of the stop mechanism for arresting the advancing motion of said disks immediately on the completion of the desired cut, substantially as herein described.

107,583.

107,584. PORTFOLIO-STANDS. D. J. Stein, New York, N. Y. [Filed July 20, 1875.]

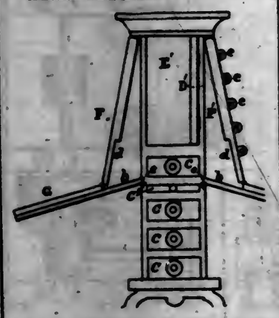
1. The combination, with a folio-stand having a platform, a, a vertical abutment, b, and supporting side pieces e, of a flap hinged upon the platform, and having its lower end extending below the platform, where it is subjected to the action of a spring for closing the flap, substantially as described.



2. The combination of the bracket f and spring f with the flaps B B, abutment b, and platform c, substantially as described.

3. A secondary flap hinged upon the hinged spring side flaps, in combination with the abutment b and platform c.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON



HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

167,586. SHAMPOO-CANE. John Stephenson, New York, N. Y. (Filed Aug. 7, 1874.)

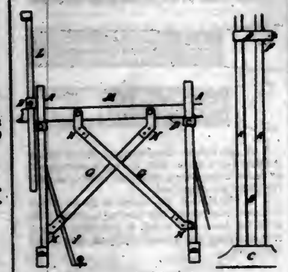
The combination of a bonnet, B, provided with a mirror, b, with an opening, or an opening covered by a transparent medium, F, in the front end of a street-car, substantially as and for the purposes set forth.

167,587. BEARING AND WRITING DESK. Elizabeth W. Dolan, Philadelphia, Pa. (Filed Mar. 24, 1875.)

1. The combination of paper-racks H with a case, A, and reading and writing folding tables G or G', substantially as and for the purposes described.

2. The book and magazine case A, having reading-doors F F', hinged at the top to the cabinet, and folding tables G G', hinged to the lower part of the said doors, and supported, when open for use, by brasses b on the doors, and notches or rabbets e on the case, substantially as described and shown.

3. The combined book and magazine case, reading and writing tables, and paper-racks, constructed on demand, consisting of a case, A, provided with notches or rabbets e, and having shelves B in the middle, drawers C, sliding tables G', doors D D', pigeon-holes and space E F in the ends, swinging doors F F', provided with recesses d, folding tables G G', provided with brasses b, and paper files or racks H on the sides, substantially as and for the purposes described.



167,588. PREPARATIONS OF BATTER OF EGGS. Wm. Osborn Stoddard, New York, N. Y. (Filed May 31, 1875.)

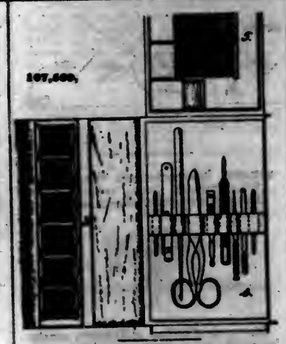
1. The process of desiccating batter of eggs, consisting in drying the mixed batter evenly and by means of a flexible sheet of tin, and upon a rotating cylinder previously prepared with said sheet, substantially as described.

2. The product herein before described, consisting of desiccated batter of eggs having the natural color and substantial qualities of the fresh, moist batter, free from offensive odor, and containing about the proportions of forty-five per cent. of fat and oil soluble in ether, and forty per cent. of soluble albumen.

167,589. SCAFFOLDS. Levi W. Swafford, Vicksburg, Miss., assignor to himself, J. S. Horan, and Charles F. Tuth, same place. [Filed July 30, 1875.]

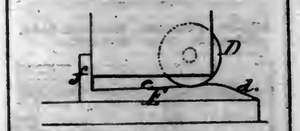
Brief.—The uprights are secured to standards, and have a wedge-shaped slot their entire length to receive the cross-pieces or supporting-timbers, which are adjusted at any desired height by a screw-clamp. The cross-timbers are cut away, so as to cross each other, and are provided with metallic plates and set-screws for ready attachment to the standards and cross-pieces. The steadying-braces are provided with plates and set-screws at one end, and at the other end with a flat perforated plate for attachment to the floor. A slotted post for bracing the device against the ceiling fits over the cross-timbers, and is secured by screw-clamps.

1. In an adjustable portable scaffold, the supporting post or upright, consisting of timber A, secured to a standard, C, and slotted its entire length by a tapering or wedge-shaped opening, B, and clamp D E F, as and for the purposes set forth.



2. In an adjustable portable scaffold, the braces G cut away at G', and provided at each end with jaws or plates H and clamping-screw I i, as and for the purposes described.

3. In combination with the slotted posts A B, the door-brace J, provided at one end with clamping-screw, and at the other with a perforated angle-plate, J', as and for the purposes described.



4. In combination with the timber M, the ceiling-brace L and clamp D E, as and for the purposes described.

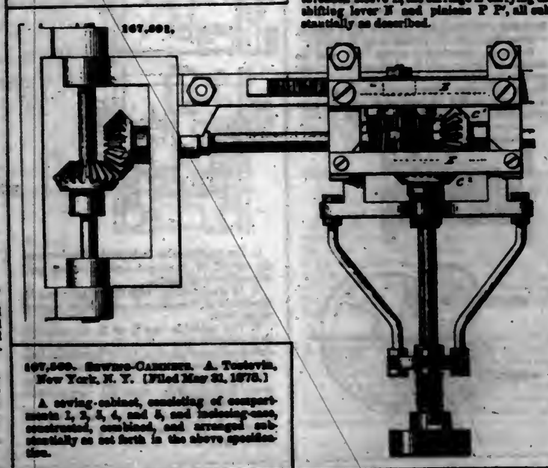
5. The adjustable portable scaffold, composed of slotted posts A B C, cross-braces G, door-braces J J', timber M, and clamping devices D E F, and with or without the ceiling-braces L L', all constructed, arranged, and adapted to operate as described.

167,590. DOOR-CHECKER. W. Vandeventer, Peoria, Ill. [Filed June 15, 1875.]

Brief.—An angular corner-plate secures a friction-roller to the corner of the door, which roller rides upon a track-plate, with double inclines and a stop.

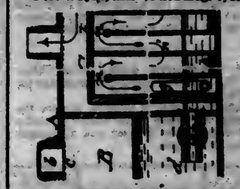
The angular frame C, provided with the roller D, and recessed in the lower face of the door, and flush with it, in combination with the track-plate E, having the inclines d e, and stop f, constructed as described, and for the purpose set forth.

167,591. SLICING-POLISHING MACHINES. P. H. Walsh, Waterbury, Conn. [Filed Apr. 12, 1875.]



Brief.—A horizontally-swinging frame, provided with a driving-shaft, supports a polishing-frame, which is automatically moved back and forth by means of a sliding sleeve having right-hand screw-threads at one end and left-hand threads at the other, with which two pinions in a swinging frame alternately engage, actuated thereto by adjustable stops.

The combination of the swinging arm A', provided with adjustable stops E E', the driving-shaft C carrying the right- and left-threaded sleeve I, the carriage B carrying the shifting lever F and pinions P P', all substantially as described.

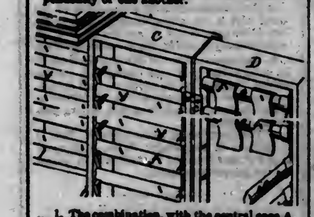


167,592. SEWING-CABINETS. A. Tesierin, New York, N. Y. [Filed May 31, 1875.]

A sewing-cabinet, consisting of compartments 1, 2, 3, 4, and 5, and inclining-case, constructed, combined, and arranged substantially as set forth in the above specification.

167,593.

167,594. CARBURETTERS. Daniel L. Westcott, Fort Wayne, Ind. [Filed Aug. 7, 1875.]



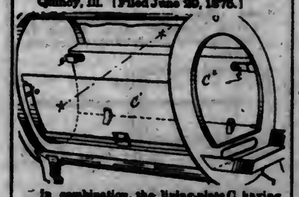
1. The case A, having at one end the reservoir B, with feed-pipe d leading into the chamber f of the chest, in combination with the removable box C, substantially as described.

2. The combination, with the chest A, of the removable box C, having its inner and outer walls covered with an absorbent cloth, and provided with the air-inlet pipe g and outlet-pipe g', substantially as described.

3. The removable box C, having vertical division-walls D D', removable strips h h, and absorbent cloth, substantially as and for the purpose set forth.

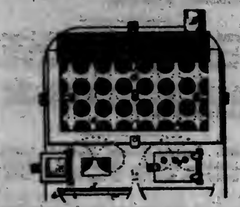
167,595. TICKET-CASES. Isaac White, Cedar Rapids, Iowa. [Filed July 21, 1875.]

Brief.—The doors of the main case are made in vertical sections, hinged together in such manner as to form receptacles independent of the main case. These doors are so connected together and pivoted to their case that the outer sections, (when folded upon the inner sections and both together closed upon the main case,) become the inner sections. The ticket-bars are hinged to swing outward independently of one another.



1. The combination, with the central case A, of the hinged extensible case-sections C D, having the inner sections C of such extension pivoted at their inner front corners a, to admit of their being folded and unfolded, each with the other, and to the central case A, in the manner substantially as herein set forth.

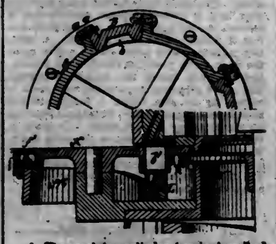
2. The bearers or holding-arms e of a coupon-ticket holder, hinged to their cases separately and independently of each other, to admit of being swung out from the case and loaded independently of each other, substantially as and to obtain the advantages herein stated.



3. An extensible case of two or more hinged sections, pivoted to the main case to admit of their being folded therewith, with their rear sides b d on a line with the narrow sides of the case, and with their outer sections C forming the fronts of doors of the case A, substantially as described.

167,596. HEATING-STOVES. Thos. White, Quincy, Ill. [Filed June 30, 1875.]

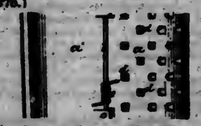
In combination, the lining-plate C, having the flanges b b and stops c c, and the lining-plates C' C', having the hooks d, notches f, and buttons g, constructed and arranged substantially as and for the purposes set forth.



167,598. SEWING-MACHINES. Joseph H. Williams, South New Market, N. H. [Filed Apr. 12, 1875.]

1. In combination with the exit end of the tube-sheet of a tubular boiler, a perforated sliding plate, G, that closes over the ends of the tubes from above, so as to retain a volume of hot air in the upper parts of the tubes, and to cause the heated products of combustion to flow along the lower portions of the tubes, as described.

2. The sliding damper G, in combination with the exit end of the tube-sheet of a tubular boiler, the damper having its opening so as to close the upper tubes more than the lower ones, and thus equalize the flow of heated air through all of the tubes, as specified.



167,599. FRUIT-MACHINES. Carmi H. Williams, St. Paul, Minn., assignor of two-thirds his right to Charles D. Williams and Charles M. Parker, Jr., same place. [Filed Feb. 16, 1875.]

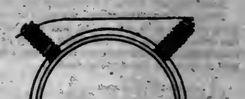
1. The receiving-cylinder herein described, consisting of the alternate sections A and B, provided with side flanges a a, and the sections B, having interior vertical recesses b, substantially as and for the purposes herein set forth.

2. The combination, with the stationary case-wheel M, of the rotating mold-table K, and the detachable follower L, each provided with under cams L', side recesses N N', passages f f', and perforated top f', all constructed and operating substantially as set forth.

167,597. CORN-SHELLING IMPLEMENTS. J. M. Wilson, Nashua, N. H. [Filed Jan. 19, 1875.]

A head-corn-sheller, consisting of the toothed concave plate a and smooth concave plate a', each hinged to the other, and provided with the spring e supported on the hinging-rod b, substantially as and for the purposes described.

167,600. RAILROAD-RAIL JOINTS. Samuel H. Wilmer, Cincinnati, Ohio. [Filed July 24, 1875.]



Brief.—A rail-joint fastener in which a chamfered sole-plate is held to the under side of the rails by double flared or wedge-formed chocks or clamps, which are drawn toward each other by horizontal bolts passing through them, and through channels or grooves in sole-plate, and bearing against under side of rail.

The rail-joint fastening, composed of the chamfered sole-plate B O O D D O O G G O', doubly-flared chocks I i i J J' i' i J J', and slotted bolts E F F F, the whole being combined and adapted for use with an ordinary notched rail, in the manner herein explained.

REISSUES.

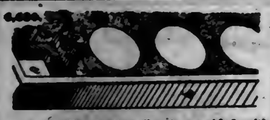
6,969. STEERING-RIGGS. Wolcomus Jenckes, Manchester, N. H., assignor to Geo. Draper & Son. Patent No. 20,027, dated May 25, 1858; reissue No. 5,702, dated Dec. 23, 1873. [Filed July 31, 1875.]

1. The combination of a ring-rail, provided with a passage through it for the spindle, with a ring and with adjusting mechanism, whereby such ring may be moved or adjusted with relation to the spindle-passage, and to placed concentric with the spindle, substantially as described.

2. A ring-rail having seats of the contents for the rings made larger in diameter than the seat or portion of the ring to enter it, in combination with rings and with adjusting mechanism, whereby the rings may be placed concentric with the spindle, substantially as specified.

3. The combination, with a ring-rail and a ring, of adjusting devices adapted to operate against different parts of the periphery of the ring to adjust the same concentric with the spindle, substantially as described.

6,970. GRAIN-CLEANING MACHINES. Gerner B. Throop, Syracuse, N. Y. Patent No. 165,676, dated Feb. 11, 1875. [Filed June 3, 1874.]



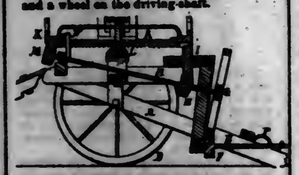
1. In combination with a receiving cleaning apparatus, a contracting case and head A, having on them concentric rings of various diameters, upon which the contracting case is drawn and gradually reduced in size as the brush wears away, substantially as and for the purposes herein set forth.

2. In combination with a contracting cylinder, a revolving brush, having a solid or continuous surface, substantially as set forth.

3. The fan-blower C, disconnected from the cleaning-case, for the purposes herein set forth, with openings o o around its head A, and the feather-bladed fan-wheel f, as shown, as combined as to direct the auxiliary blast upward through the annular space b and air-flues, all as herein specified.

6,971. ELECTRO-METAL TYPE. Thos. Hyatt, New York, N. Y. Patent No. 166,888, dated July 20, 1875. [Filed Aug. 28, 1876.]

6,680.



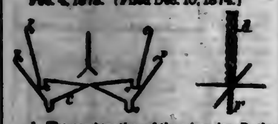
1. An illuminating-tile, A, provided with cross-bars *a'* and *a''*, that have the form of inverted arches, the abutments *a''* of which arches are flush with the upper surface of said tile, substantially as and for the purpose specified.

2. An illuminating-tile provided with cross-bars, each of which has a portion of its upper surface flush with the upper surface of said tile, while another portion is removed to permit the plastic filling to pass from one lens-opening to another, and form an interlocked seam of the same, substantially as and for the purpose shown.

3. An illuminating-tile, having a portion of its upper surface composed of emery combined with adhesive material, substantially as and for the purpose set forth.

6,681. HORSE-POWERS. Ole C. Sturle, Milwaukee, Wis., assignor to himself and J. C. Overby, same place. Patent No. 160,612, dated May 21, 1872. (Filed May 26, 1875.)

Brief.—The master-wheel operates two pinions, one on each side of it, one attached to the driving-shaft, and the other acting as an intermediate pinion between the master-wheel and a wheel on the driving-shaft.



1. The combination of frame A, tongue C, and loops P P, substantially as described.

2. The combination of master-wheel K, pinions F, H, I, and M, wheel G, lugs E, rollers L, and tumbling-rod B, arranged to be operated substantially as described.

3. A horse-power, with a master-wheel, in combination with pinions H, I, and M, arranged substantially as set forth.

6,682. BED-BOARDS AND BOLSTERS. Edward P. Woods and Daniel Sherwood, Lowell, Mass., assignees to themselves and Cyrus H. Latham. Patent No. 70,769, dated Nov. 12, 1867; reissue No. 5,269, dated Feb. 4, 1873. (Filed Dec. 10, 1874.)

1. The combination of the wire ring B, the ribs C having feet *c*, and the continuous spiral *d*, substantially as described.

2. The combination of the wire rings *a a* with the central supporting-stem F, substantially as described, supporting them upon the base of the holder.

3. The combination of the wire ring B, the wire rings *a a*, and the central supporting-stem F, substantially as described, the rings *a a*, connected together by controlling clasps or binders, and to the ring B by loops at the top end of each rib C.

4. The combination of the wire rings *a a*, the central supporting-stem F, and the ribs C, substantially as described.

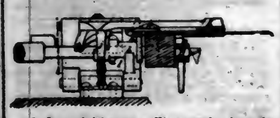
5. The compound twisted wire sheath A, having its wires and strands B soldered or connected together at their internal tangential points, substantially as described.

6. The wire handle of the stand, provided with a loop on its upper end, formed of the twisted wire sheath B, substantially as described.

7. The rings *a*, constructed each of a single wire, substantially as described, said wire being led from the sheath, bent into proper form, and united to itself at or near its junction with the sheath.

8. The combination of the ribs C with each other and with the central wire stem F, by the wires of the latter binding them together, substantially as described.

6,683. DENTAL PLATES. Daniel M. Lamb, London, Canada. Patent No. 160,667, dated Feb. 9, 1875. (Filed May 26, 1875.)



A dental plate constructed of the vulcanized inspissated juice of a plant of the asclepias or milkweed family.

6,684. DENTAL PLATES. Daniel M. Lamb, London, Canada. Patent No. 160,667, dated Feb. 9, 1875. (Filed May 26, 1875.)

A dental plate constructed of a vulcanized compound of the inspissated juice of a plant of the asclepias or milkweed family, and caoutchouc or other vulcanizable gum, and sulphur or its equivalent.

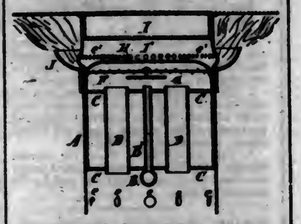
6,685. PLAITING ATTACHMENTS FOR SEWING-MACHINES. William Walker, Brooklyn, N. Y., assignor to George H. Wooster. Patent No. 141,610, dated Aug. 5, 1873. (Filed Aug. 20, 1875.)

Brief.—The cloth is carried forward by a pair of nippers reciprocating simultaneously, and a vertically-vibrating arm in advance of their limit of stroke striking the cloth on its under side produces a fold, which is always made upon the upper surface of the cloth. The "striker" swings down in time to allow the nippers to carry the fold under the presser-foot. The upper nipper-plate presses the cloth against the lower on their forward motion, but is lifted from the cloth on the reverse movement. The lower nipper-plate has a straight edge, and is mounted upon a spindle that is secured in a swinging frame, the outward motion of which is limited by a screw. A laterally-projecting arm acted on by a cam upon the main shaft produces the forward motion, and a spring causes the backward motion. The upper nipper-plate provided with teeth is carried by an arm, which is hinged to the spindle carrying the lower, whereby it receives its reciprocating motion, while it is made to vibrate vertically by a cam on the main shaft, which acts in a laterally-projecting arm kept in contact by the spring previously mentioned. The striker is mounted on an arm actuated by a cam in like manner.

1. In a plaiting or ruffling mechanism, the combination of an arm or nipper carrier with a pair of reciprocating nippers or jaws, the upper member of which is adapted to be shut or closed upon and move the cloth or material forward for a fold, and to be opened and release itself from the material on the return-stroke of the nippers, both members of the nippers reciprocating forward and backward simultaneously, and to the same distance, substantially as described.

2. The horizontally-reciprocating under-plate *f* and its carrier, in combination with the upper plate, adapted to be reciprocated by the carrier of the under plate, and with mechanism for automatically lowering and raising the upper plate, substantially as described, with relation to the under plate, to engage or free the material lying on the under plate, substantially as described.

3. In a plaiting or ruffling mechanism, the combination, with a cloth-carrier, of a bender or fitter adapted to bend the cloth for a fold prior to its being carried forward, substantially as described.



4. The combination, with a presser and a bender adapted to move the material in substantially a perpendicular direction, of a cloth-carrier adapted to move the material forward in substantially a horizontal direction and complete the fold started by the bender, substantially as described.

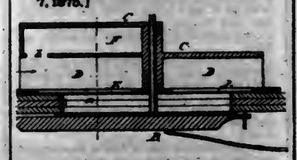
5. The combination of a bender and cloth-carrier, adapted to operate substantially as described, with a feeding mechanism to move the material after the fold is completed, substantially as set forth.

6. In combination, a vertically-movable bender, reciprocating nippers, and a cloth plate or support, the bender being interposed between the nippers and support, substantially as and for the purpose described.

6,686. GAS-STOVES. John J. West, Chicago, Ill. Patent No. 160,944, dated May 18, 1875. (Filed June 14, 1875.)

Brief.—The flame is directed against the bottom of the vessel to be heated by means of the flange. The diffuser and diaphragm mix the air and gas.

1. The combination, in a gas-stove, of the external flame-protecting shield or flange J and the gas-ports *c c*, substantially as and for the purpose specified.



2. The chamber I', inclosed by the outer walls of the stove, and having therein the ports or openings *c' c'*, in combination with the shield or flange J, projecting from the outer wall, and arranged somewhat below the said ports, substantially as shown and described, and for the purposes set forth.

3. The combination, in a gas-stove, of the outer wall A, the wire-cloth diaphragm F, the cap I, the gas-ports *c c'*, and the shield J, all substantially as and for the purposes specified.

4. The combination of the pipe B', flues D D, annular flange H, and chamber I', having therein the ports or openings *c c'*, all operating together in connection with a diffuser in a gas-stove, substantially as and for the purposes specified.

5. The combination of the pipe B', flues D D, diffuser G, diaphragm F, flange H, openings *c c'*, and chamber I', substantially as and for the purposes set forth.

6,687. ORGAN REED-BOARDS. Alfred W. Wilcox, Worcester, Mass. Patent No. 140,750, dated July 8, 1873. (Filed Aug. 7, 1875.)

1. An auxiliary air-chamber, F, provided with an opening, *b*, in combination with a reed cell or chamber, D, of a musical instrument, substantially as and for the purpose set forth.

2. A reed or tube board, C, provided with cells D and auxiliary communicating-chambers F, substantially as set forth.

6,688. ORGAN REED-BOARDS. Alfred W. Wilcox, Worcester, Mass. Patent No. 140,750, dated July 8, 1873. (Filed Aug. 7, 1875.)

The combination of a valve and sounding board, A, constructed of thin veneers laid and glued together crosswise of the grain, with the tube or reed board B of a musical instrument, substantially as and for the purpose set forth.

COMMISSIONER'S DECISIONS.

GEORGE E. GLINES.—*Appeal.*

[*Appeal from the Examiner of Trade-Marks in the matter of the application of George E. Glines for registration of a* TRADE-MARK.]

SPEAR, *Acting Commissioner:*

This appeal is taken from the refusal of the Examiner to register as a trade-mark the words "Slate Roofing Paint," which applicant proposes to apply to a specified kind of paint intended for roofs.

I find by an examination of the specification in this case, as well as of the patent referred to in the specification, that the paint to which applicant proposes to apply this trade-mark is not composed of slate to any considerable extent, having less than two per cent. of that material. I cannot, therefore, agree with the Examiner that the terms are purely descriptive. Upon careful consideration, I am inclined to think that they are not in any sense such terms as would naturally be employed in the ordinary use of the language to describe any composition of this general description, and that therefore the words are arbitrarily chosen and sufficiently out of the ordinary signification to constitute a peculiar mark.

It is no objection to a mark sought to be registered as a trade-mark that it is appropriate to the article to which it is to be applied, or suggestive of good qualities, or peculiarly fit in any such way. In the present instance the words used as a trade-mark may be suggestive of qualities in the peculiar paint, resembling or thought to resemble slate-roofing. It is not slate-roofing, but an article sufficiently distinct from it; nor is it slate-paint; and, as I have said, although the words are suggestive, they are not descriptive according to the ordinary use of the language.

For these reasons I must reverse the decision of the Examiner, and authorize the registration of the trade-mark in accordance with the prayer of applicant.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF NEW YORK.

CHAS. G. JOHNSEN *vs.* IRA BEARD.

[*In equity.—Before* WOODRUFF, *Cir. J.—April*, 1875.]

Where it appeared that the drawing of a patent had been changed at the time of the reissue thereof, and the complainant in a suit under the reissue had introduced a duplicate of the Patent Office model which conformed to the drawing of the reissue: *Held*, that the defendant ought to be permitted to show the condition of the model at the time when it was filed in the Patent Office and at the date of the original patent.

A motion to reopen a case for the introduction of such proofs, it being alleged that the testimony was newly discovered, was entertained at final hearing, and was allowed.

The invention disclosed in Letters Patent for bale-ties, granted to Chas. G. Johnsen as assignee of Charles Swett, October 23, 1866, held not to be substantially the same as that embodied in the "Eureka" tie, and that the making, using, and selling of the "Eureka" tie is no infringement of any exclusive privilege legally vested in the patentee by the reissue of said patent as made May 7, 1872.

[This was a suit in equity for an alleged infringement of Letters Patent of the United States for bale-ties, granted to Charles G. Johnsen as assignee of Charles Swett, May 7, 1872. This patent was a reissue of an earlier patent granted the same patentee October 23, 1866, (antedated April 23, 1866,) upon an application originally filed in the Patent Office in the year 1856. At the time of the reissue the drawing was amended to conform to the model *as it then was*. The defendant in the suit set up that this change was unwarranted and vitiated the patent.

A duplicate of the model conforming in all essential particulars to the drawing of the reissue, and certified

to by the Commissioner of Patents several months subsequently to the date of the reissue, was put in evidence by the complainant.

After the proofs were closed the defendant moved to open the record for the introduction of testimony to prove the condition of the model at the time when it was filed in the Patent Office, as well as at the time of the grant of the original patent, it being alleged in support of the motion that the defendant had discovered, after the proofs were closed, that the model had been changed after its filing in the Patent Office, and that, originally, and even as late as October 23, 1866, it was in the condition shown in the drawing of the original patent.

This motion first came up in an interlocutory proceeding, and, after argument by counsel, was denied upon the ground that the essence of the allegation was fraud in the grant of the reissue, and in a collateral proceeding like a suit for infringement, the question of fraud could not be inquired into.

When the case came on for final hearing the motion was renewed. The question having been argued at considerable length, the court took it under advisement and rendered the following oral decision:]

[*Samuel A. Duncan* and *Geo. Gifford*, for complainant.
J. H. B. Latrobe and *Geo. Harding*, for defendant.]

WOODRUFF, *Cir. J.*:

In regard to the motion which was made in the case yesterday, I am constrained to the conclusion that fairness and justice to this defendant require that he should be permitted in some way to put upon the record in this cause the fact, if it be a fact, that the original record of the patent, embracing, of course, the patent, specification, and model, is not before the court.

I understand it to be an important point in the defense that the reissued patent is broader in its scope than the original. I am bound to assume that the court has to determine that question by an examination of the record, and cannot go outside of it for information. I understand the Supreme Court to have settled, distinctly and finally, that this court cannot enter into the examination of any question of fraud upon the Commissioner who granted the reissue, or of any matter which is outside of the record; and that the only power which the courts have over reissues, when their validity is sought to be impeached upon such grounds, is to look at the record of the original patent and of the reissue, and to determine upon their face whether or not as matter of law the reissue is a lawful one without inquiring by what means it was procured, and without inquiring what matters of facts were laid before the Commissioner of Patents; but assuming, in the first instance, that so far as matters of fact were involved, *de hors* the record, the act of the Commissioner in granting the reissue, is final and conclusive. If that be the view in which I am bound to deal with this case under the instructions of the Supreme Court, then this court is to be furnished with the record of the original patent on the one hand and with the reissue on the other, and then, governed by legal principles, declare whether that reissue patent is or is not valid. In order to do that the court must have, first, the original record, and that, without any inquiry, as I have said, as to what was before the Commissioner on the reissue. I have nothing to do with that; but I am to be furnished with the original record.

A model is produced here and certified to be a copy of a model which is now, or was when the testimony was taken, in the Patent Office at Washington. I do not perceive that that is conclusive. If the Patent Office had been burned and all the models destroyed, and this question had then arisen, I think the parties must have been permitted to show what that original record was. If they differed on the subject they would have been permitted to take proof, so that when the court came to pass upon the question they would necessarily have to determine, first, what was that record, and, second, does the reissued patent conform to it, or has it gone beyond the scope and limit of the original. If that be the correct view of the subject then the party producing a certified copy of a model from the Patent Office does not conclude the defendant. He may, and the defendant should be permitted to show that what he produces is the original, or a true copy of the original. I can readily suppose a case in which for some purpose, if the model at Washington had been destroyed, the defendant might have in his possession a certified copy of the original model as it was filed and made by the Patent Office directly after it was filed, and so might be able to place before the court a certified copy of the original model.

I quite agree that the question is not entirely without doubt. It may be and has been very plausibly argued that, for this court to enter into an inquiry of what was the original model, is to enter into an inquiry whether or not the Commissioner was not deceived when he made the reissue. That question may be incidentally involved; but after all the main question is not whether the Commissioner of Patents was deceived or defrauded, but whether, in point of fact, the reissue conforms to the original.

I am constrained to hold that the defendant ought to be permitted to place this fact upon the record. Certainly the Supreme Court has not yet gone so far as to say that what was the original model may not be proved in the court for the purpose of making the comparison which the Supreme Court say may be made.

To deny this motion would be to deprive the defendant, if a final decree shall be entered against him, of an opportunity to review this question, because he will have no opportunity to say to the Supreme Court that the judgment or decree should be reversed, because he was not permitted to show what was the original model with which the reissue was compared. I think that the defendant ought not to be placed in that situation. If I was inclined to believe that it would ultimately have no effect upon my determination of this case, I am not so clear upon this subject but that I should deem it my duty to give to the defendant the benefit of an exception, so that my ruling upon so important a question as this may be, in favor of the plaintiff, might be the subject of review. The Supreme Court may go the whole length, and say that the court was not at liberty to inquire what the Commissioner had before him; but if they say that they will go further than they have in any opinion yet gone. Up to this point they say that the court *may* look at the record. If the court *may* look at the record the parties have a right to bring that record before the court in a form which is authenticated by evidence satisfactory to the court that the record which they offer is correct.

I am, therefore, disposed to give the parties an opportunity to make this proof, unless the parties are still of opinion that such proof would not effect their case, and prefer to admit it. If they do, of course, the case may go on.

[The parties thereupon stipulated, for the purposes of the suit, a state of facts regarding the former condition of the model, and the case proceeded to a final hearing. The conclusions of the court were expressed as follows:]

WOODRUFF, *Cir. J.*:

My conclusions in this case are, first, that Charles Swett, the person named in the bill of complaint as assignee of the complainant, and therein alleged to be the inventor of the invention and improvement for which the letters patent therein mentioned were issued to the complainant, was not the inventor of any tie or mode of fastening cotton-bale ties made or used by the defendant herein; nor any tie, buckle, or method of fastening cotton-bale ties which is substantially the same in construction, or operating in substantially the same way as the ties made and used by the said defendant.

Second, that neither the original patent issued to the said complainant on the 23d day of October, 1866, upon or for the alleged invention of Charles Swett, in the said bill of complaint mentioned, nor the specification annexed thereto, nor the model of the alleged invention, nor any record of such invention in any manner shows, claims, intimates, or suggests a tie or method of fastening cotton-bale ties which is substantially the same in construction, or operates in substantially the same way as the tie made or used by the defendant herein.

Third, that the practicability of employing the tie or method of fastening made and used by the defendant was not conceived by the said Swett, nor by the complainant until after the said original patent was issued, and was borrowed from the suggestions of other parties.

Fourth, that if the reissued patent granted to the complainant dated May, 7, 1872, and the claims made in the specification annexed thereto, must be construed so as to include (as the patented invention) the tie or method of fastening used by the defendant and called the "Eureka tie," such reissue is invalid.

Fifth, that the defendant has not, by making, selling, and using the said Eureka tie infringed any right of the complainant, and such making, using, and selling is no infringement of any exclusive privilege legally vested in the complainant, or to which he is in any manner entitled.

The statement of these conclusions is sufficient to enable counsel to prepare a decree in such more technical or specific form, if any, as may be proper.

The state of my health forbids that I should attempt an elaborate discussion of the various points very ably presented by the counsel for the respective parties.

Let the bill of complaint be dismissed with costs.

U. S CIRCUIT COURT, WESTERN DISTRICT OF PENNSYLVANIA.

HENRY C. MEYER, FREDERIC R. SMART, AND SAMUEL J. SNIFFEN *vs.* GEORGE C. BAILEY AND S. A. BAILEY.

[*In equity.—Before* MCKENNAN, *Cir. J.—Decided May term*, 1875.]

1. An *assignee*, under the patent act of 1836, is one who has transferred to him in writing the whole interest of the patent, or an undivided part of such whole interest, in every portion of the United States.
2. A *grantee* is one who has transferred to him in writing the exclusive right under the patent to make and use, and to grant to others to make and use, the thing patented, within and throughout some specified portion of the United States.
3. If a part of the whole patent has been vested in another, so as to constitute him an assignee within the meaning of the statute, an efficacious surrender can be made only by the concurrence of both of the owners of the patent; but this may be manifested by the assignee by his direct co-operation in the surrender, or his subsequent ratification of it.
4. The owner of an exclusive territorial right under a patent may ratify a reissue thereof in which he did not join, by making an assignment under such reissue.
5. It is not essential to the validity of a reissued patent that a transferee of an interest in the original patent, who is not an assignee within the meaning of the statute, concur in the surrender.
6. Nor is it necessary to aver in a bill brought under a reissued patent that the grantee of a territorial right acted with the patentee in the surrender of the original patent or concurred in the reissue thereof.
7. M., the patentee, assigned the State of Pennsylvania to B., and afterward reissued the patent. Subsequently to the reissue B. assigned his title to an interest in the State of Pennsylvania, except as to certain counties, under the *reissued* patent, to the complainants, who, under the title thus acquired, filed a bill in equity against the defendants. Defendants demurred on the ground that B.'s interest was outstanding at the time of the surrender, and that he did not appear to have been a party to or to have assented to or approved of the surrender, and therefore the reissue was void: *Held*, that B. was not an assignee within the meaning of the statute, and therefore it was not necessary for him to concur in the surrender in order to give validity to the reissue.
8. The bill sets out complainant's title to the exclusive right, title, and interest under the patent, to the State of Pennsylvania, excepting certain counties, and then avers that the defendants "are *now* constructing, using, and vending" the infringing goods. * * * * * "in the western district of Pennsylvania," concluding the averment as follows: "All of which acts and doings are in violation of the exclusive rights and privileges, *so as aforesaid* vested in your orators, under and by virtue of the said recited reissued letters patent." *Held*, that these averments, taken in connection with statement of complainants' title, necessarily import a charge of infringement *after the grant to the complainants*; and, also, *within* the *territory covered by the grant*.

[This was a bill in equity to restrain the infringement of letters patent granted to John G. Murdock on the 26th day of May, 1863, for Improvement in Hydrants, and reissued May 11, 1869.

Murdock, on the 18th of September, 1867, assigned the full and exclusive right for the State of Pennsylvania, under the original patent, to one Augustus Buerkle. Subsequently, on the 11th day of May, 1869, Murdock surrendered the original patent and received a reissue thereof. On the 27th day of January, 1875, Buerkle assigned the entire title to and interest in the State of Pennsylvania, under the reissued letters patent, excepting certain counties, to the complainants.

George C. Bailey, one of the respondents, demurred to the bill on three grounds, which are fully stated in the opinion.

The case came up on the demurrer.]

[*W. Bakewell* and *T. B. Kerr*, for complainants.
G. H. Christy, for respondents.]

MCKENNAN, *Circuit J.*:

One of the defendants demurs to the bill on three grounds—

1. That the reissue upon which the suit is founded was granted upon a surrender of the original patent by the patentee after he had made an assignment of "the full and exclusive right, title, and interest in and to the said (original) letters patent and invention, in and to the State of Pennsylvania," while said assigned interest was outstanding, and it does not appear that

the assignee was a party to or assented to or approved of said surrender.

2. That the infringement complained of is not averred to have been committed within the territory covered by the assignment to the complainants.

3. That it is not averred that the infringement was committed after the date at which the interest of the complainants in the patent accrued.

Of the two last clauses of demurrer it is sufficient to say that they rest upon too narrow an interpretation of the averments of the bill, and are therefore unfounded in point of fact.

The bill sets out the date of the reissue, and the grant of a defined and exclusive territorial interest in it to the complainants, and then avers "that the said defendants are *now* constructing, using, and vending to others to be used and sold, large numbers of hydrants and street-washers, in some parts thereof, substantially the same in construction and operation as in the said reissued letters patent mentioned, the exclusive right and privilege to make and use which and vend to others to be used is thus by law vested in your orator." And, further, that the defendants have "made and used and intend still to continue to make and use the said improvements in the western district of Pennsylvania, *all of which acts and doings are in violation of the exclusive rights and privileges, so as aforesaid vested in your orators under and by virtue of the said recited reissued letters patent.*"

Taking these averments in connection with the statement of the complainants' title to which they refer, they import necessarily a charge of infringement after the date of the reissue and of the grant to the complainants, and within the territory covered by the grant. They allege infringement at and before the date of the bill, and, therefore, after the date of the reissue and the grant within the western district of Pennsylvania, "in violation of the exclusive rights and privileges *so as aforesaid* vested in" the complainants, and therefore within the territory in which, as before stated, they were granted the exclusive right to make, use, and vend the invention. This is too clear for contention, and the demurrer therefore cannot be sustained on either of these grounds.

The bill avers that the patentee, on the 18th day of September, 1867, "by an assignment in writing, sold, assigned, and transferred unto Augustus Buerkle the full and exclusive right, title, and interest in and to said letters patent, in and to the State of Pennsylvania."

The interest thus granted was outstanding at the time of the surrender by the patentee of the patent, and this constitutes the gravamen of the first clause of the demurrer. The 13th section of the patent act of 1836 provides for the surrender of a patent by a patentee, if he is at the time sole owner of the patent by his personal representative after his death, and by an assignee when there has been an assignment of the original patent. If a part of the whole patent has been vested in another, so as to constitute such an assignee within the meaning of the act, an efficacious surrender can be made only by the concurrence of both the owners of the patent; but this may be manifested by the assignee by his direct co-operation in the surrender or his subsequent ratification of it.

The bill does not aver that Buerkle, the assignee, joined in the surrender of the original patent; but it does aver a fact from which his adoption and ratification of the act of the patentee, in making the surrender, is conclusively deducible. He accepted the reissued patent and transferred to the complainants a part of the interest in it which was originally vested in him by the patentee. There could be no more expressive form of ratification by him of the act of the patentee. This is set out in the bill and is sufficient, in any aspect, to avert the objection to the validity of the reissue.

But, if this were not so, he was not an assignee within the contemplation of the act, whose concurrence in the surrender of the original patent is required to give validity to the reissued patent. What is meant by an assignee seems now to be settled by repeated adjudication, and by the explicit definition of the act of 1836. In *Taylor* vs. *Fuel* (6 Cranch) it was held, under the act of 1793, that one to whom was transferred all the rights secured by a patent, excepting certain counties in the State of Vermont, was not an assignee within the meaning of the law, but a mere grantee of a sectional interest in the patent. And in *Whittemore* vs. *Cutter*, (1 Gallison, 429,) it was held that the transferee of an undivided part of an entire patent was an assignee. From these decisions it results that only a person who is invested with the entire ownership of a patent or an undivided part of the whole, is to be regarded as an assignee.

Such, also, is the import of the act of 1836, in the 11th section of which it is provided that "every patent shall be assignable in law, either as to the whole interest or any undivided part thereof, by any instrument in writing," and this assignment "and *also* every *grant* and *conveyance* of the exclusive right under any patent to make and use and grant to others to make and use the thing patented within and throughout any specified portion of the United States shall be recorded," &c. The distinction established by previous judicial decision between an assignee and the grantee of a sectional interest in a patent is evidently contemplated by this section, as it is also by the 14th section, which authorizes the bringing of suits by "patentee, assignee, or grantee of the exclusive right within and throughout a specified part of the United States."

It was, therefore, properly determined in *Potter* vs. *Holland*, (1 Fisher, 333,) that "an assignee is one who has transferred to him in writing the whole interest of the original patent, or an undivided part of such whole interest in every portion of the United States, and no one, unless he has such an interest transferred to him, is an assignee. A grantee is one who has transferred to him in writing the exclusive right under the patent to make and use, and to grant to others to make and use, the thing patented within and throughout *some specified portion* of the United States."

Now it has been seen that besides the patentee and his personal representatives, an assignee only is authorized to surrender a patent and obtain a reissue. It is a plain sequence from this that the concurrence in the surrender of a patent by a transferee of an interest in it who is not an assignee within the meaning of the statute, is not essential to the validity of a reissued patent.

Was Buerkle, then, such an assignee as the statute contemplated? Evidently he was not. The transfer to him embraced only the State of Pennsylvania, and within its limits his interest was exclusive. He was, therefore, not an assignee within the statutory definition, but merely a grantee of an exclusive right under the patent to make and use the thing patented within and throughout a specified part or portion of the United States, and it was not necessary to aver that he united with the patentee in the surrender of the original patent.

The demurrer must, then, be overruled, and the defendant ordered to answer.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date September 14, 1875.]

8,647.—Medal.—WILLIAM B. CUNNINGHAM and PHILIP HILL, Philadelphia, Pa. Application filed August 9, 1875. Term of patent 3½ years.

8,648.—Piano-Forte Leg.—CHARLES E. HOFFMEISTER, New York, N. Y. Application filed August 20, 1875. Term of patent 7 years.

319.—Title: "**The Atwood Cologne.**"—HENRY W. ATWOOD, New York, N. Y. Application filed July 31, 1875.

320.—Title: "**Japanese Wafers.**"—JOHN M. CARTER, Newburyport, Mass. Application filed August 18, 1875.

321.—Title: "**Florentine. A new Iron Water.**"—JOHN R. COLEMAN, St. Louis, Mo. Application filed September 2, 1875.

322.—Title: "**Harris' (Sherwood's) Cough Specific and Lung Balsam.**"—JOHN J. HARRIS, Evansville, Ind. Application filed September 6, 1875.

323.—Title: "**Hamburger Seife.**"—LAUTZ BROTHERS & Co., Buffalo, N. Y. Application filed July 8, 1875.

324.—Title: "**Recipe and Directions for making Crystal Maple-Sugar.**"—JONATHAN LEONARD, Norwalk, Ohio. Application filed May 19, 1875.

325.—Title: "**Testel's Compound Extract of Buchu, Cubebs, and Copaiva.**"—WM. HENRY TESTEL, Jackson, Mich. Application filed August 24, 1875.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

INDEX OF INVENTIONS PATENTED SEPTEMBER 14, 1875.

	Class No.	No. of Patent.
Alarm, burglar, J. B. Allen	24	167,725
Alphabet exhibitor, B. B. Whaley	54	167,812
Auger, earth, J. P. Summers	51	167,628
Awnings, wooden frame for hinged, H. Sykes	30	166,709
Baby walker, Nickerson and Tripp	31	167,683
Barrels, device for pitching, G. Meyer	40	167,681
Bed, camp, H. R. Mills	62	167,617
Bedstead, sofa, R. S. McEntire	62	167,680
Blind stop, W. Wright	24	167,815
Boats, propelling canal, A. Bugbee	139	167,641
Boiler, wash, O. Davis	91	167,748
Boot and shoe heels, manufacture of, S. W. Baldwin	16	167,728
Boot and shoe pegging stand, A. Stone	16	167,802
Boots and shoes, insole for, C. F. Hill	16	167,762
Boots and shoes, machine for lasting, R. C. Lambert	16	167,676
Bottle stopper fastening, W. H. Bate	1	167,633
Bottle stoppers, machine for bending wire frames of, C. De Quillfeldt	1	167,650
Brick machine, Wilson and Smithson	90	167,720
Burner, gas, T. Trudeau	64	167,713
Burner, lamp, P. S. Underhill	90	167,714
Calendar, J. F. Tapley	146	167,629
Cans, handle for milk, E. B. Curtis	45	167,647
Capstan, A. Russell	79	167,693
Car brake shoe, M. Madden	122	167,616
Car brake, steam, Taylor and McCamish	122	167,804
Car brake, vacuum, F. W. Eames	122	167,750
Car coupling, W. R. Hunter	122	167,767
Car coupling, G. Wernimont	122	167,718
Carburetor, D. L. Wescott	27	167,811
Carpet beater and cleaner, J. Leiss	62	167,770
Carriage cast bows, forming the ends of, C. Renton	31	167,690
Carriage step, E. A. Cooper	31	167,646
Carriage top, A. W. Gilbert	31	167,658
Cartridge loading device, W. Noyes	32	167,778
Casting mold boards, J. Oliver, (reissue)	33	6,642
Casting mold boards, chill for, J. Oliver, (reissue)	33	6,647
Cement, hydraulic, C. F. Dunderdale	153	167,653
Chair, reclining, G. Hunzinger, (reissue)	62	6,641
Chimneys, soot arrester for, M. Brinkerhoff	4	167,602
Chuck, planer, J. C. Mulberry	100	167,618
Churn, J. W. McClure	45	167,774
Cigar boxes, revenue guard for, O. T. Earle	160	167,752
Clay and similar substances, pulverizing machine for, J. K. Caldwell	20	167,742
Clothes clamp, G. W. Kniffen	91	167,673
Clothes drier, M. N. Lovell	91	167,615
Clothes drier, C. Schifferley	91	167,694
Clothes drier, J. Sutton	91	167,708
Cook stove, O. T. Earle	152	167,751
Coffin, Richey, and McDougall	39	167,691
Collar and muff, combined, C. Stattmann	38	167,799
Colliery plant, R. A. Wilder	61	167,719
Condenser, H. W. Bulkley	150	167,642
Cotton gin, O. W. Massey	41	167,679
Crimping machine, T. J. Greenwood	16	167,661
Crozing and leveling tool, Steel and Reel	40	167,704
Curtain fixture, L. H. Gano	62	167,758
Cuspadore, G. Booth	62	167,735
Dental fillings, preparing, R. S. Williams	46	167,813
Dinner box, J. S. Davis	88	167,648
Ditching machine, F. Taylor	51	167,805
Dip pipes, rotary valve for, W. Farmer	66	167,606
Dip pipes used in gas making apparatus, movable, W. Farmer	66	167,605
Dovetailing machine, C. P. Balle	173	167,727
Dray, three wheeled, J. W. Miner	31	167,776
Drills, manufacturing twist, C. B. Hunt	100	167,766
Drills, triped for rock, J. C. Githens	124	167,659
Egg batter, apparatus for desiccating, W. O. Stoddard	56	167,801
Egg beater, F. E. Schonmeyer	88	167,696
Eggs, composition for preserving, J. K. Boone	116	167,637
Engine, rotary, Roth and Barker	150	167,692
Engine, rotary, Stream and Miller	150	167,803
Engine, rotary, Vanorder and Savage	150	167,806
Explosive compound, C. Dittmar, (reissue)	71	6,645
Fare register, A. F. Johnson	42	167,670
Fare register, W. Miller	42	167,682
Fare register, J. Sangster	42	167 693
Farrier's tool, M. Baltes	60	167,632
Fats, &c., separating the various constituents of, T. M. Fell	26	167,607
Feed water regulator, C. M. Bridges	148	167,639
File holder, H. Baumgartel	53	167,731
Fire arm, magazine, E. A. F. Toepperwein	18	167,712
Fire arms, elastic butt plate for, H. A. Silver	35	167,701
Fire extinguisher, Hart and Dillon-Lee	35	167,664
Fishing lines, sinker for, E. Pitcher	143	167,687
Fishing, spoon hook for, G. R. Pierce	143	167,784
Flower pot, C. J. Sands	63	167,700
Furnace door casing, H. F. Hayden	149	167,665
Furnace for destroying insects, W. F. Woolsey	63	167,722
Furnace for the manufacture of iron and steel direct from ore, W. A. Stephens	99	167,800
Furnace, hot air, H. D. Freer	154	167,657
Furnace, hot air, N. Toye	154	167,631
Gage, siding, C. Sargent	29	167,791
Game apparatus, J. J. Weber	143	167,716
Game counter, C. E. Hackley	143	167,662
Gas governor, W. D. Snow	64	167,795
Gas making apparatus, movable dip pipes used in, W. Farmer	66	167,605
Gasalier, extension or drop light, J. H. Seaman	64	167,697
Generator, steam, R. H. Thom	148	167,711
Glassware, manufacture of, J. C. Gill	68	167,608
Grain drier, J. Souter	48	167,797
Grate, J. Habermehl	154	167,660
Harness rosette, Ulrich and Hachmeister, (reissue)	79	6,643
Harrow, wheel, J. S. Snively	73	167,703
Harvester, J. Gore, (reissue)	74	6,640
Hat bodies, machine for forming, W. H. Croke	76	167,746
Heat regulator, W. S. Hill	154	167,611
Heating drum, Munson and Dick	154	167,777
Hoisting apparatus, N. W. Hoffman	79	167,763
Hook for hanging pictures, adjustable, T. C. Richards	62	167,620
Horse detaching apparatus, J. W. Glover	31	167,660
Horses, toe weight for, W. H. Abbott	144	167,599
Horseshoe, A. Albright	60	167,600
Horseshoe, M. S. Roberts	60	167,789
Hose and pipe coupling, H. G. Koehler	167	167,675
Hydrant, J. Fleming	167	167,656
Hydrocarbons, burning, J. W. Nystrom	149	167,684
Ice pick, M. Cowles	88	167,745
Key fastener, J. Knight	93	167,674
Lamp, B. B. Schneider	90	167,792
Lamp support, wagon, Boudren and Johnson	31	167,736
Lantern, A. M. Duburn	90	167,651
Lard drier and cooler, G. Bogen, Jr	26	167,636
Lathe, universal turning, Koch and Müller	173	167,614
Leather finishing machinery, E. Settle	92	167,698
Leg artificial, J. O'Brien	5	167,779
Line fastener, W. Haddock	91	167,610
Liquid measure, G. W. Aldrich	132	167,601
Liquors, apparatus for forcing, J. F. Bennett, (reissue)	1	6,639
Lock, combination, H. C. Hovey	93	167,764
Locomotives with water, apparatus for supplying, H. Howe	118	167,765
Loom shuttle, A. Edwards	95	167,753
Loom shuttle spindle, Logan and Thompson	95	167,678
Lounge, invalid, A. Shiele	62	167,700
Lubricating compound, B. F. Bartlett	67	167,730
Mains, process and apparatus for preventing the accumulation of tar in hydraulic, D. H. Fox	64	167,755
Measure, liquid, G. W. Aldrich	132	167,601
Meat cutter, D. L. Degroat	25	167,649
Meat in cutting, apparatus for holding, W. Tetley	26	167,710
Medical composition, L. P. Brand	98	167,737
Mill, smut, Richmond, Ryan, and McGill	57	167,788
Nail extractor, L. N. Burdick	29	167,740
Nipple, rubber, A. M. Knapp	156	167,613
Ore crusher and amalgamator, C. Braids	3	167,638
Ore feeder, C. P. Stamford	3	167,695
Paint oil compound, D. S. Robinson	107	167,622
Painting cloth, machine for, H. H. Phillips	107	167,783
Paper box, C. A. Young	109	167,723
Paper box machine, G. L. Turney	109	167,807
Paper, machine for cutting roll, Cohen and Frank	109	167,645
Paper pulp from palm, making, J. P. Herren, (reissue)	108	6,646
Pen holder, E. Barberot	146	167,729
Pen, ruling, J. R. Gleburne	97	167,759
Picker staff check, Stevenson and Nuttall	95	167,707
Pictures, mirrors, &c., device for hanging, H. D. Pope	62	167,786
Pipe cutter, F. I. Maule	100	167,773
Plane, Carpenter's, M. C. Mayo	29	167,772
Planer chuck, J. C. Mulberry	100	167,618
Planing machine, Doane and Passel	173	167,749
Planing machines, cutter holder for, W. B. Smith	100	167,793
Planter, corn, J. Kelly	133	167,812
Plow, I. Freeman	114	167,756
Plow, M. Ormond	114	167,686
Pocket book lock, Hanau and Bendit	146	167,663
Press, cotton and hay, W. H. Burgess	7	167,741
Printer's quoin, A. J. O'Shea	117	167,780
Printing press, A. E. Redstone	117	167,787
Propelling canal boats, A. Bugbee	139	167,641
Pumps, valve for pneumatic, W. B. Chisholm	118	167,604
Purifier, middlings, H. F. Nothohm	57	167,619
Railroad frog point, J. Johnson	120	167,671
Railroad switch, D. F. Cavanaugh	120	167,743
Railroad switch, safety, J. A. Duggan	120	167,652
Refrigerator, J. Schmelzer	58	167,695
Refrigerator, B. A. Stevens	58	167,706
Rein holder, Owen and Custer	31	167,781
Revenue guard for cigar boxes, O. T. Earle	160	167,752
Roll for rolling metal, A. R. Boluss	125	167,734
Sash balance, W. J. Lewis	24	167,677
Sash cord fastener, E. N. Connor	24	167,744
Sash fastener, P. T. Share	24	167,694
Saw, band, G. F. Wood	131	167,721
Saw bucks, wood holder for, S. Hollingsworth	130	167,667
Sawing machine, scroll, E. Smith	130	167,794
Sawing machine, stone, S. Thompson	153	167,806
Scales, weighing, T. D. Stetson	132	167,705
Scraper, road, E. Huber	51	167,668
Sewing machine, S. B. Brown	134	167,640
Sewing machine, C. S. Cushman	134	167,747
Sewing machine caster, L. A. Parker	134	167,782
Shingling bracket, W. H. Seymour	30	167,699
Shoes, elastic goring for, H. A. Blanchard	16	167,732
Sifter, ash, A. C. Ferris	154	167,655
Sleigh, T. Brown	31	167,739
Sleigh, J. M. Story	31	167,627
Snow plow, S. B. Miner	122	167,775
Soap, compound for, G. L. S. Jenifer	26	167,669
Soap holder, W. J. Johnson	91	167,769
Soda water fountains, making, A. D. Puffer	1	167,688
Spark arrester, Brayton, June, and French	94	167,738
Speculum, E. W. Hilgdon	156	167,666
Speeders, &c., roller bearing for, S. Dyer	142	167,654
Sphygmoscope, W. R. Pond	156	167,785
Stamp, hand, S. F. Robinson	146	167,621
Stone sawing machine, S. Thompson	153	167,806
Stove, regenerative hot blast, Cochrane and Cowper	12	167,644
Swaging machines, blank feeding attachment for, R. Thompson	100	167,630
Table, steaming, A. J. Randell	134	166,689
Tar in hydraulic mains, process and apparatus for preventing the accumulation of, D. H. Fox	64	167,755
Telegraph, electro magnetic, J. Olmsted	50	167,685
Tire setting machine, I. H. Spelman	31	167,798
Tooth pick, G. S. Boice	161	167,733
Torpedo envelope machine, Wolfe and Lilliendahl	105	167,814
Toy, balancing, F. Markoe	143	167,771
Toy, chime, E. C. Barton, (reissue)	143	6,644
Toy whistle, H. B. King	143	167,673
Trunk stay, M. A. Waas	103	167,809
Tubing, manufacture of metal, D. M. Somers	163	167,796
Type setting machine, R. T. P. Allen	117	167,726
Universal joint and clamp, T. J. Carrick	67	167,603
Valve, oscillating balanced, A. W. Eldredge	152	167,754
Vinegar, apparatus for making, E. Burlingame	19	167,643
Wagon, dumping, T. Weaver	31	167,715
Wagon lamp support, Boudron and Johnson	31	167,736
Washing machine, G. Friend	91	167,757
Washing machine, G. W. Grubb	91	167,761
Watchee, hollow staff for, Belcher and Plume	36	167,634
Water closet, R. D. O. Smith	8	167,702
Wells, tools for setting tubes in artesian, J. B. Stellwagen	51	167,626
Windmill, J. A. Allen	118	167,724
Window sash tightener, J. Benson	30	166,635
Window shade clasp or fastening, H. M. Wells	62	167,810
Wire, machine for screw threading, L. Goddu	16	167,760
Wrench, R. J. Welles	100	167,717
Yoke coupling, neck, N. E. Irish	31	167,768

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED SEPTEMBER 14, 1875.

	Patent No.
Abbott, W. H., Toe weight for horses	167,599
Adams, J. & Co., assignees	167,608
Albright, A., assignee, (reissue)	6,643
Albright, A., Horseshoe	167,600
Aldrich, G. W., Liquid measure	167,601
Allen, J. A., Windmill	167,724
Allen, J. B., Burglar alarm	167,725
Allen, R. T. P., Type setting machine	167,726
Balle, C. P., Dovetailing machine	167,727
Baldwin, S. W., Manufacture of boot and shoe heels	167,728
Baltes, M., Farrier's tool	167,632
Barberot, E., Pen holder	167,729
Barker and Roth	167,602
Barnes, F. A., assignee	167,618
Bartlett, B. F., Lubricating compound	167,730
Barton, E. C., Chime toy, (reissue)	6,644
Bate, W. H., Fastening for bottle stoppers	167,633
Baumgartel, H., File holder	167,731
Belcher, W. A., and D. J. Plume, Hollow staff for matches	167,634
Bendit and Hanau	167,663
Bennet, E. R., assignee	167,671
Bennett, J. F., Apparatus for forcing liquors, (reissue)	6,639
Benson, J., Window sash tightener	167,635
Blanchard, H. A., Elastic goring for shoes	167,732
Bobbitt, C., assignee	167,639
Bogen, G., Jr., Lard drier and cooler	167,636
Boice, G. S., Tooth pick	167,733
Boluss, A. R., Roll for rolling metal	167,734
Boone, J. K., Composition for preserving eggs	167,637
Booth, G., Cuspadore	167,735
Boudren, T., and G. H. Johnson, Wagon lamp support	167,736
Braids, C., Ore crusher and amalgamator	167,638
Brand, L. P., Medical composition	167,737
Brayton, R., D. June, and O. S. French, Spark arrester	167,738
Breed, D., assignee	167,767
Bridges, C. M., Feed water regulator	167,639
Brinkerhoff, M., Soot arrester for chimneys	167,602
Brown, S. B., Sewing machine	167,640
Brown, T., Sleigh	167,739
Bugbee, A., Propelling canal boats	167,641
Bulkley, H. W., Condenser	167,642
Burdick, L. N., Nail extractor	167,740
Burgess, W. H., Cotton and hay press	167,741
Burlingame, E., Apparatus for making vinegar	167,643
Cable Screw Wire Company, assignee	167,760
Caldwell, J. K., Pulverizing machine for clay and similar substances	167,742
Campbell, W., assignee	167,709
Carrick, T. J., Universal joint and clamp	167,603
Case, E. O., assignee	167,789
Cavanaugh, D. F., Railroad switch	167,743
Chandler, T. E., assignee	167,805
Chatterton, G., assignee	167,685
Chisholm, W. B., Valve for pneumatic pumps	167,604
Cochran, C., and E. A. Cowper, Regenerative hot blast stove	167,644
Cohen, L. P., and I. Frank, machine for cutting roll paper	167,645
Connor, H. N., Sash cord fastener	167,744
Cooper, E. A., Carriage step	167,646
Cowles, M., Ice pick	167,745
Cowman, C. H., assignee	167,693
Cowper and Cochrane	167,644
Croke, W. H., Machine for forming hat bodies	167,746
Curtis, E. B., Handle for milk cans	167,647
Cushman, C. S., Sewing machine	167,747
Custer and Owen	167,781
Darling, W. P., assignee	167,646
Davis, J. S., Dinner box	167,648
Davis, O., Wash boiler	167,748
Degroat, D. L., Meat cutter	167,649
De Quillfeldt, C., Machine for bending wire frames of bottle stoppers	167,650
Dick and Munson	167,777
Dillon-Lee and Hart	167,664
Dittmar, C., Explosive compound, (reissue)	6,645
Doane, W. H., and G. W. Passel, Planing machine	167,749
Duburn, A. M., Lantern	167,651
Duggan, J. A., Safety railway switch	167,652
Dunderdale, C. F., Hydraulic cement	167,653
Dyer, S., Roller bearing for speeders, &c	167,654
Eames, F. W., Vacuum car brake	167,750
Earle, O. T., Stop cock	167,751
Earle, O. T., Revenue guard for cigar boxes	167,752
Edwards, A., Loom shuttle	167,753
Eldredge, A. W., Oscillating balanced valve	167,754
Fairbanks, E. and T., & Co., assignees	167,705
Farmer, W., Movable dip pipe used in gas making apparatus	167,605
Farmer, W., Rotary valve for dip pipes	167,606
Fay, J. A. & Co., assignees	167,749
Fell, T. M., Separating the various constituents of fats, &c	167,607
Ferris, A. C., Ash sifter	167,655
Field, J. F., assignee	167,809
Fisher, J. G., assignee	167,767
Fleming, J. Hydrant	167,656
Fox, D. H., Process and apparatus for preventing the accumulation of tar in hydraulic mains	167,755
Frank and Cohen	167,645
Franke, J., assignee	167,681
Freeman, I., Plow	167,756
Freer, H. D., Hot air furnace	167,657
French, Brayton, and June	167,739
Friend, G., Washing machine	167,757
Gano, L. H., Curtain fixture	167,758
Garrett, W. H., assignee	167,774
Gerding, H., assignee	167,810
Gilbert, A. W., Carriage top	167,658
Gill, J. C., Manufacture of glassware	167,608
Gleburne, J. R., Ruling pen	167,759
Githens, J. C., Tripod for rock drills	167,659
Glover, J. W., Horse detaching apparatus	167,660
Goddu, L., Machine for screw threading wire	167,760
Gong Bell Manufacturing Company, assignee, (reissue)	6,644

	Patent No.
Gore, J., Harvester, (reissue)	6,640
Greenwood, T. J., Crimping machine	167,661
Grubb, G. W., Washing machine	167,761
Habermehl, J., Grate	167,609
Hachmeister and Ulrick, (reissue)	6,643

TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED SEPT. 14, 1875.

167,600. TOE-WARMERS FOR HORSES. Wm. H. Abbott, Fryeburg, Me. [Filed July 30, 1875.]

The improved toe-weight herein described, consisting essentially of the part *a*, recessed to fit the hoof, having the slot *c* and toe-calk *b*, in combination with the arm *d*, having the hook *f* and the nut *g*, as and for the purposes set forth.

167,601. ROOFING. Andrew Albright, Newark, N. J. [Filed Apr. 2, 1875.]

Brief.—A malleable metal skeleton shoe is provided with lugs projecting both from the inner and outer lower edges, to be bent or clinched over a rubber fillet, to hold it in place, and which fitting may be extended over a rib on the inside to form an interlocking joint.

1. The plate A, provided with slots *a*, and groove *c*, in combination with the elastic filling E, constructed and operating substantially as and for the purposes set forth.

2. A central tubular roller (or elastic substance) and metal bearings, constructed with an elastic lateral guard, I, formed upon a projecting rib, *r*, substantially as and for the purposes set forth.

167,602. LOCOMOTIVE. George W. Alden, Dunmore, assignor of one-half his right to I. B. Pharis, Golden, N. Y. [Filed Dec. 20, 1874.]

The improved liquid-measure herein described, consisting of the spherical body A having both ends open, and the loose bottom B, having its rod *a* extending upward for the purpose of drawing the liquid to the top, constructed and operating substantially as shown and specified.

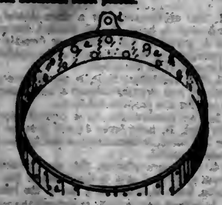
167,603. SHOE-ASSORTMENT FOR CHILDREN. Marion Brinkerhoff, Mansfield, Ohio. [Filed Aug. 30, 1875.]

1. The stairway A, constructed or provided at the bottom with box or drawer C, downwardly-projecting entrance-foot-D, and perforations I F, as and for the purposes described.

2. In combination with the chimney A, with perforations I F, the case-mantel B, constructed with slanting or inclined partitions *b b'* and valve F, as and for the purposes described.

167,604. [illegible]

167,605. [illegible]



167,606. UNIVERSAL JOINTS AND CLAMPS. Thos. J. Carrick, Baltimore, Md., assignor to Henry Snowden and Chas. H. Grosman, same place. [Filed May 26, 1875.]

Brief.—Two flexible clamps for rods, a cone projection on the side of one fitting into a cone in the other, a cone-headed, square-shanked cone-bolt passing through both.

A combination of clamping-blocks, with projecting conical sleeves, and cone-seats to fit, with a cone-headed and nut to clamp and fasten by a single half-turn of said nut, to form a universal joint and clamp.

167,607. VALVES FOR PNEUMATIC PUMPS. William R. Chisholm, Cleveland, Ohio. [Filed July 23, 1875.]

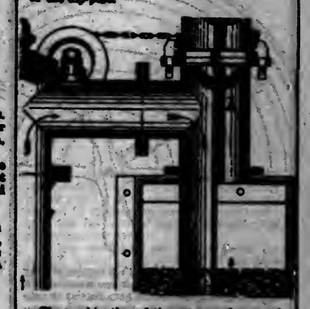
Brief.—The combination of a flexible head-valve with reinforced steel plates.

1. A head-valve, composed of an elastic flexible spring head and a flexible pliable body, substantially as set forth.

2. The head-valve described, in combination with the leg *i* and pin *f*, substantially as set forth.

3. An air-port ring, *c* or *c'*, in combination with a combined steel and India-rubber head-valve, substantially as described.

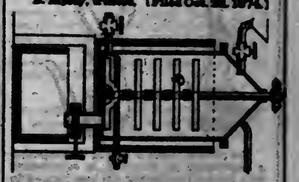
167,608. MECHANICAL DIE-PRESS DRIVING MECHANISM APPARATUS. William Parmer, New York, N. Y. [Filed Aug. 28, 1875.]



Brief.—Rubber extend from the top of the bar, in which the dip-pipe works, down into a cushioning liquid, and through these pass the connecting rods from the lever to the dip-pipe.

The combination of a movable dip-pipe with the expanding rods *b* and the sealed pipes *g*, arranged substantially as described.

167,609. [illegible]



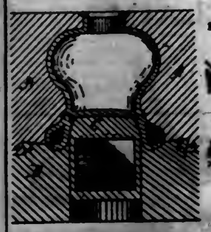
167,610. ROTARY VALVES FOR DIP-PIPES. William Parmer, New York, N. Y. [Filed Aug. 28, 1875.]

Brief.—The rotary valve, having a central partition, forms the top of the dip-pipe, which also has a central partition. One-half of the pipe extends into the cushioning liquid in the hydraulic main, and the other half opens above the liquid. The valve opens to open communication with either side, so as to close the passage between the retort and the short side of the dip-pipe.

The combination of the rotary valve *a* and the partitioned dip-pipe *b* with the hydraulic main and the stand-pipe, substantially in the manner described.

167,611. PROCESSES OF SEPARATING THE VARIOUS CONSTITUENTS OF FAT, &c. T. M. Fell, Brooklyn, N. Y., assignor to Geo. B. Bisbey, trustee. [Filed Oct. 28, 1874.]

1. The method or process of treating fats and oils for the separation of their various constituents, herein before described.



2. The method or process of obtaining the separate constituents of crude animal fats, by treating the same with diluted sulphuric acid, steam, and petroleum-naphtha, all the said steam and in the proportions of the several ingredients, and by the consecutive steps, substantially as herein before set forth.

167,612. MANUFACTURE OF GLASSWARE. James C. Gill, Pittsburg, Pa., assignor to John Adams & Co., same place. [Filed July 6, 1875.]

Brief.—The parts of the article are pressed or fitted together while visible thereof, when at a temperature that will cause the glass to fuse.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

No. 167,608.

1. The method, herein described, for forming blown-glass articles, consisting in folding or pressing together parts of a blown-glass article while within the mold, and at a welding temperature, or such a temperature as will cause the glass to reunite.

2. A blown-glass article having a bowl and base or foot formed in a single piece and at one operation, the cavities of the bowl and base having no connection one with the other, substantially as specified.

167,609. GRATES, John Hohenwald, Allegheny, Pa. (Filed June 1, 1875.)

Brief.—The curved bars of the agitator are concentric with the grate-bars.

An agitator, movable with a turning sliding motion on the bottom bars, in combination with a grate having its bottom bars curved or running in unison with the circular path or motion of the agitator, substantially as and for the purpose specified.

167,610. LAMP-FASTENING, Worcester Haddock, Pittsburgh, Pa., assignor to himself, Henry Gaskins, and Thomas Jones, same place. (Filed Feb. 6, 1875.)

The pivoted clamp F having the projection *f*, constructed as described, in combination with the hook A, having the bars inclined to the point b and the guides B B, substantially as hereinbefore described and set forth.

167,611. BOOT-BOTTOMING, W. S. Hill, Boston, Mass. (Filed Feb. 20, 1875.)

Brief.—The flexible spring is designed to maintain a constant pressure upon the valve equal to the tension of the spring.

1. The pawl *d*, in combination with the ratchet-wheel *c*, provided with pins *g g* and *f f*, and shaft *c*, operated by spring *e*, in the manner and for the purpose specified.

2. The combination of the adjustable spring *h*, the pawl *d*, and the diaphragm *a*, operating in connection with a heat-regulating device, in the manner and for the purpose specified.

3. The combination of the air-chamber D and diaphragm *a*, with the pawl *d*, and the ratchet-wheel *c*, operating in the manner and for the purpose specified.

167,612. CORN-PLANTERS, John Kelly, Troy, Ohio. (Filed Mch. 10, 1875.)

Brief.—To the wheeled frame is pivoted a beam that extends forward, and is secured to the runner-frame. To a cross-bar is pivoted a weighted, notched hook, that works through a slot in the longitudinal beam, and engages with cross-bars therein, for elevating or depressing the runner-frame by a lever working over a toothed sector.

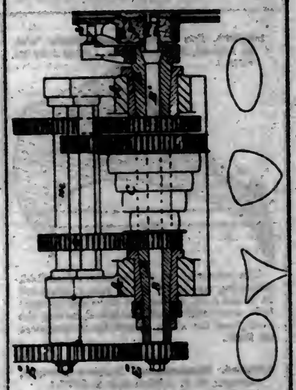
1. The combination, in a corn-planter, of hand-lever L, hook B, and beam *a*, for raising or lowering the runners, or forcibly depressing the same, at the will of the operator, substantially as described.

2. The combination, in a corn-planter, of hook B and counter-balance *c*, substantially as and for the purpose set forth.

3. The combination, in a corn-planter, of the hook B, hand-lever L, and footboard counter and catch, substantially as and for the purpose specified.

4. In a corn-planter, the combination of beam *a*, pivoted at *d* to the frame of the machine, hook B, resting in a slot in the beam *a*, as described, and lever L, to actuate the same, for the purpose set forth.

167,613. BURNER NOZZLES, A. M. Kinne, Providence, R. I. (Filed Aug. 6, 1875.)

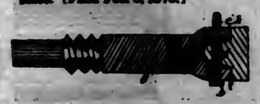


Brief.—A fine lateral division in the very slight outer end of the nipple closes automatically when the chief jet ceases, and this acts as a valve to prevent the falling back of the milk in the suction-tube.

In a rubber nipple, the combination of a thickened rod and a fine lateral division, *a*, all arranged as and for the purpose set forth.

167,614. UNIVERSAL TURNING-LATHE, Richard Koch and Hermann Müller, Dortmund, Prussia. (Filed Mar. 12, 1875.)

Brief.—The face-plate of the lathe is so connected with the system of gearing, by which it is driven, as to describe ovals and other forms in its rotation.

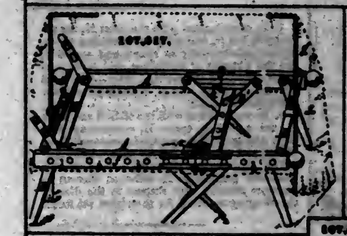


A bent-crank, A, with two mandrels, B and B', having a common center, in combination with the wheels E E', shaft *a*, wheels E'' and E''', eccentric F, face-plate G, and rest H, connected with said face-plate, the whole being arranged and operating together in the manner and for the purpose substantially as herein described.

167,615. GLOVERS'-DRESSES, M. M. Lovell, Erie, Pa. (Filed Feb. 19, 1875.)

In combination with the uprights A A and screwbolt B B, the hinge C, constructed and operating substantially as shown, and for the purposes mentioned.

167,616. GAS-BRACE SCREWS, Michael Middan, Harrisburg, Pa., assignor of one-half his right to William G. McFadden, same place. (Filed Feb. 6, 1875.)



The combination of the claw *a*, provided with the flanges 1 and 2 and perforated tongue *c*, with the plunger-rod C, having perforated lips 3 and 4, bolt b, perforated at *c*, and constructed with a cam-shaped head *d*, and combining pin or split key passing through said perforations *c*, substantially as and for the purpose set forth.

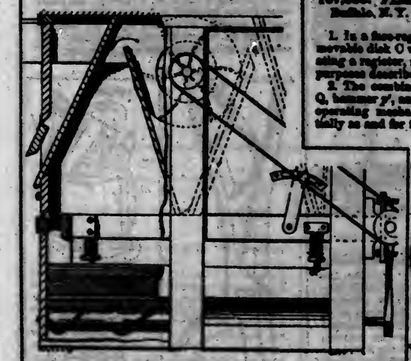
167,617. CARS-SEATS, Elwyn B. Mills, Port Huron, Mich. (Filed Nov. 17, 1874.)

Brief.—The corners of the rods and upon the water-proof fabric can be applied to the structure to form a shelter-tent.

The combination of the fitting and adjustable frames A B and end bottom B with the rods *f*, rods *g'*, and open *g*, said rods being adapted to receive the water-proof fabric F, substantially as set forth.

No. 167,617.

No. 167,620.



167,618. PLANER-CHUCKS, James O. Mulberry, Grand Rapids, Mich., assignor of one-half his right to Francis A. Barnes. (Filed June 8, 1875.)

Brief.—The socket in the lower part or base B of the chuck has in it a quarter-circular block, G, and the upper plate A has a semi-circular plate, H, so that, when brought together, the socket is three-quarters filled, allowing of adjustment or movement to the extent of ninety degrees or a quarter circle.

The combination of the base B, to be attached to planer-head having the double sockets F K, right-angular plate G, and plane surface T with the plate A, having the projecting circular surface F and counterwater plane H, and carrying the chuck-jaws, substantially as described and for the purpose set forth.

167,619. MINERAL-PAINTING, Hermann F. Nothaker, Milwaukee, Wis., assignor of one-half his right to Edward C. Nothaker, same place. (Filed Apr. 9, 1875.)

The combination, with a longitudinally reciprocating or vibrating shaker, screen, or conveying-frame, supported on pivoted hangers or levers, or springs for supporting the same, whereby the hangers or levers are kept in their relative working position, substantially in the manner shown and described.

167,620. ADJUSTABLE HOOKS FOR HANGING PICTURES, Thos. C. Richards, West Winsted, Conn. (Filed Feb. 15, 1875.)

The combination, with a hook for hanging pictures, of an adjustable slide or hanging-plate, substantially as described, whereby the said hook is adapted to moldings of different size and shape, substantially as set forth.

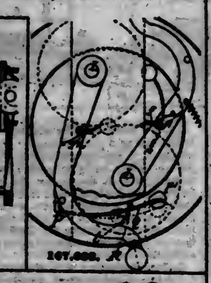
167,621. HAND-STAMPS, Samuel F. Robinson, Quincy, Ill., assignor of one-half his right to Philip M. Quinn, St. Louis, Mo. (Filed Apr. 10, 1875.)

Brief.—The type are placed between the central jaws and the spring rules, and are secured by the clamping-ring.

The combination of the plate C, the clamping D, central jaws E, and concentric spring-rules F F, the whole combined, arranged, and operating substantially as described.

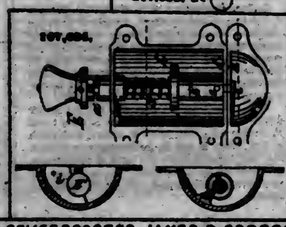
167,622. PAINT-OIL COMPOUNDS, Darius S. Robinson, Cleveland, Ohio, assignor of one-half his right to Anthony M. Scarlett, same place. (Filed Mar. 18, 1875.)

1. The above-described process of making a mineral oil by grinding a mixture of cotton-seed and linseed oil, and then expressing the oil from the meal thus made, substantially in the manner and for the purposes set forth.



2. The above-described paint-oil compound, consisting of the oil obtained by the above-claimed process, sulphate of zinc, sugar of lead, india-rubber, and black oxide of manganese, substantially as described.

167,623. FARE-REGISTERS, Jos. Sampster, Buffalo, N. Y. (Filed Aug. 2, 1875.)

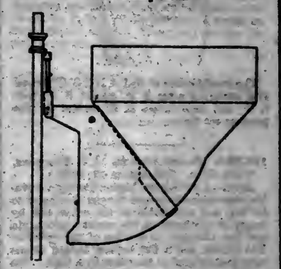


1. In a fare-register, the combination of the movable disk C with the mechanism for operating a register, substantially as and for the purposes described.

2. The combination of the spring P, plate Q, hammer *p'*, and stationary pin E with the operating mechanism of a register, substantially as and for the purposes specified.

The combination, with a longitudinally reciprocating or vibrating shaker, screen, or conveying-frame, supported on pivoted hangers or levers, or springs for supporting the same, whereby the hangers or levers are kept in their relative working position, substantially in the manner shown and described.

167,624.



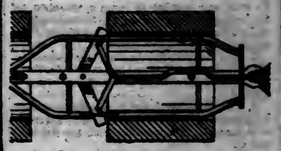
167,625. PAINTINGS FOR THE MINNOWS-BAILS OF SEINES, Philip T. Shaw, Baltimore, Md. (Filed July 22, 1875.)

Brief.—As an improvement on Patent No. 166,194, October 11, 1870. The keeper and bolt are so constructed that, as the bolt moves, it will both lock the ends and draw them tightly together. There are also guides, which serve to guide the end of the bolt accurately into the keeper, allowing it to move only when in position for locking or unlocking, and likewise holding the bolt at two places when the device is locked.

The combination of keeper K, cam H, incline *i*, bolt B, pin *a*, spur *n*, and right-angled slot *a o*, substantially as and for the purposes set forth.

167,626. GUN-FIRERS, Chas. F. Stansbury, San Francisco, Cal. (Filed May 1, 1875.)

Brief.—A stationary hopper is connected with a movable mouth-piece or chute. The bottoms of both are formed on the arc of a circle, whose center is at the pivot upon which the chute works. The chute moves backward and upward like a sleeve over the mouth of the hopper, and discharges a portion of ore at each blow of the stamp-stem.



1. The combination, with an oscillating ore-stamp feeder, having its bottom formed on the arc of a circle, of an ore-hopper, having the back of its discharging-mouth curved to coincide with the curve of the feeder-bottom, for the purposes set forth.

2. The oscillating ore-stamp feeder described, having its pivot placed to the front side of the center of gravity, in combination with the stamp-stem, so that when its forward end is depressed by said stamp-stem it will return to its normal position by its own gravity, as and for the purposes set forth.

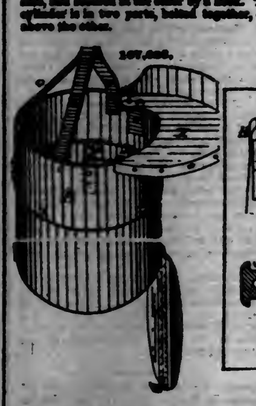
3. The oscillating ore-stamp feeder described, having its bottom formed on the arc of a circle, and having its pivot placed to the front side of the center of gravity, in combination with the stamp-stem, constructed and arranged, substantially as described and shown.

4. The combination, with an oscillating ore-stamp-feeder with its bottom formed on the arc of a circle and having its pivot placed to the front side of the center of gravity, of a stop for governing the extent of the forward motion of the feeder, substantially as described and shown.

167,627. TOOLS FOR SETTING TUBES IN ARTESIAN WELLS, Jacob B. Stollwerck, Frankfurth, Ill. (Filed Aug. 10, 1875.)

The bar A and rods C, forming a sign with a small lever rod, and the combination therewith of the yokes *d d*, levers *e e*, toggles *f f*, trip-rod *g*, and trip-line *h*, substantially as and for the purposes set forth.

167,627. SLEDGES, Joseph M. Story, Cincinnati, Ohio. (Filed Jan. 6, 1875.)



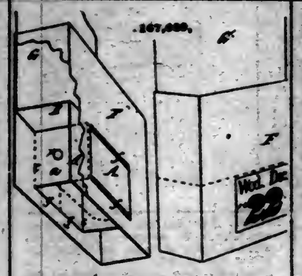
No. 167,677.

The combination of disk A E O O', wheel D d, swinging arms B F, cranks F F', rods G G', and hand-levers H H', as and for the purpose set forth.

167,680. BARB-ANVILS. J. P. SIMMONS, Tiffin, Ohio. [Filed Aug. 12, 1875.]

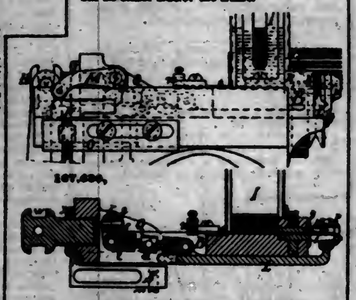
Brief.—A cylindrical basket having a movable runner and conveyer hinged at one end to its top, and adjustable at the other end by means of pin-holes on the runner, and a pole and line attached to the top of the cylinder. The basket has a flat bottom hinged at one side, and secured at the other by a hook. The cylinder is in two parts, bolted together, one above the other.

No. 167,680.



1. The movable bit, runner, and conveyer B, with any number of holes *a*, attached to the cylinder at one end by a pivot or hinge, *d*, and at the other end by a pin, *b*, and line F F', as herein set forth and described.

2. The movable flat bottom C, attached to the cylinder by a hinge on one side and a hook on the opposite side, as herein shown and described.

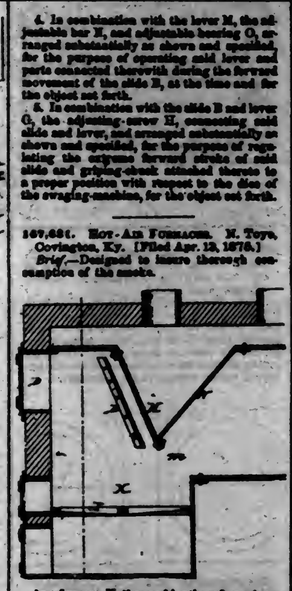


3. Two cylinders A and B, attached together by means of bolts, which can be used together or separately, in connection with the flat bottom C.

4. The combination of the movable bit, runner, and conveyer B, pivot *d*, pin *b*, two lugs F F', any number of holes *a*, cylinders A and B, movable flat bottom C, attached by a hinge and hook, with bottom G Q Q, substantially as herein set forth and specified.

167,682. CALENDARS. James F. Tapley, Springfield, Mass. [Filed Aug. 6, 1875.]

No. 167,680.



No. 167,682.

1. In an attachment for feeding wire-blanks to the dies of a nozzle-crowning machine, the plunger *a*, in combination with the slide B, lever I, spindle *g*, and griping-chuck *i*, arranged substantially as shown, for the purpose of forcing an intercepted blank from said hopper through said spindle into its proper position in said griping-chuck, and removing a crowned blank therefrom during the backward movement of said slide, substantially as and for the object set forth.

2. In combination with the griping-chuck *i*, the step *j*, and spring *k*, arranged between the jaws of said griping-chuck, substantially as shown, for the purpose of preventing the crowned blank from being thrust from its proper position in said griping-chuck into the spindle *g* during the crowning operation upon said blank, as specified.

3. In combination with the griping-chuck *i* and thimble *p*, the flatted bar L, bars *t* and *t'*, double adjusting-screw *u*, lever *v*, rock-shaft *q*, and levers M and Q, for the purpose of forcing said thimble upon the jaws of said chuck, or removing the same therefrom, substantially as shown and described, and for the object set forth.

No. 167,680.

4. In combination with the lever M, the adjustable bar N, and adjustable bearing O, arranged substantially as shown and specified, for the purpose of operating said lever and parts connected therewith during the forward movement of the slide B, as the time and for the object set forth.

5. In combination with the slide B and lever Q, the adjusting-screw H, connecting said slide and lever, and arranged substantially as shown and specified, for the purpose of regulating the extreme forward stroke of said slide and griping-chuck attached thereto to a proper position with respect to the dies of the swaging-machine, for the object set forth.

167,681. HOT-AIR FURNACES. N. Toye, Covington, Ky. [Filed Apr. 13, 1875.]

Brief.—Designed to insure thorough consumption of the smoke.

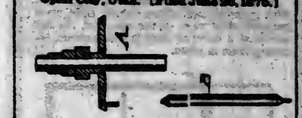
In a furnace, X, the combination of openings D *a*, plate L, wall H, and flitwork *n*, plate L being removed sufficiently for from wall H to allow the passage of air between them, as and for the purpose specified.

167,683. FARMERS' TOOLS. Michel Bolles, Prentiseville, Wis. [Filed Aug. 14, 1875.]

An improved groove-cutter, formed by the combination of the handles A B, the straight jaw C having a notch, *c*, formed in the inner edge of its forward end, the curved jaw D having an edge, *d*, formed upon its forward end, and the spring B with each other, substantially as herein shown and described.

167,690.

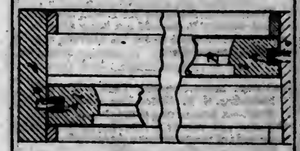
167,692.



167,690. FASTENINGS FOR BOTTLE-STOPPERS. William H. Hale, Maywood, assignor to himself and Mathias Bodenmacher, Boston, Mass. [Filed Aug. 12, 1875.]

Brief.—The stopper-plate and bridge or guide form one piece. The device shows the usual loop, hole, and stopper. The cam-lever is fulcrumed on a cross-bar resting upon the upper eyes of the hole, and has a bifurcated handle. The stopper is fastened or released by depressing or raising said lever-handle when the former is in proper position.

The cam-lever *a*, pivoted to a swinging frame, A, suitably attached to the neck of the bottle, in combination with the looped guide *g*, extending over the lever, the cap *c*, with or without the groove *d*, and the stopper *f*, all constructed to operate substantially in the manner and for the purpose set forth.



167,684. HOLLOW STAFFS FOR WAGONS. William A. Belcher and David J. Pierce, Ophir City, Utah. [Filed June 26, 1875.]

The hollow staff A, provided with the solid driven plug B, as and for the purpose specified.

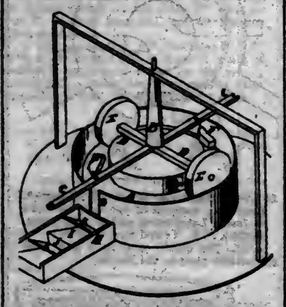
167,685. WINDOW-SASH TIGHTENERS. Jos. Bowes, Boston, assignor to J. Wellman, Marblehead, Mass. [Filed Aug. 12, 1875.]

Brief.—The central studs draw the closed sash tightly against the parting bead, making a close joint against the admission of dust, and preventing noise.

The combination of studs *g* and sockets *h* with a sash and sash-frame, substantially as described, for the purpose specified.

167,686. LAND DRAINS AND COOLERS. Geo. Bogue, Jr., Cincinnati, Ohio. [Filed May 20, 1875.]

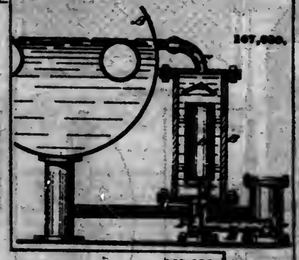
Brief.—From the rendering-tank lard is run into catch-basin, where impurities settle, thence along the devious passage, successively, over the steam-heater and water-cooler.



1. In a lard cooler and drier, the combination of a catch-basin and two or more chambers, having deflecting sides with openings at alternate ends, substantially as and for the purpose set forth.

167,687. COMPOSITIONS FOR PRESERVING BEES. Joseph K. Brown, Bonneville, Mo. [Filed Jan. 19, 1875.]

The compound of clams and lime, in equal proportions, dissolved in hot water, for the preservation of eggs, substantially as specified.



167,688. OIL GRINDERS AND AMALGAMATORS. Charles Boehm, Copperopolis, Cal. [Filed Mar. 10, 1875.]

Brief.—The ore is fed into a circular trough in which it is crushed by two heavy rollers. Between the rollers are two drags, for the purpose of stirring and completing the crushing of the mass of ore.

In combination with a circular trough, A, two revolving bars, C D, arranged at right angles and bearing a pair of drag-weights, F F, and a pair of crushing-wheels, H H, as specified.

167,689. FEED-WATER REGULATORS. C. M. Bridges, Leon, Iowa, assignor to himself and Orrel Babbitt, same place. [Filed Aug. 6, 1875.]

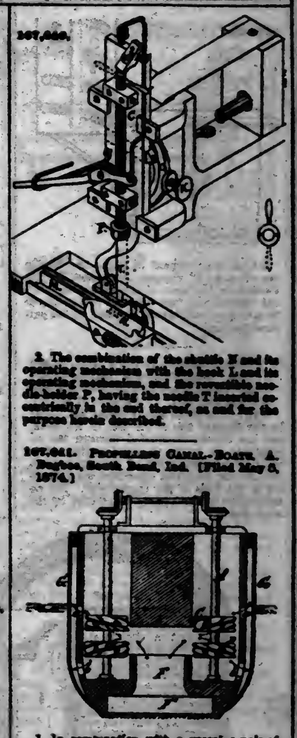
No. 167,689.

No. 167,689.

2. In a lard cooler and drier, the combination of a catch-basin, two or more chambers, having deflecting sides with openings at alternate ends, and one or more of heating or cooling chambers beneath said chambers, substantially as and for the purpose set forth.

3. In a lard cooler and drier, the combination of a catch-basin having an outlet-cock and chambers having deflecting sides and openings at alternate ends, substantially as and for the purpose set forth.

4. In a lard cooler and drier, the combination of a catch-basin having outlet-cock with chambers having deflecting sides and openings at alternate ends, and heating and cooling chambers, having outlet-cocks, substantially as arranged, and for the purpose set forth.



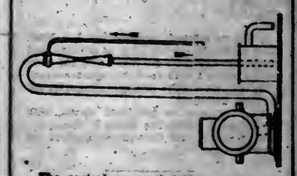
The feed-chamber B, feed D, passage E, and valve I, combined with the boiler and the pump, in the manner described, to open a circulating-passage through the boiler and feed-pump when the feed fails, and close it when the feed fails, substantially as specified.

167,690. STEAM-MANIFOLDS. S. H. Brown, Lowell, Mass. [Filed Jan. 6, 1875.]

Brief.—The needle is located eccentrically in the end of the needle-bar, which is adapted to be turned upward in bearings formed in a supporting-plate, so that the path of the said needle may be brought in juxtaposition with either the shields or keeper on a lock or chain-stitch is desired to be formed. A button on the supporting-plate locks the needle-bar in position after the same has been adjusted.

1. The reversible needle-holder F, having the needle T inserted eccentrically in the end thereof, in combination with the bottom S, as and for the purpose described.

167,692. PROPELLING CANAL-BOATS. A. Boyton, South Bend, Ind. [Filed May 6, 1874.]

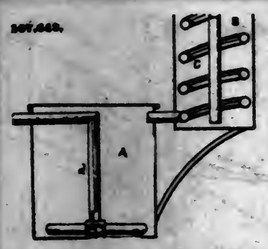


No. 167,692.

1. In combination with a vessel a pair of turbines, C and D, having their buckets arranged in reverse positions, induction-apertures a and b, and chamber-aperture F', substantially as and for the purpose set forth.

2. In combination with the elements enumerated in the first claim, the main G with oblique plates G', substantially as and for the purpose specified.

167,693. CONDENSERS. Henry W. Bulkley, New York, N. Y. [Filed Oct. 7, 1874.]

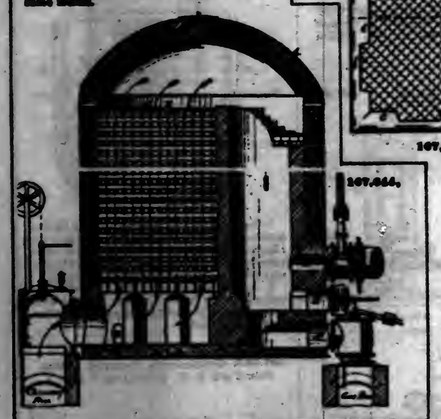


The conical or parabolical nozzles and straight connecting-tank, as described, in combination with a steadier water-opening, when the action is independent of any valve or valves, steam-jets, or streams of water under pressure, but is elevated solely by a descending column of discharge-water, sufficiently high to overcome the pressure of the atmosphere, the whole arranged substantially as described.

167,695. APPARATUS FOR MAKING VINEGAR. E. Burlingame, Centreville, R. I. [Filed Aug. 1, 1874.]

Brief.—The vessel that holds the wash is provided with a radiating perforated tube through which air is forced. Connected with the vessel is another vessel provided with a worm for returning any alcohol evaporated from the wash to the vessel containing it.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON



167,642.

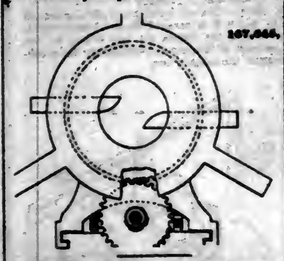
As an improvement in apparatus for the manufacture of vinegar, the vessel B, provided with the worm C, in combination with the vessel A and tube *d*, having radiating perforated arms, substantially as and for the purpose specified.

167,643. REGENERATIVE HOT-BLAST STOVES. Chas. Cochrane, Grange, Shenbridge, and Edward Alfred Cowper, Westminster, England. [Filed Mar. 16, 1875.]

Brief.—The waste heating-gases, fire, enter by the circular flue at the side of the oven, and are equally distributed through the regenerator by means of a distributing-plate covering the entire top of the regenerator, and having recurved apertures surrounding to the flue of the regenerator. The returning air is also equally distributed by the same means.

1. The cylindrical regenerative hot-blast stove described, having a flue at one side, and inlets and outlets on the other side, and having the flue K with recurved apertures surrounding the regenerative passages, as and for the purposes described.

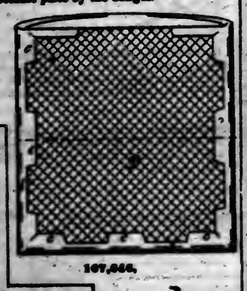
2. In regenerative hot-blast stoves, with checker-work filling, the plates K with apertures of smaller area than the passages of the checker-work.



167,644. MACHINES FOR CUTTING ROLL-PAPER. Lewis P. Ochsie and Lemuel Frank, New York, N. Y. [Filed Feb. 10, 1875.]

Brief.—To movable ring-shaped changing standards are attached number revolving cutter-heads, having suitably-moving knives, which are automatically fed forward to the center and retracted.

1. A machine for cutting roll-paper into sections without unwinding, constructed of stationary and movable changing-standards with revolving cutter-heads and simultaneously-feeding cutting-knives, the whole being arranged and operated substantially in the manner and for the purposes set forth.

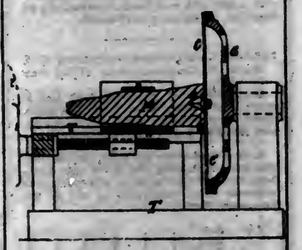


2. The combination, with the ring-shaped roll-changing standard, of a revolving cutter-head with one or more cutting-knives, feeding by suitable mechanism from the circumference of the head toward the center, and back again on reversing the motion of the cutter-head, substantially as specified.

167,645.

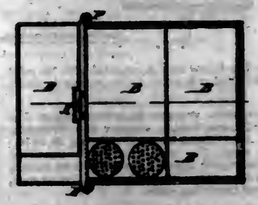
167,646. CARRIAGE-STEPS. R. A. Cowper, Lancaster, assignor of one-half his right to Josiah Leinbaugh and W. P. Darling, Buffalo, N. Y. [Filed Aug. 6, 1875.]

Brief.—The elastic covering is held upon the metallic plate by the flanges.



167,647.

167,648. MEAT-CUTTERS. Emil I. Degreat, Newburg, N. Y. [Filed Dec. 4, 1874.]



Brief.—A cone having sharp cutters presses the meat and crowds it laterally, so that the inner ends of the cutters can shave it off clean.

The rotary cutter-head G, knife C C', and cone A, substantially as and for the purpose specified.

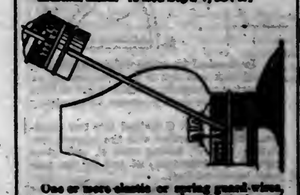
167,649. DRAWER-RUNNER. James S. Davis, Monroe, Mich., assignor to himself and G. B. Hurd, same place. [Filed July 10, 1875.]

Brief.—The liquid-holding can is provided with grooved projections, which slide upon perpendicular ways on the case, and the can serves as a cover or door to the drawers, securing them in place.

The combination of the can D with the case A and drawer B, the said can being fitted to slide in the case and secure the drawers, substantially as specified.

167,650. MACHINES FOR BENDING WIRE FRAMES OF BOTTLE-STOPPERS. Charles de Quillfeldt, New York, N. Y. [Filed July 10, 1875.]

Brief.—The wire blanks are fed on a table inboard to a recess in the main frame, where they are acted by a vertically-sliding plunger that bends down to a concave bed-block, and hold thereon while horizontal side shafts slide in and revolve to form the eyes in the sides of the frame, whereupon side plungers above them shafts bend over its ends. On the retreat of these operating parts the completed frame is delivered by a pivoted, hook-shaped extractor, actuated by the vertical plunger.



1. A machine for bending the wire frames of bottle-stopping devices, composed of a vertically-sliding plunger and bed-block, sliding and revolving eye-forming shafts, end-bending side plungers, and swinging extractor, all arranged to operate substantially in the manner and for the purposes set forth.

2. The combination of the recessed main frame and feed-hopper with the grooved descending main plunger for imparting the first bending to the wire blank, substantially as set forth.

3. The combination of the grooved plunger with the concave bed-block and the revolving spring-shafts, having central pins and raised cones, to receive inclined position of wire frame and formation of eyes at both sides, as set forth.

In the herein-described handle, the combination, with a shield, A, having an opening, *a*, made in the socket portion B, of the bow D, constructed with a leg, *b*, on its cross-bar, operating in the opening *a*, in the manner and for the purpose specified.

167,651. LANTERNS. Anthony M. Dubois, Adrian, Mich. [Filed Sept. 7, 1874.]

One or more sheets or spring guard-wires, having pivotal connection to the body and dome of a lantern, and in combination therewith, arranged and operating to shut of the newly-renewed air-supply by contraction of the guard-wires and movement of the dome, substantially as shown and described.

167,652. BOLT-CUTTERS. Daniel I. Degreat, Newburg, N. Y. [Filed Dec. 4, 1874.]

Brief.—A cone having sharp cutters presses the nut and crowds it laterally, so that the inner ends of the cutters can shave it off clean.

The rotary cutter-head G, knife C C', and cone A, substantially as and for the purpose specified.

167,653. MACHINES FOR BENDING WIRE FRAMES OF BOTTLE-STOPPERS. Charles de Quillfeldt, New York, N. Y. [Filed July 10, 1875.]

Brief.—The wire blanks are fed on a table inboard to a recess in the main frame, where they are acted by a vertically-sliding plunger that bends down to a concave bed-block, and hold thereon while horizontal side shafts slide in and revolve to form the eyes in the sides of the frame, whereupon side plungers above them shafts bend over its ends. On the retreat of these operating parts the completed frame is delivered by a pivoted, hook-shaped extractor, actuated by the vertical plunger.

1. A machine for bending the wire frames of bottle-stopping devices, composed of a vertically-sliding plunger and bed-block, sliding and revolving eye-forming shafts, end-bending side plungers, and swinging extractor, all arranged to operate substantially in the manner and for the purposes set forth.

2. The combination of the recessed main frame and feed-hopper with the grooved descending main plunger for imparting the first bending to the wire blank, substantially as set forth.

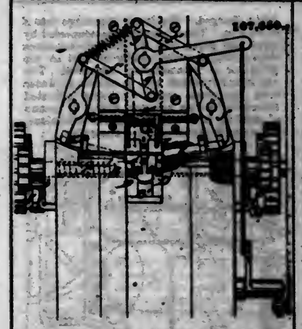
3. The combination of the grooved plunger with the concave bed-block and the revolving spring-shafts, having central pins and raised cones, to receive inclined position of wire frame and formation of eyes at both sides, as set forth.

167,654. CARRIAGE-SEAT SUPPORTS. Thomas Hall, Jr., Cleveland, Ohio. [Filed Feb. 10, 1875.]

Brief.—The seat-supporting springs are connected to the body-bolster by a bracket, and to the axle by a bracket, and the seat-supporting springs are connected to the brackets by a bolt, which passes through the ends of the springs and the brackets, and has a nut on each end.

1. The combination of the bracket C, the bracket D, and the seat-supporting springs A, substantially as and for the purpose specified.

2. The combination of the bracket C, the bracket D, the seat-supporting springs A, and the bolt *a*, substantially as and for the purpose specified.

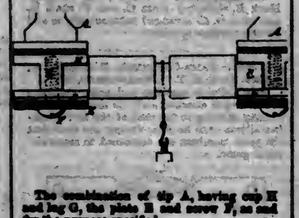


167,655. CARRIAGE-SEAT SUPPORTS. Thomas Hall, Jr., Cleveland, Ohio. [Filed Feb. 10, 1875.]

Brief.—The seat-supporting springs are connected to the body-bolster by a bracket, and to the axle by a bracket, and the seat-supporting springs are connected to the brackets by a bolt, which passes through the ends of the springs and the brackets, and has a nut on each end.

1. The combination of the bracket C, the bracket D, the seat-supporting springs A, and the bolt *a*, substantially as and for the purpose specified.

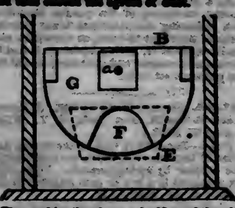
2. The combination of the bracket C, the bracket D, the seat-supporting springs A, and the bolt *a*, substantially as and for the purpose specified.



167,656.

4. The combination of main plunger, having recessed side shoulders, with the sliding side plungers to bend the ends of wire frames, as specified.

5. The combination, with the vertically-sliding plunger B, having notch *f*, of the pivoted, hook-shaped extractor F, having projection *i*, to operate as shown and described.



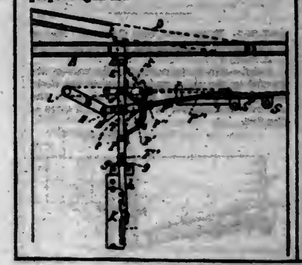
167,657. ROLLER-BEARINGS FOR STEERING-GEAR. Saml. Dyer, Natick, R. I. [Filed June 10, 1875.]

The combination of tip A, having cup E and leg G, the plate H and screw F, as and for the purposes specified.

167,658. AXLE-SKEINS. Alfred C. Perrin, Philadelphia, Pa. [Filed May 22, 1875.]

Brief.—The oscillation of the pivoted oscillating lever in its supporting-case intermittingly closes the oil-case-holding opening therefrom, and then checks the egress of dust.

The combination, in an axle-skein, of the pivoted oscillating lever E, supported opposite E upon H, pivoted arm G, and semi-circular D, constructed and arranged substantially as described.



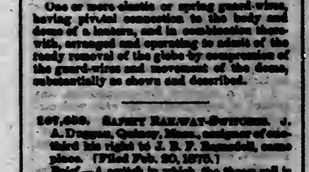
167,659. BURNERS. James Fleming, Chicago, Ill. [Filed June 4, 1875.]

Brief.—The valves are seated and operated by shaft moved by gear-wheels, as shown. The shaft has screw-bolt and collar connected in order to receive longitudinal motion. The movement of said collar opens and closes the exterior waste-valve.

1. In combination with valve F and seat F', located at the lower end of pipe D adjacent to the steam-cocks, the shaft G and screw-bolt K', the latter connected to the shaft, whereby a longitudinal movement is imparted to said shaft for opening and closing the valve by the rotation of the bolt, as specified.

2. In combination with valve F and seat F', located at the lower end of pipe D adjacent to the steam-cocks, the shaft G and screw-bolt K', the latter connected to the shaft, whereby a longitudinal movement is imparted to said shaft for opening and closing the valve by the rotation of the bolt, as specified.

3. In combination with valve F and seat F', having the valve-rod M', the shaft G and collar valve K, the latter located between valve F and the steam-cocks, as and for the purposes specified.



167,660. RETRACTILE CHAINSTAY. Cleveland F. Dandelake, New York, N. Y. [Filed July 10, 1874.]

A compression for making hydraulic cement, consisting of the artificial silicatures of lead, tin or other silicate of aluminium, and the oxyd or minerals known as Adler's earth, and designated by the analysis as herein mentioned, with the lime or the carbonate thereof, in the manner and for the purpose as herein set forth.

167,661. BOLT-CUTTERS. Daniel I. Degreat, Newburg, N. Y. [Filed Dec. 4, 1874.]

Brief.—A cone having sharp cutters presses the nut and crowds it laterally, so that the inner ends of the cutters can shave it off clean.

The rotary cutter-head G, knife C C', and cone A, substantially as and for the purpose specified.

167,662. MACHINES FOR BENDING WIRE FRAMES OF BOTTLE-STOPPERS. Charles de Quillfeldt, New York, N. Y. [Filed July 10, 1875.]

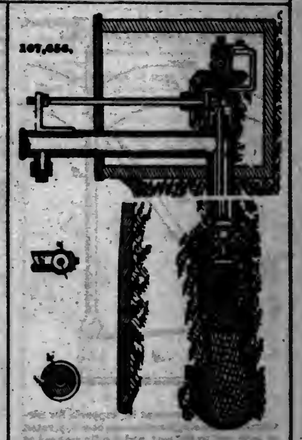
Brief.—The wire blanks are fed on a table inboard to a recess in the main frame, where they are acted by a vertically-sliding plunger that bends down to a concave bed-block, and hold thereon while horizontal side shafts slide in and revolve to form the eyes in the sides of the frame, whereupon side plungers above them shafts bend over its ends. On the retreat of these operating parts the completed frame is delivered by a pivoted, hook-shaped extractor, actuated by the vertical plunger.

1. A machine for bending the wire frames of bottle-stopping devices, composed of a vertically-sliding plunger and bed-block, sliding and revolving eye-forming shafts, end-bending side plungers, and swinging extractor, all arranged to operate substantially in the manner and for the purposes set forth.

2. The combination of the recessed main frame and feed-hopper with the grooved descending main plunger for imparting the first bending to the wire blank, substantially as set forth.

3. The combination of the grooved plunger with the concave bed-block and the revolving spring-shafts, having central pins and raised cones, to receive inclined position of wire frame and formation of eyes at both sides, as set forth.

167,663. BURNERS. James Fleming, Chicago, Ill. [Filed June 4, 1875.]



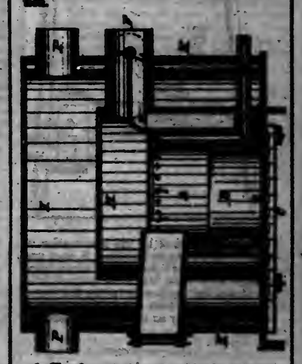
Brief.—The valves are seated and operated by shaft moved by gear-wheels, as shown. The shaft has screw-bolt and collar connected in order to receive longitudinal motion. The movement of said collar opens and closes the exterior waste-valve.

1. In combination with valve F and seat F', located at the lower end of pipe D adjacent to the steam-cocks, the shaft G and screw-bolt K', the latter connected to the shaft, whereby a longitudinal movement is imparted to said shaft for opening and closing the valve by the rotation of the bolt, as specified.

2. In combination with valve F and seat F', located at the lower end of pipe D adjacent to the steam-cocks, the shaft G and screw-bolt K', the latter connected to the shaft, whereby a longitudinal movement is imparted to said shaft for opening and closing the valve by the rotation of the bolt, as specified.

3. In combination with valve F and seat F', having the valve-rod M', the shaft G and collar valve K, the latter located between valve F and the steam-cocks, as and for the purposes specified.

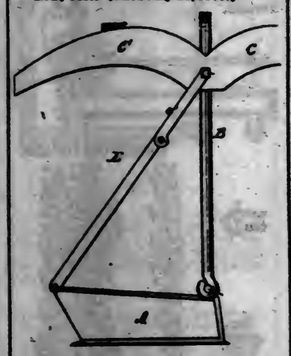
167,664.



1. The fire-pot A, cast with the air-space jacket cavity around its upper and lower ends, and the water-passage opening into the fire-pot, and the vertical passage communicating with said top and bottom passages, in combination with the horizontal air-passage A communicating with the external air, as and for the object specified.

2. The combination, in a hot-air furnace, of the double casing K I, the base G, the fire-pot A, having upper and lower, and central and with the discharge-water partition D, the steel radiating-frame E, passing over the fire-pot and the heated pipe F, passing through the double casing and connecting with the frame, the upper one of which opens into the drum H, with the lower one in position and extends beneath the diagonal partition of the fire-pot, as and for the purpose described.

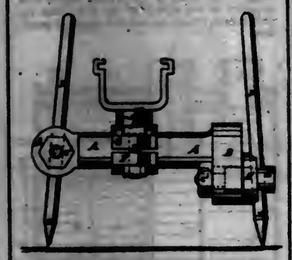
167,665. HOT-AIR FURNACES. H. D. Frost, Akron, Ohio. [Filed June 24, 1875.]



Brief.—Air is thoroughly heated in the passages in the walls of the fire-pot before it is supplied to the surface of the fire. The indirect draft passes around the diagonal partition.

1. The fire-pot A, cast with the air-space jacket cavity around its upper and lower ends, and the water-passage opening into the fire-pot, and the vertical passage communicating with said top and bottom passages, in combination with the horizontal air-passage A communicating with the external air, as and for the object specified.

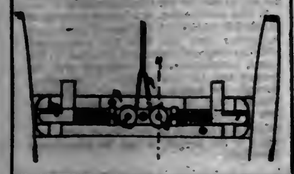
2. The combination, in a hot-air furnace, of the double casing K I, the base G, the fire-pot A, having upper and lower, and central and with the discharge-water partition D, the steel radiating-frame E, passing over the fire-pot and the heated pipe F, passing through the double casing and connecting with the frame, the upper one of which opens into the drum H, with the lower one in position and extends beneath the diagonal partition of the fire-pot, as and for the purpose described.



167,669. GARMENT-TOPS. A. W. Gilbert, Lodi, Ohio. [Filed July 20, 1875.]

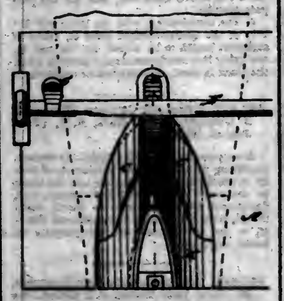
1. As an improvement in supports for carriage-tops, the single continuous bow B, pivoted at each end to the seat, and rigidly secured at the top on each side to the central portion of the sides of the right canopy-frame C C', in combination with single-jointed bows B, pivoted to the frame C at the junction of the frame and bow, and to the rear of the seat, as and for the purposes described.

2. In combination with the single continuous pivoted support or bow B and single-hinged bows E, the right canopy-frame composed of double arched or curved sides C, made in one piece, and cross-bars C', rigidly secured at its central portion to the bow B, as and for the purposes described.



167,670. TRIMMER FOR RAKE-TEETH. Jos. G. Gilchrist, New York, N. Y. [Filed June 29, 1875.]

The tripod, formed by the combination of the shaft A, having a cross-head, B, upon one end, the three bolts C, having transverse holes through their ends, the three pointed sold legs D, and the washers E, having half-round notches formed in their outer sides with such notches, substantially as herein shown and described.



167,671. HORSE-DISCHARGING APPARATUS. Johnson W. Glover, Mount Sterling, Ky., assignor to himself and Wm. B. Kinkead, same place. [Filed July 17, 1875.]

Brief.—A weight attached to the cord withdraws the spring-bolts, thus disunking the animal upon the overturning of the vehicle.

The spring-catch bolts A, cord D, pulleys C, and weight E combined and arranged with the whiffletree of a carriage, for automatically detaching the traces when the carriage turns over, substantially as specified.

167,672. CHEESE-MACHINES. Thomas J. Greenwood, Warren, Ill. [Filed July 10, 1875.]

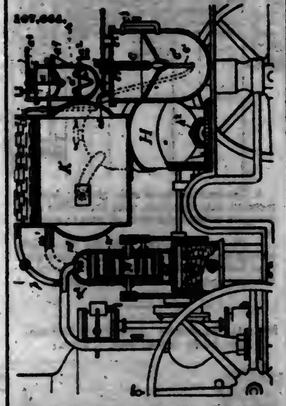
The combination of bed-piece A, crimping-block B, clamping-plate C, cam F, shaft E, and lever G, all arranged substantially as and for the purpose specified.

167,673. GRAIN-COCKTRIER. C. B. Hackley, New York, N. Y. [Filed June 10, 1875.]

Brief.—Point numbers and score numbers are arranged concentrically on the same disk. A long opening in the path of the score number allows it to be seen during the time that the point numbers are advanced to score another game.

As a new article of manufacture, a gauge-marker, consisting of the circular revolving disk C, having the outer and inner threaded series of numerals thereon, as described, and the front plate E, having openings F and G therein, all arranged and operating as and for the purpose set forth.

167,674. POCKET-BOOK LOCKS. J. Hazen and S. Beebe, New York, N. Y. [Filed Aug. 28, 1875.]



Brief.—The loop or bolt of the closing-flap is formed between rolls, which are held against one another by spring-pressure. These rolls are arranged in a box or case attached to the outside of the pocket-book.

The combination, with the loop G of a pocket-book, of a series of sliding wires, E, and one or more springs, C, arranged and operating substantially in the manner described.

167,675. FIRE-EXTINGUISHERS. Henry C. Hart and Hermanius H. St. J. Ellis-Lee, Adrian, Mich. [Filed Dec. 28, 1874.]

Brief.—The cold-tank, which supplies the main generator, is divided into two chambers, one of which, that one may be filled while the other is operating. Pressure is brought upon the surface of the cold from an auxiliary generator, which forces it into the main generator. Two of the latter are used, that one may be at work while the other is being charged. The latter discharges into a gasometer. These parts are so connected by pipes and cocks that the pressure operates throughout, and the supply of acid to the generator is automatically controlled. The gas is incorporated with a stream of water from the steam-pump by being admitted therewith into an ejector, where, by means of jackets receiving in opposite directions, the water is rendered into a fine spray.

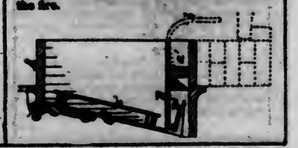
1. In chemical fire-extinguishers, containing an acid-tank and one or more generators, an automatic pressure for generating gas to force the acid into the main generator, substantially as herein set forth.

2. The acid-tank C divided into two chambers, *c c'*, and provided with the valve *d'*, connecting-pipe *f'* having cock *d'*, and glass pipes *e' f'*, substantially as and for the purposes herein set forth.

3. The generator A, having chamber *a* for the acid, and chamber *a'* for the carbonate, in combination with the acid-tank C and the gas-pipes H and *l*, the acid-tank being connected with the generators H and I by the pipes F and G, substantially as and for the purposes set forth.

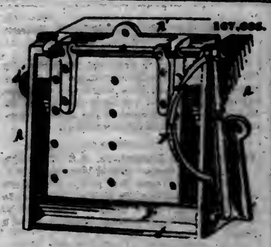
4. In a chemical fire-extinguisher, the method of impregnating the water with carbonic-acid gas, by exerting the water to a fine spray, and, while in that condition, allowing it to come in contact with the gas under pressure, substantially as herein set forth.

5. The agitator B, provided with paddles revolving in opposite directions, in combination with an apparatus for supplying gas thereto, and with a water-supply, substantially as and for the purpose set forth.



6. The combination of the generator A and acid-tank C with the pressure-H and I as an angle of about forty-five degrees, and the gasometer K, with their respective connections, substantially as described.

7. A fire-extinguisher provided with an agitator having means for the admission of water and gas separately preparatory to charging the water with the gas, substantially as described.



8. The combination of a steam-pump, a gas-generating apparatus, and an agitator, all connected to a suitable frame-work, and mounted on a truck, substantially as herein set forth.

167,676. PORTABLE-DOOR GUARDS. Henry T. Hayden, Washington, D. C. [Filed Sept. 2, 1875.]

Brief.—Air-ducts, controlled by valves, are formed in the sides and bottom of the door-casing, for admitting currents of air to the combustion-chamber at the front and sides of the fire.

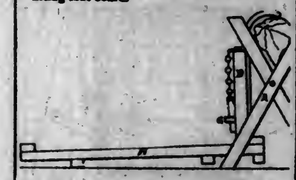
167,676.

1. The vertical air-ducts *a* at the sides of the furnace-door, and between the double walls or side plates of the casing, in combination with a valve or valves for controlling the admission of the currents of air, substantially as described.

2. The lower horizontal air-duct *a'*, underneath the door and coal-chute, and between said chute and the casing-door A', in combination with a valve, D', controlling the admission of air to the front of the fire, as described.

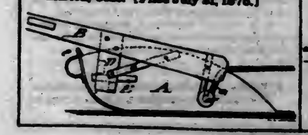
3. The combination of the vertical ducts *a* and horizontal duct *a'*, and the valves for controlling the admission of air through the same, with a furnace-door, substantially as and for the purpose set forth.

167,677. SHOULDERS. Edwin W. Higbee, Northampton, Mass. [Filed Apr. 10, 1875.]



Brief.—A short and long blade are combined, with a collar upon one of them, which fits closely upon the valve, and not only acts as a stop, but also prevents the hair and soft parts from obstructing the view.

In a bivalve-speculum, the combination of of the short blade B, contracted at *b* and expanded at *b'*, so as to serve both as a stop and guard, and a long blade, A, to which the former is hinged, substantially as and for the purpose set forth.

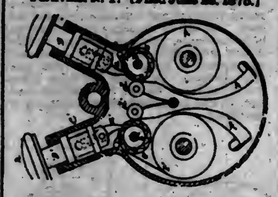


167,678. WOOD-HOLDERS FOR SAW-BUCKS. Sanders Hollingsworth, Pike Township, Marion County, Ind. [Filed Mar. 11, 1875.]

Brief.—The wood is firmly held in the beak while being sawed by means of a metal hook adjustable in an upright post attached to a sliding foot-board.

In combination, with the foot-board H, the upright post D, and adjustable hook C, constructed as described, and used in connection with a saw-buck, substantially as specified.

167,679. ROAD-SCRAPERS. Edwd. Huber, Marion, Ohio. [Filed July 27, 1875.]



In combination with the body A of the scraper, having the horizontal side rim B, the spring-catches D, having the legs *d d* arranged as specified, and the bail C, having looped end, and handles B B attached thereto above the pivots *c'*, all as shown and described, to operate as specified.

167,680. COMPOUNDS FOR SOAP. Gustavus L. S. Junker, Cincinnati, Ohio. [Filed Aug. 28, 1875.]

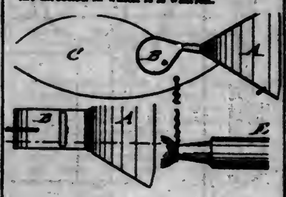
The improved compound for soap, consisting of water, sal soda, carbonate of ammonia, borax, salts of tartar, common salt, and hard-coarse soap, combined substantially in the proportions and as herein before specified.

167,681. FARE-REGISTERS. A. P. Johnson, Parkville, N. Y. [Filed June 28, 1875.]

1. The combination, in a fare-registering device, of an imprinting-roller, *c*, presser-roller *d*, and plunger D, the said several parts being constructed and operated substantially as described, and arranged to record each fare received upon a continuous strip of paper, F, as set forth.

2. In a fare-registering apparatus provided with an imprinting-roller, *c*, and a bell, H, the plunger D, having a projection, *f*, formed on one side, and a pawl, *e*, pivoted thereto on the opposite side thereof, and arranged substantially as set forth, to strike the bell, and record the fare by one and the same stroke of the said plunger.

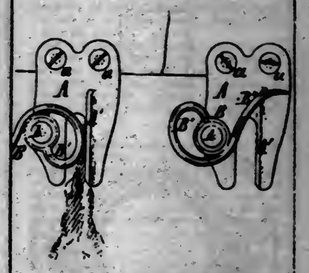
167,682. RAILWAY FROG-POINTS. James Johnson, Harrogate, England, assignor to Joseph Wood, Red Bank, N. J., and Edwin H. Bennett, New York, N. Y. [Filed Jan. 28, 1876.]



Brief.—An improved mode of making the angular junction in that class of frog-points which are made from railway-rails. Instead of cutting away a portion of both rails, as usual, the intersecting rail alone is cut, and is fixed to the web and head of the main rail, leaving it of full proportions and strength, without vacant spaces between the webs.

A railway-crossing or frog-point, formed or grooved or tapered rails A and C, secured together by means of plates *d e* and bolts *f f*, substantially as shown and described.

167,683. TOY WHISTLES. Henry B. King, Paterson, N. J. [Filed July 17, 1875.]

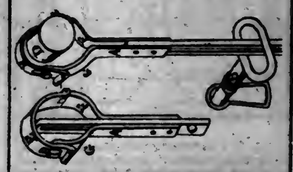


Brief.—To the whistle, having a flaring mouth to collect air, is attached a vane for keeping the funnel always to the wind, or in the direction in which it is whirled.

1. The toy whistle herein described, having the flaring or funnel-shaped mouth A and the vane C, all arranged as and for the purpose described.

2. The whistle or reed E, flaring mouth A, vane C, cord or wire D, and handle B, substantially as described.

167,684. CLOTHES-CLAMPS. G. W. Knibb, New York, N. Y. [Filed July 20, 1875.]



1. The clamping-piece B, turning on the axis *b*, in combination with the fixed part A, having the inclined projection A', as described, whereby the holder is adapted to hold the clothing by friction, and likewise it entirely on its being pulled downward, substantially as herein specified.

2. The projection A', having the inclined portion, as described, in combination with the turning part B, and adapted to arrest and avoid the rebound of the arm or lever B', as and for the purposes herein specified.

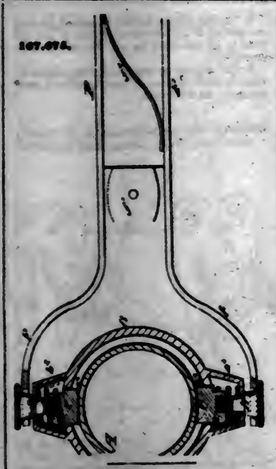
167,685. KEY-FASTENERS. James Knight, Denver, Colo. [Filed July 3, 1875.]

Brief.—A detachable key-fastener is formed with two bent arms, having a hinged top, opening out, and clasping over the shank of the door-knob. A slotted or extensible arm slides between the bent arms, and its entrance end, passing down through the loop of the door-key, holds the key in place, and prevents tampering with it, the construction being such that the slotted arm gives ready adjustability, or, when slid entirely in, makes the device compact and portable.

1. In a key-fastener, the slotted arm C, sliding between the bent arms F and G, substantially as described and shown.

2. The bent arms F and G, hinged and shaped to the top E, substantially as set forth and shown.

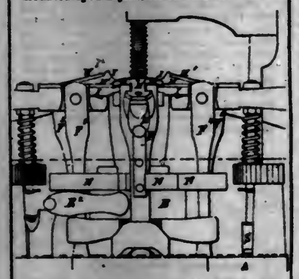
3. The combination of the slotted arm C, with the bent arms F and G, and the hinged top E, substantially as shown and described.



167,686. HOSE AND PIPE COUPLINGS. Henry G. Koehler, Cleveland, Ohio. [Filed Aug. 14, 1875.]

Brief.—When one section is inserted in the other, the spring-catch engages with the corresponding groove, thus uniting the parts. Uncoupling takes place by releasing the catches with the thumb or tongs shown.

1. The combination of the part A, made with the external shoulder *a'* and the ring-groove *a''*, the part B, made with the internal shoulder *b'* and the hollow projections *b''*, the beveled catches C, the screws D, and the springs E with each other, substantially as herein shown and described.



2. The combination of the tongs F *f' f''* with the screws D of the coupling A B C D E, substantially as herein shown and described.

167,076.

167,076. MACHINERY FOR LASTING BOOTS AND SHOES. Richard C. Lambert, Quincy, assignor of one-half his right to Henry H. Townsend, Boston, Mass. (Filed Feb. 6, 1875.)

Brief.—The last, with the upper drawn upon it, when mounted upon a standard in the machine is surrounded by an elastic ring or band, which presses against the lower edge of the upper, folding it over upon the insole in position to be secured by any suitable fastening. The ring or band is held by clamps mounted upon adjustable standards.

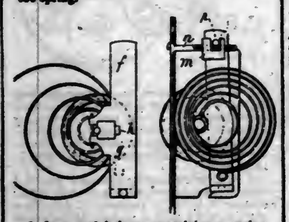
1. In a machine for lasting boots and shoes, an endless band or ring of rubber or other suitable elastic material entirely surrounding the last at or near its tread-surface, with its inner edge pressing against the upper upon the last and adapted to be mechanically raised and lowered along the sides thereof, and to press the upper over upon the inner sole, all substantially as and for the purpose described.

2. The elastic band or ring I, in combination with the pivoted levers H H, secured thereto by the clamp-plates H', substantially as described.

3. In combination with the endless band or ring of rubber I and the vibrating levers H H carried thereby, a series of standards pivoted at one end to a suitable support, and at their upper ends to the levers H H, substantially as described.

4. The disks E and F, one or both, having attached thereto one or more toggle-bars, F, in combination with one or more pivoted standards, carrying at their upper ends the levers H H, and the elastic band or ring I secured thereto, substantially as described.

5. The disks E and F, mounted upon adjustable bearings and connected together by suitable gearing to compel their operation in unison, in combination with the elastic band I, levers H H, standards F, F', F², F³, F⁴, and F⁵, one or more, and one or more toggle-links, E, all arranged to operate as and for the purposes specified.



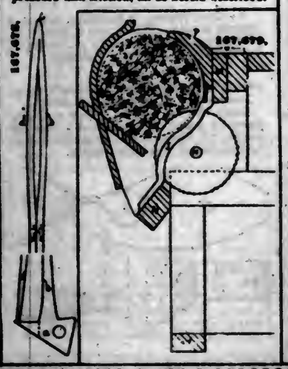
6. The standards F, F', F², F³, F⁴, and F⁵, one or more, pivoted to adjustable supports, in combination with the elastic ring or band I and levers H, all substantially as and for the purposes described.

7. In combination with the elastic band I, levers H H, and standards F, F', F², F³, F⁴, and F⁵, one or more, the springs L L, arranged to force the movable ends of the standards, the levers H, and band I, toward the last or shoe, substantially as described.

8. In combination with the band I, and levers H, springs J J, arranged to act upon the levers H, substantially as described, for the purpose specified.

167,077. SASH-BALANCE. Wm. J. Lewis, Denver, Colo. (Filed Aug. 4, 1875.)

Brief.—A metal casing is fitted with an inner detachable frame carrying a steel ribbon-spring, the strain of which tends to rotate a rubber-faced roll, and thus raise or support the sash. The axle of the pulley has its bearings in journal-boxes, which are arranged to slide in slots or openings cut in the frame-work, and rest against an elastic pad introduced into their openings. Legs upon the inner frame rest in curvilinear slots of the outer case, and suitable nuts and screws adjust the tension of the spring.



1. In a sash-balance containing a spring, the strain of which tends to turn the roll and to raise or support the sash, the combination of the casing *a*, provided with curvilinear openings *d*, the frame *f*, the nut *m*, and the screw *n*, all constructed as described, and co-acting as described.

2. In a sash-balance containing a spring, the strain of which tends to turn a roll, and raise the sash, the pulley *o*, the periphery of which is covered with rubber, in combination with the journal-box *g* and elastic pad *h*, as and for the purposes described.

167,078. LOCK-SHUTTLE SPINDLES. Thos. H. Logan and Jas. B. Thompson, Lowell, Mass. (Filed June 17, 1875.)

A split shuttle-spindle, constructed as described, with a head, *c*, slotted vertically in its under side, a vertically-expanding friction-bow, *b' b'*, near the tip *c*, a fulcrum, *b² b²*, near the center, and a frictional tensioned rear bottom spring-lever, *d*, entering the slot *g* and operating to retain the rear end of the cop and the yarn, and, by its fulcrum and leverage alone, to expand the bow and increase its outward pressure and friction, all as herein described.

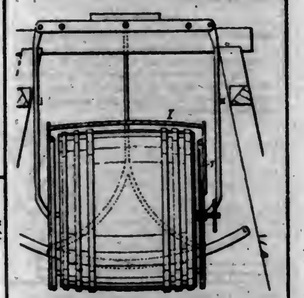
167,078.

167,079.

167,079. COTTON-GIN. Orrin W. Mooney, Macon, Ga. (Filed June 28, 1875.)

The front board Q with interior curve, the rib-board P with interior curve, and the curved upper portion of the ribs J, combined and forming the major part of a circle in the roll-box, so that the cotton is ginned by the saws in a circular roll, substantially as set forth.

167,080. SOFA-BEDSTEAD. R. S. McMaster, Burlington, Iowa. (Filed Mar. 22, 1875.)



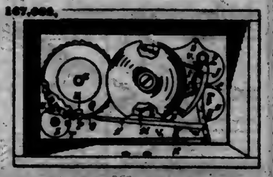
Brief.—The hinged foot of the lounge are arranged and adjusted in such a manner as to give the lounge a low position when used as a lounge, and high position when used as a bed.

The combination, with a lounge, of the hinged folding foot A, substantially in the manner and for the purpose set forth.

167,081. DEVICES FOR PITCHING BARRELS. Gustavus Meyer, Quincy, Ill., assignor of one-half his right to Julius Franke, same place. (Filed Apr. 7, 1875.)

Brief.—A frame, supporting a shaft, which serves as an axle for a double walking-beam, provided with hangers pivoted to the end of the arms of the walking-beam. At the lower end of the hangers there is a cage for casks, &c., for the purpose of turning the casks from a horizontal to a vertical position. One of its ends is constructed to revolve the cask when in vertical position.

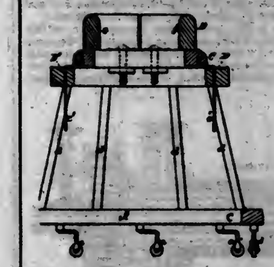
1. The frame A, having the shaft B, which serves as an axis for the double walking-beam E, provided with the pivoted hangers H, in combination with the receiver I, substantially as and for the purpose shown and described.



2. The receiver I, provided with the turn-table or receiving end J, substantially as and for the purpose shown and described.

3. A cage or receiver, I, supported in pivoted hangers H, substantially as and for the purpose shown and described.

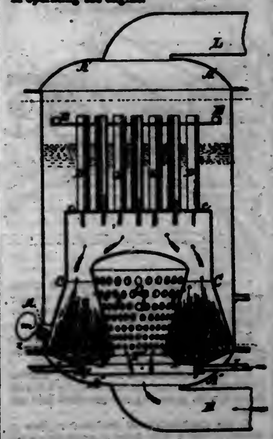
167,082. PANS-REGISTERS. William Miller, Boston, Mass., assignor to Chas. A. Shaw, same place. (Filed Mar. 18, 1876.)



RELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

167,083.

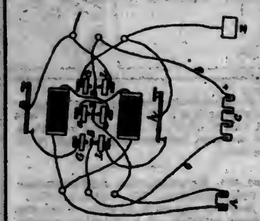
In a fare-register, provided with an alarm mechanism arranged to operate substantially as set forth, the numbered pinion-wheel O, provided with the pin Y, the wheel W, provided with the pins X, the numbered plate U, notched plates S Q, pawl E, and V, and lever G, combined to operate substantially as and for the purposes specified.



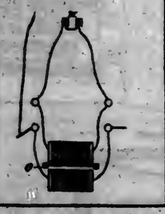
167,084. BABY-WALKERS. Miranda B. Mathewson and Nathan M. Tripp, South Wareham, Mass. (Filed June 10, 1875.)

The improved child's walking-stand, as described, consisting of the cage A, the ring C, the semi-rings *g g*, the latch-arms or racks *e' e'*, the pinion D' D', and wedges E E, arranged and applied as specified.

167,085. DURHAM HYDROCARBONS. John W. Nystrom, Philadelphia, Pa. (Filed July 29, 1875.)

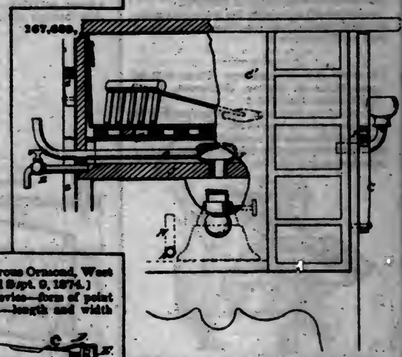


Brief.—By means of a blast combustion is supported, and the products thereof forced into the steam-space, to be used with the steam in operating the engine.

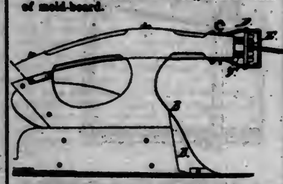


The hereinbefore described apparatus, in which the water casing or cylinder A, combustion-chamber C, tubes D and D, oil-reservoir F *f*, and pipes H, I, K, and L, are combined to operate in the manner and for the purpose substantially as specified.

167,086. ELECTRO-MAGNETIC TELEGRAPH. Jos. Channel, Providence, R. I., assignor of one-half his right to Chas. G. McKnight and Geo. Chesterton, same place. (Filed May 15, 1875.)



The combination, with a telegraph line, of a commutator, charging the line with alternating currents, a pair or series of pairs of keys, and a pair or series of pairs of relays, one of the keys of a pair acting to cut off from the line the + currents only, the other to cut off the − currents, and one relay of each pair being arranged so as to vibrate by the passage therethrough of + currents, and the other by the − currents, and both relays arranged to give a signal or close a local circuit upon the cutting off from the line of the currents affecting it, substantially as and for the purposes described.



167,087.

167,088.

167,086.

1. The clevis D, having slots *d* on its upper and lower arms, and the sliding bar E held against the notches of the clevis by the springs F, substantially as shown and described.

2. The point-share B and colter B' made in one piece, the colter standing nearly vertical and ending in a short, small point, the rear of the colter being deeply grooved to fit upon a lug or projection, *b*, upon the front edge of the plow-frame, all constructed substantially as shown and described.

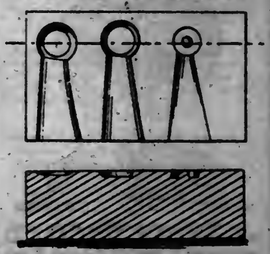
167,087. GRATING FOR FURNACE-DOORS. R. Fletcher, Brooklyn, N. Y. (Filed July 10, 1875.)

1. The combination, with a shaker, B, cast in a single piece, of an end-looped wire, A *a'*, having the concealed swivel in each end, all constructed and arranged substantially as and for the purposes described.

2. As a new article of manufacture, consisting of shaker B, concealed swivel-wire A *a'*, and rigidly-fixed hook C, substantially as shown and described.

167,088.

167,088. MARINE SODA-WATER FOUNTAIN. A. D. Puffer, Boston, Mass. (Filed May 24, 1875.)



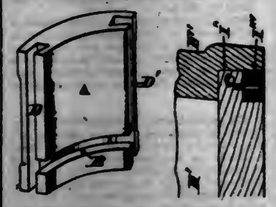
Brief.—Longitudinal grooves are formed in the inner shell or lining opposite the seams in the outer shell, to insulate and prevent the lining from the heat produced in soldering or brazing the seams. Internal pressure is applied to restore the lining to its cylindrical form.

The herein-described manufacture of soda-fountains, consisting, first, in reducing the diameter or exterior bulk of the inner vessel to obtain an air-space; second, in soldering or brazing the seams of the outer vessel or shell; and, thirdly, in restoring the inner vessel, by suitable internal pressure, to its primitive form, essentially as and for the purposes stated.

167,089. STEAMING-TABLES. Ambel J. Randall, Belvidere Seminary, N. J. (Filed July 17, 1875.)

In combination with a table, the case C, containing the steam-chamber I, having water-admission pipe Q, discharge-faucet R, lamp or gas-pipe F, and discharge-pipe O, for the purposes described.

167,090. PROCESSES FOR FORMING THE ENDS OF CARRIAGE-SLAT BOWS. Chas. Burton, Meriden, Conn. (Filed July 24, 1875.)



The method herein described of shaping the ends of carriage-slat bows, &c., consisting in passing them through a series of dies with tapering edges, of gradually-increasing inclination and of decreasing width and increasing depth, substantially as and for the purpose set forth.

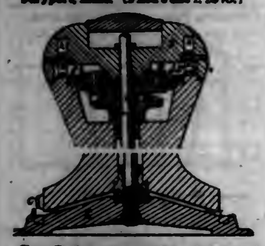
RELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

167,691. COFFIN. James Bisbey and L. H. McDougall, Cincinnati, Ohio. [Filed Aug. 23, 1875.]

Brief.—The coffin is composed of wooden sides and bottom, inserted in metallic corner-pieces. Those of the corner-pieces have vertical dovetail grooves at each edge, and a groove along the bottom, to receive the edges of the wooden plate. The fourth metallic corner has a mitred in place of the bottom, grooved so that it may be driven into place after the rest of the coffin is set up. A plug of wood closes up the opening left at the bottom of the mitred by the tongued end of the board.

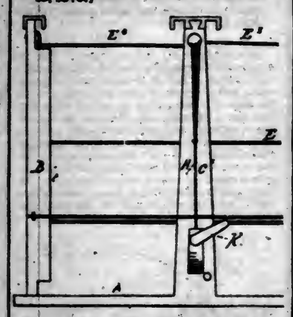
1. The coffin-body, consisting of the metallic corner-pieces A A' A'' A''', each having the dovetail grooves D D' in its vertical edges for the end and side boards F F' H H', said side-board and one end-board having the horizontal grooves B I F F', and the other end-board the rabbet I'', for the tongued edges of the bottom-board, substantially as set forth.

2. In combination with the composite coffin or burial-case body, as described, the described plug or filling-piece J.



167,692. ROTARY ENGINE. Chas. F. Rose and Elias G. Barber, Whitewood, Iowa. [Filed Mar. 29, 1875.]

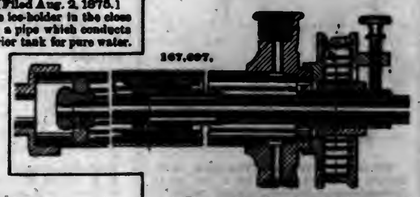
Brief.—The abutment valve is operated by a grooved cam on the shaft. To reverse the operation of said valve, the connecting-rod is moved to the opposite side in a slotted plate attached to the valve-rod.



The cam-grooved disk *n* on the axle of the cylinder B, in combination with the jointed pitman *r s*, reversible crank *n*, and duplex oscillating valve *k*, substantially as and for the purposes shown and described.

167,693. CAPSTAN. Albert Russell, Newburyport, Mass. [Filed June 1, 1875.]

For effecting rotary motions of the barrel, as described, the combination applied to the capstan-head F, barrel A, and shaft B, and consisting of the gear *f* and one or more pawls, *c*, applied to the head, the wheel G, its gear or gears *e*, and one or more pawls, *g*, the stationary ratchet-wheel H, fixed to the shaft B, and the internal gear *f* and the range of ratchet-teeth *h* applied to the barrel, all being arranged substantially as specified.



167,694. CLOTHES-DRIER. Conrad Schiffarty, North Manchester, Ind. [Filed July 15, 1875.]

A clothes-drier, consisting of the base-piece A, standards B B' C', guides *c*, sliding bars D, lines E, E', F, F', and H, and windlass K, all combined and operating together as described.

167,695. REFRIGERATOR. John Schmaltzer, Cincinnati, Ohio. [Filed Aug. 2, 1875.]

Brief.—A removable ice-holder in the close ice-box, provided with a pipe which conducts drip through the inferior tank for pure water.

1. In combination with an ice-chamber, G, having a clear-water tank, I, at the bottom of the same, and implanted therein, the removable receptacle F *n*, and the waste-pipe P, whereby the contents of said receptacle are prevented commingling either with those of said tank or with the interior of the refrigerator.

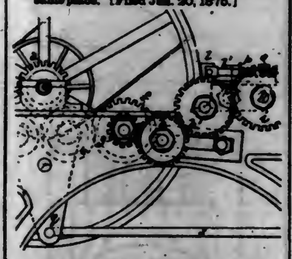
2. The pipe Q, communicating with the upper portion of the refrigerator A, and provided with the automatic vent or relief valve S and condensing-guard R, for the purpose designated.

167,696. EGG-BEATERS. Friedrich H. Schwenger, Cleveland, Ohio, assignor of one-half his right to O. B. Johnson, same place. [Filed Mar. 15, 1875.]

1. The egg beater or agitator, consisting of receptacle A, provided with cover E, hollow central dash C, and suitable handle or shaft D, whereby the said dash is operated, substantially as and for the purposes described.

2. In an egg-beater, the combination of cover E and perforated central dash C, substantially as and for the purposes described.

167,697.



1. In combination, with the drop-tube and the main stem of the gearing, of a spring to turn the drop-tube and the friction-brake, and the cam which operates the same, said friction-brakes being connected with a loose collar, substantially as and for the purpose specified.

2. The combination, with the drop-tube O and tube A', of the friction-brakes I I and cam K, substantially as herein specified.

3. The combination, in a gearing, of friction-brakes and a cam for operating the same, and a spring for turning the drop-tube, said spring operating independently of the friction-brakes and the cam, substantially as described.

4. The combination of a double cam and the friction-brakes with the drop-light tube O and its spring, substantially as described, whereby, when the drop-light tube O is turned in one direction by the spring, the brakes will bear upon the inner surface of the tube A, as set forth.

167,698. LEATHER-FINISHING MACHINERY. Edward Sotile, Brooklyn, N. Y., assignor of one-half his right to Benjamin Sherill, same place. [Filed Jan. 20, 1875.]

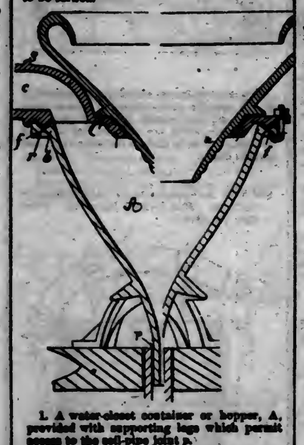
1. In combination, the driving-shaft *a*, cog-wheels *d e f g h i k l*, screw *k*, and mortar *l*, arranged to operate substantially as and for the purposes described and set forth.

2. The mortar *l*, with its shaft *F*, blocks *m* and *n*, spring *o*, and regulating-nut *p*, in combination, as and for the purposes set forth.

3. The combination of drum *b* and mortar *l* with the cog-wheels *d*, *e*, and *e' f g h i*, and screw *k*, with guides *f j*, as described and set forth.

4. The combination of the shaft *r*, plate *s*, wheels *r* and *s*, with lever *z*, arranged to operate in manner and for the purposes described and set forth.

5. The combination of lever *z*, rocking plate *y*, wheels *r* and *s*, cog-wheel *d* on driving-shaft *a*, wheels *f g h i k l*, and screw *k*, when arranged to operate substantially as described and set forth.



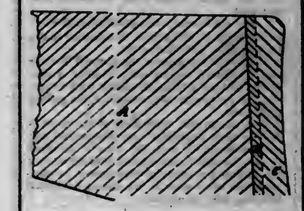
167,699. SHINGLING-BRACKETS. Wm. H. Seymour, Gloversville, N. Y. [Filed Aug. 28, 1875.]

The bottom plate *a*, having back of the jaw the hole *b* of the form described, with the cams or sockets *c c* thereto, and the lever *e*, having back of the jaw the shoulders *e e* on its sides, and the spur *f* on top, constructed to operate as described and shown, in combination with the brace *b* and bar *h*, substantially as and for the purpose set forth.

167,700. WATER-CLOSETS. R. D. O. Smith, Washington, D. C. [Filed Aug. 10, 1875.]

Brief.—The lower part of the hopper has the supporting-legs shown, so that the joint between the former and the soil-pipe is exposed to view. The upper portion of the hopper has the circumferential groove seen, and into this fits the rib of the cover, making a tight joint, and allowing the bowl and cover to be turned.

1. A water-closet container or hopper, A, provided with supporting legs which permit access to the soil-pipe joint *p*.



2. A water-closet container, A, combined with a circular adjustable cover, C, provided with a circular rib, *r*, adapted to fit in said groove, and compress the putty or other calking matter, to insure a tight joint, as and for the purpose set forth.

3. A water-closet container, A, constructed with a circular groove, *b*, in its upper edge, combined with a cover, C, provided with a circular rib, *r*, adapted to fit in said groove, and compress the putty or other calking matter, to insure a tight joint, as and for the purpose set forth.

4. A water-closet container, A, constructed with a circular top, and provided with an overhanging flange, *q'*, combined with a cover, C, and hook-bolts *d*, which engage under said flange, and permit an adjustment of and rigid attachment of said cover.

5. A water-closet container and cover, C, provided with an opening for the admission of the neck *n* of the receiver or bowl, combined with a conical flange depending from the edge of said opening, for the purpose set forth.

167,701. BLASTS BUTT-PLATES FOR FIRE-ARMS. Hugh Adams Silver, Cornhill, London, England. [Filed Dec. 18, 1874.]

As a new article of manufacture, a recoil cushion or pad for fire-arms, constructed of a base-plate, B, of hard rubber combined with a cushion, C, of soft rubber, the two being secured together to form one body of varying degrees of hardness, substantially as set forth.

167,702. WHEEL-HARROWS. J. S. Sutrby, Greencastle, Pa. [Filed July 8, 1875.]

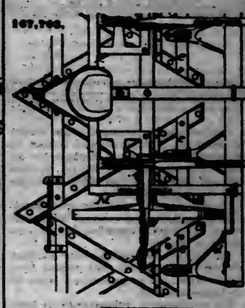
Brief.—The harrow is made in four sections, all hinged together, the two outer ones by long hinges, and placed outside the wheels. Levers are so situated that the outside harrows can be turned up over the wheels, and the inner ones raised for transportation.

1. A wheel-harrow having frames completely outside of the wheels, substantially as set forth.

2. A wheel-harrow having one or more frames or frames between and one or more frame or frames outside of the wheels, substantially as expressed.

3. A wheel-harrow, the frames of which are arranged in sets, one frame of each set being outside of, and the other frame of the same set inside of, the wheel, substantially as set forth.

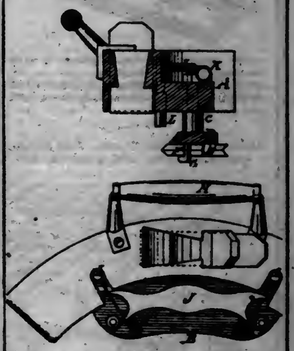
4. A wheel-harrow having frames arranged in sets, one frame outside of, the other inside of, the wheel, and connected as stated, so that any set or any frame may be operated and done operate independently of any other set or frame, substantially as set forth.



5. The yokes E, having their front ends pivoted to the bar D, and their rear ends hinged to the harrow-frames F, substantially as stated.

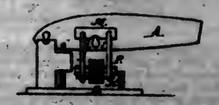
6. The rear yokes E', having their front ends pivoted to the bar D, as specified, and provided with the spring-bolt *k*, all so as to permit the suspension of the frame in a vertical position, substantially as set forth.

7. The segmental cog-guide *f*, for the uses set forth.



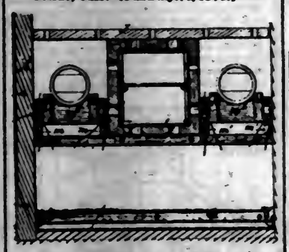
8. The slot *x'*, for the uses and purposes substantially as set forth.

167,703.



167,704. CROZING AND LEVELING TOOLS. Saml. S. Steel, Martin, and Geo. W. Reed, Woodville, Ohio. [Filed May 10, 1875.]

Brief.—A planing-bit for leveling the barrel and a crozing-tool are arranged in a segmental stock, which is provided with a suitable handle. The planing-bit is secured in a recess in the stock, and the crozing-tool is attached to the inner edge of a projecting plate upon the lower part of the stock. The crozing-tool is prevented from cutting while the barrel is being leveled by means of studs or pins attached to a frame adjustable by springs, and passing through orifices in the stock.



A combined crozing and crozing tool, constructed substantially as described—that is, having a projection B, studs O O, plate D, springs E E, adjustable pins L L, and handle M, as shown and described.

167,705. WHEELBARROW-SCALES. Thomas D. Stetson, New York, N. Y., assignor to E. and T. Fairbanks & Co., St. Johnsbury, Vt. [Filed Dec. 30, 1874.]

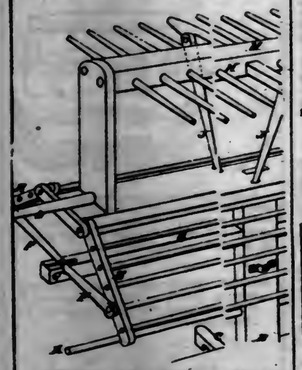
In combination with the knife-edges *i j*, fixed in the fixed and centred levers B A, the blades M H and connecting-loops or loop P, arranged to serve as and for the purposes herein specified.

167,706. REFRIGERATOR. B. A. STOVER, Toledo, Ohio. [Filed Apr. 1, 1875.]

1. The combination, substantially as herein before set forth, of the removable bottom, its lining provided with upturned edges, the detachable cantons and the flanges secured thereto and overlapping the edges of the lining, for the purpose specified.

2. The combination, with the refrigerator-chamber, of a removable sectional lining, one section of which holds the other in place, substantially as set forth.

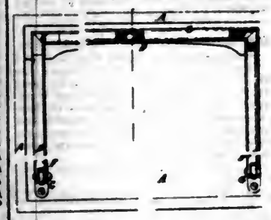
3. The lining for the refrigerating-chamber, constructed as described, with turned front and back edges, and a separate back plate, for the purposes specified.



4. The combination, substantially as herein before set forth, of the removable rack secured in the refrigerator, and the removable barrel-holder or support sliding in the rack through the refrigerator-door.

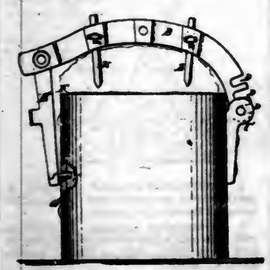
167,707. PICKER-STAFF CHECKER. William W. Stevenson and Isaac Nuttall, Taunton, Mass. [Filed Aug. 26, 1875.]

The improved picker-staff arrester or shuttle-check described, consisting of the case B, strap E, pad D, and spring C, constructed and arranged to operate substantially as set forth and specified.



167,708. CLOTHES-DRIER. John Sutton, Deep River, Iowa. [Filed June 12, 1875.]

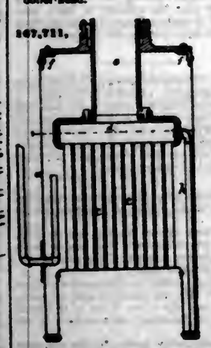
1. The racks B B, pivoted to opposite sides of plate D, and provided with the pivoted braces F, and the notched arms G, projecting from standard E, equilibrium between the racks, as shown and described, to operate as specified.



2. The racks B, braces J, standards I, top plate D, standard E, platform A, racks B, braces F, and arms G, combined and arranged substantially as specified.

167,709. WOODEN FRAME FOR HINGED AWNINGS. Henry Sykes, New York, assignor to himself and William Campbell, Brooklyn, N. Y. [Filed July 24, 1875.]

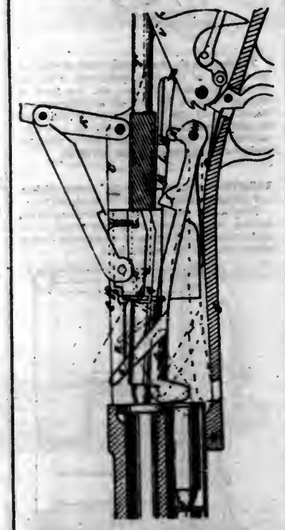
The swing-frame, consisting, essentially, of the metallic screw-threaded elbow-couplings E and the wooden bars B C, provided with recess, which are screwed into the said couplings, so as to make a perfectly rigid and smooth frame.



167,710. APPARATUS FOR HOLDING MEAT IN CUTTING. Wm. Tetley, Pana, Ill. [Filed Feb. 13, 1875.]

A detachable meat-holder for butchers' blocks, consisting of lever B having the front hook E, rear fulcrum-bearings D, and intermediate pins K L, as shown and described.

167,711. STEAM-GENERATOR. Royal H. Thom, Syracuse, N. Y. [Filed Feb. 6, 1875.]



Brief.—The lower end of the smoke-stack is connected to a movable combustion-chamber, to which the fire-tubes are attached. When the tubes expand or contract the smoke-stack rises and falls through a stuffing-box in the boiler-head.

1. The combination of the tubes c, movable chamber d, and sliding smoke-pipe e, passing through a stuffing-box in the top of the boiler, constructed and arranged substantially as and for the purposes set forth.

2. The combination of the straight air-tube b with the movable adjustable chamber d, as described, and passing down through the water-leg within the boiler, so as to accommodate it to the expansion and contraction of the tubes c, as specified.

167,712. MAGAZINE FIRE-ARM. Emil A. F. Toepperwein, Reuss, Tex. [Filed July 24, 1875.]

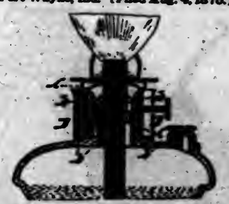
1. The spring O, in combination with the cartridge-lifter, substantially as specified.

2. The bar L and stops M N on the breech-closer, in combination with the cartridge-lifter G, having the arm H and the projection J, and being arranged on a pivot, W, substantially as specified.

3. The combination of the spring R with the cartridge-lifter and the breech-closer, substantially as specified.

167,713. GAS-BURNER. Tecumseh Trudeau, Ottawa, Canada. [Filed May 22, 1875.]

Brief.—The tip and the pieces supporting the shade can be inclined in any direction by means of the ball-and-socket joint.

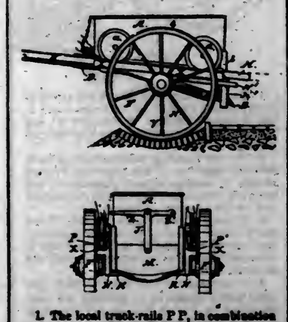


1. A gas-pillar, fitted with a ball-and-socket joint, for the horizontal adjustment of the gallery and shade, substantially as shown and described.

2. In a gas-burner, the combination of a removable tip, C, and a tube, E, attached to the tip and removable therewith.

3. The combination of the parts D E F, or their described equivalents, forming a gas-pillar, having a ball-and-socket joint to permit the horizontal adjustment of the gallery and shade.

4. A gas-burner, consisting of the parts D E F, or their described equivalents, and the removable tip C, with the tube E attached thereto, as shown, the construction permitting the gallery and shade to be adjusted horizontally, and the burner to be changed without affecting said adjustment.



167,714. LAMP-BURNER. P. S. Underhill, Fort Wayne, Ind. [Filed Aug. 4, 1875.]

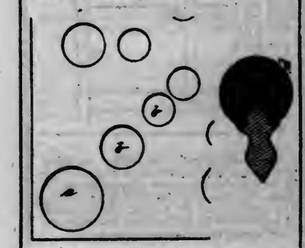
1. The cylinder or shield B in combination with the foraminated burner A, an air space or chamber being provided between the same, substantially as and for the purpose set forth.

2. The cylinder or shield B, having the flange b', and burner A, in combination, substantially as and for the purposes specified.

167,715. DUMPING-WAGONS. T. Weaver, Harrisburg, Pa. [Filed July 24, 1875.]

1. The local truck-rails P P, in combination with the extensible rails H H, when the latter are applied loosely as switches on the sides of the former, and arranged to have a common grade with them, that the bed A, provided with the trundles c c, may be moved back and forth thereon manually to various points on the graded way, for the purposes set forth.

2. The extensible switch structure, made with the rails H H rigidly combined with each other at their rear ends, and upheld thereat by the feet H', for the purposes set forth.



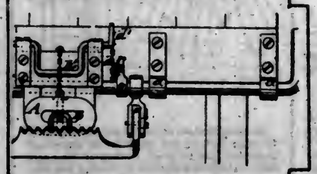
3. The track-platform, composed of the side frames P N, the cross-head Q, and the cross-tie K, all constructed and arranged to admit the bed A into it and to allow it free exit to the rear, as set forth.

4. The switch-treadle H H', in combination with the staples g on the thills G G, to carry the device, and with the spring-catch H' to retain the device on the truck, as shown and described.

5. The slide M, the lever E, and link J, in combination with a cart-bed, A, all arranged for operation as set forth.

167,716. GAME APPARATUS. J. J. Weber, St. Clair, Pa. [Filed June 17, 1875.]

Brief.—A board having different-sized holes, at which a rubber ball having an attached spike is thrown or pitched.

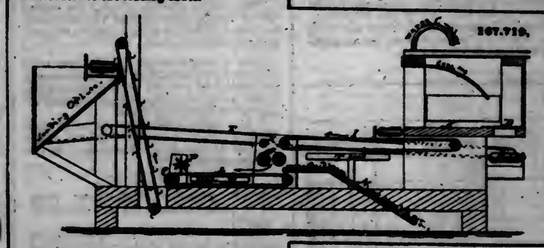


167,717. WRENCHES. Richard J. Wells, St. Joseph, Mo. [Filed May 28, 1875.]

The handle H, threaded and movable on screw-shank, to form an adjustable jam-nut to the revolving nut F', as shown and described.

167,718. CAR-COUPLINGS. G. Wernimont, Dubuque, Iowa. [Filed Aug. 21, 1875.]

Brief.—The crank-lever operates the guide and at the same time the pin.



1. The combination, with the coupling-link, of a serrated link-guide and lateral crank-shaft provided with supporting-arms for holding the link for coupling, substantially as and for the purpose set forth.

2. The combination of the lateral crank-shaft, crank-arm, and chain with a swinging crank-frame, connecting-chain, and coupling-pin for raising and dropping the pin in uncoupling and coupling, as set forth.

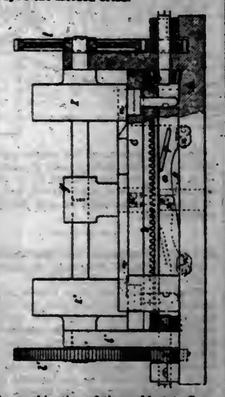
167,719. COLLIERY-PLANTS. R. A. Wilder, Orenaca, Pa. [Filed Aug. 12, 1875.]

Brief.—The coal is dumped into the chutes and delivered to a platform, where it is washed by water from pipes or nozzles, the water and the dirt escaping through the screen. The lumps which are not to be broken are thrown by hand upon the side conveyers, and carried directly to the loading-chute. The remainder is thrown upon the conveyers in front of the platform and carried to the breakers, from which it falls upon the next conveyer, on each side of which the pickers are seated to cull the waste by hand, and is finally delivered by an elevator to the loading-chute.

1. The assorting-platform, in combination with chutes, screens, and conveyers.

2. In combination with an assorting-platform, the conveyer to take the coal directly to the loading-chutes or pockets.

3. The pressure-pipe under the breaker, in combination with the conveyer, whether moving with or against the current from the pipe.



4. The seats or benches and conveyer, placed parallel to each other, allowing the latter to carry the mixed coal and slate in front of the former, as described, so that the coal and slate will pass before all the pickers.

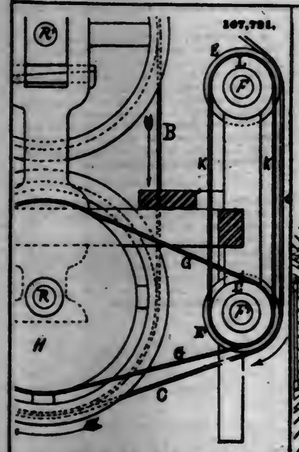
5. The revolving raker F, in combination with the conveyer L and slate-separator Q.

6. The combination of the conveyer at the top of the chutes, with the trunker J, conveyer L, elevator M, and storing pockets or platforms, substantially as set forth.

167,720. BRICK-MACHINES. Geo. R. Wilson and George Smithson, Washington, D. C. [Filed Aug. 19, 1875.]

Brief.—The outer ends of the molds, being farther from the axis of the mold-plate, passes under the rollers more rapidly than the inner portion. The movement of the mold-wheel and rollers coact to give a twist to the pressure exerted upon the molded brick.

1. The combination of the mold-plate C, revolving around a vertical axis, with the rollers I I' revolving around horizontal axes, substantially as and for the purposes specified.

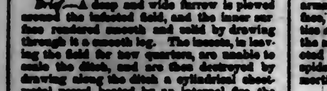


2. The mold-plate C, provided with plungers a' having stems m' and grooves o', combined with the rollers I I' and bed-plate A, having a step, q, inclined planes o and ribs p, substantially as and for the purposes herein specified.

3. The combination of the mold-plate C, yoke f, plungers and stems a' m', and rollers n', with the rollers I I' revolving around horizontal axes, substantially as specified, and for the purposes set forth.

4. The mold-plate C and rollers I I', combined with the yoke f placed at an angle, as described, and inclined knives or boards s, substantially as and for the purposes herein specified.

167,721. BAND-SAWS. George F. Wood, Philadelphia, Pa. [Filed May 3, 1875.]



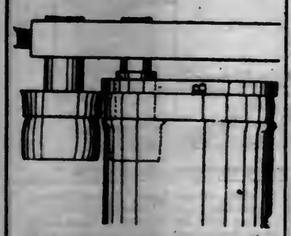
Brief.—The saw is relieved from tensile strain by means of a system of counter-pulleys and counter-shafts, arranged upon a vertical frame in front of the saw-table, in connection with a belt of suitable material passing over the outside of the saw-blade, and over the counter-pulleys directly opposite to the saw-pulleys.

167,721. 

The arrangement of the carrier-pulleys B and B', counter-shafts F and F', pulleys I, I', I, and H, and belts K and G, in combination with the belt C, saw-blade B, and pulleys A and A', substantially as and for the purpose specified.

167,722. PUDDLING FURNACE DOOR. James Armstrong, Birmingham, Pa. (Filed Dec. 17, 1874.)

Brief.—A deep and wide furrow is plowed around the infested field, and the inner surface rendered smooth and solid by drawing through it a smooth log. The insects, in leaving the field for new quarters, are unable to scale the ditch, and are then destroyed by drawing along the ditch a cylindrical sheet-metal vessel, heated by an internal fire, the radiated heat destroying the insects.

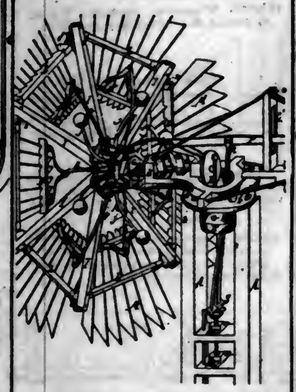


167,722.

The improved insect-destroying furnace herein described, being an oblong hollow metal case, adapted in shape to the shape of the furrow in cross-section, and provided with ash-doors, grate, smoke-pipe, and a tongue, all substantially as specified.

167,723. PAPER BOXES. Charles A. Young, Providence, R. I. (Filed Dec. 17, 1874.)

Brief.—The rim is placed in the end of the box, where it is passed between the compressing and bead-forming rollers.



1. A paper box provided with the projecting bead and having a compressed rim, substantially as described.

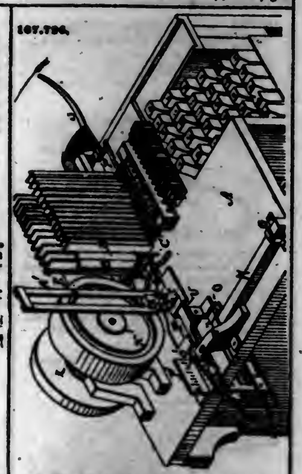
2. The ring B, in combination with rollers, arranged substantially as herein described, and for the purpose specified.

167,724. WINDMILLS. James A. Allen, Albion, assignor to himself and H. Osborn, Sheridan, Mich. (Filed May 4, 1875.)

Brief.—The application of a centrifugal governor to a sliding head carrying the wheel-arms, and rotating with a hub at the end of the wheel-shaft. The centrifugal force of the weighted arms slides the head upon the hub, and, through a system of levers, shifts the angles of the sails.

The combination of the spider H, flanged on its outer face for the reception of the wheel-arms, and having a set of lugs on its inner face, with the sliding hub F, having the mortises *s* and the governor-arms J and levers K, the said governor-arms and levers being pivoted in the said lugs on the inner face of said spider, and having their ends project into the mortises in the sliding hub.

167,725. BURGLAR-ALARMS. Jos. R. Allen, Lionville, Pa., assignor of one-half his right to B. O. Irons, same place. (Filed June 8, 1875.)



Brief.—Wire frames, covering the entire door or window, are connected with the alarm apparatus, so that an entry cannot be effected without giving an alarm.

1. In a burglar-alarm, the wire frame C, with rib *c*, suspended from the window-frame, in combination with the wires D, bell-crank E, and an alarm mechanism, substantially as and for the purpose set forth.

2. In a burglar-alarm, the suspended wire frames C, wires D, and bell-cranks E, all detachably connected with each other, for the purpose set forth.

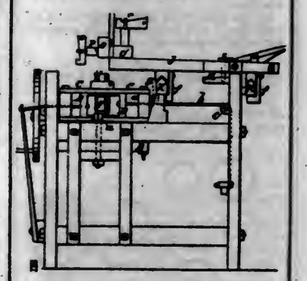
167,726. TYPE-SETTING MACHINES. Robt. T. P. Allen, Farmdale, Ky. (Filed July 26, 1875.)

Brief.—Types are expelled from perpendicular tubes by pushers, which eject them so that they lie sidewise on the sliding stick. The vibrating pusher propels them toward the right end of the stick, and also moves the stick along as matter accumulates upon it. The line is raised by a lever, which forces it backward into the galley. The motion of lever releases stick from its ratchet, and it is drawn back by a spring. The type-pusher or shuttle is held up to work by a coiled spring, which gives it a yielding motion.

1. The combination, with the key-levers of a type-setting machine, of the levers J and L, bar H, shuttle-carriage S, standard A', and spring β, all substantially as and for the purpose herein set forth.

2. The combination, substantially as hereinbefore described, of the type-stick F, type-shuttle S, carriage S, and standard A', and spring G', arranged to operate in the manner and for the purposes set forth.

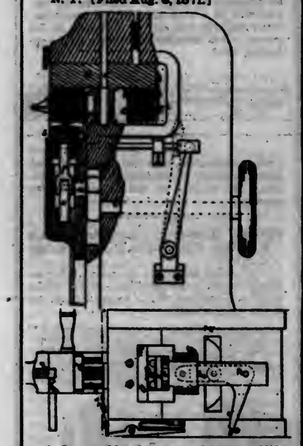
3. In combination with the type-stick F and shuttle S, arranged to operate as described, the lever S' and gate V, for the purpose of transferring the type to the form, substantially as herein set forth and shown.



4. In combination with the type-stick, provided with a ratchet at its rear end, the pawl M', cord *n*, and lever S', arranged to operate as herein described and shown.

5. In combination with the type-stick, ratchet and pawl and lever S', the spring Y, secured to the standard W and pointer O', for the purpose of returning the type-stick to its original position after the type have been transferred to their type-form, substantially as herein set forth and described.

6. In combination with the sliding type-stick and sliding type-pusher, the type-shield W, for the purpose of retaining the type in place upon the type-stick, substantially as herein set forth and described.



167,727. DOVETAILING-MACHINES. Charles P. Bails, New Windsor, Md. (Filed July 6, 1875.)

Brief.—The vertical cutter-head moves laterally to make the double cut.

The combination of the vertical reversing cutter-head, the horizontally-sliding carriage D, made in two pieces and carrying the cutter-head, the horizontal guides C for supporting the carriage, and the vertical adjustable tool B, upon which the guides are placed, substantially as and for the purpose described.

167,728. MANUFACTURE OF BOOT AND SHOE HEELS. Stephen W. Baldwin, Yonkers, N. Y. (Filed Aug. 6, 1871.)

1. In a machine for compacting a set of lifts for a boot or shoe heel independently of the boot or shoe, a nail-hole plate, against which the heel-blank is compacted and consolidated, and a gang of movable punches operating through the nail-hole plate to punch the nail-holes in the blank while under pressure, substantially as described.

2. In a machine for compacting a set of lifts for a boot or shoe heel independently of the boot or shoe, a nail-hole plate, against which the heel-blank is compacted and consolidated, and a gang of drivers for driving the nails, substantially as described.

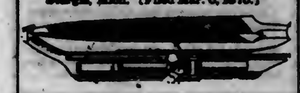
3. In a machine for compacting, punching, and inserting nails in a boot or shoe heel, a perforated plate, against which the heel is compacted and consolidated, and through which it is pointed and loaded, substantially as described.

4. In combination with the nail-hole plate, against which the heel-blank is clamped, and with the clamp-plate *c*, a gang of drivers, by which all the nails are driven and their heads left protruding from the heel-blank, substantially as described, for the purpose specified.

5. In combination with the heel-holding and nail-driving mechanism, the ejectors, substantially as described.

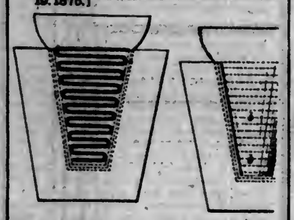
167,729. PEN-HOLDERS. Emile Barberot, Paris, France, assignor to J. Reckendorfer, New York city. (Filed Aug. 31, 1875.)

Brief.—The pen is ejected by revolving either cylinder.



The combination, with the inner tube, its centering ferrule, and retaining prongs or fingers, of the revolving outer tube, held between said prongs at one end, and the ferrule at the other end, as shown and set forth.

167,730. LUBRICATING COMPOUNDS. Bust F. Bartlett, Dunkirk, N. Y. (Filed July 29, 1875.)



The lubricating compound composed of the ingredients and in the proportions as follows: One gallon lard or other oil, five pounds rock-salt, and three pounds of sulphur, all in the manner and for the purpose herein set forth.

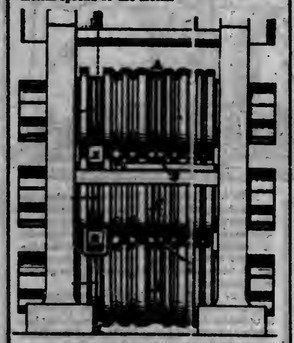
167,731. FILE-HOLDERS. E. Baumgartel, Sturgis, Mich. (Filed Mar. 6, 1875.)

The herein-described file-holder, consisting of the parts A A', adjustably secured together by the bolt and nut B B', and having the ribs and grooves described, each part provided with a socket to receive an end of the file, and a handle, all constructed and arranged substantially as described and shown.

167,732. ELASTIC GORINGS FOR SHOES. H. A. Blanchard, Boston, Mass. (Filed Aug. 19, 1875.)

An elastic goring, consisting of a rubber thread and a sheet of material, united by a sewing-thread, substantially as and in the manner described.

167,733. TOOTH-PICKS. Garret S. Brice, Jersey City, N. J. (Filed June 14, 1875.)



Brief.—The tooth-pick is slipped between the springs, which may be drawn in or out of the case.

The curved springs *d' d'*, set as shown, in the movable tube D, and inclosed within the parts A B C, so as to be thrust out and withdrawn at pleasure, as specified.

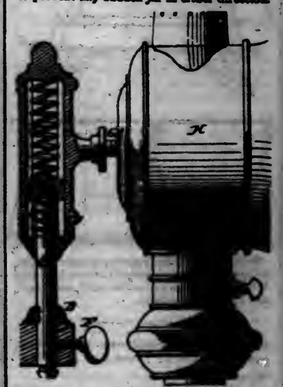
167,734. ROLLS FOR ROLLING METAL. A. B. Belden, Cincinnati, assignor to Wilder, Belden & Co., Cincinnati, Ohio. (Filed June 21, 1875.)

Brief.—The roughing passes or grooves 1, 2, 3, and 4 are each and all provided with small supplemental V-shaped grooves in their upper and lower walls, which tend to guide the bar in its proper path, and also to prevent lateral spread of the metal.

The three-high rolls, having the alternately-grooved passes 1 2 3 4 for the purpose of rolling iron on edge from a mash-bar, in the manner set forth.

167,735. CUSPADORES. George Booth, Philadelphia, Pa. (Filed July 15, 1875.)

1. The bottom D, made of cast metal, and having hollow legs *d d d* to avoid unnecessary weight, and at the same time elevate the vessel, as shown and described.



2. The cast-metal bottom D, having an annular flange, *d'*, for the purpose specified.

3. In combination with a sheet-metal body, C, a cast-metal bottom, D, united to said body by a flange, *c*, lapping over the annular flange *d'*, as set forth.

4. A cast-metal bottom for cuspadores and other vessels, having hollow legs *d d d* and an annular flange, *d'*, as shown and described.

167,736. WAGON-LAMP SUPPORTS. Thos. Boudren and George H. Johnson, Bridgeport, Conn. (Filed July 10, 1875.)

Brief.—Within the support there is a diaphragm pressed upon each end by a spring, to prevent any sudden jar in either direction.

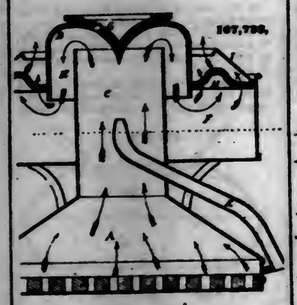
1. In combination with a lamp for vehicles, one or more supports provided with springs arranged with relation to the weight of the lamp, so that they will act in opposite directions, substantially as herein set forth.

2. The combination of the lamp-supporting case A, interior diaphragm B, springs *a a*, and spindle C, all constructed substantially as and for the purpose herein set forth.

3. In a lamp-support, the combination of the case A, springs *a a*, diaphragm B, spindle C, with collar D and the set-screw F, all substantially as and for the purpose herein set forth.

167,737. MEDICAL COMPOSITIONS. Louis P. Brand, New Orleans, La., assignor of one-half his right to Auguste Wilson, same place. (Filed June 1, 1875.)

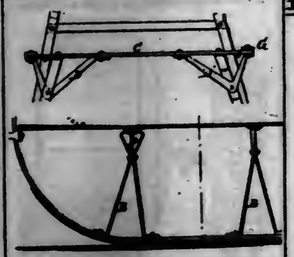
The composition of matter for medicine consisting of simaruba, dog-grass, and nitrate of potassa, substantially as specified.



167,738. SPARK-ARRESTERS. Robert Brayton, David Jones, and Orsino S. French, Fremont, Ohio. (Filed July 13, 1875.)

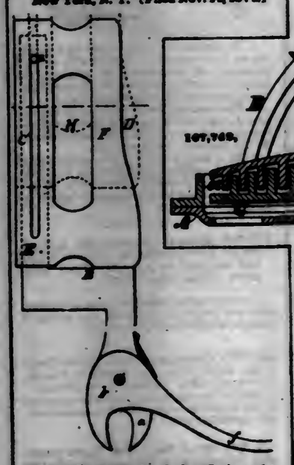
Brief.—The sparks and cinders passing out of the uptake are deflected into a water-reservoir located therein.

1. The base A, fire C, shell D, and removable deflecting-cover G, in combination with the reservoir F, substantially as described, and for the purpose set forth.



2. The herein-described spark-arrester, consisting of the base A, fire C, shell D, door G, wire-cloth H, hood I, exhaust-pipe K, and reservoir F, substantially in the manner as described, and for the purpose set forth.

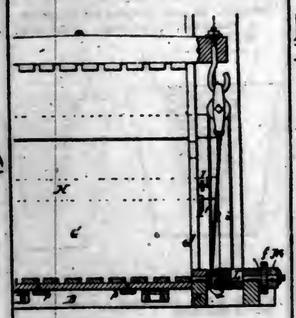
167,739.



167,739. SLEIGH. Thomas Brown, Forest Lake, Pa. [Filed May 3, 1875.]

Brief.—The sleigh is made entirely of spring-steel.

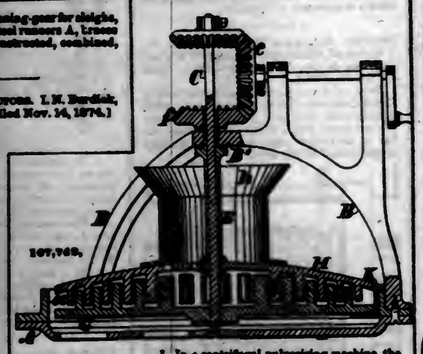
The herein-described running-gear for sleighs, composed of the spring-steel runners A, braces B C D, and guards G, constructed, combined, and arranged as shown.



167,740. WAR-BEDSTEADS. I. N. Burdick, New York, N. Y. [Filed Nov. 14, 1874.]

The nail-extractor herein described, consisting of the parallel shank-sections O' O', having the guide-stud a, and connected by the curved shoulder B, above a b, spring-lever f, and the reciprocating hammer-handle D, having slotted sleeve E, hand-rod H, and gripping portion F, substantially as specified.

167,741. COTTON AND HAY PRESSES. Wm. H. Burgess, Jackson, N. C. [Filed May 6, 1875.]



Brief.—An upright frame has, at bottom, a short winding-shaft on each side, their axes in a line, operating by ratchet-levers, ropes passing through blocks suspended to platen above.

1. The headed bars I F, provided with the pins a a, in combination with the doors G G' and notched bars H H, as and for the purposes set forth.

2. The combination of the windlasses L L, arranged lengthwise of the press, and provided with pulleys d d, the notched levers M M, with bars N N, ratchet-wheels f f, and pawls h h, all constructed substantially as set forth.

167,742. PULVERIZING-MACHINES FOR CLAY AND SIMILAR SUBSTANCES. John K. Caldwell, Philadelphia, Pa. [Filed Aug. 19, 1875.]

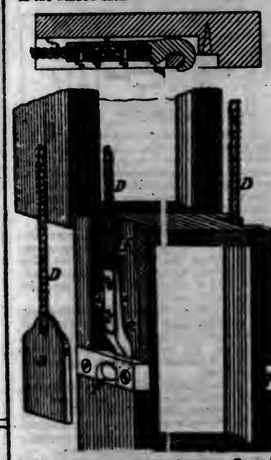
1. In a centrifugal pulverizing-machine, the combination of the fan or convex disk G, and the concave disk H, said disks being armed with steels or projections, revolving in opposite directions, and relatively so arranged that the distance between them diminishes from center to circumference, substantially as shown and described.

2. In a centrifugal pulverizing-machine, the combination of two studded disks revolving in opposite directions in horizontal planes, the steels ff projecting from the faces of the disks, substantially as shown and described.

3. The combination of the base A, standards B B B, shafts O R, gear-wheels e f, and disks G H, combined for operation substantially as shown and described.

4. In combination with the base A, the scraper K, attached to the disk G and revolving therewith, substantially as shown and described.

167,743. RAILROAD-SWITCHES. Dennis F. Cavanaugh, Greensburg, Pa. [Filed July 28, 1875.]



Brief.—A switch in which the movable rails are prevented from accidental displacement, by pressure of flange of wheels, by the employment of a stationary lug or projection, which engages with similar projection on the pitman which connects the rails with the operating shaft.

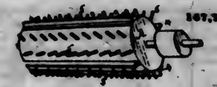
The combination, with the crank-shaft and switch or siding rail B, of the shouldered pitman g and stops h, as and for the purpose specified.

167,744. GAME-CORD FASTENERS. Herbert N. Connor, Philadelphia, Pa. [Filed July 2, 1875.]

Brief.—The end of the cord being securely held in a channeled hook, which works under and engages with a recessed catch-bar in the window-sash.

The combination, with the vertically and transversely recessed sash C, of the recessed catch-bar F and concavely-channeled hook H, provided with the concave-convex plate c recessed thereto by screws f passing through and holding the cord D, substantially as shown and described.

167,745. ICE-PICKS. Martin Corwin, Unionville, Conn. [Filed Feb. 26, 1875.]

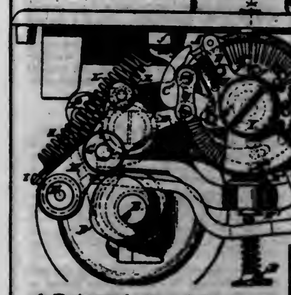


As a new article of manufacture, an ice-pick having a hollow spheroidal-shaped handle, constructed of two parts, and having a polygonal cone formed thereon, whose angles form breaking-edges, said handle being attached to the pick, substantially as shown and described.

167,746. MACHINERY FOR FURNISHING HATBODIES. William H. Orcutt, Philadelphia, Pa., assignor of two-thirds his right to T. W. Hagaman, same place. [Filed Aug. 20, 1875.]

Brief.—Interposes detachable plain-edged fur-plates between the picker-teeth, so as to avoid using expensive fur-plates provided with serrated edges. These plates are less in height than are the picker-teeth, so as to not interfere with the function of the latter.

167,746.



The within-described picker-cylinder, consisting of the body A, sheet-metal fan-plates A, and the picker-teeth B, substantially as and for the purpose set forth.

167,747. SEWING-MACHINES. Cyrus S. Cochrane, Philadelphia, Pa., assignor to H. D. Stoops, same place. [Filed Aug. 20, 1875.]

Brief.—Improvement on Letters Patent No. 165,792. A crown-wheel gears with a pinion on the feed-shaft, and is operated by a vibrating lever, the one end of which is pivoted to the frame of the machine, and the other or free end is connected by means of a link to an oscillating plate, carrying a pawl which engages with ratchet-teeth on the said crown-wheel. A pattern-cam, operated by a pawl and ratchet, is arranged midway between the ends of the lever, and is provided with slots through which drops a pin on the said lever as each slots, during the revolution of the cam, are brought in proper relative position to the said pin, thereby allowing the said lever to vibrate to its fullest extent, which movement revolves the feed-plate and changes the direction of the feed, while at other times this pin rests upon the periphery of the cam between its slots, and the revolution of the feed surface is prevented. The crown-wheel, in addition to the ratchet-teeth on its periphery, is provided with apertures in its side, into which may engage pins, carried by the oscillating-plate that carries the pawls, the engagement of either the one or the other of which pins with the said apertures is regulated by a second plate adapted to be manipulated by hand.

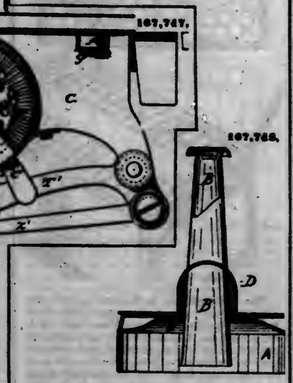
167,747.

1. The improved pattern wheel or cam, consisting of a rotating cylinder provided with slots, openings, or indentations at one end, in combination with the driving-shaft and levers which operate the crown-wheel, which gives motion to the feed-plate, substantially as described, whereby an intermittent rotary motion is imparted to the feed-plate at proper intervals to change the direction in which the fabric is moved, to form the desired configuration of the stitches.

2. The combination of the slotted rotating pattern wheel or cam, the oscillating lever operated by a cam on the driving-shaft, and a pin, pawl, or projection, adapted to drop through the slots on the pattern-cam as they are successively presented, and allow the lever to move to its full extent for the purpose of rotating the crown-wheel, and thus change the line of motion of the feed-plate.

3. The combination, substantially as herein described, of the cam D, attached to the driving-shaft, the lever E, carrying the adjustable pin K, the pattern-wheel M, operated by a pawl and ratchet, and connecting, secured to the driving-wheel, the lever V connected to the lever E, and carrying the pawls A' and D' D', the controlling-lever O', and the ratchet-and recessed crown-wheel W gearing into the pinion of the feed-wheel shaft, all arranged to operate substantially as herein set forth.

4. The combination, substantially as herein set forth, of a cam attached to the driving-shaft, an oscillating lever, operated by said cam and secured by means of a link at its end to an auxiliary lever mounted upon a short journal or stud, secured to the lower part of the machine, the crown-wheel formed with ratchet-teeth on its periphery, operated by said pawl, and a pinion-wheel, into which gears the said crown-wheel, for the purpose of imparting an intermittent rotary motion to the dentated feed-plate, substantially as described.



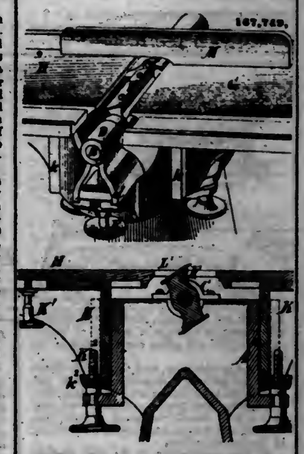
5. The combination, substantially as herein set forth, of the oscillating lever, operated by a cam on the driving-shaft, and carrying an adjustable pin, the slotted pattern-wheel operated by a ratchet and pawl, which derives its motion from a cam on the driving-shaft, and the oscillating pawl-lever and crown-wheel, mounted on a common journal, said pawl-lever being provided with sliding spring bolts or pawls adapted to work into recesses on the face of the wheel and impart an intermittent rotary motion to the same, substantially as and for the purpose set forth.

6. In combination, with said pawl-lever, provided with sliding spring bolts or pawls and the recessed crown-wheel gearing into the pinion-wheel on the feed-plate shaft, a regulating lever for throwing the pawl and sliding bolts and pawls into and out of gear with the crown-wheel for the purpose of varying the motion of the cams to change the pattern of the stitches, substantially as described.

7. The combination, with the driving-shaft and levers E V, and crown-wheel W, operated as described, the driving-shaft O' carrying the feed-plate and its attachments with the levers for imparting a vertical and horizontal reciprocating motion to the feed-plate, substantially as described.

167,748. WASH-BOILERS. Omer Davis, Bourbon, Ind. [Filed Feb. 23, 1875.]

Brief.—The lower chamber is extended above the rack and perforated.



The combination of the receiver A, provided with perforated chamber D, the tube B, and perforated plate O, substantially as shown and described.

167,749. PLANING-MACHINES. William H. Deane and George W. Pearl, Cincinnati, Ohio, assignors to J. A. Fay & Co., same place. [Filed Apr. 24, 1875.]

Brief.—For obviating the use of a third table the gap between the tables at one end of the cutter-head is bridged by a slide, working in a longitudinal groove in one table and a recess in the end of the other. The tables are supported upon brackets arranged in guides on transverse webs upon the columns of the machine, and are vertically and horizontally adjustable, independent of each other, and can be held at any required elevation by set-screws passing through longitudinal slots in the brackets into nuts or taps in the tables, and set-screws supported in lugs on the webs and working in nuts fixed on the brackets.

167,749.

1. The combination of table H, slide I, slotted in a longitudinal groove therein, and table G, having a recess, I', in the end adjacent to table H, substantially as and for the purpose specified.

2. The combination of table G or H, slotted bracket K I', guides h h, screw K', nut I', and screw K', substantially as and for the purpose specified.

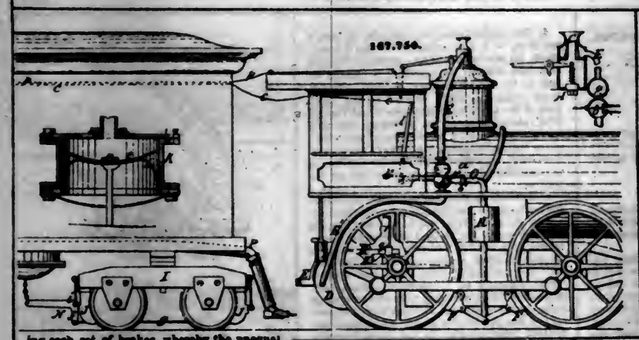
167,750. VACUUM CAR-BRAKES. F. W. Hamon, Watertown, N. Y. [Filed Nov. 20, 1874.]

Brief.—The vacuum is derived from the automatic escape of steam from the boiler, or the safety-valve may be opened by the engineer. The brakes are controlled by a two-way cock, and may be applied from the vacuum-chambers or from the safety-valve. Should the train separate the brakes are put on automatically from a tank on each car. The flexible piston is supported by a metallic plate. A separate cylinder is used for each truck.

1. In a vacuum power-brake for railway-trains, a steam air-ejector, in combination with an automatically-operating valve, substantially in the manner and for the purpose herein set forth.

2. The combination, in a vacuum power-brake, of an automatically-operating steam air-ejector, C, with a storing vacuum-chamber or chambers, D, and the connecting brake-pipes O and F, substantially in the manner and for the purpose herein set forth.

3. The combination of a steam air-ejector, C, and an automatically-operating ejector-valve, A, connected therewith, with a vacuum-chamber, D, or chambers, and an intermediate check-valve, c, substantially in the manner and for the purpose herein set forth.



4. The combination of a steam air-ejector, C, and an automatically-operating valve, A, connected therewith, with a vacuum-chamber, D, arranged upon the locomotive, and a vacuum-chamber or the chambers located upon each car, the brake-pipes O and F, and the two-way cock g, substantially as and for the purpose herein set forth.

5. The flexible pistons I, provided with a re-enforcing-plate, c, which is free from air-connection or edge attachment with said piston, in combination with the vacuum-chamber K, whereby the said plate serves as a shield to re-enforce the flexible piston under the action of the vacuum only in the cylinder, as herein set forth.

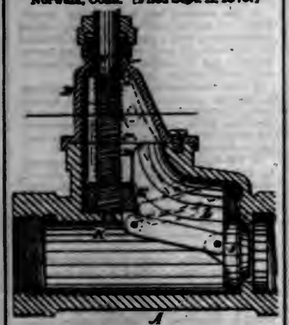
6. The combination, with the flexible pistons I, of the steam air-ejector C, the locomotive and car vacuum-chambers D, and the brake-pipes O, uniting these parts for joint operation.

7. The combination, with the flexible pistons I, of the steam air-ejector C, the locomotive and car vacuum-chambers D, and the brake-pipes O and F, uniting these parts for joint operation.

8. The combination of the separate flexible pistons I, with each truck, one piston operat-

ing each set of brakes, whereby the unequal adjustment or breakage of one set of brakes or levers will not effect the efficiency of the others.

9. The combination, with the flexible pistons I, of the ball-crank connecting-levers N, pivoted to the brake-beams by a swiveling joint, t, whereby both trucks and the levers may have a joint lateral movement or deflection, without injury to or interrupting the working of the flexible pistons.



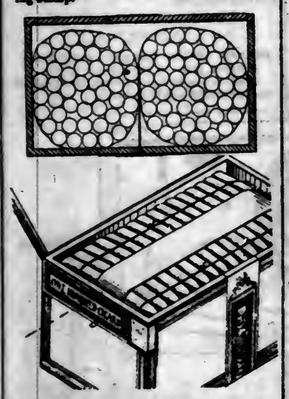
10. The combination of the cock-shifting piston R, the three-way cock Q, and the spring s, with the brake-pipe P, the locomotive vacuum-chamber D, and the steam air-ejector C, whereby the cock may be opened and closed, for the purpose of applying or releasing the vacuum at the will of the engineer.

11. The combination of the three-way cock Q, the vacuum-chamber D, and the brake mechanism of a continuous rod or chain, l, uniting the several cars of the train, whereby the cocks of each car may be opened at once throughout the train by the accidental separation of the train at any point to apply the brake to all the cars.

12. The combination, with the three-way cock Q, the vacuum-chamber D, the braking mechanism, the connecting rod or chain l of the train, of the automatic griping-lever n, whereby the said cock is held open after the separation, to maintain the pressure on the brakes.

13. The combination, with the valve T, of a piston, Y, which is open to the atmosphere, and of a larger diameter than said valve, to keep the latter closed by the pressure of the outer air, substantially as herein set forth.

167,761. STOP-COCKS. Oscar T. Earle, Norwalk, Conn. [Filed Sept. 11, 1875.]



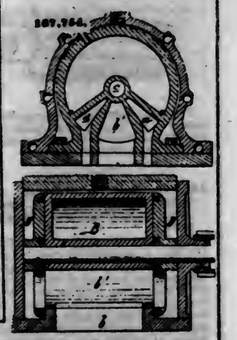
1. The combination, in a stop-cock, of the valve J, connecting-rod I, horizontal spindle-stop and nut-stop K, nut L, located outside the valve-way, and spindle F, substantially as described and shown.

2. The combination, in a stop-valve, of valve J, connecting-rod I, horizontal spindle-top and nut-stop K, nut L, spindle F, ring s working in its groove and against the inner and upper wall of bonnet B, guard D, and handle G, all operating in the manner substantially as shown and described.

167,762. REVENUE-GUARDS FOR CIGAR-BOXES. Oscar T. Earle, New York, N. Y. [Filed Feb. 20, 1875.]

Brief.—The cigars are secured in the box without injury by means of a strip of flexible material placed tightly over, or, preferably, around them, and so arranged in connection with a revenue-stamp, of usual construction, as to have its ends covered and protected by such stamp, whereby the removal of the cigars, singly or in bulk, without destroying the guard-strip, is absolutely prevented, while at the same time the box is left free to open for the inspection of its contents, without involving the rupture or cancellation of the covering-stamp.

The combination, in revenue-guards for cigar-boxes, of a revenue-stamp of the ordinary construction with a ribbon, tape, cord, wire bandage, or other flexible strip attached thereto, and placed under the lid, and arranged over or around the cigars in the box, the ends of such strip, tape, cord, or bandage being passed out through a slot or slots in the box-body or over the edge of the same, and secured directly to the stamp or immediately underneath and in contact with the same, substantially as and for the purpose set forth.



167,763. LOOM-SHUTTLES. A. Edwards, Providence, R. I. [Filed July 2, 1875.]

A loom-shuttle provided with a yielding eye, consisting of a tube, C, which is pivoted as described, and actuated by a spring, D, substantially as and for the purpose specified.

167,764. OSCILLATING BALANCED VALVES. Alonzo W. Eldredge, Big Rapids, assignor of one-fourth his right to Fitch Phelps, Mecosta, Mich. [Filed June 17, 1875.]

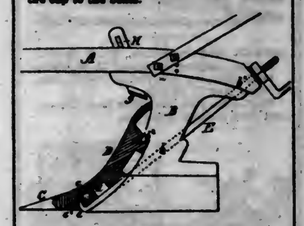
Brief.—A chamber with steam and exhaust ports at both ends receives and exhausts steam through two oscillating valves, which face each other.

The valves D D, constructed as described, and mounted upon the rock-shaft C, in combination with the hollow elevated valve-seat B, provided with the ports *a' a' b'*, substantially as and for the purpose set forth.

167,765. PROCESSES AND APPARATUS FOR PREVENTING THE ACCUMULATION OF TARRY HYDRAULIC MAINS. David H. Fox, Reading, Pa. [Filed July 20, 1875.]

Brief.—Jets of steam are forced down into the tar in the hydraulic main, keeping it agitated and in a liquid state, so that it will readily flow off by the waste-pipe. Jets of water are forced in opposite directions diagonally across the gas-ascension pipe rising from the main, for the purpose of condensing and washing down the tar. A pipe with stop-cock extends from the top of the vaporizer to the tar-tank

1. For the purpose of preventing the continuous deposits of carbonaceous matter or tar in the hydraulic main B from becoming too thick or stiff to flow freely out through the usual tar-line waste-pipe *b'*, the process of injecting live steam down into the liquid contents of said main, and thus, by the constant agitation and the consequent intimate mixing of the steam with the carbonaceous matter in the main, keeping the contents in a freely fluent condition, as herein before set forth.

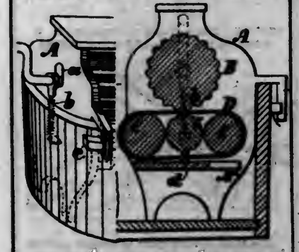


2. The apparatus consisting of the steam-pipe E provided with a plurality of lateral pipes, *c' c'*, opening into the interior of the hydraulic main, and receiving steam from any suitable generator, substantially as and for the purpose hereinbefore described.

3. The cold-water jet pipes 2 2, horizontally arranged to inject sprays of cold water in opposite directions into the take-off pipe D from any suitable pressure-source, substantially as and for the purpose described.

4. The pipe I, provided with the stop-cock *f* at its upper end, in combination with the steam-heated vaporizer H, provided with a stop-cock, *h'*, near its upper end, and the tar-tank G, having the lower end of said pipe I immersed in the liquid in said tank, the said parts being constructed and arranged substantially as set forth, for the purpose of relieving the vaporizer H from the pressure of vapor by opening the stop-cock *f* as soon as the stop-cock *h'* shall be closed, especially at the close of the day's work, as described.

167,766. PLOWS. Irvin Freeman, Corpus Christi, Tex. [Filed Sept. 3, 1875.]

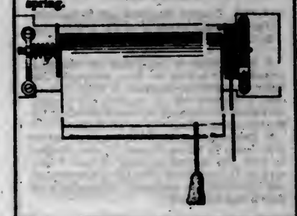


Brief.—Point and mold-board secured to the frame by a hook-bolt from the under side, which also is used to fasten the rear end of the cap to the beam.

1. The combination of the mold-board, provided with the slotted projecting hook D', and the share C, having the recessed projection c, with the oblique hook-rod E and skeleton S, having lip *b'*, as shown and described.

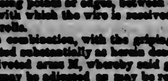
2. The combination, with a share recessed on the under side, and the skeleton having lip *b'*, of the hook-rod E, passing through the rearward-projecting portion *b'* of said skeleton, and securing it to the beam, in the manner specified.

167,767. WASHING-MACHINES. G. Friend, Philadelphia, Pa. [Filed Aug. 2, 1875.]



1. The improved washing-machine herein described, designed for attachment to a common crank-bolt, and consisting of the frame A A A' A', having the rollers O O and B, the former provided with the endless band D, held in place by holding-pins *d d*, and the latter having spring-bearings in the vertical slots *a a*, with the L-shaped clamps E E resting upon the edge of the tub, and notched on their depending arms, and wedges *e e*, the several parts being constructed and combined for operation substantially as shown and described.

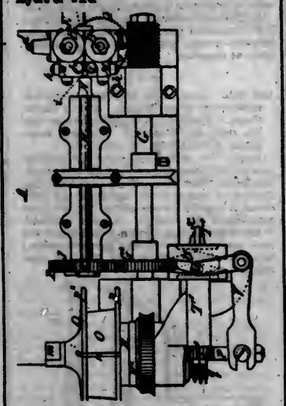
2. The combination, with the frame A A of a roller washing-machine, of the L-shaped clamping-arms E, having notches in their depending portions, and the curved wedge *e*, corresponding to the cylindrical form of the tub, substantially as shown and described.



167,768. CURTAIN-FIXTURES. L. H. Gunn, New York, N. Y. [Filed Apr. 6, 1875.]

Brief.—At one end of the roller a spiral spring presses against the bracket, and at the other end of the roller the bracket is made box-shaped, to receive one or more pieces of rubber, through which the journal of the roller passes, and against which rubber a washer is pressed by the action of the coiled spring.

The roller a, pulley a, spring g, washer h, rubber i, and box-shaped bracket, when all are combined for operation substantially as specified.



167,769. ROLLING-PINS. John R. Osborne, Washington, D. C. [Filed Jan. 28, 1875.]

The rolling-pin, consisting of the cylindrical shank C, two sides parallel, or nearly so, forming an ink-reservoir at E, and the rounded point D, all constructed substantially as and for the purpose specified.

167,770. MACHINES FOR SCREW-THREADING WIRE. Louis Cobbs, Boston, Mass., assignor to the American Cable Screw Wire Company, same place. [Filed Aug. 27, 1875.]

Brief.—The machine comprises a pair of feed-rolls, griping device—viz., a pair of sharp-edged revolving horizontal disks, a hollow revolving shaft, having a nose-piece, in which the cleaner is located, a revolving and laterally-reciprocating rod, and devices for gradually reducing the speed of the reel to the varying circumference superinduced by the successive layers of wire.

1. In a machine for cutting screw-threaded wire in indefinite lengths for use in the manufacture of boots and shoes, the combination, with the feed-rolls and a revolving cutter, of intermediate griping and straightening devices, co-operating to hold the wire and prevent it from turning or twisting while under the action of the cutter.

2. The combination, with the griping and straightening devices whereby the wire is held from turning or twisting, of a hollow nose, *i*, projecting from the cutter-head H in line centrally with the feed of the wire, and lying close to and between the griping devices, to form thereby a continuation of the holding and straightening device, and present the wire firmly for the action of the revolving cutter.

3. The griping and holding devices for the wire, consisting of rolls provided with circumferential grooves *g* and fine or blades *f*, resiliently arranged to form a series of holding and pressing points or edges, between and in contact with which the wire is received from the feed-rolls.

4. The combination, with the griping-rolls constructed substantially as herein described, of the pivoted arms M, whereby said griping devices may be adjusted as may be required to give a proper pressure upon the wire.

5. The combination, with the revolving cutter-head H and the hollow receiving-nose *i* thereof for the wire, of the cutter L in the slotted head, arranged to form the thread at the point where the wire leaves the nose *i* and enters the slot *j*, substantially as and for the purpose described.

6. The cutter L, constructed as described and shown.

7. The combination, with the feed-rolls B B, the griping devices, and the revolving cutter-head, of the hollow driving-shaft H, in line with the feeding and griping devices, and forming a continuous support therefrom for the threaded wire to the spooler.

8. The feeding-rolls B, in combination with the long-shouldered boxes D, adapted to fit in the recesses *b* in the frame, and the adjusting-screws *d*, substantially as and for the purpose described.

9. The combination, with the feeding-rolls B and their shaft-carrying boxes D, of the gear-wheels E F F' and the worm F of the counter-shaft G, whereby a definite feed of the wire is obtained.

10. The combination, with the train of gearing G' I J K, connecting the revolving cutter-shaft H with the counter-shaft G, of the worm F and cog-gearing E F' F' of the feed-rolls, whereby the latter are driven directly from the hollow driving-shaft.

11. The combination, with the revolving screw-cutter k and its hollow receiving and containing shaft H for the wire, of a spooler, O, having a movement at right angles to the line of the threaded wire, and adapted to receive said wire as it is delivered from the revolving cutter-shaft.

12. The combination, with the screw-cutting, wire-feeding, and delivering devices, of a spooler for the wire, having a removable end disk, Q, substantially as and for the purpose herein set forth.

13. The combination, with the screw-cutting, wire-feeding, and delivering devices, of a spooler constructed with a removable end disk, Q, and a slightly-tapering hub, O, substantially as and for the purpose herein set forth.

14. The spooler O, provided with the grooves a and *c* in its body and flanges, substantially as and for the purpose set forth.

15. The combination, in a spooler for receiving and coiling screw-threaded wire from a hollow cutter-shaft, of a friction device, operating automatically to regulate the speed of the spooler according to the varying diameter of the coil, substantially as herein described.

16. The combination, with the spooler and the friction-disk R, of the pins *s s*, whereby the spooler is united to the friction-disk, but is free to have an axial movement with its carrying-shaft.

17. The combination, with the spooler and the friction-disk R, of the bushed gear-wheel S', the sleeve S, and worm T on the counter-shaft G, whereby the spooler receives its maximum speed, yet is independent of the positive action of the gear by reason of the friction device.

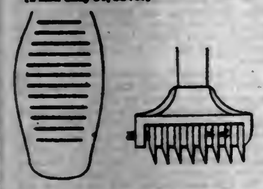
18. The combination, with the spooler and the bushed driving-gear S' and the support for the friction-sleeve S, of a friction device having a yielding or combined pressure upon the friction-disk R, and ring *r*, substantially as and herein set forth.

19. The combination, with the spooler and its axially-movable shaft P, of the ball-crank device V, its operating-cam U, gear-wheel T', and the sleeved worm-gear T', whereby the spooler is moved back and forth, substantially as herein described.

21. The combination, with the screw-cutting, wire-feeding, and delivering devices, and a spooler having a compound rotary and an axial movement, of a cam, U, constructed to give said spooler and its shaft a movement equal to the width of the coil, substantially as herein set forth.

22. The combination, with the cam-driving shaft P and the spooler, of a cam, U, made fast to its shaft T', and unclamped therefrom by the means and for the purpose herein set forth.

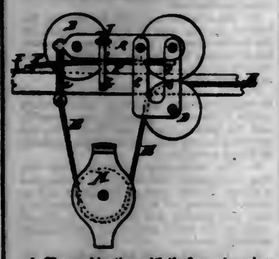
167,771. WASHING-MACHINES. George W. Grubb, East Coventry, Pa. [Filed Apr. 12, 1875.]



1. In a washing-machine, the combination of a vessel having sides *f f*, inclined outward from the rear to the front, with a detachable vibrating rubber, E, as set forth.

2. The combination of the vessel W and its inclined base with a frame or stand on which the said vessel may be adjusted, substantially as and for the purpose herein set forth.

167,762.

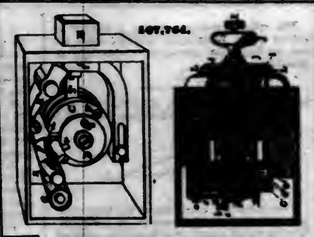


167,762.—HANDLES FOR HOOPS AND HOOPS. Charles F. Hill, Baltimore, Md., assignor to himself and George D. Hill, same place. [Filed May 31, 1875.]

1. As a new article of manufacture, an intermediate having transverse slits to increase its flexibility, substantially as described.

2. The knife-blades *c c*, arranged in an order corresponding to the outline of the ball of a cake, so that the longest blades shall be in the center, and the shortest at the respective extremes of the curve, substantially as and for the purpose specified.

167,763.—HOISTING APPARATUS. Nicholas W. Hoffman, Lebanon, N. J., assignor of one-half his right to Jos. Hoffman, same place. [Filed Mar. 31, 1875.]



1. The combination, with the frame A, spring J, hooks G, and the hook F, provided with sloping ways *f'*, of the step I and sheave H, all constructed and operating substantially as shown and described.

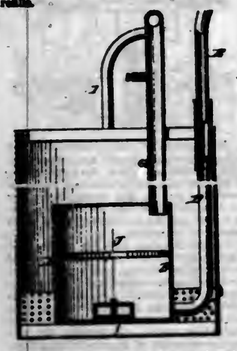
2. The combination, with the frame A, sheave D, rope or fall B, sheave H, and cord *c*, of the spring *d*, hooks G, sliding hook F, provided with sloping ways *f'*, and the step I, arranged and operating substantially as shown and described.

167,764.—CONDENSER-LOCKS. Hermon C. Hervey, Ayer, Mass. [Filed Apr. 28, 1875.]

Brief.—The lock is provided with projecting arms that engage with pins on the tumbler-wheels, so as to distribute or discharge the said wheels to the act of unlocking the bolt.

167,764.

1. The adjustable graduated ring I, with its flange *i*, in combination with the knob J, sliding pins *j*, and conical pointed set-screw J, whereby the graduated ring may be released and readjusted to any position desired, substantially as described.



2. The pawl F, with its detent *e* and finger *e*, the weighted lever G, with its projections *l l'*, and the connecting-arm E, with its detent *c*, in combination with the notched driving-wheel D, and the notched combination-wheels C' C' C', substantially as and for the purposes set forth.

3. The combination of the driving-wheel D, with its pin *c*, the connecting-arm E, with its curved projection *b* and detent *c*, the pawl F, with its detent *e*, and the locking-lever H, with its projection *d*, substantially as set forth.

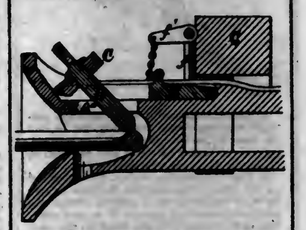
4. The combination of the distributing-arms T T', connected with the bolt B, and the combination-wheels with their pins *g*, substantially as described.

167,765.—APPARATUS FOR SUPPLYING LOCOMOTIVES WITH WATER. Henry Howe, Council Bluffs, Iowa, assignor of one-half his right to Walter R. Vaughan, same place. [Filed June 26, 1875.]

Brief.—The steam, entering either supply-pipe at will, presses down the float in the tank, and forces water through the discharge-pipe. The cut-off valves are so arranged that when steam is applied to one of the flexible pipes connected the valve in the other is closed. When steam is shut off that remaining in the tank condenses, not being allowed to escape; then a vacuum being created the tank soon refills.

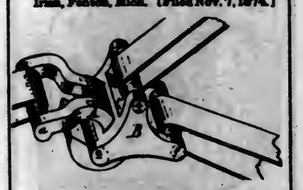
The combination of the submerged tank B, having float J and valve C, the pipe G and steam-pipe H, having flexible pipes I I, with valves *a a*, and the pipe D, having swiveled spout E, all used for supplying water to the tender by means of steam from the locomotive acting upon the float in the water-tank, substantially as set forth.

167,766.—PROCESSES OF MANUFACTURING TWIST-DRILLS. Charles B. Hunt, Springville, Pa. [Filed May 1, 1875.]



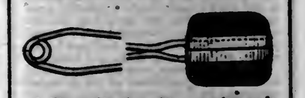
The process of forming a twist-drill consisting in tempering the blank, then forging or hammering it into the form of two straight grooves with a curve at top and bottom, then twisting it while hot, and again hammering and tempering it, substantially as described.

167,766.



167,767.—CAR-COUPLINGS. W. R. Hunter, Toledo, assignor to himself, B. W. Kelly, Painesville, and J. G. Fisher, Toledo, Ohio. [Filed May 17, 1875.]

Brief.—The yoke has within its ends a pivoted block fastened to the pin.



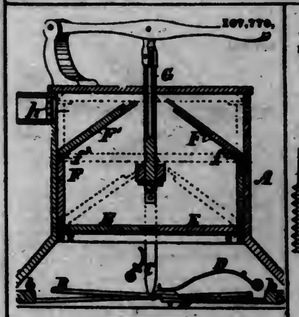
The hereinbefore-described car-coupling, in which the draw-bar A, yoke B, pivoted block C, and coupling-pin D are constructed, combined, and operate in the manner and for the purpose specified.

167,768.—NECK-YOKE COUPLINGS. N. B. Irish, Fenton, Mich. [Filed Nov. 7, 1874.]

The hook A, having the bifurcated ends of its shank connected by a pin, *a*, in combination with the casting B, provided with pins *c*, *c'*, *c*, and *f*, for the purpose set forth.

167,769.—SOAP-HOLDERS. Wm. J. Johnson, Newton, Mass. [Filed July 12, 1875.]

1. The combination, with a soap-box made in two parts, as set forth, of A spring-wire handle having one of its ends attached to one part of the box and the other to the other part of the box, and formed substantially as shown and described, so that while normally holding together the two parts of the box the pressing together of its outer portion will force the offset of separating said parts, as specified.



2. The combination, with the wire-wire ends A A and flanges, of spring-wire handle C, substantially as and for the purposes set forth.

167,770.—CARPET BEATERS AND CLEANERS. Julius Lotz, Philadelphia, Pa. [Filed Aug. 2, 1875.]

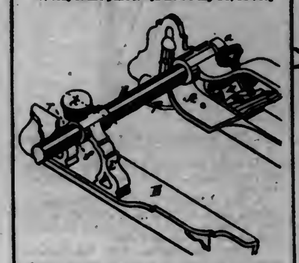
1. A machine or apparatus for cleaning carpets while laid on the floor, embracing the following instrumentalities: A light box or case, a series of rods or beaters, and a valve or valves for drawing up the dust raised by the beaters, substantially as set forth.

2. The combination of the series of beaters B B, frame F, valves H and H', and plunger G, with the tappets C, arms *c'*, bars I, and springs D, the several parts being constructed and combined for operation, substantially as shown and described.

167,770.

167,771.—BALANCING TOYS. Fredk. Marbee, Philadelphia, Pa. [Filed Aug. 4, 1875.]

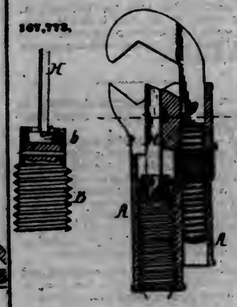
Brief.—Relates to the method of attaching the balancing-weight.



1. In combination with the stand B of a balancing toy, the weight B, having a neck, *c*, for insertion in said stand, as shown and described.

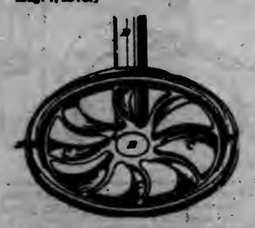
2. The combination of the stand B, having ears *f f*, the weight B, having a neck, *c*, and the disk D, passing through said ears and neck, substantially as shown and described.

3. A balancing-weight, B, formed with a neck, *c*, for passing through a stand, and an opening for the passage of an axis, said weight and neck being cast or formed in one piece, substantially as and for the purposes shown and described.



167,772.—CARPENTERS' PLANES. Matthias C. Mayo, Boston, Mass., assignor to J. G. Weld, same place. [Filed July 14, 1875.]

1. The divided clasp C, provided with bearing C', slot *f*, and clamping-screw *d*, adapted to hold and embrace the arm D of a stock, A, substantially as shown and described.

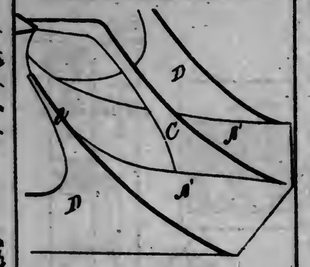


2. The combination, with the curved plate C, provided with a lip or flange, *c*, of the cutter I, pivoted clamping-lever H, provided with concave enlargement *c'* and adjustable gage E, substantially as shown and described.

167,773.—PIPE-CUTTERS. Francis I. Meade, Philadelphia, Pa. [Filed Apr. 17, 1875.]

A pipe-cutting instrument, in which are combined a screw-stem, B, a cutter, H, having an enlargement, *d*, and a flanged ferrule, *b*, by which the said enlargement is connected to the stem, the whole being adapted to the body A of the instrument, as set forth.

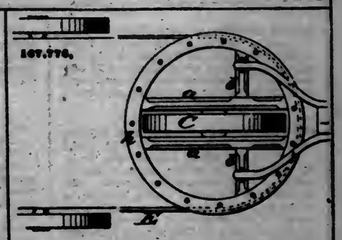
167,774.—CHUCKS. Jacob W. McClure, St. Louis, Mo., assignor of one-half his right to William H. Garrett, same place. [Filed Aug. 7, 1875.]



1. The chuck-shaker formed of hub A, inclined radial spokes or vanes C, and rim D, having circular recess D', as and for the purpose set forth.

2. The combination of the propeller-shaker C D, firmly attached to shaft H, and short-curving hand-sleeve or handle E, substantially as and for the purpose set forth.

3. The combination of the rotatory shaker A C D and shaft H, with handle E, and bolt *c*, as and for the purpose set forth.

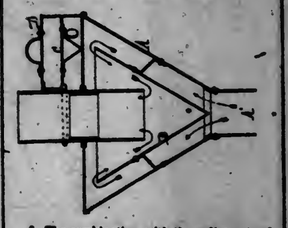


167,775.—SNOW-PLOWS. S. B. Miner, St. Peter, Minn. [Filed Apr. 10, 1875.]

The double-inclined shovels A' A' extending to the front end of the plow, in combination with the inclined cutter C, wings D D, and mold-boards *b b*, whereby the snow is carried rearward and discharged laterally on each side of the track, substantially as described.

167,776.—THERM-WHEELED DRAFT. John W. Miner, Middleborough, Mass. [Filed Mar. 20, 1875.]

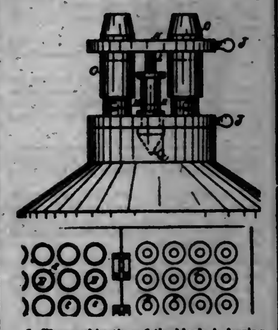
167,776.



1. A third or guiding wheel, C, having its axle-bearings in bars which are rigidly secured to a horizontal flanged ring movable about its axis, in combination with the embracing-strap E, secured to the bed A of the vehicle, substantially as described.

2. The flanged ring formed of two metal flanges, *b b*, bolted to an intermediate wooden body, *g*, and applied to the bed A, substantially as described.

167,777.—HEATING-DRUMS. Frank Munson and L. B. Dick, Buchanan, Mich. [Filed June 17, 1875.]



Brief.—The shelf is supported on the drum and can be revolved around the pipe.

1. The combination, with the radiator A, of the shelf C, supported above the surface of said radiator, and capable of a complete revolution around the stove-pipe, substantially as described and shown.

2. The combination, with the radiator A, of the shelf C, supported above the surface of said radiator, and the cover D, substantially as described and shown.

167,778.—CARTRIDGE-LOADING DEVICES. Warren Noyes, Gorham, N. H. [Filed Mar. 10, 1874.]

1. The combination, with the plate F, the powder or shot cup and fixed cover-rod L, & with cover H, the charger I, outer shells C, and inner registered shells, and cut-off valves J J, substantially as and for the purposes set forth.

2. The cartridge-filling device herein de-

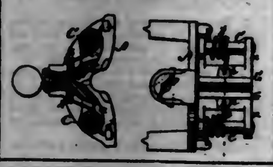
scribed, consisting of the perforated base A B C, having cushioned and hinged cover D and E, and the powder-and-shot case provided with adjustable charges, as described, and the rammer F G H, when combined to operate substantially as and for the purposes set forth.

167,779. ARTIFICIAL LEGS. Jos. O'Brien, Kalamazoo, Mich. [Filed Dec. 20, 1874.]

Brief.—A flat spring, bearing upon the inner end of the lever-arm, brings it back to position when forced in either direction. The movement of the heel is guided by a curved recess, on which the end of a metallic arc works. This arc of metal is secured to the leg portion above the heel, and has connected with it a spring to throw the heel forward. A metal-valve turns upon the leg portion in pivoted between circular chocks upon the thigh portion, and heel secured to it a pendent plate. A spring within the leg portion works between this upon a crescent-shaped cross-bar.

1. The toe-section D, pivoted to the section C at *a*, in combination with the knuckle articulation, the spring *s*, the step *s'*, and the bearings *b*, substantially as described.

2. The foot C, connected to the leg-section B by means of a ball-and-socket joint, in combination with the arc *f* and spring *g*, substantially as described.



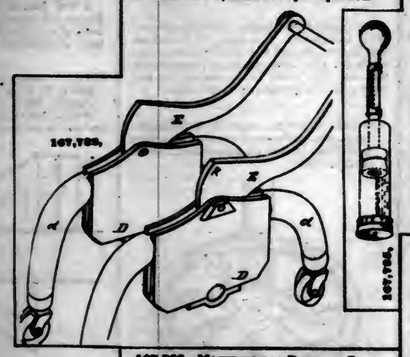
3. The ankle-shield E, attached to the foot by means of side springs *h*, substantially as described.

4. The semicircular tenon G, pivoted between the cheeks I I, and having the patella-plate *j* secured to it, in combination with the spring K and the cross-bar J, substantially as described.

167,780. PRINTERS' GROOMS. A. J. O'Hara, Jersey City, N. J. [Filed July 30, 1875.]

A printers' quoin, composed of a guide-frame, A, follower B, and screw C, which extends in the cross-bar of the guide-frame, all combined and operating substantially as shown and described.

167,781. HEMP-HOLDERS. John D. Owen and Geo. M. Coulter, Mattoon, Ill. [Filed Jan. 20, 1875.]

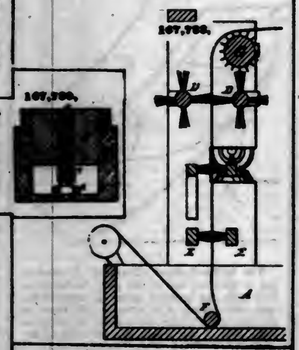


The combination, with the bed-plate A, having clamps for securing it to the desk-board, of the independently-acting cams G G having lugs *a b*, springs *b b*, and hung on posts O O, all as set forth.

167,782. SEWING-MACHINE CASTERS. L. A. Parker, Norwalk, Ohio. [Filed June 26, 1875.]

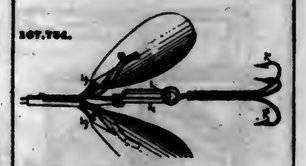
Brief.—A transverse sliding bar, carrying a pair of casters, works within a slide-box secured to the treadle-shaft, there being one arranged on either side of the sewing-machine table. A cam-lever with projecting handle is pivoted within and near the top of the slide-box, and serves to actuate the bar, forcing it down to raise the machine on the casters, or, by releasing it, rests the weight thereof on the feet of the table in normal position.

The combination, with the caster-feet and transverse sliding bar *c*, of the cam-lever E, and slide-box D, substantially as specified.



167,783.

167,783. MACHINES FOR PAINTING GLOVE. Henry H. Phillips, Suffolk, N. Y. [Filed July 10, 1875.]



Brief.—Delivery-roller is armed with spurs, over which the fabric is intended to pass without nearing the surface.

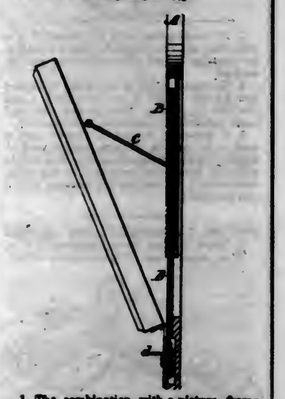
1. The zinc-rest A, having the guide F, in combination with the stationary brushes B B and rotary brushes D D, arranged on opposite sides of the fabric to be cleaned, and roll G, armed with points, substantially as and for the purpose set forth.

2. The combination, with a outer or zinc rest and its contained guide, of a bearing-roll G, having its cylindrical surface composed of bearing-points over which the fabric passes, for the purpose set forth.

167,784.

The above-described spoon-hook, having, in combination with rod *r* and hooks *a*, the sliding and revolving sleeve *s*, with two spoons directly opposite each other, attached thereto by hinges *s*, supported by springs *s*, substantially as and for purpose set forth.

167,785. SPHYGMOSCOPE. W. R. Pond, Stockton, Cal. [Filed Aug. 30, 1875.]



1. A sphygmoscope provided with a terminal or indicator tube, whose outer end terminates in a bulb or enlarged chamber closed to the atmosphere, substantially as set forth.

2. The combination of a fluid-receptacle, a terminal or index tube, and a bulb or air-chamber closed to the atmosphere, and communicating with said tube, substantially as set forth.

3. In a sphygmoscope, the combination, with the terminal or indicator tube, of a scale adjustable thereon, substantially as set forth.

4. The combination, with the fluid-receptacle, of a terminal tube or indicator, provided with a piston end, and fitting and movable in the fluid-receptacle, to regulate the height of column in the instrument, substantially as set forth.

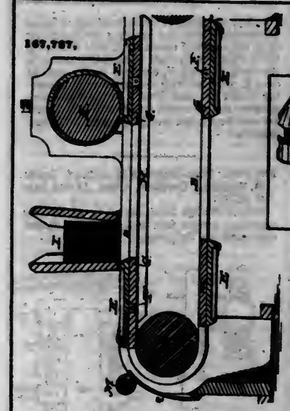
167,786. DEVICES FOR HANGING PICTURES, MIRRORS, &c. Harvey D. Fogg, Dayton, Ohio. [Filed Aug. 30, 1875.]

1. The combination, with a picture-frame or mirror, of the links C and a sliding bar, D, to which the lower part of the frame or mirror is hinged, as and for the purpose described.

2. The combination of the holder case B, having teeth or notches *a*, with the sliding bar D, having a rod, *b*, pawl *c*, and latch *d*, as and for the purpose described.

3. The combination, with the picture-frame, of the links C, sliding bar D to which the picture-frame is hinged, the rod *b*, pawl *c*, latch *d*, and case B, having teeth *a*, for the purpose described.

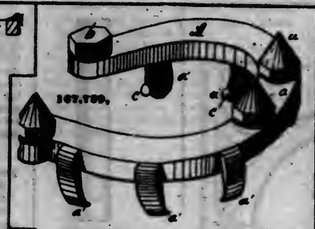
167,787. PRINTING-PRESSES. Alex. R. Rodgers, Westchester, D. C., assignor of one-half his right to Daniel Reed, same place. [Filed Apr. 24, 1876.]



Brief.—An endless belt, carrying several forms, passes under the hopper, from which a card is taken and held over the bed by the fingers, and carried under the impression-roll, when it is deposited into a suitable receptacle.

1. The endless apron or belt B, having forms E attached thereto, in combination with the ink-roller M, the impression roller or cylinder K, and the card trough or hopper I, substantially in the manner and for the purposes set forth.

2. The automatic feed-fingers or card-separators O, in combination with the shields R, to protect them from ink in passing the ink-roller, substantially as set forth.

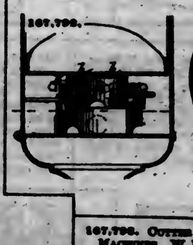


167,788. SHUT-MILLS. William Richmond, Thomas Lyon, and Jas. McGill, Lockport, N. Y. [Filed Apr. 17, 1875.]

Brief.—Arrangement of parts to secure accurate adjustment of the brushes.

1. In combination with the horseshoe A, the pallet *a*, having their faces countersunk, substantially as described.

2. In combination with the base A of a horseshoe, the fastening-lugs on opposite sides, provided, respectively, with the horizontal inwardly-projecting screws *a*, and the inwardly-projecting flanges *a'*, whereby said shoe may be fastened and unfastened by merely turning the screws against the side of the hoof, substantially as described.



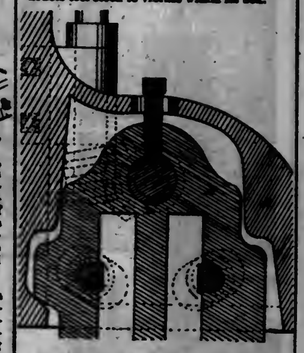
167,789.

167,790.

167,790.

167,791.

The combination of the frame A, exterior hollow box B, having the slide b, with the cutter C, double springs *c c'*, and marker D, all constructed and operated substantially as and for the purpose hereinbefore set forth.



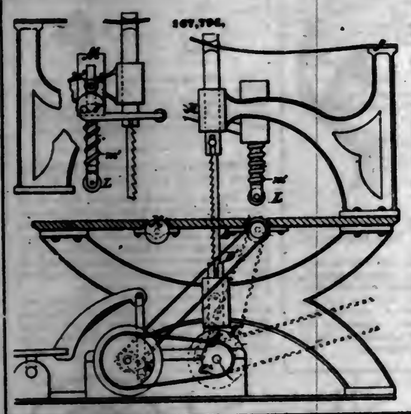
167,792. LAMPS. Bennett B. Schneider, New York, N. Y. [Filed Aug. 12, 1875.]

1. The oil-reservoir provided with an independent locking-stop for operation in connection with a locking-slot or opening in the receiver, in combination with a separate connection for the valve in the bottom of the reservoir, whereby the closing of the valve is insured when unlocking the reservoir to remove the latter, essentially as described.

2. The combination, with the valve F, constructed to turn and at the same time move axially, of one or more spiral grooves, *h*, and tents or projections *i*, substantially as and for the purposes specified.

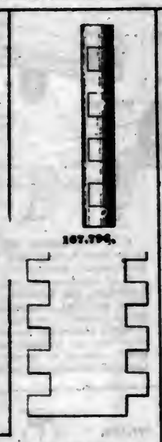
167,793. CUTTER-HOLDERS FOR PLANING-MACHINES. W. Bell Smith, Charleston, S. C. [Filed July 17, 1875.]

Brief.—The worm and wheel cause the double tool-stock to vibrate within its box.



The box A and double tool-stock B vibrating in same, in combination with worm and worm-wheel, all constructed and operating substantially as and for the purpose described.

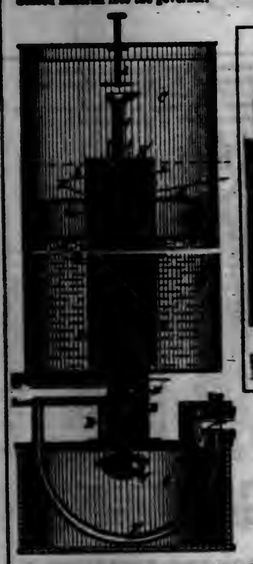
167,794. SCROLL-SAWING MACHINES. H. Smith, Philadelphia, Pa. [Filed July 27, 1875.]



Brief.—The pressure-roller is supported in bearings attached to the lower part of a rod vertically adjustable in a post secured to an arm projecting above the table. The roller is held down by a spiral spring operating upon the rod, to which it is connected and can be raised, when required, by a pivoted cam-lever, working against an anti-friction roller secured to a short shaft on said rod.

The pressure-roller *k*, held down by the spring *m'*, in combination with the cam-lever *l*, for raising it when required, substantially as set forth.

167,796.

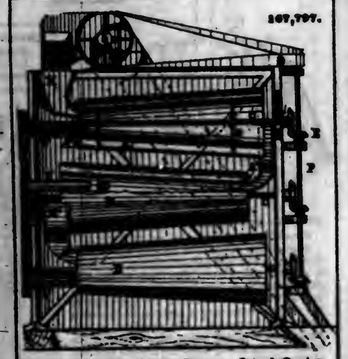


167,796.

167,796. GAS-GOVERNORS. WM. D. SHOW, Brooklyn, N. Y. [Filed Aug. 20, 1875.]

Brief.—The hollow valve is carried by a tubular stem attached to the float, and projecting upward to admit of the insertion of shot, whereby the center of gravity of the valve and float is kept as low as possible. The siphon-trap prevents the entrance of condensed material into the governor.

1. The gas-holder float, consisting of the body H, dome H', and sheath S, tube t, and hollow ball-valve V, all constructed and combined in the manner and for the purposes specified.



2. The combination with the float H H' S, tube t, and valve V, of the chamber O', valve-seat tube E, and cones D, perforated at top with holes f, and laterally with holes h, all constructed and arranged as and for the purpose specified.

3. The combination, with a gas-governor, of the siphon-trap T, connecting the inlet and delivery pipes, to prevent the entrance of condensed matter into the governor, and provide for its escape into the meter in the manner described.

167,796. MANUFACTURE OF METAL TUBING. Daniel M. Somers, Brooklyn, N. Y. [Filed Apr. 12, 1874.]

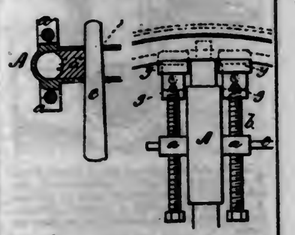
The method of making short metallic tubing by bending a blank of metal into a tubular form, then coating its entire surface with soft metal or alloy, which unites its edges, and then forcing the same by a mandrel through dies, substantially as described.

167,797.

167,797. GRAIN-DRIERS. Joseph Boutar, Buffalo, N. Y., assignor of two-thirds his right to Chas. Lenfest and G. A. Phillips, same place. [Filed Aug. 2, 1875.]

Brief.—The conveying-drums are provided on their interior surfaces with longitudinal elevating ribs. An air-blast is forced through the dust and its branches.

1. In a drying apparatus, the combination, with a suitably arranged frame, of the conical non-perforated drums arranged one above the other, and revolving with their axial lines in a horizontal plane, with the larger end of one drum opposite the smaller end of the next, substantially as described.



2. In a drying apparatus, the combination, with the non-perforated conical shell B, of the longitudinal radially-projecting ribs A', spiders D, and the shaft C, said shaft being arranged horizontally within a suitable frame, and rotated by mechanism, substantially as described, for the use and purpose set forth.

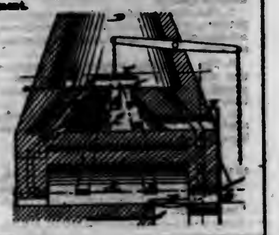
3. In a drying apparatus, the combination, with the drums B, arranged horizontally within a suitable frame, of the hopper K', hot-air duct R, and receiver L, said drums consisting of conical non-perforated shells, having spider-arms D and shafts C, and the inwardly-projecting rim A", and revolving in a horizontal plane, substantially as described, for the purpose stated.

4. The combination, with the skeleton frame X, provided with the bearings for the shafts C, of the series of revolving drums B, having bevel-wheels E on their ends, connected with the upright shaft F, hoppers K K', and the duct R, provided with the branches U, extending within the said drums B, the whole constructed and arranged substantially in a manner and for the use and purpose set forth and described.

167,798. TIRE-SETTING MACHINES. Irwin H. Spelman, Cortland, Ohio. [Filed July 3, 1875.]

Brief.—Wedge locks device to spoke. By operating screws felly and spoke are forced apart and tire tightened.

The U-shaped spoke-plate A, having threaded ears a a and slots c, the slide-block d, having grooves f h, the set-screws g having swivel-caps g, and the wedge e, all constructed and combined as described.

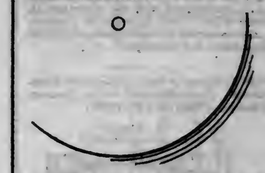


167,799. CORRUGATED COLLARS AND MUFFS. Christian Stutzmann, New York, N. Y. [Filed Jan. 20, 1875.]

In a combined collar and muff, the flexible supporting-piece O arranged between the front and lining of the collar and muff, and extending the entire length of the collar-piece and entirely around the muff, substantially as described, whereby the shape of the latter and the collar is preserved, as and for the purpose specified.

167,800. FURNACES FOR THE MANUFACTURE OF IRON AND STEEL. DEDICT FROM CHR. WILLIAM A. STEPHENS, Bordentown Station, N. J. [Filed Mar. 4, 1875.]

Brief.—By the flame gases from the lower chamber are admitted, either to the upper chamber or the stack. The ore roasted in the upper chamber is passed by flues to burners which carry it to chamber A for further treatment.

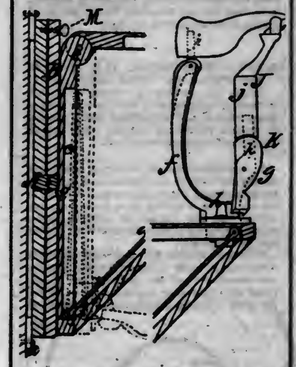


1. The combination, in a furnace for making iron and steel, of the lower arched chamber A, the fire-place B, stack D, and the conical ore-chamber C, superposed between the stack and the arched chamber, and communicating with the latter by passages c c, substantially as described, for the object specified.

2. The combination, with the arched chamber A, fire-chamber B, stack D, and conical chamber C, superposed between the stack and arched chamber, and its upper end opening into the stack, of the passages c c, communicating with the arched and superposed chambers, the flues f forming a continuation of the passages c and communicating with the stack, and the dampers E, g, and g, for closing and opening the flues f and the open end of the chamber C, as set forth.

3. The combination, with the upper and lower chambers A B and stack D, of the passages d d, communicating between the above H I of the upper and lower chambers and with the stack, substantially as and for the purpose herein specified.

167,801. APPARATUS FOR DESICCATING EGG-BATTER. William Osborn Stoddard, New York, N. Y. [Filed May 31, 1875.]

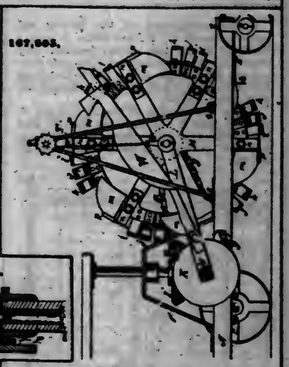


Brief.—Upon the ordinary base is used a dried film of egg-batter. Thereon other egg-batter is desiccated.

1. A film of dried batter of eggs, in combination with the base to which it is applied and adheres, in order to receive a layer or layers of moist batter of eggs to be desiccated, substantially as described.

2. The combination, with a base having a surface of non-resinous, unodoriferous wood, stone, slate, or other specified material, having the characteristic set forth of an adhering film of dried batter of eggs, substantially as described.

167,802. BOOT AND SHOE PEGGING STANDS. Andrew Swan, Ticonderoga, N. Y. [Filed May 1, 1875.]



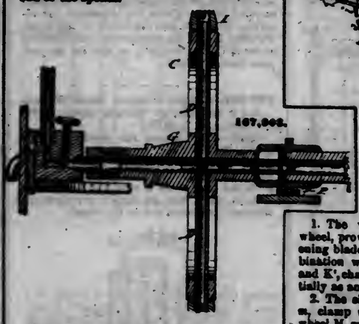
1. In a boot and shoe sticking stand, the combination of the step-jointed rods D with the plate C and hinged leaf B, substantially as specified.

2. The combination of the jointed rods D, plate C, hinged leaf B, and pivoted plate E, substantially as and for the purpose set forth.

3. The pivoted cam K, provided with the projection k, and detachable arm J, having the support H, in combination with the arm f, having projecting pin p, adapted to receive the last L, all substantially as shown and described.

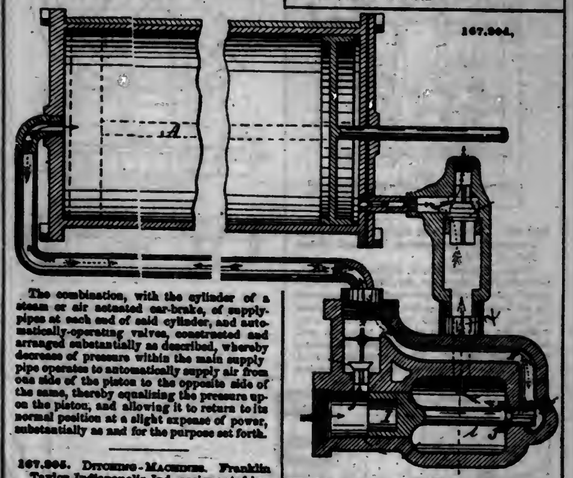
167,803.

1. The vertically-adjustable excavating-wheel, provided with a series of curved loosening blades and shovels, i, j, and k, in combination with the frame L, chain-wheels K and K', chain g, and driving-shaft H, substantially as and for the purpose set forth.



2. The shovel, composed of the side pieces m, clamp n, and scraper p, attached to the wheel M, substantially as and for the purpose set forth.

3. In a ditching-machine, the driving-axle D, revolving in adjusting journal-boxes, and provided with friction-wheel F, in combination with the connections F', lever F'', and friction-wheel G, upon the driving-shaft H, as and for the purpose set forth.



4. The portable bridge E, provided with the guiding-rollers r and side pieces g, as and for the purpose specified.

5. The double cone windlass V, provided with a crank and ratchet, and mounted upon the removable frame T, in combination with the chains w, swivels w', and wheel M, as and for the purpose set forth

167,804.

167,804.

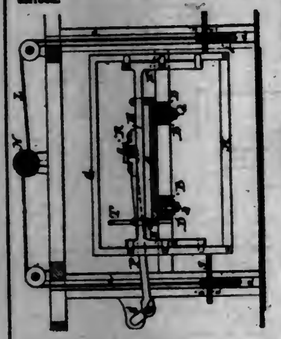
The combination-of hollow shaft G, hollow spoke D, having caps I, with parts x, and the interior sliding tube J, provided with parts a a and a' a', the exterior sleeve L, and lever P, all constructed substantially as and for the purposes herein set forth.

167,805. STEAM CAR-BRAKE. HORACE H. Taylor and Alfd. McCamish, Beardstown, assignors of one-third their right to Wm. H. Smith, same place; said Taylor, McCamish, and Smith assignors of one-fourth interest to Robert O. Loosley, Rock Island, Ill. [Filed Aug. 30, 1875.]

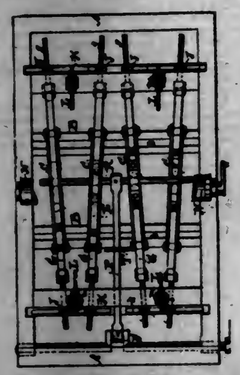
The combination, with the cylinder of a steam or air actuated car-brake, of supply-pipes at each end of said cylinder, and automatically-operating valves, constructed and arranged substantially as described, whereby decrease of pressure within the main supply-pipe operates to automatically supply air from one side of the piston to the opposite side of the same, thereby equalizing the pressure upon the piston, and allowing it to return to its normal position at a slight expense of power, substantially as and for the purpose set forth.

167,806. DITCHING-MACHINES. Franklin Taylor, Indianapolis, Ind., assignor to himself and Thomas B. Chandler, same place. [Filed June 5, 1875.]

Brief.—The excavating-wheel is made vertically adjustable, and is provided with a series of curved blades and shovels of peculiar forms, which loosen and deliver the earth onto a pivoted oblique double apron, located on each side of the wheel. The bucket-shovel is composed of side pieces and a scraper, held in place by a clamp. Frictional gearing is used. The wheel is adjusted by a double cone windlass and ratchet on a removable frame. Grade-rails and pins, against which friction-wheels on the frame revolve, guide the machine.



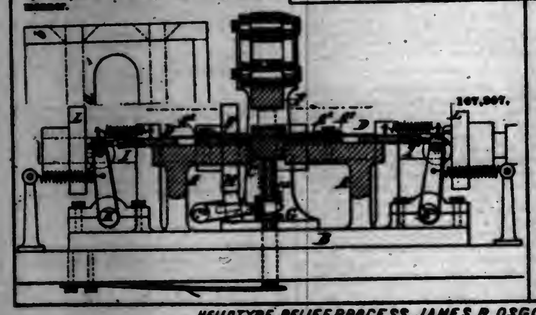
6. The grade-rails O, in combination with the grade-pins h, provided with clamps for the reception of the rails, as shown and described.



7. The combination of the excavating-wheel M, provided with curved loosening blades and shovels, with the pivoted oblique double apron W, arranged substantially as shown and specified.

167,806. STONE-SAWING MACHINES. Saml. Thompson, Hart's Falls, N.Y. [Filed Aug. 30, 1875.]

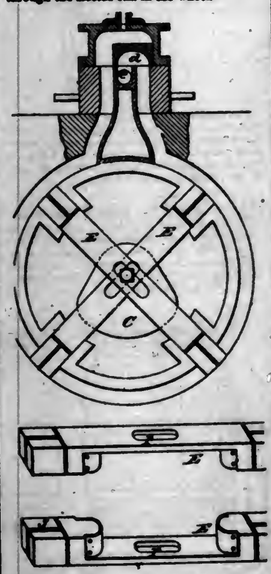
1. The combination of the driving and guide frame E F, the saw-frame G sliding vertically therein and moving longitudinally therewith, the stationary but adjustable driving and guide-frame guides C, and the rising and falling saw-frame guides J, substantially as herein described.



2. The combination of the driving-rod P, its fixed guide T, and the cross-head R, with the driving and guide frame, and saw-frame and their guides, substantially as herein described.

167,807. PAPER-BOX MACHINES. George Leonard Turney, London, England. [Filed Feb. 4, 1875.]

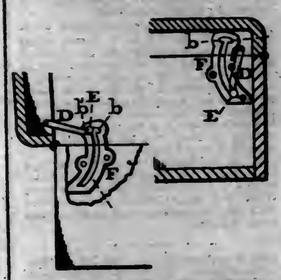
Brief.—A paper blank, of the form shown, is placed over the pieces, the detachable former is laid onto it, and the pressing-plate depressed for an instant, causing the sides of the blank to turn upward. The pieces is held down while the plate rises and the side and end folders advance. The plate then descends, completing the box. The former is removed by hand, and the box pasted in any suitable manner.



167,807.

1. The novel construction of box above described, consisting of a creased and folded blank composed of a lining-paper and a covering-paper, with an oval or other shaped hole cut therein to give access to the interior of the box, each lining and covering papers being so arranged as to form guides for the reception of a sliding lid for closing the box.

2. The combination, in a machine for manufacturing boxes from paper blanks prepared as described, of the creasing-table A, the rectangular piston C, with its projection for receiving the blank, and the former E, the pressing-plate F, and the alternately-reciprocating slides D D', substantially as and for the purpose above set forth.



167,808. ROTARY ENGINES. Jacob W. Vanorder and George Sloyage, Sioux, Iowa. [Filed Apr. 7, 1875.]

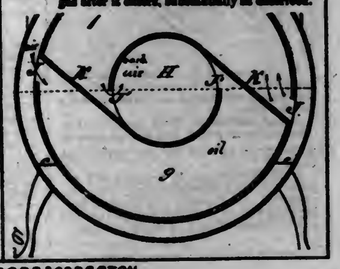
Brief.—The pistons are provided with a longitudinal slot at the center, through which passes the axis of the engine. Said pistons are also cut away in their middle portions, to receive the cam which is attached to the fixed axis, by which they are caused to reciprocate through the slotted rim in the wheel.

The pistons E, cut out and slotted in their middle portions, in combination with the fixed cam C and retaining slotted rim-wheel B, as shown and described, to operate as specified.

167,809. TRUNK-STAVE. Maurice A. Wess, Philadelphia, Pa., assignor of one-half his right to Jos. F. Field, same place. [Filed Aug. 2, 1875.]

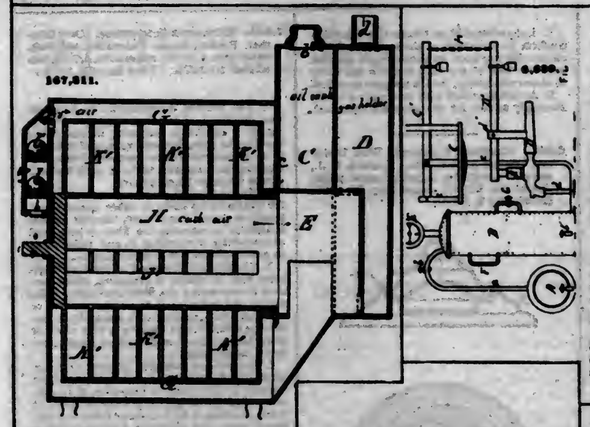
As an improvement in the art, the lower plate F, rigidly connected to the body of the trunk, and having a longitudinally-extending slot, c, and slots *b b'*, projecting laterally therefrom, in combination with the upper arm D, pivoted to the lid and formed with a button, E, all constructed, arranged, and operating as herein shown and described.

167,810. WINDOW-SHADE CLASPS OR FASTENERS. Henry Marshall Wells, Toronto, Canada. [Filed July 27, 1875.]



The within-described shade or curtain holder, composed of the two clasping parts A and E, one part being materially longer than the other, the coiled spring C, and the arms or handles D E, projecting beyond the coiled spring the whole formed of a single piece of wire, and the ends of the wire being adapted to be inserted and concealed within the coiled spring, substantially as set forth.

167,811. CARBURETTERS. D. L. Westcott, Fort Wayne, Ind. [Filed Aug. 4, 1875.]



Brief.—The air-blowing cylinder revolves in a tank of hydrocarbon fluid, which rises in about its axis, and is provided with a number of vertical partitions, between which the air passes and becomes carbureted.

1. In a carburetter, the revolving cylinder G, having the tube H, the vertical and longitudinal partitions K K', and openings J J', whereby the air or gas is carried down into the hydrocarbon fluid and discharged uniformly into a suitable receptacle from the tube of said cylinder, as described.

2. In a carburetter, the combination, with the revolving cylinder G, as described, and the feed-chamber O, of the gas-chamber D, provided with valves, to prevent a return of the gas after it enters, substantially as described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

167,811.

6,660.

167,812. ALPHABET-REMINDERS. Barnett B. Whaley, Brooklyn, N. Y. [Filed Apr. 17, 1875.]

1. The holders B' B', constructed of a station frame to receive and hold removable cards, &c., in combination with the box or casing A; and the operating-keys E connected with the holders, and projecting through the box, all constructed and arranged substantially as and for the purpose described.

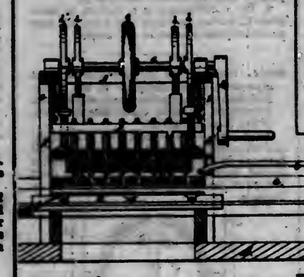
2. The cases A, having the cushion F applied to its bottom, in combination with the pivoted holders B' and the keys E, as and for the purpose described.

167,813. PREPARING DENTAL FILLINGS. R. S. Williams, New York, N. Y. [Filed June 7, 1875.]

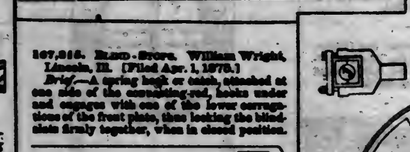
Brief.—The foil may be plain, or roughened by shrinkage between papers heated and pressed, or between sheets of stretched rubber allowed to contract. It is formed into the shapes shown, and formed as claimed. Evaporation of the volatile substance then causes

The process hereinbefore described of preparing foil for dental purposes, by causing the last or overlapping layer of foil to adhere to the foil next beneath it by or with the aid of collodion or other substance dissolved in a volatile fluid, substantially as described.

167,814. TORPEDO-ENVELOPE MACHINES. D. J. Webb and Gustavus A. Lilienthal, Jersey City, N. J. [Filed Aug. 10, 1874.]



Brief.—The paper is placed on the perforated cutting-board, when the slotted perforated plate carrying rubber cushions on its face descends, and holds the paper in position, while the sliding gang-knives cut it into shape opposite. The plungers then descend, forcing the paper through the cutting-board into the movable perforated holding-plate.

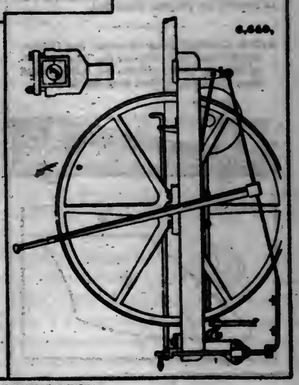


1. The combination of the plate B, having pins b, with the perforated plates C, D, and E, operating substantially as and for the purpose specified.

2. In combination with a machine for cutting and forming paper torpedo-envelopes, the perforated holding-plate E, operating as and for the purpose herein specified.

3. The combination of the gang-knives f f, the grooved perforated plate D, and the plate b, arranged to cut and form the paper into envelopes, substantially as described.

4. The combination of the perforated plate D with the perforated grooved plate C, which is provided with rubber bearing-surfaces, for the purpose of holding the paper in position when being cut and formed into paper torpedo-envelopes, substantially as described.



167,814.

167,815. BLIND-STOPS. William Wright, Lincoln, Ill. [Filed Apr. 1, 1875.]

Brief.—A spring hook or catch, attached at one side of the connecting-rod, hooks under and engages with one of the lower corrugations of the front plate, thus locking the blind-plate firmly together, when in closed position.

The spring hook or catch H, in combination with the corrugated plate D, having ledges projections a a, and spring G, having coils c c, and bent arms b, all substantially as and forth.

6,660.

REISSUES.

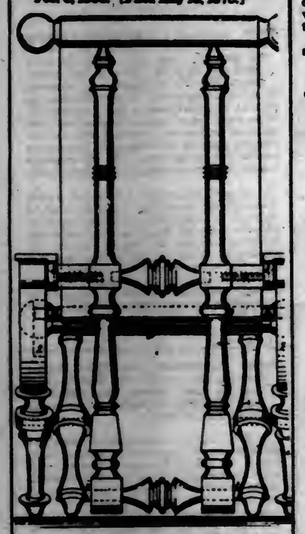
6,660. APPARATUS FOR FORCING LIQUORS. John F. Bennett, Pittsburg, Pa. Patent No. 126,010, dated Apr. 23, 1872; antedated Apr. 12, 1872. [Filed Aug. 2, 1875.]

Brief.—The air in the reservoir is compressed by the inflowing water. It then passes to the tank, an equable pressure being maintained. When the pressure exceeds the standard limit, the lever mechanism, connected with the flap-plunger, shuts off the water until the pressure returns to a normal state. The air-receptacle has the pressure-gage and attachments shown.

1. In combination with a barrel or similar receptacle for containing liquid or draft, a reservoir for compressed air to exert aeriform pressure upon the liquid, and an automatic device to regulate and render uniform the pressure of the aeriform body upon the liquid in the barrel, substantially as specified.

2. The combination of the tank B, (divided or undivided,) pressure-valve C, and hydrant or pipe D, when combined to act substantially as set forth.

6,659. HARVESTERS. John Gere, Brattleborough, Vt. Patent No. 30,682, dated Dec. 27, 1860; reissue No. 1,120, dated Jan. 15, 1861; extended seven years. [Filed May 17, 1875.]



1. The combination, substantially as above set forth, of the finger-beam projecting laterally at one side of the main frame and stiff-draft tongue, and of both the running-wheels of the harvester, the hinged link connecting the finger-beam and main frame, and the hand-lever connected with the inner end of the finger-beam, for the purpose of turning up the outer end thereof upon the lower hinge-pivot of the said link as an axis.

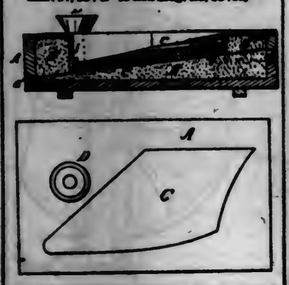
2. The combination, substantially as before set forth, of the finger-beam projecting laterally at one side of the main frame and stiff-draft tongue, and of both the running-wheels of the harvester, the link connecting the finger-beam and main frame, the hand-lever connected with the inner end of the finger-beam, and the second lever upon the main frame.

3. The combination, substantially as before set forth, of the cutter-stock, the crank for driving the same, the connecting-rod, and the swivel journal-box of the connecting-rod, having its pivots arranged longitudinally of said connecting-rod.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

6,441. REAPING-CRADLE. Geo. Hunsinger, New York, N. Y. Patent No. 59,410, dated Feb. 6, 1866. [Filed May 10, 1875.]

1. The combination, with the leg-frames, or two pairs of legs pivoted together, and provided with a suitable seat, of a back-frame, mounted at its lower end on one of the leg-frames, and suitably connected above to other portions of the chair, substantially as and for the purpose described.



2. The combination, with the two leg-frames, a back-frame, and a seat and back, of a cord, bar attached to said seat and back at their junction, and having its ends arranged in grooves 3 3 in one of the leg-frames, substantially as and for the purposes described.

3. The combination, with the back-frame and the two leg-frames, of arms K K, or their equivalents, pivoted to the rear upper portions of one of the leg-frames and to the back-frame, as and for the purposes described.

4. In combination with the leg-frames, back-frame, and connecting-arms K K, means for varying or adjusting the arms relatively to the leg-frame to set and hold the back at different inclinations, as set forth.

5. A seat-frame, having one set of its cross-bars extended upward above the level of the seat, in combination with a back-frame which is coupled or connected to said seat-frame above the level of the seat, all substantially as and for the purpose described.

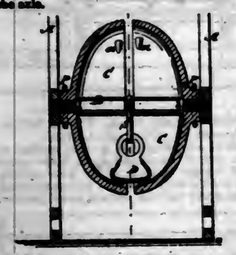
6,442. CASTING MOLD-BOARDS. Jos. Oliver, South Bend, Ind. Patent No. 70,263, dated Apr. 28, 1868; reissue No. 6,321, dated Mar. 17, 1874. [Filed Aug. 20, 1875.]

1. A chamber-chill, its bottom constructed to conform to the shape of the mold-board, the chamber being open its entire length parallel with the face of the chill to allow the water to steam off rapidly, for the purpose specified.

2. A chill provided with core-seats *c c*, substantially as and for the purpose described.

6,443. HARROWS-ROSETTE. Wm. Ulrich and Charles Hachmeister, Newark, N. J., assignors to Andw. Albright, same place. Patent No. 90,610, dated May 25, 1869. [Filed July 9, 1875.]

1. The combination, in a rosette, of a metal base-plate with a base of compressible composition.



2. The combination, in a rosette, of a metal base-plate with a base of compressible composition united by means of rosette or bolt B.

3. The combination, in a rosette, of the base-plate B with the hard-rubber boss A.

4. The combination, in a rosette, of base-plate B, having rosette *m*, with a suitable boss or center-piece secured in said recess.

6,444. CHEEK-YOKE. Elijah C. Barton, East Hampton, Conn., assignor to the Gong-Bell Manufacturing Company, same place. Patent No. 150,033, dated May 19, 1874. [Filed Aug. 14, 1876.]

Brief.—The bells revolve with the wheels, and are rung by means of tappets, with which they are furnished, coming in contact with a tongue loosely hung to the axle. The draft is applied through a bail loosely pivoted on the axle.

1. The combination, with the connected wheels A A, of one or more bells, arranged between, and connected to, said wheels, so as to revolve simultaneously therewith, and to ring when so revolving.

2. The combination of the loosely-connected tongue or draft-bar P with the wheels A A, and intermediately arranged revolving bell or bells.

3. The combination of the following elements: the wheels A A, a pair of open-mouthed or gong-shaped bells, B C, provided with striking mechanism, and an axle or cross-rod, D, connecting the said wheels.

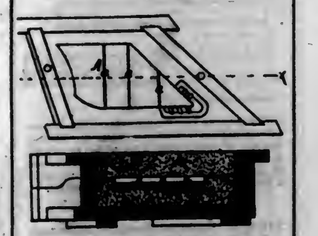
6,445. EXPLOSIVE COMPOUNDS. Carl Dittmar, Boston, Mass. Patent No. 145,402, dated Dec. 9, 1873; reissue No. 6,750, dated Feb. 10, 1874. [Filed May 22, 1875.]

1. The process, substantially as hereinbefore described, of treating vegetable fiber to render it explosive, consisting in converting the fiber to pulp, desiccating it, and reducing it to grains, powder, or compact forms, and treating the same with nitric or nitric and sulphuric acids, all as explained.

2. The process of preparing vegetable fiber for treatment by acids or other specified materials to render it explosive, the said process consisting in reducing the fiber to pulp, and subsequently desiccating it, and reducing it to grains, powder, or compact forms.

3. The process described of treating vegetable fiber to render it explosive, which consists in converting the fiber into pulp, desiccating and reducing it to powder, grains, or compact forms, soaking it in a starchy or saccharine solution, and treating it with nitric or nitric and sulphuric acids and an alkaline solution, as set forth.

4. The process described of preparing vegetable fiber for being rendered explosive, which consists in converting it into pulp, drying it, and reducing it to grains, powder, or compact forms, treating it with nitric or nitric and sulphuric acids, and adding to it nitrate or chlorate of potash or nitro-glycerine, all as stated.



5. As a new or improved manufacture, the described explosive compound, consisting of starch, sugar, nitrate or chlorate of potash, or nitro-glycerine, and the granular or compact and solidified vegetable fiber, as herein before set forth.

6,446. PROCESSES OF MAKING PAPER-PULP FROM PALM. James P. Hayes, Washington, D. C. Patent No. 151,022, dated June 2, 1874. [Filed Mar. 27, 1876.]

1. Paper and paper-stock made partly or wholly from palm, and possessing the peculiar fiber, had the glossy or tacky-silicious ivory appearance and distinguishable properties, substantially as described.

2. The within-described process of making paper material from variegation of palm, wherein the subsumen is cut or torn into pieces of suitable size, then cooked in a close digester with thorough agitation and under steam-pressure, in a weak solution of alkali, naphtha, benzine, or soap, as set forth; then completely ground while steam passes freely through the grinder and intermingles with the material in grinding, reducing and bleaching it, the material being finally washed, all substantially as set forth and described.

6,447. CHILLS FOR CASTING MOLD-BOARDS. James Oliver, South Bend, Ind. Patent No. 90,573, dated Feb. 2, 1869; reissue No. 6,321, dated Mar. 11, 1873. [Filed Sept. 6, 1875.]

A chill for casting mold-boards for plows, constructed to conform to the shape of the mold-board, and provided with counterbored recess or openings of sufficient width to allow the escape of gas or steam while they prevent the entrance of molten metal therein when it is poured upon the chill, substantially as described.

NEW-TYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 12. TUESDAY, SEPTEMBER 21, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

UNITED STATES PATENT OFFICE,
Washington, D. C., September 29, 1875.

Employés of the Office have been strictly prohibited, under penalty of dismissal, from furnishing copies of official records, except when ordered through the regular official channel. It is understood that the practice has grown up, partly because of difficulty in procuring copies promptly, by regular order, when required for immediate use. That no such inconvenience may arise, orders for copies needed immediately, will, upon request, be made special, and filled at once.

ELLIS SPEAR,
Acting Commissioner.

COMMISSIONER'S DECISIONS.

LOUIS MCMURRAY.—*Appeal.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the application of Louis McMurray for patent for manufacture of* SOLDER-WIRE.—*Decided September* 28, 1874.]

A claim covering the manufacture of solder-wire by cutting a cord from the periphery of a solder-disk, and compressing it into finished form between rollers, is not anticipated by a patent for manufacturing zinc wire, by cutting a cord from a zinc disk, rounding its corners by compressing-rollers, and then drawing it out through a draw-plate, because solder-wire could not be made by the zinc-wire process.

Where an applicant avails himself of a portion of a plan and mechanism used to make one article, and supplies to it the steps necessary to constitute a complete and novel process for making another article, a patent should be granted.

THACHER, *Commissioner:*

The alleged invention in this case is clearly stated in the following claim:

The manufacture of solder-wire by cutting up the solder disk or stock into a cord and then subjecting this cord to compression between roller-shaping dies, substantially as shown and set forth.

The above claim stands rejected on English patent of William Newton, No. 10,256 of 1844.

In this patent Newton describes his method of manufacturing zinc wire as follows:

In commencing the manufacture of wire, a plate or sheet of zinc of about the thickness of the wire intended to be produced is taken, and must be cut into strips or rods by means of the ordinary shears or apparatus used for slitting or cutting up iron, or the rotary cutters hereafter described may be employed. These strips are cut off in widths equal to the thickness of the metal plate, so as to form *square rods*. These rods are then rounded off by passing them between grooved rollers, after which they are passed through the draw-plate, or they may be conducted direct to the draw-plate, without employing the grooved rollers.

In Newton's case, then, the zinc is first cut into *square rods*, and, if advisable, the corners rounded by passing the rod between grooved rollers, and finally the wire is reduced to any desired size by "drawing" it through suitable dies.

In applicant's case the cutting-disks are provided with an adjustable gage, so that strips of sheet-solder of different widths can be cut from the disk, and as the metal is sufficiently pliable the strips, whether narrow or wide, can be compressed into cylindrical, semi-cylindrical, or other shaped wire of different sizes.

The solder-wire cannot be manufactured by subjecting it to Newton's process for making finished-zinc wire, as solder is not sufficiently ductile to admit of "drawing."

Applicant, by availing himself of a portion of the mechanism used in the manufacture of zinc wire, has produced a new result in the production of a valuable and improved article in a new way, and in so doing has transformed an incomplete process in the art of manufacturing zinc wire into a complete and novel process in the art of manufacturing solder-wire.

As the result effected in this case is new and useful,

and the inventive faculties appear to have been exercised in its production, I am convinced that a patent should issue for the invention applied for.

The decision of the Board is reversed.

GEORGE W. CASILEAR AND W. C. McINTIRE.

[*In the matter of the application of George W. Casilear and W. C. McIntire for letters patent for* IMPROVEMENT IN STAMPS, &c., *filed August*, 1875.—*Decided September* 27, 1875.]

The practice established in the Rouse and Stoddard case (7 OFFICIAL GAZETTE, 169) of suspending action upon an application, when that application is found to cover subject-matter embraced by a prior and rejected application, for the purpose of obtaining evidence from the prior applicant, if possible, of the abandonment of the invention by him by reason of public use or sale, abolished.

It having been decided by the courts that abandoned applications are no bar to the issue of a patent, they cannot delay that issue, and are not to be regarded at all.

The statute and the decisions of the courts being sufficient notice to rejected applicants, they and not the Office must be held responsible for any injury resulting from the abandonment of their applications.

SPEAR, *Acting Commissioner:*

It is alleged by applicants that one of their claims is held to cover subject-matter set forth in a rejected and abandoned application, and, in view of that fact, they ask that the rule requiring the Examiner in such cases to institute an inquiry for the purpose of ascertaining whether the invention embraced by the abandoned application has been brought into public use, be waived in this instance. They base their request upon the ground that the practice, under the rule mentioned, is unauthorized by law and practically inoperative. The practice referred to was established in the case of *Rouse and Stoddard*, (7 OFFICIAL GAZETTE, 169.) In accordance with the long-continued practice of the Office, the Primary Examiner had given, as one answer to the application of Rouse and Stoddard, a prior rejected application covering part of the same subject-matter included by their application. The doctrine had been recently distinctly announced by the United States Supreme Court, in the case of *Brown* vs. *Guild*, (6 OFFICIAL GAZETTE, 392,) that a mere application for a patent which had been withdrawn and never renewed was not a bar to a further patent for the same invention; and that where the invention had never been perfected or brought into actual use by the prior applicants, but had simply been experimented with by them, the mere fact of having unsuccessfully applied for a patent could not take the case out of the category of abandoned experiments. This decision was deemed by the Commissioner as obligatory upon the Office in its practice in regard to rejected and abandoned applications, and he accordingly held that the same should no longer be cited to defeat subsequent applicants for patents. At the same time it was his opinion that, as he was not only the guardian of the rights of inventors, but of the interests of the public as well, it was his duty to inform himself before granting a patent to the subsequent applicant whether that invention had not become the property of the public by reason of the introduction and public use of the same by the prior applicant. To this end he directed the Examiners that whenever such cases arose, letters of inquiry should be forthwith dispatched to the prior rejected applicant and his attorney of record, for the purpose of ascertaining whether the invention had been brought into actual use—at the same time informing them that an application was then pending for the same invention, and that the inquiry was made for the purpose of determining the right of the subsequent applicant to a patent therefor. The information was required to be in the form of affidavits, and counter affidavits were also to be received from the other applicants, if they desired.

The Commissioner declared he had no doubt that he had ample authority under the law to institute such an inquiry; but it was a question with him as to how such an investigation should be prosecuted. He admitted the fact of the unsatisfactory nature of *ex parte* evidence, but, under the restrictions of the law, was unable at the time to devise any better mode than an *ex parte* inquiry.

It will be seen, then, that the course finally adopted to obtain the information desired was in the nature of an experiment, the success or failure of which could alone be determined by experience.

And now that the practice has been fully tried, and it is alleged not only by present applicants but by many others, examiners as well as applicants, to be not only inoperative, but the cause of large additional labor on the part of the Office, which in effect has been entirely fruitless as respects the object it was designed to accomplish, it is eminently proper that such objections should be considered, and if the practice is found to be detrimental rather than beneficial, the same should be abolished.

In the first place it is urged that the proceeding being in the nature of an inquiry merely, the information returned by the person addressed is entirely voluntary on his part. He may, too, as is often done, refuse or neglect to reply at all. If he responds, the proceeding being an entirely *ex parte* one, and no provision made for examination or cross-examination, the bare statement of the party in interest must be received, and, if uncontradicted by opposing affidavits, must be acted upon without question. Indeed, there is little opportunity for opposing evidence in the absence of any provisions for the examination of witnesses, notice of time of taking testimony, day of hearing, &c.

Consulting his own interest alone, the person addressed may, with the hope of securing a renewal of his old application, conceal or withhold evidence that would have shown public use of the invention, or having lost interest or faith in the invention, or actuated with no desire to benefit others, he may give testimony which, on its face, would amount to evidence of abandonment or public use of the same in a completed form, yet, if tested by a proper examination, might have shown simply an unsuccessful and abandoned experiment. Thus, it is alleged, the proceeding recognizes the existence of contesting parties, and yet there is an entire absence of nearly all regulations analogous to a trial in court for judicially determining the matter in dispute. It is also urged that the Office, having decided that a rejected and abandoned application was not a sufficient reference on the ground established by the courts, that it was not legal evidence of a completed invention, and was therefore to be treated, so far as the merits of its subject-matter were concerned, as having never been filed, or as a dead letter, it is hardly consistent with such a view to ask the rejected applicant, as is now done in the circular sent out by the Office, to state the extent and character of the public use by him of "the invention fully described and shown in your" (his) "application."

The experience of the Office for the past few months has established the truth and force of these objections in a majority of cases. Examiners have found that, in order to fully comply with the requirements of this practice, a more critical examination than ever of rejected applications is necessary, and that after performing the additional labor of instituting the inquiry in question, they are left in no better condition to properly decide the case than before. I have concluded, therefore, to abolish the practice in the case of those applications filed prior to the passage of the act of 1870. The propriety of this course is, I think, manifest on every ground. In contemplation of the law, as interpreted by the decisions cited above, (and with the interpretation in those decisions I have nothing now to do,) these applications and the inventions for which they were made are absolutely abandoned, so far as these applicants are concerned, beyond the possibility of recall. To attempt to make them, therefore, the basis of action in instituting proceedings for the purpose of determining whether or not a patent would be valid if issued to a subsequent applicant, would be, in my judgment, to usurp the functions of the courts, and that in relation to questions of a nature the most difficult to decide. In the attitude in which the Office now stands toward the applications last considered, there can be no other possible object in attempting to enter into communication with the parties whose applications have been abandoned. The notice cannot be of any benefit to them if it do not serve to defeat the subsequent application.

In respect to applications filed since the passage of the act of 1870, in which cases the Office holds that only the application is abandoned, and that the parties may file new applications, it might be urged that the Commissioner should notify these parties and give them an opportunity to file a new application. But these applications must unquestionably be held to be abandoned under the statute, except under certain conditions, the judgment of which is in the discretion of the Commissioner.

If these abandoned applications are no bar to the issue of a patent, then they cannot delay that issue, and are not to be regarded at all. For if I may not delay a pending application on account of them, but must proceed at once with the examination, and am bound, in case no statutory bar appear, to issue the patent, then it is idle to notify the parties to these abandoned applications, and offer to give them opportunity to file new applications. Even while I am sending notices, I must issue the patent. But if any injury be done them, it is not without remedy. The patent is notice to them. In fact the statute was notice, and the decisions of the courts, and those who have abandoned these applications, and not the Office, must be held responsible for any injury that may happen.

The course I have indicated seems to me to be a logical consequence of the position taken by the Office in the decisions which I have cited, and, until reversed, those decisions must stand with all their consequences.

I direct, therefore, that the practice of sending the circulars named be discontinued, and that no further examination be made of abandoned applications.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date September 21, 1875.]

8,655.—Toy Money-Bank.—CANDIDE W. CRÔTEAU, Philadelphia, Pa. Application filed August 24, 1875. Term of patent 7 years.

8,656.—Pipe.—CLOUSE D. GRIMM, Glenwood, N. J. Application filed September 10, 1875. Term of patent 3½ years.

8,657.—Cigar-Box.—MAX HILSON, New York, N. Y. Application filed August 26, 1875. Term of patent 3½ years.

8,658.—Fancy Worsted or Woolen Fabrics.—AARON JEWELL, Lawrence, Mass., assignor to the WASHINGTON MILLS, same place. Application filed July 14, 1875. Term of patent 7 years.

8,659.—Gantlet-Boxes.—BYRON G. SHULTS, Johnstown, N. Y. Application filed January 2, 1875. Term of patent 3½ years.

8,660.—Stove.—WILLIAM TWEEDDALE, Brooklyn, N. Y. Application filed June 26, 1875. Term of patent 7 years.

8,661.—Jaws of Mop and Brush Holders.—CHARLES B. CLARK, Buffalo, N. Y. Application filed September 2, 1875. Term of patent 14 years.

8,662.—Cane or other Handle.—THOMAS R. LOVETT, Philadelphia, Pa. Application filed July 30, 1875. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date September 21, 1875.]

2,944.—Yeast.—SAMUEL AGER, Somerville, Mass. Application filed July 6, 1875.
"words 'SURPRISE EXTRA DRY HOP YEAST.'"

2,945.—Thrashers and Separators.—ALTON AGRICULTURAL WORKS, Alton, Ill. Application filed August 6, 1875.
"word 'CHAMPION.'"

2,946.—Self-Indexing Files.—WILLIAM A. AMBERG, Chicago, Ill. Case A. Application filed July 31, 1875.
"words 'self-indexing.'"

2,947.—Self-Indexing Files.—WILLIAM A. AMBERG, Chicago, Ill. Case B. Application filed August 5, 1875.
"word 'Indexicon.'"

2,948.—Fertilizers.—ATLANTIC AND VIRGINIA FERTILIZING COMPANY, New York, N. Y. Case A. Application filed June 12, 1875.
"VIRGINIA PATRONS."

2,949.—Stove-Polish.—H. A. BARTLETT & CO., Philadelphia, Pa. Application filed August 26, 1875.
"'Salamander' and the picture of a lizard in flames of fire."

2,950.—Brass, German-Silver, and Silver-Plated Goods.—BROWN & BROTHERS, Waterbury, Conn. Application filed July 24, 1875.
"a human hand and a star."

2,951.—Whisky.—JOHN E. CASSIDY, Watertown, Mass. Case B. Application filed July 31, 1875.
"words 'Salt Mash Bourbon Whiskey.'"

2,952.—Miners' Lamp-Wick.—ROBERT CHADWICK, Lower Merion, Pa. Application filed July 22, 1875.
"miner's lamp."

2,953.—Liniment.—GEORGE CLEIS, Goshen, Ind. Application filed July 19, 1875.
"elephant with a cloth strapped over its back and the words 'Dr. Cleis' French Liniment' inscribed upon said cloth."

2,954.—Fluting-Machines.—CHARLES FELDER, Newark, N. J. Application filed July 31, 1875.
"word 'CHAMPION.'"

2,955.—Spool-Threads.—GEORGE F. FOSTER, Brooklyn, N. Y. Application filed August 6, 1875.
"letters 'N. E. T.' printed on a diamond-shaped figure, in connection with the words 'London Mills.'"

2,956.—Shirts.—FOSTER & MERRILL, Boston, Mass. Application filed August 6, 1875.
"words 'IMPERIAL SHIRT.'"

2,957.—Carpets.—WILLIAM H. HANKINSON, New York, N. Y. Application filed February 17, 1875.
"word 'ORIGINAL.'"

2,958.—Soap.—EDWARD KRAFFT & CO., New York, N. Y. Application filed August 2, 1875.
"words 'CRYSTAL SALICINE.'"

2,959.—Satin Goods.—LEISLER & SOMMERHOFF, New York, N. Y. Application filed June 26, 1875.
"letters 'St. & S.' and the figure of a star."

2,960.—Gin.—LESZYNSKY & TROUP, New York, N. Y. Application filed July 24, 1875.
"word 'SULTANA.'"

2,961.—Axes.—J. FEARON MANN, Bellefonte, Pa. Application filed August 21, 1875.
"words 'The Red Mann Axe.'"

2,962.—Pressed Cake-Soap.—ROSELL H. MEAGLEY, Binghamton, N. Y. Application filed July 23, 1875.
"letters and word 'R. H. Meagley' and the words 'Tip Top.'"

2,963.—Nautical Instruments.—ROBERT MERRILL & SONS, New York, N. Y. Application filed July 31, 1875.
"star, in the center of which is the letter M."

2,964.—Spices.—PACKARD & JAMES, New York, N. Y. Application filed September 14, 1875.
"letters 'A A A.'"

2,965.—Spices.—PACKARD & JAMES, New York, N. Y. Application filed September 14, 1875.
"letter 'A.'"

2,966.—Spices.—PACKARD & JAMES, New York, N. Y. Application filed September 14, 1875.
"letters 'A A.'"

2,967.—Spices.—PACKARD & JAMES, New York, N. Y. Application filed September 13, 1875.
"a diamond-shaped figure."

2,968.—Cream of Tartar.—PACKARD & JAMES, New York, N. Y. Application filed September 14, 1875.
"letters 'A A A.'"

2,969.—Cream of Tartar.—PACKARD & JAMES, New York, N. Y. Application filed September 14, 1875.
"letters 'A A.'"

2,970.—Cream of Tartar.—PACKARD & JAMES, New York, N. Y. Application filed September 13, 1875.
"diamond-shaped figure."

2,971.—Cream of Tartar.—PACKARD & JAMES, New York, N. Y. Application filed September 14, 1875.
"letter 'A.'"

2,972.—Dress and other Dry Goods.—A. PERSON, HARRIMAN & CO., New York, N. Y. Case A. Application filed August 23, 1875.
"sheep's head and covering, resembling a fleece."

2,973.—Dress and other Dry Goods.—A. PERSON, HARRIMAN & CO., New York, N. Y. Case B. Application filed August 23, 1875.
"word 'GOLDEN-FLEECE.'"

2,974.—Dress and other Dry Goods.—A. PERSON, HARRIMAN & CO., New York, N. Y. Case C. Application filed August 25, 1875.
"bird above a body of fire."

2,975.—Dress and other Dry Goods.—A. PERSON, HARRIMAN & CO., New York, N. Y. Case D. Application filed August 25, 1875.
"word 'PHŒNIX.'"

2,976.—Brandies.—VE. PLANAT & CO., Cognac, France. Application filed September 13, 1875.
"PLANAT & CO., in combination with a representation of a winged griffin."

2,977.—Orange Marmalade.—THOMAS RITCHIE & CO., Jacksonville, Fla. Application filed September 4, 1875.
"orange and orange-leaves in connection with the words 'Florida Orange Marmalade,' arranged above, and the firm-name, 'Thomas Ritchie & Co., Jacksonville, Fla.,' arranged below the picture of the orange."

2,978.—Soap.—ROBINSON BROS. & CO., Boston, Mass. Application filed September 4, 1875.
"word 'Fashion.'"

2,979.—Watches.—SCHWOB BROTHERS & CO., New York, N. Y. Application filed July 8, 1875.
"Congress Watch. New York."

2,980.—Watches.—LOUIS STRASBURGER & CO., New York, N. Y. Application filed August 11, 1875.
"words 'Leopold Huguenin' in connection with the figure of a locomotive."

2,981.—Carpenters' Planes.—THE STANLEY RULE AND LEVEL COMPANY, New Britain, Conn. Application filed January 27, 1875.
"patented plane, showing the adjusting screw or nut of said plane."

2,982.—Refrigerators and Ice-Chests.—THE ST. LOUIS WOODEN GUTTER MANUFACTURING COMPANY, St. Louis, Mo. Application filed August 28, 1875.
"word 'Centennial.'"

2,983.—Driers, Drying-Oils, and Varnishes.—WALTER & FIELDING, New York, N. Y. Application filed June 16, 1875.
"word 'Ozone.'"

2,984.—Superphosphate.—WATTSON & CLARK, Philadelphia, Pa. (Re-registration.) Application filed October 22, 1870.
"letters W. C. with a small × placed between them."

2,985.—Fertilizers.—MANUFACTURERS' COMBINATION, New York, N. Y. Application filed September 16, 1875.
"letters and words, as follows:
G. S. G.
Georgia State Grange."

2,986.—Evaporated Sugar-Corn.—THOMAS ROBERTS & CO., Philadelphia, Pa. Application filed September 13, 1875.
"arbitrary word-symbol "RIVERTON,' in connection with the word 'SUGAR-CORN,' and the monogram 'T. R. & Co.'"

LABELS REGISTERED DURING THE WEEK.

[Each certificate bearing date September 21, 1875.]

326.—Title: "Balser's Fever and Ague Cure."—GUSTAVUS BALSER, New York, N. Y. Application filed September 15, 1875.

327.—Title: "Mrs. R. P. Finch's Transformer for Curling the Hair."—MRS. R. P. FINCH, South Bend, Ind. Application filed September 11, 1875.

328.—Title: "Dr. Bull's Celebrated Pectoral Compound Cough-Syrup."—A. C. MEYER & Co., Baltimore, Md. Application filed July 29, 1875.

329.—Title: "The Irish Fairy Glow-Starch."—KELLY, RILEY & Co., Millville, Pa. Application filed September 4, 1875.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

BOUND VOLUMES OF PATENTS.

The bound volumes of patents, containing the specifications and drawings of patents in full from May 30, 1871, to within a few months of date, may be consulted at the following places:

Astor Library, New York city.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

INDEX OF INVENTIONS PATENTED SEPTEMBER 21, 1875.

	Class No.	No. of Patent.
Addressing machine, G. H. Stout	117	167,952
Bale rolling attachment for compressors, automatic, H. Reisel	7	167,939
Bale tie, W. H. Walker	7	167,960
Bed bottom, spring, L. N. and M. Hoyt	62	167,902
Bed bottom, spring, A. T. Sherwood	62	168,056
Bedstead fastening, C. T. Laib	62	167,909
Bedstead, sofa, J. B. Kline	62	167,908
Bell, door, E. M. Lockwood	24	167,846
Belt and band, driving, E. G. Isaacs	81	167,838
Belting, clasp for machine, G. H. Fox	81	167,833
Blind, inside Venetian, J. Seaman	69	167,942
Blind slat adjuster, G. A. Myers	24	167,923
Blind slats, Machine for compressing the ends of, E. Cather	30	167,824
Blind, Venetian, T. Fuyat	62	167,899
Bolt, F. E. S. Crane	24	167,898
Book supporter, R. T. Stoddard	146	167,951
Boot and shoe, M. Robling	16	168,051
Boot and shoe fastening, H. E. Dennett	16	167,829
Boot and shoe heel, R. Vint	16	167,959
Boots and shoes, channel opener and molder for, T. L. Miller	16	168,045
Brick for constructing retorts, M. Foster	20	167,831
Bridle bit, B. L. Rowley, (reissue)	72	6,656
Buckle, D. L. Smith	23	167,947
Buckle, harness, T. J. Magruder	72	167,917
Burner, lamp, A. Taplin, (reissue)	90	6,650
Burnisher holder, A. Swallow	16	167,953
Button hook, Rasines and Power	23	167,937
Buttons to wearing apparel, setting instrument for attaching, D. Heaton	23	168,016
Can, metallic, G. W. Bell	136	167,870
Can, paint, J. F. Drummond	107	168,001
Car coupling, G. H., and C. L. McGlothlen	122	168,041
Car heater, railroad, E. H. Ashcroft, (reissue)	154	6,652
Car poles, draw iron for street, L. C. Prouty	122	167,933
Car, sleeping, Field and Pullman, (reissue)	121	6,648
Car, sleeping, E. P. Kellogg	121	168,027
Car, sleeping, E. Wheeler, (reissue)	121	6,651
Car starter, L. C. Parker	122	167,928
Car, stock, J. R. McPherson	121	168,043
Car, stock, Steventon and McGrath	121	168,061
Cars, draw bar for street, F. F. Adams	122	167,968
Carburster, air and gas, Porter and Grimes	27	168,048
Carpet stretcher, B. Darragh	62	167,876
Carriage seat irons, former for bending, Emerson, Clark, and Richmond	31	168,007
Carriage spring, J. Cunningham	31	167,991
Carriage spring, H. M. Curtis	31	167,992
Carriage spring, J. Fredenburgh	31	167,888
Cartridge shells, device for necking, Salisbury and Wells	32	167,940
Cement, marble, A. Boag	153	167,979
Centering device, M. T. Greenwood	100	167,834
Centrifugal machine, C. C. Webber	155	167,962
Chandelier, F. McLewee	64	167,921
Chandeliers, friction clutch for extension, E. C. Bruen	64	167,984
Chuck, planer, H. Thomas	100	168,064
Church pew, L. Lancaster	62	167,910
Churn, R. Great	45	167,893
Churn, E. Hosher	45	168,024
Churn, W. P. Mangum	45	167,918
Cigar boxes, revenue stamp for, F. C. Hamilton	54	168,014
Clock case, W. N. Weeden	36	167,963
Cloth press, W. Hebdon	37	168,017
Coal agglomerating press, A. G. Lasserre	3	168,031
Coal hod, G. Seyfang	154	167,857
Coal tar burner, Brooke and Wright	149	167,873
Cock, automatic glass gage, Bee and Garrett	148	167,819
Cock, shower and bath, H. J. Bailey	167	167,817
Condensing vapors, gases, &c., apparatus for, Speir and Mather	47	168,060
Cooking apparatus, steam, G. H. Ferris	154	167,830
Corset, D. H. Horne	60	167,898
Corset fastening, F. E. Vandercook	60	167,958
Countersink, T. P. Farmer	29	167,824
Cradle rocking device, L. L. King	62	168,028
Cryolite, decomposing, H. Burgess	35	167,986
Cultivator, Winfield and Flynn	43	168,074
Dam, adjustable, W. Smith	82	167,946
Dental engines, fan for, Hopkins and Beidler	46	168,023
Dental forceps, L. J. P. E. Gaillard	46	168,012
Derrick, W. C. Wetherill	79	167,863
Doll, walking, A. E. Hotchkiss	143	167,899
Door spring, O. F. Comfort	24	167,989
Drill, rock, G. Friebee	121	168,010
Drills, ratchet brace for metal, H. C. Hart	100	167,897
Eaves trough hanger, W. H. and H. W. Triesler	126	167,935
Electric machine, magneto, O. Heikel	50	168,018
Elevator, grain, E. Körting	79	168,029
Engine, rotary, W. Lyon	150	168,035
Engines, dash pot for, F. Steele	152	167,950
Faucet, basin, J. Denning	167	167,880
Faucet, vent, R. Brenner	167	167,821
Follies and tires, clip for, R. Ray	31	167,938
Fence, farm, J. E. Winters	52	167,966
Fifth wheel, W. A. Parker	31	167,927
File cutting machines, feed mechanism for, J. Garland	53	167,833
Fire escape, F. M. Harman	30	168,015
Fire extinguisher, E. H. Ashcroft, (reissue)	154	6,653
Fire kindler, C. A. Maynard	154	167,849
Fire place blower, J. C. Keuneday	154	167,906
Flour packers, double acting valve cut off to, A. M. Hobbs	57	168,020
Fruit and jelly press, Cook and Bostwick	19	167,887
Fuel, composition for artificial, E. F. Loiseau	61	167,914

	Class No.	No. of Patent.
Fuel, machine for mixing and molding artificial, E. F. Loiseau	61	167,913
Furnace for brick kilns, W. S. Colwell	20	167,826
Garments, machine for cutting out, J. L. Fry	38	168,011
Gas apparatus, F. H. Eichbaum	66	168,006
Gas apparatus, J. H. Pugh	66	168,049
Gas check for ordnance, L. W. Broadwell	105	167,981
Gas mains, drain for, J. Nader	64	167,854
Gas, process and apparatus for the manufacture of illuminating, T. W. Lion	66	167,844
Gas, process and apparatus for the manufacture of illuminating or heating, T. S. C. Lowe	66	167,847
Gate, automatic, L. E. Thorson	52	167,954
Gate hinge and closing rod, combined, W. H. McCormick	52	168,040
Generators, furnace grate for steam, A. Winton	149	168,075
Governor, J. Felber	69	167,885
Grain, apparatus for steaming, J. C. Hunt	57	167,837
Grain binder, C. E. Donnellan	74	167,997
Grist alarm, G. H. Eastman, (reissue)	57	6,655
Harness, check guard for, F. Howard	72	167,836
Harness cockeye, Schneider and Meek	72	168,054
Harrow, I. N. Harbaugh	73	167,896
Harrow, J. W. Price	73	167,939
Harrow and cultivator, combined, J. W. Dilley	73	167,879
Hat and fur box, J. C. Budd	62	167,885
Hat brushing machine, Silver and Swords	76	167 945
Hatchway, C. M. Dalsen	30	167,993
Hay, apparatus for gathering and elevating, A. J. Park	79	167,926
Heater, M. W. Baily	147	167,868
Heel and sole trimming machine, J. H. Bussell	16	167,874
Hinge and closing rod, combined gate, W. H. McCormick	24	168,040
Hinge, combination spring, G. Z. House	24	167,900
Horse boot, J. B. Hall	144	167,895
Horse power, N. Potter	159	167,930
Horseshoe, J. T. Walker	60	168,068
Horseshoe blanks, machine for bending and swaging, R. and R. W. Hale	60	167,894
Horseshoe machine, S. Espach	60	168,008
Hose reel, J. A. Miller	31	167,851
Hub band, D. W. Baird	31	167,970
Ink, copying, A. J. Dexter	146	167,878
Ironing apparatus, G. W. Cottingham, (reissue)	91	6,654
Ironing board, J. Watson	91	168,069
Jack, lifting, G. W. Edwards	79	168,005
Joint, combination shell, O. C. Little	67	167,845
Kilns, furnace for brick, W. S. Colwell	20	167,826
Lamp, E. Blackman	90	167,871
Lamp bracket, for sewing machines, Willson and Vassie	90	167 864
Lamp, diver's, C. Marschalk	90	168,038
Lamps, removable drip cup for Argand, A. Bechet	90	167,669
Latch, reversible, P. Mathes	93	168,036
Lathes, slide rest for metal turning, G. F. Ballou	100	167,974
Lock, combination, A. E. Peters	93	167 929
Lock, seal, A. F. Whiting	93	168 070
Lock, time, E. Stockwell	93	168,062
Locomotives, exhaust pipe for, J. C. Farmer	94	167,883
Mantel for fire places, composite, D. K. Innes	4	168,025
Meat, preserving, J. A. Wilson	58	168,073
Mill, flour, T. C. Delaplane	57	167,995
Molder's flask, H. H. Garrett	33	167,890
Motor, mechanical, J. W. H. Doubler	67	167,999
Nail, A. Marotzki	103	168,037
Nut lock, C. Holton	14	168,021
Nut lock, Shoemaker and Jones	14	167 944
Nut lock, J. C. Wright	14	167,967
Ordnance, gas check for, L. W. Broadwell	105	167,981
Paper ruling machine, J. Stewart	15	167,859
Pegging machine, screw, A. C. McKnight	16	168,042
Pencils, machine for manufacturing, R. Lanstrom	146	168,030
Piston, steam, O. M. Stillman	151	167 960
Pitcher, molasses, L. Wagner	68	167,862
Pitman connections, oscillating joint for, A. K. Smith	67	167,948
Plane guide, W. S. Shipe	29	167,943
Planer cutter sharpener, G. Manvel	70	167,920
Planter, corn, E. Morgan	133	168,046
Plow, wheel, J. Flow	114	167,887
Pocket book, S. Lyon	146	167,916
Pocket book fastener, L. Prahar	146	167,931
Polishing machine, B. E. Sperry	70	167,858
Press, coal agglomerating, A. G. Lasserre	3	168,031
Press, cloth, W. Hebdon	37	168,017
Printing presses, delivering apparatus for, J. W. Kellberg	117	167,840
Printing presses, delivering apparatus for, J. W. Kellberg	117	167,841
Pump, T. Dowling	118	167,881
Pump, M. J. Johnson, (reissue)	118	6,649
Pump bucket, chain, W. Cooper	118	167,900
Pump buckets, endless chain, J. S. Manley	118	167,919
Pump, rotary, W. Lyon	118	168,034
Punch, hydraulic, J. B. Barnes	119	167,975
Railroad crossing, C. C. Shelby	120	168,055
Railroad crossings, gate for, S. Keller	120	167,842
Railroad signal, electric, H. W. Spang	50	168,058
Railroad signal, electric, H. W. Spang	50	168,059
Rammer, steam road, S. Johnson	110	167,839
Reefing and furling gaff top sails, B. P. Lecraw	138	167,911
Refrigerators, ice floor for, H. Braunlich	58	167,980
Register, F. J., and W. H. Hoyt	42	167,901
Registering and recording machine, F. W. Brooks	42	167,922
Rein holder, B. F. Brown	31	167,963
Rein holder, Gilmore and Spencer	31	167,891
Rolling metal tubes, machine for, C. L. Johnson	163	168,026
Rolling mills, feed device for, S. Vanstone	125	167,861
Roof, composite, R. Lee	126	168,032
Roundabout, L. Schaeffer	143	167,941
Row lock, J. S. Dougherty	13	168,000
Sad iron, H. R. Robbins	91	168,050
Sash fastener, E. B. Beach	24	167,976
Sash fastener, E. W. Brettell	24	167,822
Sash fastener, R. L. Pruyn	24	167,935
Sash holder, J. Stauffer	24	167,949
Saw, hand, H. Disston	29	167,996
Saw handles, crosscut, J. L. Edgar	29	168,003
Saws for sawing stone, inserting diamonds into, J. E. Emerson	153	167,882
Sawing machine, scroll, I. P. Hicks	130	168,019
Screws, machine for cutting wood, Chamberlin and Cushing	171	167,988
Settee, J. P. Sayles	62	168,053
Sewing machine shuttle, H. L. Walker	134	168,067
Sewing machines, lamp bracket for, Willson and Vassie	90	167,864
Sheet iron blank, G. E. Taylor	136	168,063
Shoe, club foot, W. Autenrieth	156	167,867
Shoe edge trimming machine, Addy and Abbott	16	167,816
Shoe pegging machines, attachment to, J. H. Oliver	16	167,855
Shutter fastener, R. L. Pruyn	24	167,934
Shuttle fastening, C. A. Smith	24	168,057
Signal, fog, W. S. Martin	138	167,848
Sink, L. Robinson	8	168,052
Slate polisher, Coffin and Klots	153	167,875
Sleigh, G. McConnell	31	168,039
Soap cutting machines, attachment to, J. C. Ralston	26	167,936
Soldering iron, J. Aguiar	136	167,969
Soles, roller for buffing, J. B. Johnson	16	167,904
Soles, roller for buffing, J. B. Johnson	16	167,905
Spindle steps in their supports, securing, A. S. Hopkins	142	168,022
Spindles, apparatus for oiling, Buttrick and Flanders	87	167,823
Spinning machines, whirl for, Wilson and Hall	142	167,965
Stamp, check, &c., revenue, Casilear and McIntire	54	167,987
Stamp for cigar boxes, revenue, F. C. Hamilton	54	168,014
Stamps, composition for elastic, J. Scott	146	167,856
Stamps, device for securing and canceling revenue, F. C. Hamilton	54	168,013
Stone, inserting diamonds into saws for sawing, J. E. Emerson	153	167,882
Stove, J. Duffy	154	168,002
Stove, J. A. Moore	154	167,852
Stove doors, turn button for, W. Morand	154	167,853
Stove leg, I. A. Lovejoy	154	167,915
Stove, magazine cooking, Perry, Dickey, and Liddle	154	168 047
Sucker rod socket, P. E. Jenks	118	167,903
Suspenders, A. R. Warren	38	167,961
Table, ironing, J. W. Field	91	167,886
Table, paper hanger's, J. Orgill	62	167 924
Tailor's measure, F. H. Ullrich	38	167,957
Tanning hides and skins, J. Angus	92	167,866
Telegraph, printing, T. A. Edison	50	168,004
Thrashing machines, Feeder for, A. W. Lockhart	159	167,912
Tire shrinking machine, J. D. Hobbs	60	167,835
Tire upsetting machine, J. H. Merts	60	167,922
Trap, fly, J. S. White	143	168,071
Truss, H. Becker	156	167,818
Truss, J. N. Bell	156	167,977
Tube cleaner, J. Williams	148	168,072
Tubes, machine for rolling metal, C. L. Johnson	163	168,026
Tuyeres, machine for making, E. J. Mildren	12	167,850
Type setting machine, A. Miller	117	168,044
Valve, balanced, J. F. Allen	152	167,865
Vegetable cutter, J. T. Lohr	50	168,033
Vehicle spring, M. Gluck	31	167,892
Vehicle wheel, E. Ball	31	167,971
Wagon axle, Lants and Mitchell	31	167,843
Wagon spring, L. P. Devendorf	31	167,877
Walls, construction of, G. H. Ballentine	4	167,973
Wash stand and water closet combined, R. C. Ball	8	167,973
Washing machine, T. P. Benton	91	167,978
Washing machine, T. B. Kirkwood	91	167,907
Watches, compound balance staff for, J. J. Thornton	36	168,065
Watches, escapement for, E. Bourquin	36	167,872
Watchman's time check, Osborne and Le Grande	42	167,925
Water closet valve, P. D. Donnelly	8	167,998
Water in pipes, apparatus for indicating and recording the velocity of, G. F. Deacon	167	167,994
Water wheel, H. Twitchell	168	167,956
Weather strip, G. P. Bennett	30	167,820
Wind wheel, turbine, L. G. Feliner	118	168,009
Windmill attachment, H. Weld	118	167,964
Wrench bars, &c., die for forming, A. G. Coes	50	167,825
Yarn, machine for spooling, A. M. Wade	142	168,066

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED SEPTEMBER 21, 1875.

	Patent No.
Abbott and Addy	167,816
Adams, F. F., Draw bar for street cars	167,968
Adams, L. M., assignee	168,005
Addy, C. J., and E. S. Abbott, Shoe edge trimming machine	167,816
Aguiar, J., Soldering iron	167,969
Aiken, J., assignee	168,006
Allen, J. F., Balanced valve	167,865
American Steam and Water Recorder Company, assignee	167,950
Angus, J., Tanning hides and skins	167,866
Ashcroft, E. H., Railroad car heater, (reissue)	6,652
Ashcroft, E. H., Fire extinguisher (reissue)	6,653
Autenrieth, W., Club foot shoe	167,867
Babbitt, B. T., assignee	168,026
Bacon, H. E., assignee	167,861
Bailey, H. J., Shower and bath cock	167,817
Baily, M. W., Heater	167,868
Baird, D. W., Hub band	167,970
Baldwin, R. J., assignee	167,868
Ball, E., Vehicle wheel	167,971
Ball, R. C., Wash stand and water closet combined	167,972
Ballentine, G. H., Construction of walls	167,973
Ballou, G. F., Slide rest for metal turning lathes	167,974
Ballou, R. A., assignee, (reissue)	6,652, 6,653
Barnes, J. B., Hydraulic punch	167,975
Beach, E. B., Sash fastener	167,976
Bechet, A., Removable drip cup for Argand lamps	167,869
Becker, H., Truss	167,818
Bee, A. W., and I. W. Garrett, Automatic glass gage cock	167,819
Beidler and Hopkins	168,023
Bell, G. W., Metallic can	167,870
Bell, J. N., Truss	167,977
Benedict & Burnham Manufacturing Company, assignees	167,963
Bennett, G. P., Weather strip	167,820
Benton, T. P., Washing machine	167,978
Blesicks, S., assignee	167,998
Blackman, E., Lamp	167,871
Bliss, G., assignee	167,952
Bliss, J. W., assignee	167,924
Boag, A., Marble cement	167,979
Bostwick and Cook	167,827
Bostwick, W. W. & Co., assignees	167,827
Bourquin, E., Escapement for watches	167,872
Braunlich, H., Ice floor for refrigerators	167,980
Brenner, R., Vent faucet	167,821
Brettell, E. W., Sash fastener	167,822
Bristol Brass and Clock Company, assignee, (reissue)	6,650
Broadwell, L. W., Gas check for ordnance	167,981
Brooke, H. A., and W. F. Wright, Coal tar burner	167,873
Brooks, E. J., assignee	168,014
Brooks, F. W., Registering and recording machine	167,982
Brown, B. F., Rein holder	167,963
Bruen, E. C., Friction clutch for extension chandeliers	167,984
Budd, J. C., Hat and fur box	167,985
Burgess, H., Decomposing cryolite	167,986
Buscll, J. H., Heel and sole trimming machine	167,874
Buttrick, C. G., and T. B. Flanders, Apparatus for oiling spindles	167,823
Casilear, G. W., and W. C. McIntire, Revenue stamp, check, &c	167,987
Cather, E., Machine for compressing the ends of blind slats	167,824
Chamberlin, G. W., and S. G. Cushing, Machine for cutting wood screws	167,988
Chicago Wheat Steaming Machine Manufacturing Company, assignee	167,837
Clark, Richmond, and Emerson	168,007
Clarksville Iron Wagon Manufacturing Company, assignee	167,971
Codington, E., assignee	168,005
Coles, A. G., Die for forming wrench bars, &c	167,825
Coffin, J. H., and P. S. Klotz, Slate polisher	167,875
Colwell, W. S., Furnace for brick kilns	167,826
Comfort, O. F., Door spring	167,989
Cook, C., and W. W. Bostwick, Fruit and jelly press	167 827
Cook, J. M., assignee	167,967
Cooper, W., Chain pump bucket	167,900
Cottingham, G. W., Ironing apparatus, (reissue)	6,654
Cottingham Ironing Machine Company, assignee, (reissue)	6,654
Cramer, W. V. T., assignee	167,999
Crane, F. E. S., Bolt	167,828
Cunningham, J., Carriage spring	167,991
Curtis, H. M., Carriage spring	167,992
Cushing and Chamberlin	167,988
Dalsen, C. M., Hatchway	167,993
Dalton, J. E., assignee	167,978
Darragh, B., Carpet stretcher	167,876
Davenport, J. L., assignee	167,952
Deacon, G. F., Apparatus for indicating and recording the velocity of water in pipes	167,994
Delaplane, T. C., Flour mill	167,995
Dennett, H. E., Boot and shoe fastening	167,829
Devendorf, L. B., Wagon spring	167,877
Dexter, A. J., Copying ink	167,878
Dickey, Liddle, and Perry	168,047
Dilley, J. W., Combined harrow and cultivator	167,879
Disston, H., Hand saw	167,996
Donnellan, C. E., Grain binder	167,997
Donnelly, P. D., Valve for water closets	167,998
Downing, J., Basin faucet	167,880
Doubler, J. W. H., Mechanical motor	167,999
Dougherty, J. S., Row lock	168,000
Dowling, T., Pump	167,881
Drummond, J. F., Paint can	168,001
Duffy, J., Stove	168,002
Eastman, G. H., Grist alarm, (reissue)	6,655
Edgar, J. L., Crosscut saw handle	168,003
Edison, T. A., Printing telegraph	168,004
Edwards, G. W., Lifting jack	168,005
Eichbaum, F. H., Gas apparatus	168,006
Ellis, R., assignee	168,000
Emerson, J. E., Inserting diamonds into saws for sawing stone	167,882
Emerson, L., A. J. Clark, and J. T. Richmond, Former for bending carriage seat irons	168,007
Engle, J. S., assignee	168,075
Espach, S., Horseshoe machine	168,008
Etchison, H. N., assignee	167,995
Farmer, J. C., Exhaust pipe for locomotives	167,883
Farmer, T. P., Countersink	167,884
Farnsworth, E. M., assignee	167,884
Farrar, A., assignee	167,998
Farwell, P., assignee	168,021
Felber, J., Governor	167,885
Fellner, L. G., Turbine wind wheel	168,009
Ferris, G. H., Steam cooking apparatus	167,830
Field, B., and G. M. Pullman, sleeping car, (reissue)	6,648
Field, J. W., Ironing table	167,886
Fishburne, E. G., assignee	168,075
Fisher, H. N., assignee	167,974
Flagg, L., assignee	167,861
Flanders and Buttrick	167,823
Fleming, H. L., assignee	167,822
Flow, J., Wheel plow	167,887
Flynn and Winfield	168,074
Ford, J., assignee	167,942
Foster, M., Brick for constructing retorts	167,831
Fox, G. H., Clasp for machine belting	167,832
Fray and Pigg, assignees	167,880
Fredenburgh, J., Carriage spring	167,888
Frisbee, G., Rock drill	168,010
Fry, J. L., Machine for cutting out garments	168,011
Fuller, T. R., assignee	167,949
Fuyat, T., Venetian blind	167,889

TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED SEPT. 21, 1875.

167,916. SAGE-EDGE-TRIMMING MACHINES. Chas. J. Addy and Ezra B. Abbott, Boston, Mass. (Filed July 10, 1875.)

1. In a sole-edge-trimming machine, the combination of the vibrating cutter E, with cutting-block and mud-guide F, acting together, substantially as described, and for the purpose set forth.

2. The combination of the knife E, the cutting-block and mud-guide F, and the movable guide H K, all operating together, substantially as described, and for the purpose set forth.

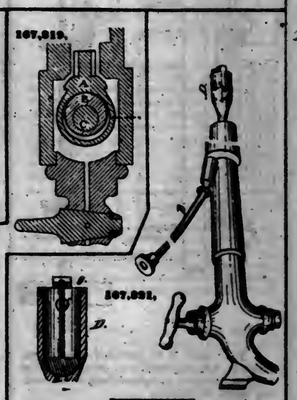
167,917. COMBINED SHOWER AND BATH COCKS. Harry J. Bailey, Pittsburg, Pa. (Filed July 29, 1875.)

Brief.—A double nozzle is attached to a hot and cold water faucet. To one nozzle a hose is attached, which conveys water to a shower-nozzle. Water is admitted directly to the bath-tub through the other nozzle.

1. In combination with a bath-tub supply-pipe and cock, a bath-tub discharge-nozzle, *b*, a shower-supply nozzle, *b'*, and a cock or valve intermediate between the nozzles and water-supply pipe, substantially as described, whereby the water-supply may be wholly shut off from both nozzles, or turned into either nozzle alone, by the adjustment or throw of the valve-cock or cock.

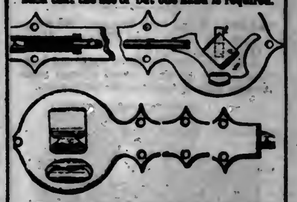
2. A double reversible nozzle, *b b'*, arranged on the discharge-pipe *a*, with parts arranged substantially as and for the purposes set forth.

3. The combination of cock B, pipe *a*, double nozzle *b b'*, hose *c*, and rose E, substantially as described.



167,918. TRUSSES. Herman Becker, Philadelphia, Pa. (Filed Aug. 2, 1875.)

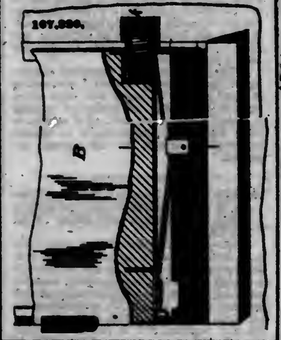
Brief.—A swinging rotating stem carries the pad, which can turn upon this stem either to the right or left, according as pressure is desired upon either side. The stem carries a ratchet with teeth turned in either direction, and a sprig-pawl, with rectangular central opening, is pivoted upon the surface of the pad.



In a hernial truss provided with a swinging joint for connecting the hernial pad A to the body-band B for the purpose of rendering the truss readily adjustable for either the right or left side of the person, as described, the combination, with the hernial pad A, of the rotary stem *d* and its ratchet-toothed cylinder *d'* and spring-lever 12, constructed and arranged substantially as set forth, for the purpose of enabling the wearer of the truss to readily adjust and secure the position of the pad A as as to bear against either the right or left side of the rupture or directly against the front of the same, as the wearer may desire, substantially as described.

167,919. SASH-FASTENERS. E. W. Bretnall, Elizabeth, N. J., assignor to H. L. Fleming, same place. (Filed Mar. 15, 1875.)

Brief.—A spring-bolt, let into the lower edge of the sash, is withdrawn by forcing down a knob, the shank of which works in a vertical slot, while the guide passes downward along one of the edges of a V-shaped slide. The pressure being released, the action of the spring returns the knob, slide, and bolt to their former position, the construction being such that the use of but one hand is required.



The knob *a*, guide *c*, and V-shaped slide *f*, operating in connection with a spring-bolt, *h*, arranged and combined substantially as shown, for the objects herein set forth.

167,920. AUTOMATIC GLARE GAGE-COCKS. Albert W. Bee, San Francisco, Cal., and I. Wilson Garrett, Philadelphia, Pa. (Filed Mar. 26, 1875.)

Brief.—While the glass tube is filled with water and steam, the automatic valve is kept open by its gravity; but when the glass breaks the rush of water or steam closes the valve. In case of leakage, by reason of the deposition of scale on the bearing-surfaces of the valve, the ordinary valve may be closed steam-tight by hand, when the scale can be removed. The cam is turned by means of the stem and handle to open the automatic valve.

The combination, in an automatic glass gage-cock, substantially as described, of an automatic valve, with a cam on the stem of an ordinary screw-valve.

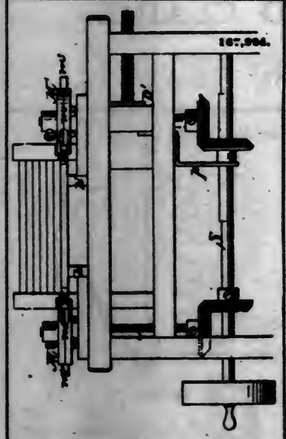
167,920. WEATHER-STRIPS. G. P. Bennett, Coventry, R. I. (Filed Feb. 17, 1875.)

The combination of the door B, strip D, spring *f*, having the bracket H, roller *i*, and cam-plate *k* fastened to the door-frame, all constructed substantially as and for the purpose described.

167,921. VENT-FAUCETS. Rudolph Brenner, Cincinnati, Ohio, assignor to Henry Varwig, same place. (Filed Nov. 6, 1874.)

In combination with the faucet, the sliding air-duct D, with its outer end open to receive air, and its inner end provided with the enlargement D, valve E, guide-rod *f*, and bar or cap *g*, constructed substantially as and for the purpose described.

167,922. APPARATUS FOR COILING SPRINGS. Charles G. Buttrick and Timothy B. Flanders, Holyoke, Mass. (Filed Apr. 6, 1875.)



1. The combination of the sleeve J, having the flange F and screw-thread *i*, with the whirl W and spindle B, in the manner and for the purpose described.

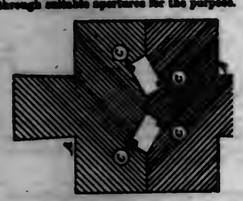
2. The combination of the step C, rail D, and hollow plug F, in the manner and for the purpose specified.

167,923. MACHINES FOR COMPREHENDING THE HEADS OF BLIND-SLATS. Edwin Cather, Fort Deposit, Md. (Filed Jan. 28, 1875.)

Brief.—The slats are placed in a vertical hopper, and the lower one has its ends compressed by means of suitable recesses in two receiving carriers, at the same time that it is carried forward to make room for the succeeding slat.

167,894.

1. The wheels M M', provided with the recesses *n* and projections *n'*, adapted to the purposes referred to, substantially in the manner herein described.

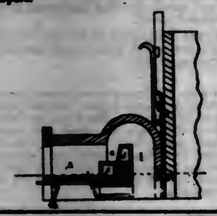


2. The combination of the two compressing and beradditing wheels M M', constructed to rotate simultaneously with equal speed in opposite directions, so as to rotate and act upon both ends of a slat simultaneously.

3. The combination of the two wheels M M' with the slat-supports and feed-grooves, substantially as and for the purposes specified.

4. The stationary compressing and berating wheel M, combined with the adjustable wheel M', substantially as and for the purposes set forth.

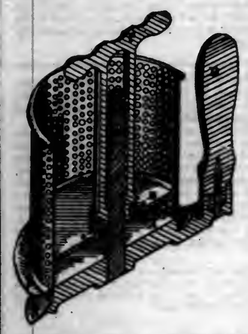
167,895. DIES FOR FORMING WIRE-RODS, &c. A. G. Cone, Worcester, Mass. [Filed Aug. 11, 1875.]



Brief.—For shearing discs of resins and dust, water, steam, or air is forced through them through suitable apertures for the purpose.

The improved forming-disc A, having passages C C, with longitudinal openings D at the angles of the matrices, substantially as and for the purposes set forth.

167,896. FURNACES FOR BRICK-KILNS. W. S. Colwell, Pittsburg, Pa. [Filed May 10, 1875.]

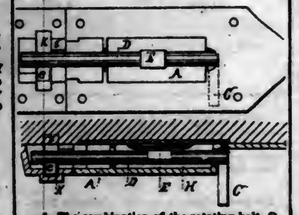


Brief.—Air is supplied to the products of combustion at various points, and they can be directed to different parts of the kiln by means of the adjustable partition and the dampers.

1. The furnace B, having fire-chamber D, flame-chamber *e*, distributing-chamber *i*, air-flues *f* and *g*, arranged, as specified, with relation to said chambers, so that three different series of air-jets are commingled with the results of combustion.

2. The distributing-chamber *i*, provided with an adjustable partition, *w*, in combination with two or more furnaces and a kiln, the fire-arches of which are provided with dampers, substantially as herein described, and for the purposes set forth.

167,897. FRUIT AND JELLY PRESSES. Carter Cook and Walter W. Bostwick, Cincinnati, Ohio, assignors to W. W. Bostwick & Co., same place. [Filed May 15, 1875.]



1. In the jelly-press above described, the combination of disk-piston B, having central hub bored and notched at *a a'*, perforated piston-rod or handle C, having lugs *b b* projecting from the lower edge of its periphery, and plugs *c c*, all constructed in the manner and for the purposes described.

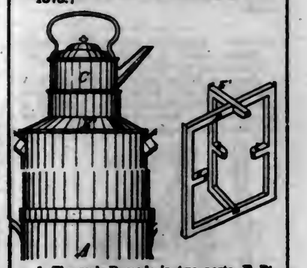
2. The jelly-press herein described, consisting of base A, having channel *f*, terminating in spout *g* upon its upper and outer edge, cover B, open-ended and perforated cylinder *F*, piston B, and piston-rod C, all of said parts being constructed and arranged to operate substantially as and for the purpose described.

167,898. BOLTS. Francis H. S. Crane, Newark, N. J., assignee of one-half his right to Edwin D. Peckhorst, same place. [Filed May 15, 1875.]

Brief.—A rotating and sliding catch-bolt has a fastened section, thumb-piece, and suitable spring. The projecting end of the bolt is formed into a ward or key, which engages with and works within a suitably notched and recessed case or keeper, the construction being such as to readily lock sliding doors or the like together, and as readily to detach them, by simple movements of the self-locking bolt only.

1. The combination of the rotating bolt D, provided with thumb-piece O and fastened section E, the spring H, and the case A, as and for the purpose specified.

2. In combination, the bolt D, having thumb-piece O, ward *c*, and section E, the spring H, the case A, and the case or keeper K, having projection I and raised part *k*, all substantially as and for the purpose set forth.

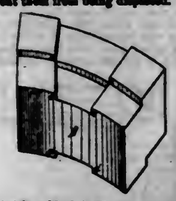


167,899. BOOT AND SHOE FASTENINGS. H. R. Dennett, Boston, Mass. [Filed May 6, 1875.]

1. The improvement in shoe-fastenings herein described, consisting of the plate A, cap *g*, sleeve *f*, and rivets *h* and *i*, combined and arranged as shown, and attached to the shoe by sewing and the rivets, in the manner described.

2. A clasp for shoe-laces, composed of a continuous piece of wire, bent to form the enlargement *s* and the narrow portion *p*, and having its ends brought together and twisted to afford means for its attachment to a boot or shoe, substantially as and for the purpose specified.

167,900. STEAM COOKING APPARATUS. G. H. Ferris, Brooklyn, N. Y. [Filed Nov. 1, 1873.]



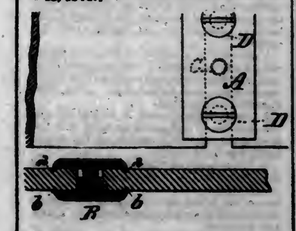
1. The rack D, made in two parts, B B', locked or otherwise connected together, and provided with the shelves *l l*, extending inward to form a support for the edges of the separate receptacles, as specified.

2. In combination with rack D, the case B and boiler A, the latter provided with the ledges *b b'*, adapted to receive the lower end of the rack and case, as specified.

3. In combination with cover B', the rim *c*, adapted to form a steam-condensing chamber, C', between the lower surface of the kettle and upper surface of the cover, and communicating with the interior of the case through opening *e* and pipe *f*, as specified.

167,901. BRICKS FOR CONSTRUCTING RECUPERATIVE FURNACES. Morrison Foster, Allegheny, Pa. [Filed Feb. 20, 1875.]

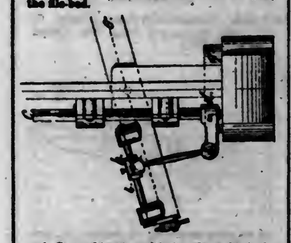
Brief.—Bricks of voussoir form provided with longitudinal and transverse shoulders, to prevent them from being displaced.



1. A brick or block having convex and concave faces, and sides provided with longitudinal shoulder, substantially as specified.

2. A brick or block having convex and concave faces, and provided with longitudinal and transverse shoulders, substantially as specified.

HELIOTYPE RELIEF PROCESS JAMES R. OSGOOD & CO. BOSTON

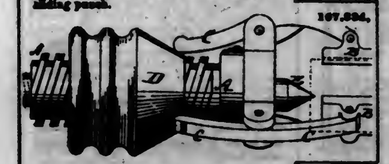


167,889. CLASPS FOR MACHINE-BELTING. George H. Fox, Boston, Mass. [Filed Aug. 13, 1875.]

The combination, in a belt-clasp, of the plates A B, provided with clamping-jaws *a a b b* placed diametrically opposite each other, with the screws D D, and spring C, substantially as set forth.

167,890. FEED MECHANISMS FOR FILE-CUTTING MACHINES. James Garland, Central Falls, R. I. [Filed Aug. 18, 1875.]

Brief.—A vertically-reciprocating shaft and lateral arm, with ball-and-socket connection to arm upon a horizontal rocking shaft, having also an arm on its end, carrying a pawl for rotating a ratchet upon the screw carrying the file-bed.



1. In combination with the adjustable bed *a*, the rock-shaft *i*, the arm *b* adjustable on the rock-shaft *i*, and the ball-and-socket connection with the reciprocating rod *c*, substantially as and for the purpose specified.

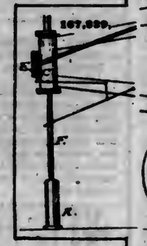
2. The combination, with the adjustable bed of a file-cutting machine, of a feeding device, operated by the reciprocating rod *c* and the intermediate adjustable mechanism, substantially as described, by which the motion is transmitted directly, substantially as and for the purpose set forth.

167,891. CHECKING DEVICES. Mary A. Greenwood, Fitchburg, Mass., administratrix of Mark T. Greenwood, deceased. [Filed Mar. 12, 1875.]

Brief.—The pivoted jaws, forced together by central nut and levers, clamp any shape of cord, when it is marked or centered by the sliding punch.

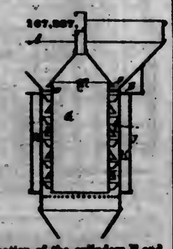
The centering device herein described, consisting of the punch B, tubular threaded shank A, central nut D, levers C, and pivoted jaws B, combined and operated as and for the purposes set forth.

167,892. TIRE-SHRINKING MACHINES. Jos. D. Hatton, Northfield, Iowa. [Filed Apr. 27, 1875.]



Brief.—The indicator is attached to the permanent bank, and is connected to one of the levers by a rod, the levers being operated by a double eccentric.

The improved tire-shrinker herein described, consisting of the combination of the anvil A, back K, carrying-cams B, and indicator S, rod O, levers H, jaws J, connecting-rods O, double eccentric L, and lever F, as and for the purposes set forth.



167,893. CHECK-GUARDS FOR HARNESS. Frederick Howard, Hyde Park, Ill. [Filed May 20, 1875.]

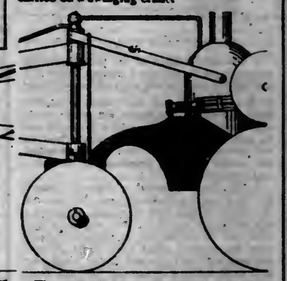
The check-guard, consisting of the vertical loop C for receiving the check-rein, and the horizontal loop B, containing the spring D, and also receiving the saddle-hook E, as hereinbefore described, and for the purposes set forth.

167,894. APPARATUS FOR STEAMING GRAIN. John C. Hunt, Chicago, Ill., assignee to Chicago Wood-Steaming Machine Manufacturing Company, same place. [Filed Jan. 9, 1875.]

1. The combination of the cylinders E and G, the annular ledges I, and the steam-chamber B, substantially as and for the purposes specified.

2. The combination of the cylinders E and G, the steam-chamber B, the annular ledges I, the hoisting-drum J, and air-holes O, as and for the purposes specified.

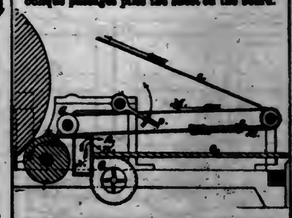
167,895. DRIVING BELTS AND BANDS. R. G. Isaacs, Kingston, Jamaica, British West Indies. [Filed July 14, 1875.]



1. A driving belt or band, A, the ends *a* of which are provided with cups or ferrules *a'*, holes *a'*, and grooves or channels *a'*, and connected together by means of a spring, B, interposed between (and having its periphery or sides in a continuous line with the periphery or sides of the belt or band and connected to) the ends *a* by means of extensions *b* passing through the holes or eyes *a'*, and resting within the grooves or channels *a'*, in the manner and for the purposes described.

2. A flat driving belt or band, A, provided at each end with a cup or cover, *a'*, and having its ends *a* connected together by means of a spring, B, composed of a series of wires or strips of material, the extensions *b* of each end of which are passed through the ends and bent down against the opposite sides of the band A, in the manner and for the purpose described.

167,897. STEAM ROAD-RAMMERS. Samuel Johnson, Philadelphia, Pa. [Filed Aug. 26, 1875.]



Brief.—A steam road-rammer, in which the reciprocating rammer and driving-cylinder are carried on a swinging crane.

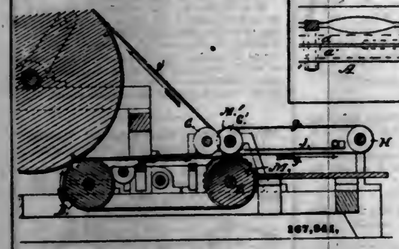
The portable steam-rammer hereinbefore described, the same consisting of the combination, with a suitable carriage supporting a boiler and a furnace, of the cranes D D, steam-pipes S S', cylinder C, and rammer R, all constructed, arranged, and operating substantially in the manner and for the purpose specified.

167,898. DELIVERING APPARATUS FOR PAPER-PRESSES. John W. Kellogg, Philadelphia, Pa. [Filed Nov. 13, 1873.]

Brief.—The sheet is held against the air-entering delivery-tapes by a blast of air until its rear end is knocked down by the automatic striker, when another blast of air from the oblique passages piles the sheet on the board.

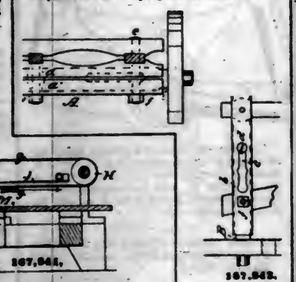
1. The combination of the tapes M, passing over the two larger series of pulleys G and F, the blower *p*, the blower O, and the air-chamber I, provided with two separate series of air-passages, *n* and *n'*, adapted to deliver and pile the sheets on the fly-board, substantially as described and set forth.

2. The combination of the smaller pulleys



HELIOTYPE RELIEF PROCESS JAMES R. OSGOOD & CO. BOSTON

H on the rearmost spindle, the second impression-cylinder A, with their endless tapes c, and the outer fly-pulleys F, on the same spindle with series H, and the inner fly-pulleys G, on their own spindle, and the endless tapes M, traveling over them, all constructed and arranged substantially as and for the purpose described

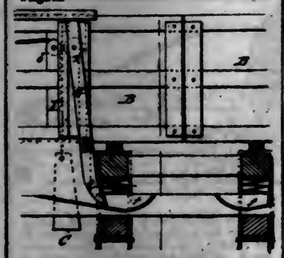


---

167,841. DELIVERING APPARATUS FOR PRINTING-PRESSES. John W. Kellberg, Philadelphia, Pa. [Filed Nov. 3, 1873.]

Brief.—The paper is carried from the cutting-cylinders by the tapes passing around the roll, which is provided with gear-wheels at its opposite ends of varying diameters, and as the larger is connected with the rolls carrying the second series of tapes, they will be made to travel faster than the first series, to allow the striker time to knock the end of the sheet down, and return to position before the next sheet arrives.

167,841.



167,842.

1. The combination of the second impression-cylinder A, spindle d, having pulleys G, the endless tapes c, the main cutting-cylinder B, fly-cylinder C, and their series of endless tapes traveling over them, the whole set in motion by means of the gears B', D, E, and C', and adapted to carry the sheet from the web and conduct it rearward between the said two series of tapes, substantially as shown and described.

2. The combination of cylinder C, gears E and M, of varying diameters, mounted thereon, the pinion M' mounted on spindle e, spindle e, the pulleys G' and H on their respective spindles, and the endless bands g adapted to conduct the severed sheet back to its place of delivery with an increased rate of speed over that imparted to it by the said first two series of tapes, substantially as and for the purpose set forth and described.

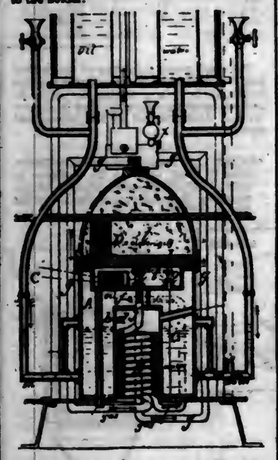
167,842. GATES FOR RAILROAD-CROSSINGS. Silas Keller, Wrightsville, Pa. [Filed July 7, 1875.]

Brief.—A railroad-gate operated by weight of passing train upon vertically-yielding sections of the track through vibrating levers, the lower ends of which are cam-shaped, and when the truck is depressed the cams bear against inclined surfaces, thereby throwing outward their upper ends, which have friction-rollers working in vertical ways in the gate, thereby causing them to be moved outwardly. They are returned to position by weights.

1. The combination of the elevated movable rails D D, hinged levers G G, having cam-ends e e, and the rearmost f f, substantially as and for the purposes herein set forth.

2. The combination of the hinged levers G G, having friction-rollers h h, the sliding gates B B, with guides I I, ropes o o, and weights O O, substantially as and for the purposes herein set forth.

167,843. WAGON-AXLES. Joseph R. Lantz and Thomas L. Mitchell, Marrowbone, Ill. [Filed July 21, 1875.]



1. The octagonal-shaped axle-sections B, in combination with the hexagonal box A, formed in sections a a', and bolt or rod d, for tightening and clamping the sections upon the axle, substantially as specified.

2. The hexagonal box A, composed of the sections a a', the latter having slot b and shoulders c, in combination with the octagonal axle-sections B and set-screw d, substantially as and for the purpose set forth.

167,843.

167,844. PROCESSES AND APPARATUS FOR THE MANUFACTURE OF ILLUMINATING-GAS. Thomas W. Lion, Brantsville, Va. [Filed July 10, 1875.]

Brief.—Oil and water are vaporized, the oil-vapor passed through a heating-coil, and the two vapors enter a chamber where they are subjected to the action of electricity. From this chamber the gas enters a second chamber, where it is again acted on by electricity, and thereby purified and improved. It is then passed through a heating-coil and carbureter to the holder.

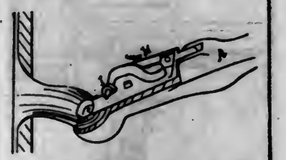
1. The process of manufacturing illuminating-gas, consisting in subjecting highly heated hydrocarbon vapor to the action of electricity, substantially as described.

2. The process of manufacturing illuminating-gas, consisting in subjecting heated hydrocarbon vapor to the action of electricity to produce a fixed gas, and then subjecting said gas to the action of electricity, substantially as described.

3. The process of manufacturing illuminating gas, consisting in subjecting heated hydrocarbon vapor to the action of electricity, and then passing the resultant gas through a carbureter, substantially as shown and described.

4. The mixing-chamber I, containing the insulated electric battery C and laminated charcoal or its equivalent, and supplied with superheated steam and carbon-vapor inlets, substantially as described.

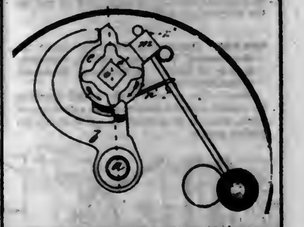
5. The cylindrical retort A, divided into the two chambers b and c, and provided with the central fire-chamber d containing the superheating-coils, as shown.



6. The cylindrical retort A, divided into the chambers b and c, in combination with the chamber d communicating with the two chambers of the retort, and containing the electric battery and charcoal, substantially as shown and described.

7. The combination of the battery C charged with salt, the gauze-basket X, and hydrocarbon-vapor chamber, as and for the purpose described.

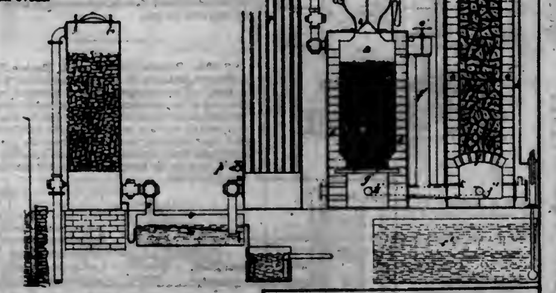
8. The combination of the retort, containing two separate chambers, the mixing-chamber I, communicating with the chambers of the retort and containing the electric battery, and the chamber I communicating with the mixing-chamber and containing a thermo-battery.



9. The combination of the retort A, provided with chamber I, the perforated plate k, and the hood n, as shown.

167,845. COMBINATION BELL-JOINTS. O. C. Little, Sheboygan Falls, Wis. [Filed Aug. 31, 1875.]

A coupling consisting of the arm A, provided with a concave cup, a, the concave-cover plate B, the part C with a hook, E, and spring H, and the loop I, all combined, together as and for the purposes described.



167,846. DOOR-BELLS. Edward M. Lockwood, West Meriden, Conn., assignor to Edward M. Lockwood and Charles Page. [Filed Mar. 17, 1875.]

The combination of the socket f, the striker e, the pivoted lever h, and the spring g, all operating to strike the bell by rotating the socket in either direction, substantially as set forth.

167,847. PROCESSES AND APPARATUS FOR THE MANUFACTURE OF ILLUMINATING OR HEATING GAS. Thaddeus S. C. Lowe, Norristown, Pa. [Filed Mar. 10, 1875.]

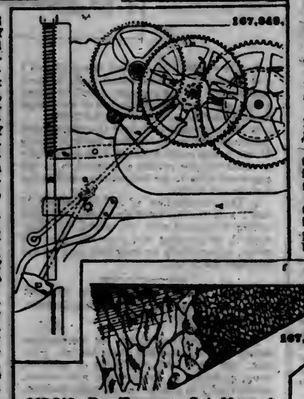
Brief.—Produce anthracite or bituminous coal in gas-generator. May use any kind of wood; saw-dust, coal-dust, or asphaltum. Products of combustion from gas-generator heat brick in superheater, and also tubes of air-oven in stack of superheater. This hot air is forced into base-chamber of the gas-generator and of the superheater. In the latter it meets products of combustion from gas-generator, and causes flame and higher degree of heat in superheater. When contents of both generator and superheater are incandescent, shuts out air from both; diverts gases from gas-generator downward through tubes of steam-generator, developing and heating steam; directs steam from its generator downward through superheater, and upward through generator; also admits substances containing volatile carbon (such as bituminous coal, petroleum, resin, cotton-seed, coal-tar, asphaltum, fats, waste of oil-refineries) into contents of gas-generator. May omit steam or may admit heated steam directly from steam-generator into gas-generator, and pass products through superheater, and either through tubes of steam-generator to washer, or directly to washer, or may pass steam through the superheater and the gas-generator, and thence pass all through another superheater. May be several gas-generators and air-ovens.

167,847.

1. For the manufacture of illuminating and heating gas, the process which consists of dropping or otherwise admitting in limited quantities, continuously or intermittently, hydrocarbon oils or other carbonaceous substances, liquid or solid, onto the top of a thick mass of coal or other carbonaceous substance, in a state of incandescence, in a close chamber previously heated by direct internal combustion, with or without the introduction of steam, and thence, for the purpose of superheating and fixing the gases of said chamber, passing them from said chamber into and through a second chamber, which also has been previously heated by direct internal combustion, substantially as set forth.

2. The process for producing an illuminating-gas, which consists of superheating steam, by passing it through a chamber previously heated by direct internal combustion, then causing cold steam to pass through a mass of coal or other carbonaceous substance, in a state of incandescence, in a close generating-chamber, to decompose the steam, and afterward, for the purpose of still further heating the gases of said generating-chamber, and thereby producing a more fixed gas, passing the gases from said generating-chamber into and through another superheating-chamber, which has been previously heated by direct internal combustion, substantially as set forth.

3. The combination of the generator a, superheater d, heat-restorer f, and flue-pipe for forcing air through the pipe h, around the tubes of the heat-restorer f, through pipes l, l', and f, into the chamber p, for generating and securing intense combustion in said chamber p, substantially as set forth.



4. The combination of the generator a, superheater d, heat-restorer f, elevated oil-tank m, the upright tubular boiler r, with their several connecting-pipes and other appurtenant parts, as described, constituting apparatus for rapidly evolving illuminating-gas, and fixing the same in its gaseous condition, substantially as set forth.

5. The combination of the generator a, superheater d, heat-restorer f, elevated oil-tank m, upright tubular boiler r, wash-box s, scrubber p, with their several connecting-pipes and other appurtenant parts, as described, constituting apparatus for rapidly evolving illuminating and heating gas, fixing the same in its gaseous condition, and purifying the same preparatory to storage or immediate use, substantially as set forth.

167,848. FOG-SIGNALS. Wm. S. Martin, Baltimore, Md. [Filed Aug. 10, 1875.]

The fog-bell B, hammer C, vibrating shaft a, bar b, sliding spring-bolt D, lever g, disk e, gear-wheel E, provided, respectively, with pins actuating the said bar and bolt, all combined substantially as described.

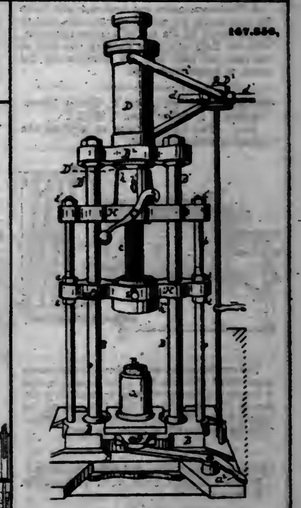
167,847.

167,848.

167,849.

167,849. FUEL-KINDLERS. C. A. Maynard, St. Louis, Mo. (Filed May 28, 1875.)

A fire-kindler composed of mineral coal, resin, or its equivalent, wood, and a paper bag combined, substantially as described.



167,850. MACHINES FOR MAKING TUYERES. Edward J. Milliron, Johnstown, Pa. [Filed Aug. 10, 1875.]

Brief.—Plastic earthy material is hammered while heated, and compressed, perforated, and shaped into tuyeres for Bessemer converters.

1. The combination of a steam-actuated piston-stem and tuyere-mold, substantially as and for the purposes set forth.

2. A cross-head, H', carrying a mold-cap, F, in combination with a mold, a, substantially as and for the purposes set forth.

3. A cross-head, H, as a carrier for the perforators c, having a detachable connection with a steam hammer, ram, or piston-stem, and in combination therewith, substantially as described, whereby the tuyere-blank may be perforated and hammered, and the perforators withdrawn through the action of the piston-stem.

167,850.

4. The combination of the cross-head H carrying perforators c, cross-head H' carrying mold-cap F, and mold a having a perforated bottom, substantially as and for the purposes set forth.

5. As a means of discharging the finished tuyere, the piston-stem D', acting directly or indirectly against the end of the tuyere, in combination with a movable bottom, a', a fixed unjointed mold, a, and counterweighted arms g', relatively arranged, substantially as set forth.

6. The cross-heads H H', playing on the posts B', in combination with the lifting-rods p and piston-stem D', substantially as set forth.

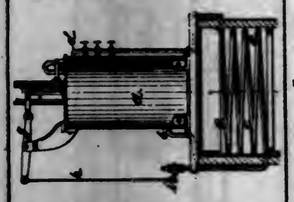
7. The combination of steam-actuated piston-stem, a perforating cross-head, a compressing cross-head, and mold, substantially as and for the purposes set forth.

8. The combination of steam-actuated piston-stem, a perforated cross-head, a compressing cross-head, and mold with a removable perforated mold-bottom, substantially as set forth.

167,851.

167,851. HOOP-BENDS. Joseph A. Miller, Providence, R. I. [Filed Mar. 17, 1875.]

1. The combination of the hoop-rod, consisting of the barrel a and disks or wheels b b secured to the barrel, with the arms c c, one end of each being shorter, secured from the center of the rod, than the other, substantially as and for the purposes described.



2. The curved arms c c, secured together to form the support for a hoop-rod, as and for the purposes set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

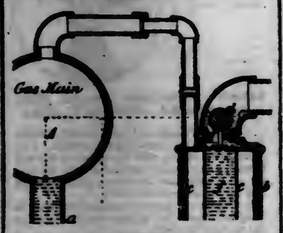
3. The combination, in a hose-reel, of a frame for supporting the reel in one position and to be supported by the reel in a reverse position, with the disks or cheeks forming the ends of the reel, and also used for transporting the same, as herein described.

167,863. STOVES. John A. Moore, Providence, R. I. (Filed Aug. 7, 1875.)

Brief.—The feed operates to regulate the supply of water admitted.

The combination, with a stove, of the heater *a*, provided with the fire *b*, the pipes *d*, *e*, and *f* connected therewith and surrounding the fire on all sides, and the feed *f*, operating the supply-valve *i*, the whole constructed substantially as and for the purpose set forth.

167,864. TURN-BOTTOM FOR STOVE-DOORS. William Morand, Troy, N. Y. (Filed July 6, 1875.)

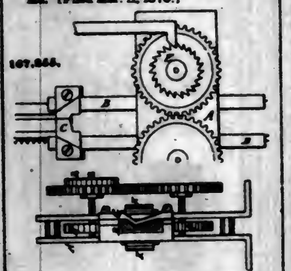


1. In combination with a stove-door having the socket *b* therein, and door-casing having the bottom-bearing *b* thereon, the turning and end-wise-moving stem A, with its bottom-finger D, collar E, hand-piece F, and spring G, all arranged to operate as shown and described.

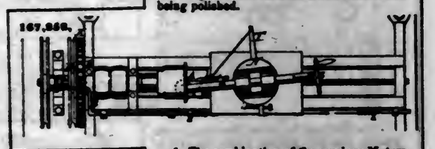
2. In combination with a door having the socket *b*, and door-casing having the finger-bearing *b*, the turning and sliding stem A, with its finger D, collar E, and hand-piece F, the spring G and the chisel-socket J, all arranged together substantially as shown and specified.

3. In combination with a door having the socket *b* in a turning thimble, I, Fig. 3, in the socket *a* in the door, the stem A, with its finger D, collar E, and hand-piece F, and the spring G, surrounded with the collar by the thimble, and all arranged to operate as shown and described.

167,865. DRAWS FOR GAS-MAINS. John Nader, Madison, Wis. (Filed Feb. 20, 1875.)



Brief.—When the tension of the gas equals a determinate hydrostatic pressure the float-valve rises, and the liquid is discharged from the main. When this pressure is diminished the valve falls again into its seat.

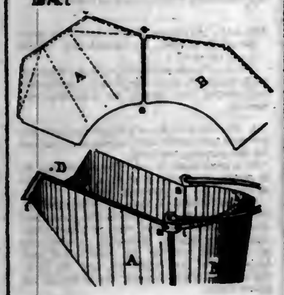


1. The combination, with the gas-main A, of the automatic drain, consisting of the connecting-pipe *c*, float-chamber *b*, valved float *e d*, and overflow-pipe *i*, operating as herein set forth.

2. The combination, with the gas-main and the automatic drain, of an equilibrium-valved pipe uniting these parts for joint action, substantially as herein set forth.

167,866. ATTACHMENTS TO SHOE-PEGGING MACHINES. James H. Oliver, Baltimore, Md. (Filed Mar. 11, 1875.)

1. The combination of feed-wheels H and I and ratchet E and the rollers K K, or their equivalents, for the purpose of feeding waxed strips, and forming the points of shoe-pegs, as herein before described and set forth.



2. The angular-edged knife C, arranged and combined with the guides B B, the feed-wheels H and I, and guide-rollers K K, substantially as described, for cutting a channel, *a*, in the peg-wood strip i, for the purpose and in the manner set forth.

3. The combination of the feed-wheels H and I with the ratchet E and guides B B and rollers K K, and with the angular cutting-knife C, for pointing and grooving peg-wood strips, substantially as described, and for the purpose set forth.

167,867. COMPOSITIONS FOR BRASS STAMPS. James Scott, Hamilton, Canada. (Filed June 12, 1875.)

An improved compound for composition stamps for ornamenting with bronze, gold-leaf, and silver-leaf, consisting of gelatine, syrup, glycerine, in combination with tannin, substantially as and for the purpose specified.

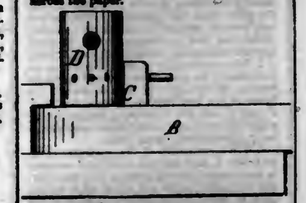
167,868. COAL-HODS. George Seyfang, Buffalo, N. Y., assignor to Heinz, Pierce & Himmelsbaur, same place. (Filed June 22, 1874.)

1. The blank A, consisting of a sheet of metal having the linear front *b c*, obtuse-angled sides *b a d* and *c e*, and the curved back or bottom *d e*, when the said lines *d a*, *a b*, *c e*, and *e c*, are all straight lines, and the sheet adapted to be bent in the lines *f*, *g*, to form the front of the coal-hod, the portion outside the lines *f a*, *g e*, the side wings *f f*, and the base of the mouth D, substantially as described, and for the use and purpose set forth.

2. The blank B, constructed with the obtuse-angled front *f b g*, and having the sides *a c*, *i h*, at or nearly at right angles with the lines *a b*, *i f*, said lines *a d*, *c i*, *h f*, *h g* being all linear, and the sheet adapted to be rolled or bent to form the back of a coal-scuttle, substantially as described, and for the use and purpose set forth.

3. The sheets A B, when their outer edges are constructed of straight lines only, and a continuous piece of wire without indentations or curves inclosed therein, substantially as described and shown.

167,869. POLISHING-MACHINES. Barton R. Sperry, Batavia, Ill. (Filed May 10, 1875.)



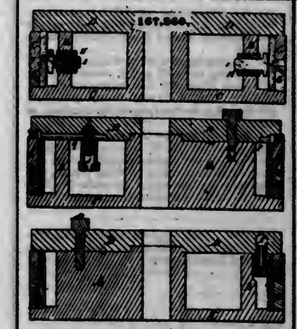
Brief.—The polishing-wheel is mounted on the end of a horizontal shaft, journaled in a vertical head-block, which is pivoted to a reciprocating carriage, so that a weight attached to a lever radiating horizontally from the pivoted head-block serves to press the grinding-wheel against the inner surface of the article being polished.

1. The combination of the carriage M, turn-table N, the arm T, the weight V, the shaft P, and polishing-wheel Q, whereby the polishing-wheel is caused to press constantly against the inner surface of the bottle, and at the same time yield to its varying size and shape, as described.

2. The spring S, in combination with the pivoted lever *r*, stop 10, cord or chain X, and weight V, for gradually relieving the arm T of the weight, so as to allow the turn-table N to gradually turn and carry the emery-wheel toward the center of the bottle, as specified.

167,870. PAPER-RULING MACHINES. James Stewart, Washington, D. C. (Filed Mar. 20, 1875.)

Brief.—The slotted guide is fastened to the side of the machine at any desired angle. The pen-beam is adjusted by means of the screw-rod and pivoted block, so that it is parallel with the edge of the sheet. By this device lines of any degree of obliquity may be ruled across the paper.

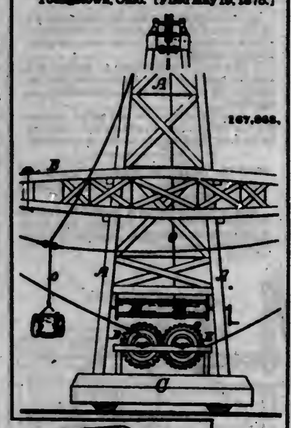


The combination of the adjustable guides B, sliding carriers C, and adjustable pivot-heads D, with the pen-beam G, constructed and operating substantially as and for the purpose herein specified.

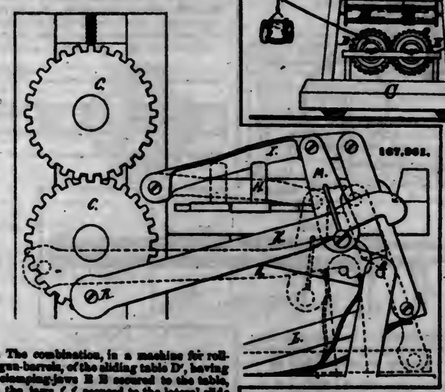
167,871. STEAM-PISTONS. O. M. Stillman, Westerly, R. I. (Filed Mar. 20, 1875.)

Brief.—The piston-rod is centrally adjusted by means of screw-plugs and plungers in the cylinder. One of the check-valves controls the admission of steam to throw the plungers out, the other the exit of steam that may escape around the plungers into the outer chamber. The segments in the follower are forced out by pressure of steam from the interior of the piston.

167,866.

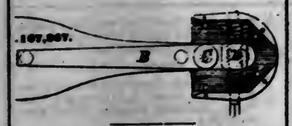


1. The screw-plugs H in the ring B, in combination with the plunger I, for the purpose of adjusting and controlling the position of the piston-rod, substantially as herein described.



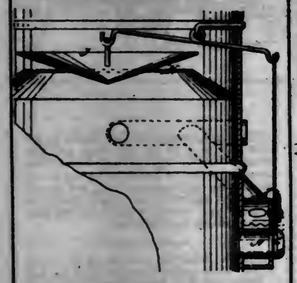
2. The combination of the plungers I with the inner and outer chambers of the piston and the check-valves J and K, for the purpose of pressing outwardly the band F, substantially as herein described.

3. The combination of the devices L *o p* with the inner and outer chambers of the piston, substantially as and for the purpose herein described.



4. The combination of the devices M *q r s* with the inner or steam-pressure chamber of the piston, substantially as herein described.

167,867. DERRICKS. William C. Wetherill, Youngstown, Ohio. (Filed May 19, 1875.)



C
C
O
K
K

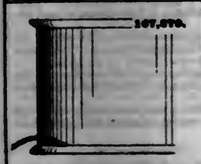
167,867.

167,868. HEATERS. M. W. Baily, Pottstown, Pa., assignor to himself and R. J. Baldwin, same place. [Filed Aug. 10, 1875.]

Brief.—The valve is operated by the opposite forces of the hot-air current and of gravity. When the hot-air registers above are closed, the valve falls, and by means of levers opens the air-inlet entering above the fire. When a full flow of hot air is utilized, the valve is raised, the above air-inlet closed, and an inlet below the grate is opened.

The combination of a valve, J, in the hot-air passage with the registers C D and the passages A B, for feeding and checking the fire, substantially in the manner described.

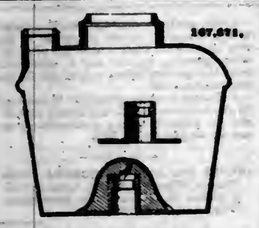


167,869. REMOVABLE DRIP-CUPS FOR ARGAND LAMPS. Alphonse Boudet, Clifton, assignor to Charles F. A. Hinrichs, Brooklyn, N. Y. [Filed Aug. 28, 1875.]

The drip-cup c, for an Argand-lamp burner, connected to the burner, substantially as set forth, so as to be moved radio horizontally front beneath the air-tube of the burner, as specified.

167,869.

167,870.

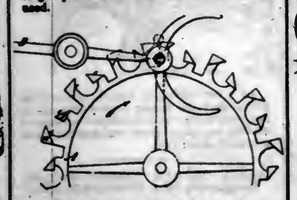


167,870. METALLIC CASE. George W. Bell, Brooklyn, N. Y. [Filed Mar. 12, 1875.]

1. A cord or covered wire inserted in a joint, seam, or flange of a sheet-metal vessel, having a projecting end to serve as a packing rod opener thereof, combined substantially as and for the purposes set forth.

2. A flanged joint or seam for a sheet-metal vessel, inclosing a fibrous or elastic packing-cord, substantially as and for the purposes set forth.

167,871. LAMPS. Ebenezer Hutchison, Brooklyn, N. Y. [Filed July 30, 1875.]

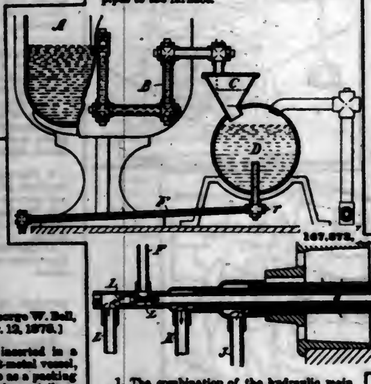


167,871.

The combination of the lamp, Fig. 1, with its socket, Fig. 2, and the pillar with its catch or projection, Fig. 3, substantially as described, and for the purpose specified.

167,872. ESCAPEMENTS FOR WATCHES. E. Bouvenin, La Heutte, Switzerland. [Filed July 24, 1875.]

Brief.—An escape-wheel, formed with two rows of reversely-inclined teeth, acts upon a single pallet instead of the two commonly used.



1. Two rows of reversely-inclined teeth, a b, on the side of the escape-wheel, in combination with a single pallet, C, in the lever, substantially as specified.

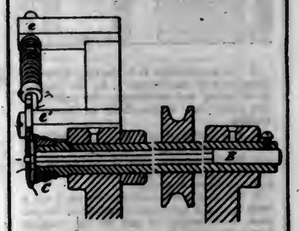
2. The teeth a b, arranged to receive and lock the pallet by their points, and give the impulse by their inclines, substantially as specified.

3. An escapement-lever and pallet, consisting of a simple lever, D, and a pin, C, attached to the lever by fitting in a hole, as described.

167,873. COAL-TAR BURNERS. Howard A. Brooks and William F. Wright, Albany, N. Y. [Filed Aug. 7, 1875.]

Brief.—The refuse tar is purified by passing through a strainer to a reservoir, from which it descends through pipes jacketed by water-pipes to the furnace.

1. The combination of the hydraulic main A, inverted discharge-siphon B, strainer C, and receiving-vessel D, substantially as set forth.



2. In combination with the furnace E, the coal-tar reservoir D, graduating feed-pipe F, having the removable angle part r, and the discharge-pipe G, substantially as set forth.

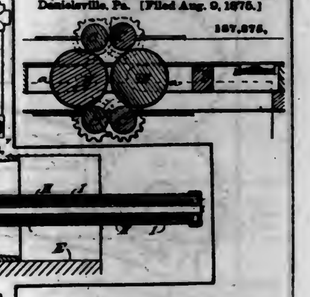
3. The combination of the discharge-pipe G, in communication with a supply of coal-tar, and the surrounding pipes H I, in communication with each other and with water supply and discharge pipes J K, substantially as described.

4. The combination of the discharge-pipe G, surrounding pipes H and I, communicating with each other and with water supply and discharge pipes J K, coal-tar-supply pipe F, and injecting air-blast pipe L, substantially as described.

5. In combination with the furnace E, having a closed ash-pit, X, under a fuel-supporting grate, s, the coal-tar-supply pipe F, discharge-pipe G, injecting air-blast pipe L, and blast-pipe M, discharging air under the fuel-grate of the furnace, substantially as described.

167,874. EDGE AND SOLE TRIMMING MACHINES. James H. Russell, Boston, Mass. [Filed July 14, 1875.]

1. In a heel or sole trimming machine, the combination of a rotary edge-trimming cutter and a rand-knife, arranged to rotate in unison therewith, but around an independent axis, the position of which, relative to the axis of the edge-trimming cutter, may be varied by the pressure of the boot or shoe, according as the width of the projecting portion of the heel or sole is greater or less, substantially as described.

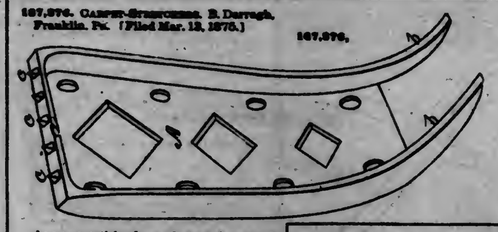


2. The combination of the hollow or sleeve shaft B, cutter C, spindle E, and rand-knife b, all constructed and arranged to operate substantially as described, for the purposes specified.

3. The cutter C, provided with the recess or groove c, in combination with the rand-knife b, adapted to rotate about a movable or variable axis, as and for the purposes described.

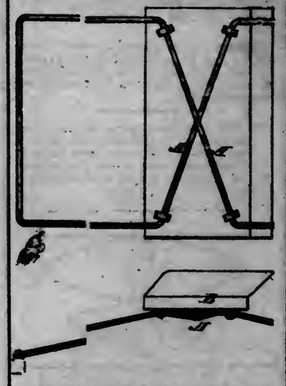
4. In a heel or sole trimming machine, the combination of a rotary edge-trimming cutter, a rand-knife, adapted to rotate about a movable axis, and a yielding rand guide or shield, inclosing the rand-knife and forming a bearing for its spindle, substantially as described, for the purposes specified.

167,875. SLATE-POLISHERS. Jas. H. Coffin and Phaon S. Klotz, Slatington, assignors of one-third their right to Geo. S. Coffin, Danielsville, Pa. [Filed Aug. 9, 1875.]



167,875.

The elastic adjustable polishing-rollers B, feeding-rollers C, having adjustable bearings w, and receiving-rollers C', in combination with the frame B, main frame A, and hinged frame A', all constructed and arranged as and for the purpose specified.



167,876. CARPET-STRETCHERS. B. Darrough, Franklin, Pa. [Filed Mar. 12, 1875.]

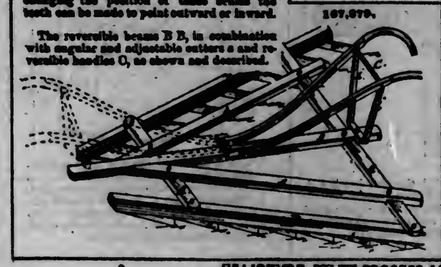
167,876.

As a new article of manufacture, the curved metallic plate A, provided with the prongs b b at one end and projecting points c at the other end, substantially as and for the purpose set forth.

167,877. WAGON-SPRINGS. L. B. Dotterer, Union, N. Y. [Filed Aug. 28, 1875.]

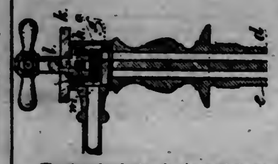
The springs A, inclined or curved upward from the ends toward the middle, and bent inward, crossing each other, for attachment to wagon axles and box or seat, substantially as set forth.

167,878. COTTING-IRES. Albert J. Dexter, St. Louis, Mo. [Filed June 30, 1875.]



A carrying-ink, composed of the ingredients, viz: Nut-galls, sulphate of iron, gum-arabic, sugar, water, glycerine, nitrate of silver, and thorns, all combined substantially as specified.

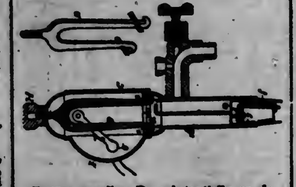
167,879. COMBINED HARROWS AND CULTIVATORS. John W. Dilley, Macomb, Ill. [Filed Dec. 30, 1874.]



Brief.—The frame consists of a central beam and two diverging side beams, secured at their front and rear ends by transverse beams. Reversible handles are attached to the central beam. They are made of thin steel plates, secured by screws or bolts to diverging beams, which are in turn bolted to the ends of the cross-beams. They project obliquely at an angle from the beams, and by changing the position of these beams the teeth can be made to point outward or inward.

The reversible beams B B, in combination with angular and adjustable cutters a and reversible handles C, as shown and described.

167,879.



167,880. RADIE-FAUCETS. James Deming, Bridgeport, Conn., assignor to himself and Peay & Pier, same place. [Filed June 11, 1875.]

The pipes d and e, terminating at their upper ends in the chamber A, that is provided with the movable screw-cap h, in combination with the disk-valve g and spring m within the chamber h, stem i, and joint o, substantially as set forth.

167,881. PUMPS. Thomas Dowling, Gloucester, Mass., assignor to himself and I. C. Mayo, same place. [Filed Apr. 2, 1875.]

Brief.—The air-chamber is coupled to the pump-barrel by a slotted coupling engaging under a flange on the latter, and secured by a nut on the top of the former. The hose enters the air-chamber through the side *b*, a projection upon it, and is supported in an adjustable journal-bearing secured to a projecting stud.

1. The coupling D, substantially as described, arranged within the air-vessel C, connected with the pump-barrel by a notched flange thereto, and provided with a nut, H, as set forth.

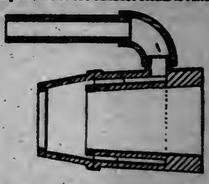
2. In combination with the pump-handle provided with the arm I, head J, and journal K, arranged as set forth, the bearing L, applied to the journal, and connected with the air-vessel, and provided with the pivotal and set screws, all substantially as specified.

3. The vessel C, arranged and combined with the shaft J, the projection I, and the pump-handle, all as and for the purpose set forth.

167,882.

167,882. MODES OF INSERTING DIAMONDS INTO SAWS FOR SAWING STONE. James B. Hodgson, Beaver Falls, Pa. [Filed Aug. 23, 1875.]

1. The process of fitting and setting diamonds into metallic plates by first incasing them in soft tough metal by gentle and even pressure, and then pressing the diamonds and their casings into harder metal plates, substantially as described.

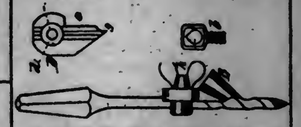


2. The process of fitting and holding diamonds in metallic plates or surfaces by embedding them by pressure into the metal when the metal is soft and cold, substantially as described.

3. The spring-holder B, having slot b, in combination with the metal plates 2 2, metal casing 1, and diamond C, constructed in the manner and for the purposes described.

4. The mode or process, as above described, of embedding diamonds in metal plates, and then removing the surplus metal to expose the cutting-edges of the diamonds, and fitting the cutting-edges to the exact position with relation to the saw by removing the metal around the diamond, substantially as described.

167,883. EXHAUST-PIPES FOR LOCOMOTIVES. Jas. C. Farmer, Providence, R. I., assignor of one-half his right to John W. White, Dedham, Mass. [Filed May 14, 1875.]

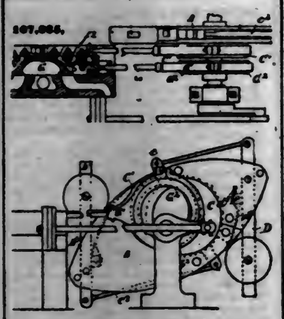


Brief.—An outer chamber is provided, having outlet-pipes at its bottom, by which the back pressure of the exhaust steam is relieved.

An exhaust-pipe for locomotive and other similar engines, constructed with a double wall and intervening relief-chamber, as described, into which relief-chamber a portion of the exhaust steam overflowing the inner wall may be deflected by the back pressure, and thence find an outlet by means of suitable escape-pipes at or near the bottom of the chamber, substantially as and for the purpose hereinbefore set forth.

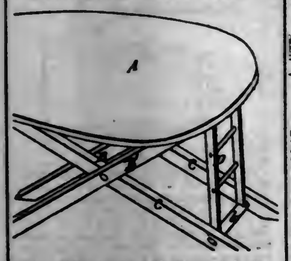
167,884. COUNTERSINKS. Thos. P. Farmer, Boston, assignor to himself and Edwd. M. Farnsworth, Revere, Mass. [Filed May 6, 1875.]

Brief.—The countersink can be readily applied to bits of different diameters by means of a screw, the head of which is provided with an opening, having its inner half semicircular, and its outer half wedge-shaped in cross-section, in connection with a longitudinal groove on the inside of the countersink, and an opening in the head of the screw, through which the screw passes and is secured in position by a thumb-nut.



The combination of the screw h, provided with the opening f and nut k, with the countersink B, provided with the groove c and the opening e, constructed and operating as shown and described, and for the purpose set forth.

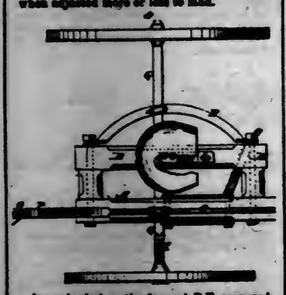
167,885. GOVERNORS. Jacob Fulker, St. Louis, Mo. [Filed June 3, 1875.]



Brief.—Centrifugal action changes the angle of the crank carrying the eccentric, to which is attached the main valve, which also changes its position. At the same time the eccentric in the housing changes the stroke of the cut-off valve, thus cutting off steam at any position of the piston.

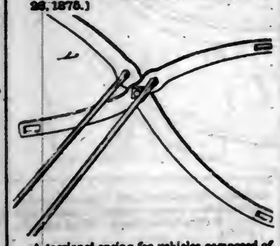
167,884.

The governor cut-off, consisting of a housing, B, containing the eccentric C, connected by rods f^1 f^2 to lever-arms D D^1 which carry the balls, as shown and described, also the eccentric C^1, made to control a cut-off valve formed to have the parts f f^1 f^2 and the further eccentric C^2 connected to slide-valve G, having parts g g^1 g^2, all said parts being constructed and combined to operate in the manner and for the purpose set forth.



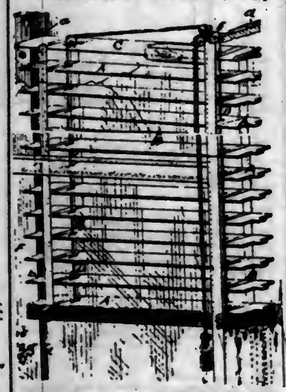
167,886. IRONING-TABLES. J. W. Field, Rockford, Ill. (Filed Mar. 20, 1875.)

In a folding ironing-table, the top A, having the legs B' and folding-brace D hinged thereto at one end, in combination with the legs C hinged to the legs B', and provided with the cross-bar b, substantially as described and for the purpose set forth.



167,887. WHEEL-PLOWS. Jos. Flow, Pilot Point, Tex. (Filed July 3, 1875.)

Brief.—One side of the frame made longitudinally-adjustable, and plow-beam hung in two sets of rigid guides to hold the plow when adjusted more or less to land.



In a wheel-plow, the frame A B E, arranged with one side longitudinally adjustable upon the axle G, in combination with the two sets of rigid guides K M and slotted plow-beam J, whereby the plow is gaged to take more or less land, substantially as shown and described.

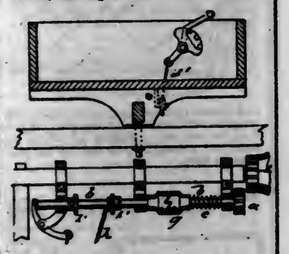
167,888. CARRIAGE-SPRINGS. John Fredenburgh, Greene, N. Y., assignor to himself and J. F. Smith, same place. (Filed Aug. 26, 1875.)

A torsional spring for vehicles composed of a steel rod secured at both ends rigidly to lever-arms swinging in opposite direction from each other, to create torsional strain in the steel rod, substantially in the manner and for the purpose set forth.

167,889. VENETIAN BLINDS. T. Fuyat, Woonsocket, R. I. (Filed June 11, 1875.)

1. The combination, with the window-frame having the grooves d, of the blind, consisting of the slats A, suspended from the piece C, pivoted to said window-frame and connected with the slats by tapes or bands B, as herein described.

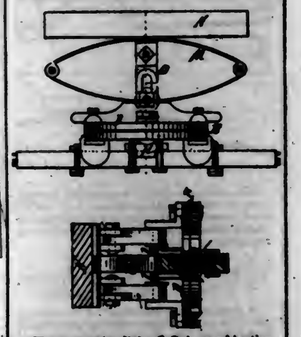
2. The combination, with the blind consisting of the slats A connected by the tapes B, and thereby suspended from the piece C pivoted to the window-frame, of the rod F, one end of which is secured to the piece C, or to an arm, c, projecting from it, and the other end, by means of notches or teeth f, bearing against a fixture, g, attached to the window-frame, the whole arranged for the purpose of adjusting the slats to any desired angle, as herein set forth.



167,890. MOLDERS' FLASKS. H. H. Garrett, Albany, N. Y. (Filed May 20, 1875.)

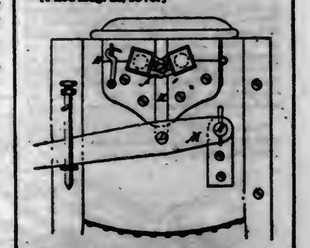
The combination, with the plate-bracket B, carrying the stop-pin or eye, of the set-pin D, provided with the open c, or its described equivalent, and the key E, substantially as and for the purpose set forth.

167,891. REIN-HOLDERS. Hugh Gilmore and Jos. T. Spencer, St. Louis, Mo. (Filed Mar. 6, 1875.)



Brief.—By operating a lever a pinion on a sliding shaft is thrown into gearing with another on the bit. To the shaft a cord is connected, running to the horse's head. This is wound by the forward revolution of the wheel, securely hitching him.

The combination of lever and cord d d^1, and sliding shaft b A, having end pinion c, spring e, shank g, and cord A, with the rear axle of a vehicle, having cog-wheel B, as and for the purpose specified.

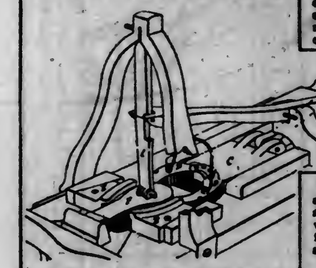


167,892. WHEELS-SPRINGS. Moritz Gluck, New York, N. Y. (Filed June 29, 1875.)

Brief.—A reach is dispensed with, the fifth-wheel and bolster being connected to the body of the vehicle by hinged vertically-sliding links.

The connecting-links O O, in combination with the spring M, rigid body N, and disk B, substantially as and for the purpose set forth.

167,893. CRUSHER. Elias Grant, Napa, Cal. (Filed Aug. 21, 1875.)



1. The oscillating breaker A, having corrugated sides D, arranged eccentric to the plane of their oscillation, substantially as specified.

2. The sliding rod K, coupled by stud J to the slotted breaker-arms I, and connected detachably by stud L to the detachable hand-lever M, substantially as specified.

167,894. MACHINES FOR BENDING AND SWAGING HORSESHOES-BLANKS. Robert Hale and Robert W. Hale, Chicago, Ill. (Filed Sept. 3, 1875.)

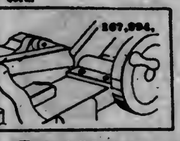
Brief.—The guides for the formers are recessed to form ways for ends of the blanks.

1. The formers D D, recessed in the crosshead C, in combination with the die constructed in two portions, the guides E E, recessed, as shown, and suitable mechanism for raising or lowering one portion of the die, substantially as and for the purpose set forth.

2. The die constructed in two parts, with the lower part recessed to form a concavity in a horseshoe, in combination with the guides E, recessed, as shown, the formers D D, recessed at their outer ends, and the discharge-opening M, substantially as and for the purpose set forth.

167,895. HORSE-BOOTS. John B. Hall, St. Paul, Minn. (Filed July 31, 1875.)

1. A horse-boot or wrapper, constructed with a lining and perforated with holes to allow of ventilation, substantially as described.



2. A horse-boot or wrapper, having a plate, substantially as does at F, for the purpose described.

3. A horse-boot or wrapper, having sponge or other soft porous material for the reception of glycerine held to the bottom of the foot by a metallic spring-plate attached to a horse-boot, substantially as described.

167,896. HARROWS. Isaac N. Harbaugh, Brighton, Iowa. (Filed Feb. 1, 1875.)

Brief.—A pair of truck-wheels support a center-beam extending rearwardly, the rear end being supported by a caster-wheel. The sections of the harrow are hinged to this central bar, which also supports the driver's seat, and from which either wing of the harrow can be raised by means of a lever and cord.

167,894.

The truck S R, having caster-wheel D, seat E, pendent bars a a, levers b b, foot-rest and treadle d, and pulley h, in combination with the carriage A A and harrow-sections Nos. 1 and 2, substantially as and for the purpose above and described.

167,897. RATCHET-BRACES FOR METAL-DRILLS. H. C. Hart, Unionville, Conn., assignor of one-half his right to J. S. Upson, same place. (Filed May 20, 1875.)

Brief.—A socket-piece upon the tool-holder is adapted to receive the end of the brace, which is connected therewith by a pin, so as to form a joint. A spring-catch upon the tool-holder is thrown into a recess in the socket-piece, when the brace is to be operated in the ordinary manner, and prevents the holder from turning therein. Two stops—one on each side of the brace—prevent, when thrown downward, the socket-piece to be received without operating the holder. When it is desirable to turn the holder left handed, the right-hand stop is thrown backward, thereby allowing the joint to yield, and permit the end of the brace to come into frictional contact with the holder, and vice versa.

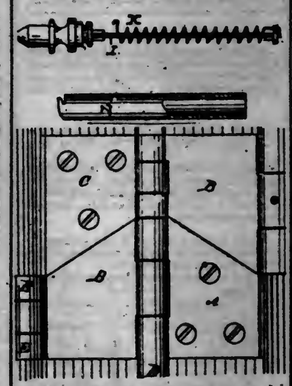
1. In combination with the body of a bit or tool-holder, the socket C, and D of a brace or lever, and stops c c, all operating together substantially as described, and for the purpose set forth.

2. In combination with the body of a tool-holder, the socket C, recess f, and spring-catch i, all substantially as described, and for the purpose set forth.

167,898. CORSETS. Daniel H. Horne, New York, N. Y. (Filed July 10, 1875.)

A corset, having the wire-gauze cups B open at upper part and supported at lower by stay-sockets, as shown and described.

167,899. WALKING-DOLLS. A. H. Hotchkiss, Cheshire, Conn. (Filed Mar. 4, 1875.)

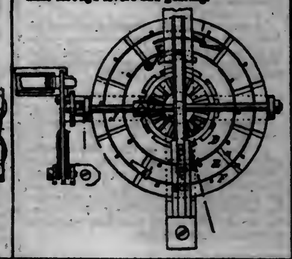


167,899.

A walking automaton figure, provided with clock-work, and having the shoes or feet a a, wheels r rr, ratchet h, and springs S and G, all said parts being combined, constructed, and arranged to operate substantially as and for the purpose described.

167,900. COMBINATION SPRING-HINGES. G. S. Horne, New York, N. Y., assignee of one-half his right to O. A. Horne, same place. (Filed Aug. 6, 1875.)

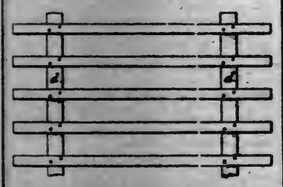
Brief.—A double-acting spring-hinge, adapted to swing a door both ways, as well as to hold it in closed position, and prevent sagging, is formed of two outer plates or levers, and a sectional center-plate, each half of which is diagonally divided, and all the plates provided with suitable knuckles or hinge-connections. A tubular pintle carries a combined torsion and spiral spring, one within the other, connected at their inner ends by a small socket-head, and the torsion, which passes entirely through the spiral, at its outer end, to a ratchet-nib. The diagonal division of the center-plate, increasing the length of this compound or combination spring, utilizing space and doubling power.



1. The combination and arrangement of the diagonal center-plates B B, giving an increased length of springs, and acting, by the compound or combination springs D D, on first plate A, and, by hinge knuckles or connections O O, on third plate C, forming a hinge held at every point of its motion to either one of the corners of the casing, as set forth and described herein.

2. The combination and arrangement of the torsion and spiral springs I and K, respectively, the one acting within the other, and connected at the inner end by means of a suitable socket-head, i, and fastened, respectively, to the two outer plates, forming a compound or combination spring, D, acting within the tubular pintle L, in the manner described and shown, and for the use and purpose hereinbefore set forth.

167,901. REGISTERS. Frederic J. Hoyt and William H. Hoyt, Batavia, N. Y. (Filed Mar. 13, 1875.)



Brief.—A register to be placed in freight-cars, and operated by the sliding door moving against a dog, which actuates the register-dials through levers and gearing.

1. The combination of registering or commutation coal-disks, with a car and sliding door thereof, and connecting mechanism, substantially as described, adapted to be operated for turning the disks and changing the coal number or character whenever said door is moved, as and for the purpose set forth.

2. The rings D, E, and F, wheel H, pinion I, and shaft J, combined for the purpose described.

167,999. SPRING BED-BOTTOMS. Isaac N. Hoyt and Elmer Hoyt, Wayland, Mich. [Filed Sept. 16, 1874.]

A spring bed-bottom, having diagonal bindb, in combination with slats a and c, and transverse supports d, substantially as and for the purpose set forth.

167,000. SOCKET-ROD SOCKETS. Plympton H. Jenks, Petrolia City, Pa. [Filed Apr. 10, 1875.]

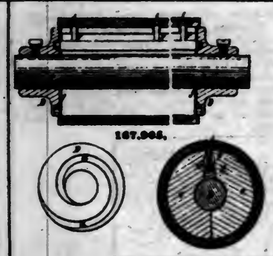
Brief.—The socket is lowered into the well against the broken rod or tube. The wedge is driven by the rod down onto the rod until a firm hold is obtained, which enables the operator to withdraw it.

1. The socket A, wedge B, and plunger C, substantially for the purpose described, either with or without the groove K.

2. The socket A, for the purpose described.

167,000.

167,004.



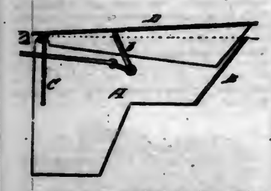
167,004. ROLLERS FOR RUFFING SOLES. J. B. Johnson, Lynn, Mass. [Filed Aug. 10, 1875.]

Brief.—The buffing-roller is provided with springs acting upon pins, whose points are protected by sand-caps.

In combination with a buffing-roller or its body, A, a series of movable blunting points or spurs, C, and springs D and screws G for operating them, all being applied substantially as and for the purpose specified.

167,005. ROLLERS FOR RUFFING SOLES. J. B. Johnson, Lynn, Mass. [Filed Aug. 10, 1875.]

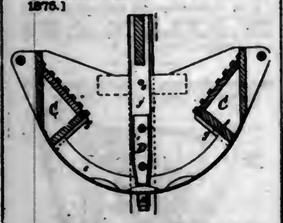
Brief.—The shaft is provided with two sand-grooved heads that bear against the ends of the buffing-roller. The buttons or eyed clamps that secure the sheet of sand or emery paper are connected to a bar, the ends of which enter the sand-grooves of the heads, and by turning the shaft the clamps are drawn within the roller and secure the paper.



167,006.

1. The combination of the hooks F, the bar E, and the grooved heads D, arranged and applied to the body of the roller and its shaft H, as set forth.

2. The combination of the oval clamps I, with the hooks F, the bar E, and the grooved heads D, arranged and applied to the roller body and its shaft, as specified.

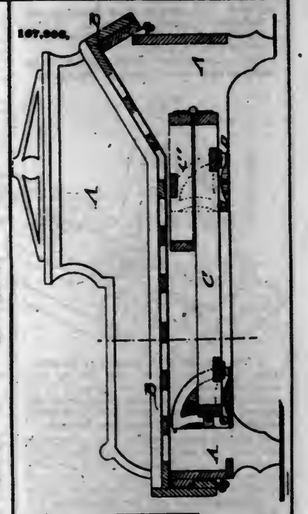


167,006. BLOWERS FOR FIRE-PLACES. J. C. Kennedday, Big Lick, N. C. [Filed Mar. 29, 1875.]

Brief.—The adjustable plate is placed on a level with and forms a portion of the hearth-surface. When desired it may be raised to introduce air under the grate, an operating-rod leading to the side of the fire-place for that purpose.

In a blower, as described, the frame or box A B C, hinged top D, and movable bow b, combined with the hearth of a fire-place, substantially for the purposes herein set forth.

167,007. WASHING-MACHINES. Thomas B. Kirkwood, Dublin, Ind. [Filed July 31, 1875.]



The combination, with oscillating axle-box, having the parallel lengthwise ribs c, and terminal ribs β, attached to the under face of chambers C, of the stationary vertical rack, formed of a series of bars, whose ends project into the grooves between the aforesaid ribs, all as shown and described.

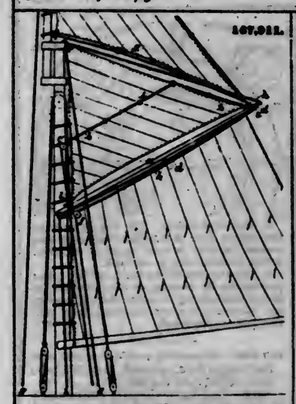
167,008. SOFA-BEDSTEADS. John B. Kline, Cincinnati, Ohio. [Filed June 19, 1875.]

1. A bed-lounge composed of a main frame, A, a sliding seat-section, B, and of a supplementary section, C, with a hinged head-piece, C', arranged within frame A, substantially in the manner and for the purpose set forth.

2. The combination of a main frame, having equidistant side guides and supporting pins or lugs, with a supplementary section swinging on pivoted arms in a level with the drawn-out seat-section, to be locked in this position, substantially in the manner and for the purpose set forth.

167,008.

1. The ferrule B, having mortises b b and spring-bearing and socket C, constructed and adapted to serve as specified.

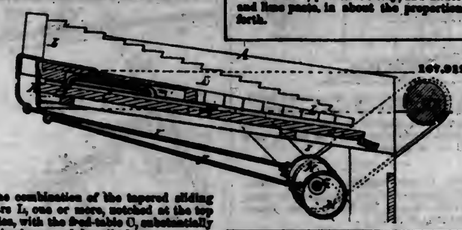


2. The combination of the posts A A, having slots a' and socket-piece C, with the head and foot boards, when constructed and arranged as shown and specified.

167,010. CHURCH-PEWS. Israel Lancaster, Richmond, Ind. [Filed Jan. 20, 1875.]

A seat-back for churches, in which the front side of the back is covered with a single piece of veneer, which extends over and around the cap to the under side thereof, the edge or joint of the veneer being fastened and concealed by the longitudinal strip C, substantially as described.

167,011. RIDING AND FURLING GAFF TOP-SAILS. Benjamin F. Loerow, Salem, Mass. [Filed Aug. 19, 1875.]



167,012.

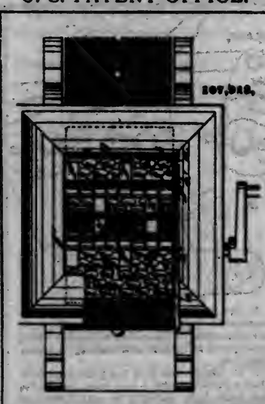
1. The device consisting of the lower gaff top-sail B, provided with a brail, b, attached to the outer corner of the same, and extending thence along the upper edge to a suitable point, c, and thence diagonally across the sail, as shown, for hauling or furling the sail to the mast, and also having a sheet, d, attached to the outer corner, and passing over pulleys e f, for the purpose of setting the sail, all constructed and arranged substantially as shown.

2. The upper gaff top-sail C, provided with sheet h for spreading and brail g for furling, said brail running through eyes along the edges of the sail, as shown, and passing from pulley f to the deck, substantially as set forth.

167,013. FENDERS FOR THRASHING-MACHINES. Alex. Washington Lockhart, Sacramento, Cal. [Filed May 8, 1875.]

167,013.

1. The combination of the tapered sliding feed-bars L, one or more, notched at the top and sides, with the feed-table C, substantially as herein shown and described.



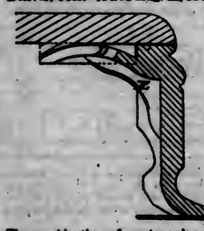
2. The combination of the guides M m' with the grooved feed-arms L and the feed-table C, substantially as herein shown and described.

3. The combination of the shaft G, the eccentrics H, the connecting-rods J, and the bars K with the feed-arms L, substantially as herein shown and described.

167,015. MACHINERY FOR MIXING AND MOLDING ARTIFICIAL FUEL. Emile F. Loisseau, Philadelphia, Pa. [Filed Aug. 21, 1875.]

Brief.—Screw-blades or shafts, revolving in opposite directions, feed the composition to the molding-cylinders. Improvement in apparatus for which Patent No. 167,695 was granted February 17, 1874, to same party.

167,015.

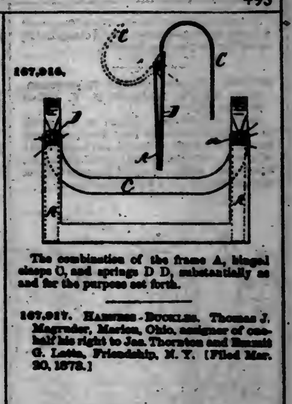


1. The solid or hollow molding-cylinders, having on their outer surfaces a series of cavities or recesses, which are connected, by small channels or openings, with the adjoining cavities, to allow the escape of air and excess of material, substantially as and for the purpose set forth.

2. The molding-cylinders, having smaller cavities or recesses at the ends of the alternating rows of the larger molding-cavities, and being also connected by small channels therewith, for the purpose of avoiding large united spaces on the roller-surfaces, substantially as specified.

167,016. COMPOSITIONS FOR ARTIFICIAL FUEL. Emile F. Loisseau, Philadelphia, Pa. [Filed Aug. 21, 1875.]

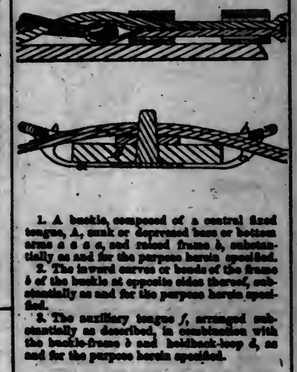
A composition for artificial fuel, consisting of coal-waste, pulverized clay, and diluted rye and lime paste, in about the proportions set forth.



167,017. STOVE-LIDS. Ira A. Loveley, Denver, Colo. [Filed Aug. 21, 1875.]

The combination of a stove-lug, having curved and bossed tongue, with a curved groove formed by recessed socket projecting at the under side of the stove-base plate, substantially in the manner and for the purpose specified.

167,018. POCKET-BOOKS. Sylvanus Lown, Springfield, N. J. [Filed Aug. 16, 1875.]

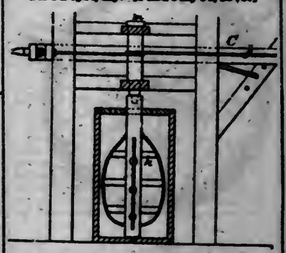


Brief.—Provides the "closing-flap" of pocket-books and similar articles with a hinged spring-clasp to keep it closed or opened, as desired.

167,016.

The combination of the frame A, hinged clasps C, and springs D D, substantially as and for the purpose set forth.

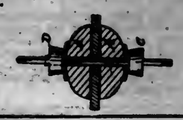
167,017. HARNESS-BUCKLES. Thomas J. Magruder, Marion, Ohio, assignor of one-half his right to Jas. Thornton and Hannah G. Lasbe, Friendship, N. Y. [Filed Mar. 20, 1873.]



1. A buckle, composed of a central fixed tongue, A, sunk or depressed base or bottom arms c c c c, and raised frame b, substantially as and for the purpose herein specified.

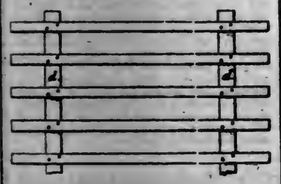
2. The inward convex or bends of the frame b of the buckle at opposite sides thereof, substantially as and for the purpose herein specified.

3. The auxiliary tongue f, arranged substantially as described, in combination with the buckle-frame b and buckhook-loop d, as and for the purpose herein specified.



167,018. CRUSHER. Wm. P. Mangum, Cropper's Depot, Ky. [Filed July 14, 1870.]

In a chute mechanism, the slide-bar C, string b, hooked pin d, having square neck, and the key e, substantially as and for the purpose set forth.

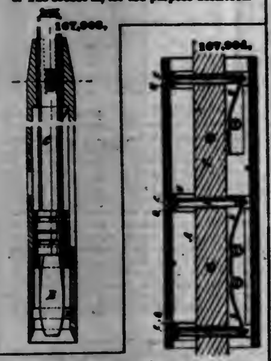


167,019. RUBBER-CHAIN-PUMP BUCKETS. Jared S. Manley, Canton, Pa. [Filed July 17, 1875.]

Brief.—The rubber bucket is made in three pieces, the central piece being a circular disk, which is clamped between the hemispherical pieces, and can be readily detached when worn.

1. The combination of registering or commutation coal-disks, with a car and sliding door thereof, and connecting mechanism, substantially as described, adapted to be operated for turning the disks and changing the coal number or character whenever said door is moved, as and for the purpose set forth.
2. The rings D, E, and F, wheel H, pinion I, and shaft J, combined for the purpose described.

167,902. SPRING BED-BOTTOMS. James N. Keyt and Minot Keyt, Wayland, Mich. [Filed Sept. 10, 1874.]

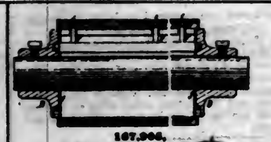


A spring bed-bottom, having diagonal block b, in combination with slats a and c, and transverse supports d, substantially as and for the purpose set forth.

167,903. SOCKET-ROD SOCKETS. Plympton B. Jenks, Petrolia City, Pa. [Filed Apr. 10, 1876.]

Brief.—The socket is lowered into the well against the broken rod or tube. The wedge is driven by the rod down into the tool until a firm hold is obtained, which enables the operator to withdraw it.

1. The socket A, wedge B, and plunger C, substantially for the purpose described, either with or without the groove K.
2. The socket A, for the purpose described.



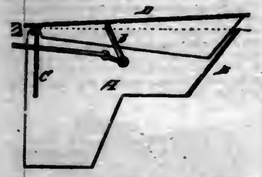
167,904. ROLLERS FOR BUFFING SOLES. J. B. Johnson, Lynn, Mass. [Filed Aug. 10, 1875.]

Brief.—The buffing-roller is provided with springs acting upon pins, whose points are protected by tower-caps.

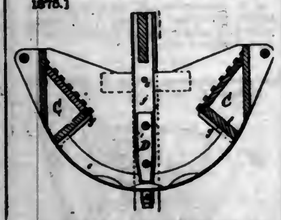
In combination with a buffing-roller or its body, A, a series of movable blocking points or spurs, C, and springs D and screws G for operating them, all being applied substantially as and for the purpose specified.

167,905. ROLLERS FOR BUFFING SOLES. J. B. Johnson, Lynn, Mass. [Filed Aug. 10, 1875.]

Brief.—The shaft is provided with two case-grooved heads that bear against the ends of the buffing-roller. The buttons or eyed clamps that secure the sheet of sand or emery paper are connected to a bar, the ends of which enter the case-grooves of the heads, and by turning the shaft the clamps are drawn within the roller and secure the paper.



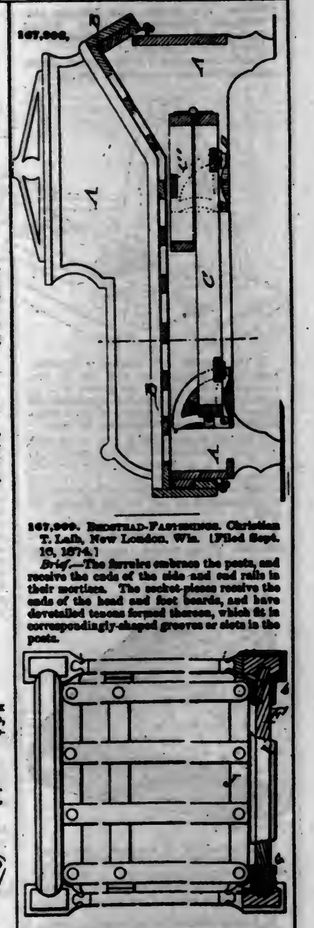
1. The combination of the hooks F, the bar E, and the grooved heads D, arranged and applied to the body of the roller and its shaft K, as set forth.
2. The combination of the eyed clamps I, with the hooks F, the bar E, and the grooved heads D, arranged and applied to the roller body and its shaft, as specified.



167,906. BLOWERS FOR FIRE-PLACES. J. C. Kennedy, Big Lick, N. C. [Filed Mar. 29, 1875.]

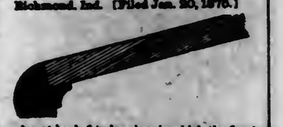
Brief.—The adjustable plate is placed on a level with and forms a portion of the hearth-surface. When desired it may be raised to introduce air under the grate, an operating-rod leading to the side of the fire-place, for that purpose.

In a blower, as described, the frame or box A B C, hinged top D, and movable bow b, combined with the hearth of a fire-place, substantially for the purpose herein set forth.



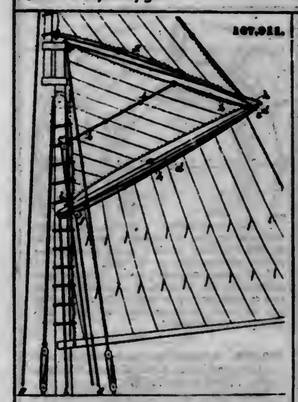
167,907. WARMING-MACHINES. Thomas B. Kirkwood, Dublin, Ind. [Filed July 31, 1875.]

The combination, with oscillating axle-bar, having the parallel lengthwise ribs e, and terminal ribs p, attached to the under face of chambers C, of the stationary vertical rack, formed of a series of bars, whose ends project into the grooves between the aforesaid ribs, all as shown and described.



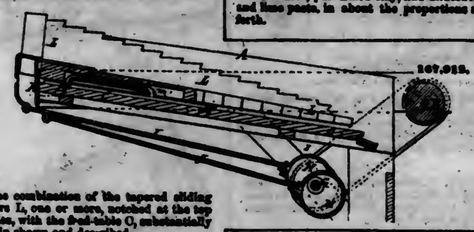
167,908. SOFA-BEDSTEADS. John B. Kline, Cincinnati, Ohio. [Filed June 19, 1875.]

1. A bed-lounge composed of a main frame, A, a sliding seat-section, B, and of a supplementary section, C, with a hinged head-piece, C', arranged within frame A, substantially in the manner and for the purpose set forth.
2. The combination of a main frame, having equidistant side guides and supporting pins or lugs, with a supplementary section swinging on pivoted arms to a level with the drawn-out seat-section, to be locked in this position, substantially in the manner and for the purpose set forth.



1. The ferrule B, having mortises b b and spring-bearing and socket C, constructed and adapted to serve as specified.
2. The combination of the posts A A, having slots a' and socket-piece C, with the head and foot boards, when constructed and arranged as shown and specified.

167,910. CHURCH-PEWS. Israel Lancaster, Richmond, Ind. [Filed Jan. 20, 1876.]

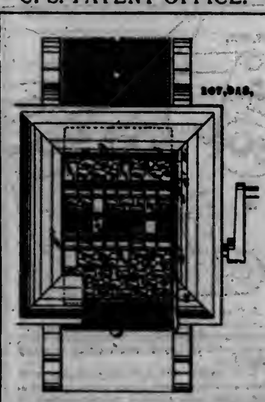


A seat-back for churches, in which the front side of the back is covered with a single piece of veneer, which extends over and around the cap to the under side thereof, the edge or joint of the veneer being furnished and concealed by the longitudinal strip G, substantially as described.

167,911. ROOFING AND FURLING GAFF TOP-SAILS. Benjamin F. Loewy, Salem, Mass. [Filed Aug. 19, 1875.]

1. The device consisting of the lower gaff top-sail β, provided with a brail, b, attached to the outer corner of the same, and extending thence along the upper edge to a suitable point, c, and thence diagonally across the sail, as shown, for hauling or furling the sail to the mast, and also having a sheet, d, attached to its outer corner, and passing over pulleys e f, for the purpose of setting the sail, all constructed and arranged substantially as shown.
2. The upper gaff top-sail C, provided with sheet b for spreading and brail f for furling, said brail running through eyes along the edges of the sail, as shown, and passing from pulley f' to the deck, substantially as set forth.

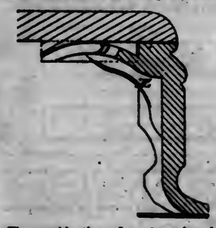
167,912. FEEDERS FOR THRASHING-MACHINES. Alex. Washington Lockhart, Sacramento, Cal. [Filed May 8, 1875.]



1. The combination of the tapered sliding feed-bars I, one or more, notched at the top and sides, with the feed-table O, substantially as herein shown and described.
2. The combination of the guides M m' with the grooved feed-arms L and the feed-table O, substantially as herein shown and described.
3. The combination of the shaft G, the eccentrics H, the connecting-rods J, and the bars K with the feed-arms L, substantially as herein shown and described.

167,913. MACHINES FOR MIXING AND MOLDING ARTIFICIAL FUEL. Emile F. Loisseau, Philadelphia, Pa. [Filed Aug. 21, 1875.]

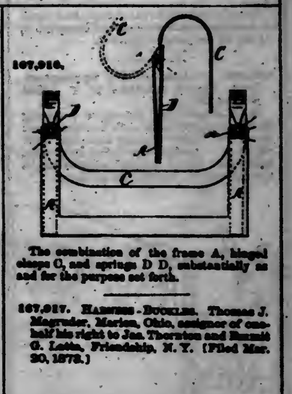
Brief.—Mirror-bladed or shafts, revolving in opposite directions, feed the composition to the molding-cylinders. Improvement in apparatus for which Patent No. 147,883 was granted February 17, 1874, to same party.



1. The solid or hollow molding-cylinders, having on their outer surfaces a series of cavities or recesses, which are connected, by small channels or openings, with the adjoining cavities, to allow the escape of air and excess of material, substantially as and for the purpose set forth.
2. The molding-cylinders, having smaller cavities or recesses at the ends of the alternating rows of the larger molding-cavities, and being also connected by small channels therewith, for the purpose of avoiding large contact-spaces on the roller-surfaces, substantially as specified.

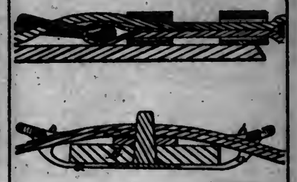
167,914. COMPOSITIONS FOR ARTIFICIAL FUEL. Emile F. Loisseau, Philadelphia, Pa. [Filed Aug. 21, 1875.]

A composition for artificial fuel, consisting of coal-waste, pulverized clay, and diluted rye and lime paste, in about the proportions set forth.



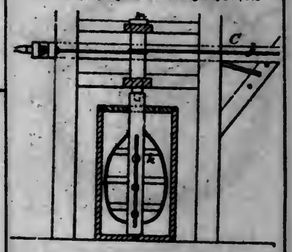
167,915. STOVE-LEGS. Ira A. Lovejoy, Denver, Colo. [Filed Aug. 21, 1875.]

The combination of a stove-leg, having curved and bevel tongue, with a curved groove formed by recessed socket projecting on the under side of the stove-base plate, substantially in the manner and for the purpose specified.



167,916. POCKET-BOOKS. Sylvanus Lyon, Springfield, N. J. [Filed Aug. 16, 1875.]

Brief.—Provides the "closing-flap" of pocket-books and similar articles with a hinged spring-clasp to keep it closed or opened, as desired.



The combination of the frame A, hinged clasps C, and springs D D, substantially as and for the purpose set forth.

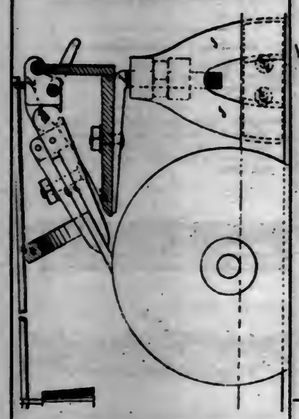
167,917. HARNESS-BUCKLES. Thomas J. Magruder, Marion, Ohio, assignor of one-half his right to Jas. Thornton and Ransom G. Lotts, Friendship, N. Y. [Filed Mar. 20, 1876.]

1. A buckle, composed of a central fixed tongue, A, sunk or depressed bars or bottom arms a a a a, and raised frame b, substantially as and for the purpose herein specified.
2. The inward curves or bends of the frame b of the buckle at opposite sides thereof, substantially as and for the purpose herein specified.
3. The auxiliary tongue f, arranged substantially as described, in combination with the buckle-frame b and buckboard-loop d, as and for the purpose herein specified.

167,918. CRUSHER. Wm. P. Mangum, Grogan's Depot, Ky. [Filed July 14, 1876.]

In a chain mechanism, the slide-bow C, spring b, headed pin d, having square neck, and the key e, substantially as and for the purpose set forth.

167,919. BOILERS-GRAIN-PUMP BUCKETS. Jared S. Manley, Canton, Pa. [Filed July 17, 1876.]



Brief.—The rubber bucket is made in three pieces, the central piece being a circular disk, which is clamped between the hemispherical pieces, and can be readily detached when worn.

The combination of two corresponding plates A A and intermediate disk *d* with clamp B O D, as and for the purpose specified.

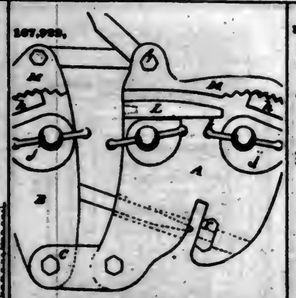
167,080. PLANER-CUTTER SHARPENER. Gerry Manvel, Rochester, N. Y. (Filed May 26, 1876.)

Brief.—The clamps, pivoted to traversing blocks, are supported at their front ends upon the edge of a table vertically and horizontally adjustable. The clamps are united by a bridge, upon which rests a weighted lever, having its rear end secured to a traversing block.

1. The clamps C, jointed at D to the traversing supports B, combined with a table that supports said clamps at H, and rests upon adjustable standards I J, as and for the purpose described.

2. The combination of weighted lever Q, traversing block N, and bridge O, with the clamps C D, and the traversing supports B, as and for the purpose specified.

167,081. CHAMPLAIN. Fredk. McLoren, New York, N. Y. (Filed Aug. 12, 1875.)



1. The combination of the wire-frame B, carrying the crystals C, with the brush pipes a and burners d, of a chandelier, substantially as and for the purpose specified.

2. The combination of the wire-frame B, carrying the crystals C, with the brush pipes a, burners d, brush pipes b, and burners c, all substantially as herein shown and described.

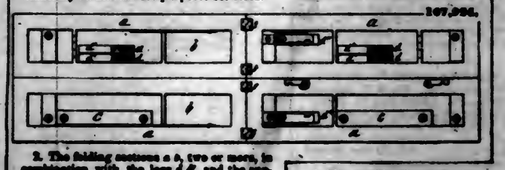
167,082. TIME-OPERATING MACHINES. John H. Mintz, Pine Bobles, Col. (Filed Sept. 4, 1876.)

Brief.—The blades are adjustable toward and from the center block for straight or curved work. For straight work the straight side of blade L is the cut; for curved work, as fires, the cutside is changed by central cam, between the curved side of the blade and the body of the machine.

167,083.

1. The parts A and B, having the curved corrugated projection M, in combination with the adjustable jaws h and the cams *i*, the whole constructed to operate substantially as herein described.

2. In combination with the parts A B, with their adjustable jaws h and cams, as shown, the guide L for straight or curved work or belt-mortising, substantially as herein described.



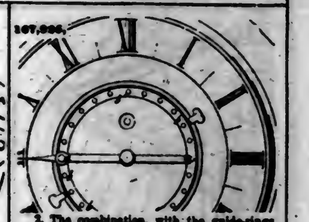
167,084. BLIND-SLAT ADJUSTER. George A. Myers, Brooklyn, E. D., N. Y. (Filed July 24, 1876.)

Brief.—A dovetailed block, sliding in a grooved or dovetailed plate attached to the inside of the window-blind, is operated by an adjustable knob or set-screw, the connection with the blind-slats being by a suitable link and hook, the construction allowing the slats to be readily adjusted or held in desired position.

The combination, with the pivoted blind-slats O C, of hook E, link F, dovetailed block G, screw I, and grooved or dovetailed plate H, as shown and described, to secure said slats in any adjustment.

167,085. PAPER-HANGERS' TABLES. John Orgill, Hartford, Conn., assignor to himself and Jeremy W. Bliss, same place. (Filed Mar. 6, 1876.)

1. The combination of folding sections a b, with legs *d d'*, and supporting-plate *e*, substantially as and for the purpose set forth.

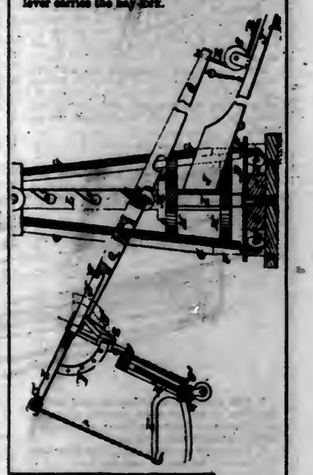


2. The folding sections a A, two or more, in combination with the legs *d d'*, and the supporting-plate *e*, and hinged legs *d''*, all constructed substantially as and for the purpose set forth.

167,086. WATCHMEN'S TIME-CHECKS. T. D. Osborne and W. W. Le Grande, Louisville, Ky. (Filed Aug. 21, 1876.)

1. In watchmen's time-checks, the combination, with the hour-hand of the clock, and a band-spring and pin applied thereto, of a spring-depressing device, of the glass front, and of a series of time-registering pins, sliding in a guide-ring, arranged to be moved back at fixed periods of time, substantially in the manner and for the purpose set forth.

167,086.



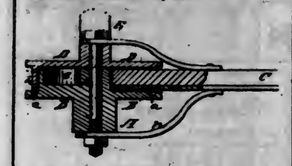
2. The combination, with the guide-rings and sliding pins, of a sliding base-ring, that carries the pins forward again for removed section, substantially as set forth.

3. The hour-indicating hand, having eye or perforation for passage of operating-pin at end of band-spring to strike the registering-pin below at or about the final time, substantially as described.

167,087. APPARATUS FOR GATHERING AND RELEASING HAY. Alfred J. Park, Virginia, Mo. (Filed Aug. 6, 1875.)

Brief.—Four legs on friction-rollers, and a central post, form a pyramidal frame, revolved around a platform by an attached lever having a ground roller, through a pulley on the top of which passes a horse-rope from the end of a lever fulcrumed on the post. This lever carries the hay-fork.

167,088. ATTACHING FOR CULTIVATORS. Jeremiah Rhodes, Jr., Bloomington, Ill. (Filed Aug. 21, 1876.)



1. The combination of the base A B C D, the wheels and sections E F, the posts G, the cross-frames H, and the central pivoting-post I, the sweep J, the grooved posts L, the adjustable flanged fulcrum-shaft O, the stationary flanged fulcrum-shaft P, the adjustable holding-lever Q, the holding-rope R, and the guide-pulley S, with each other, substantially as herein shown and described.

2. The combination, with the connected frame F G and platform H, of the wheels E, the over-running disk D, and the drum C, all arranged as and for the purpose set forth.

3. The frame G, having a central post, I, that passes through drum C and the platform H, to take the strain from wheels, in the manner specified.

167,087. PIPE-WRENCH. W. A. Parker, Marshfield, Mo. (Filed July 27, 1876.)

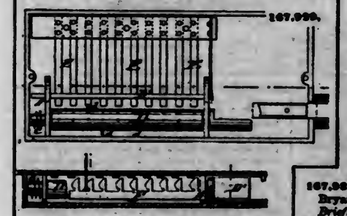
Brief.—The eye upon the end of the reach turns upon the bolt which projects from the upper side of the lower plate.

The plate B, having groove *a*, flange *b*, and bolt *d*, and plate D having flange *b*, in combination with axle A, spring-bar E, and reach C, having eye E, all substantially as and for the purposes set forth.

167,088. CAR-STARTERS. Lewis C. Parker, Robinson, Kans. (Filed Aug. 26, 1876.)

Brief.—Frame to be clamped to track, to give purchase for drawing car forward.

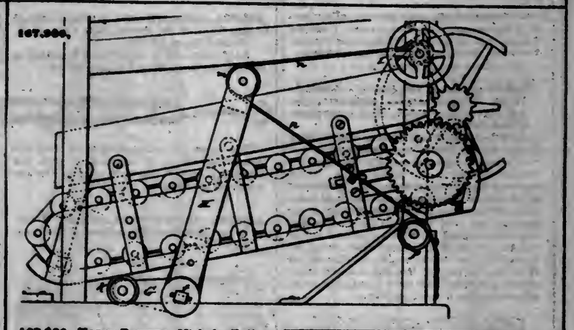
1. In a car-starter, the frames A, in combination with the wheels *c* and hooks M, as set forth.



2. The spool D, lever *b*, in combination with a rope or chain, F, as specified.

3. The combination of the frames A, standard C, spool D, lever *b*, hooks M, and draw-rod M, as set forth.

4. In a car-starter, the combination of the wheels *c* and draw-rod *m*, substantially as specified.



167,089. COMBINATION-LOCKS. Alfred E. Peters, Moncton, Canada. (Filed July 10, 1876.)

Brief.—A spring-acted roller is provided with interchangeable pins that are acted upon by spring-bars, depressed by a pin inserted through perforations in the face-plate. The spring-bars are engaged by a sliding and toothed spring-bar, that releases the preceding spring-bar and secures thereby the return of the spring-acted roller, except when the correct combination is set in regular succession, which prevents the return of the roller, and allows the throwing of the bolt.

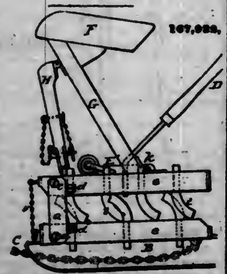
1. A combination-lock composed of a series of spring-bars capable of being depressed at the free ends, a sliding and toothed spring-bar, and a spring-roller with interchangeable pins and recesses, and, substantially as and for the purposes set forth.

2. The combination of the spring-bars, capable of depression by a pin inserted through holes of the face-plate, with a sliding and spring-acted bar, having teeth and recesses corresponding to the number of springs, so as to lock each spring when depressed, and release the same by the locking of the next spring, substantially as set forth.

167,090. HORSE-POWERS. Nicholas Potter, Troy, Pa. (Filed Mar. 24, 1876.)

1. The combination, with the track-frame D, having posts or bars E F, as described, of the boxes or bearings *o o* on the shaft *a*, and the adjustable slotted bar I, substantially as and for the purposes herein set forth.

2. The combination, with the track-frame D, of the shaft *f*, arms G, with rollers K, lever H, with pulley *n*, idle-pulley *p*, and windlass I, with rope *s*, all substantially as and for the purposes herein set forth.



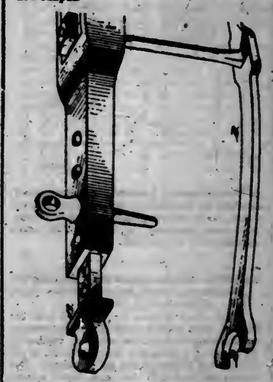
167,091. POCKET-BOOK FASTENERS. Louis Prahar, New York, N. Y. (Filed Aug. 21, 1876.)

Brief.—The rivet heretofore employed to form the pivotal point of the latch B, and attached to the frame A, is dispensed with by forming the socket *a'* in the latter, and the circular or ball-shaped end *b'* on the former.

The combination of plate A, having socket *a'*, with latch B, provided with circular or ball-shaped end *b'*, whereby the pivotal point of the latch is established, all substantially as set forth.

167,092. HARROWS. Joseph W. Price, Bryan, Ohio. (Filed July 24, 1876.)

Brief.—The harrow is made in two sections transversely to the line of draft, and so hinged as to be folded inwardly, teeth to teeth. One section is provided with runners upon the upper side, when in working position, and upon which the harrow is drawn when folded. The seat is hinged by its double standard to both sections when working, but to one when folded.



1. The combination, with a folding harrow consisting of two transverse sections, of a folding seat, substantially as specified.

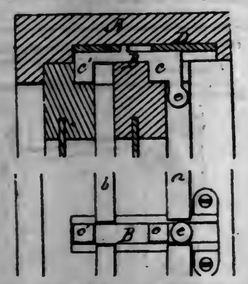
2. The folding harrow-seat, having the hinged standard G and front prop H hinged to said standard, substantially as specified.

In testimony that I claim the above I have,

167,093. DRAW-IRONS FOR GUNNEY-CAR POLES. Lyman C. Prouty, Lowell, Mass. (Filed June 23, 1876.)

Brief.—Adjustable to cars of different sizes and shapes.

The combination of the draw-iron A, having adjusting-holes therein, with the perforated pole C, adjusting-pin, and the brace-iron B, all substantially as and for the purpose set forth.

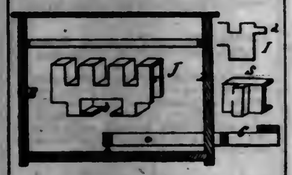


167,094. SHUTTER-FASTENERS. Robert L. Freyn, Baton Rouge, La. (Filed Aug. 14, 1876.)

Brief.—The ordinary outside blind catch or hook, engaging with a staple in the wall, is actuated from inside by a half-circular vibrating lever, with rod or handle attachment, the lever passing under the hook, and a push or pull movement of the handled rod operating the blind-catch from inside the room.

The combination, with the vertically-vibrating book *c* on blind A and catch *f* on the wall, of the vertically-vibrating operating-lever *e* and rod *E*, substantially as specified.

167,925. SASH-FASTENERS. Robert L. Pruyn, Baton Rouge, La., assignor of one-half his right to Saml. L. Hart, same place. [Filed July 31, 1875.]



Brief.—A sliding bolt, recessed into the jamb of the window-frame, is provided at each end with a raised lug or stop, which engages with suitable notches on the lateral edges. These terminal lugs, in connection with the central guide-strip and the detachable beads or inner guide-strips, serve to lock the upper and lower sash, so that they cannot be lowered in the one case or raised in the other, so that either one may be raised or lowered and locked independently of the other, and, likewise, so that the one may be lowered and the other raised, and both at the same time locked when adjusted in the desired position.

The sliding bolt B, having terminal lugs *c c'*, adapted to be received into recesses, respectively, in the central guide-strip *b* and detachable inner guide-strip *a'* of a window-frame, substantially as specified.

167,926. ATTACHMENTS TO SOAP-CUTTING MACHINES. John C. Ralston, Indianapolis, Ind. [Filed June 10, 1875.]

Brief.—Bars of soap are received from the cutting-wires upon a series of blocks, each alternate one of which is movable vertically. By pressing a lever the soap-bars are separated, each alternate one being raised. The blocks are attached to a tape, which admits of their having a slight lateral motion to spread the bars of soap and accelerate their drying. This motion is given them by pulling the end of the tape.

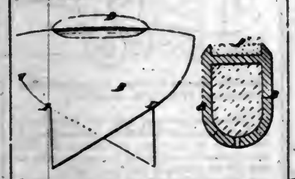
1. The combination of a series of alternately stationary and movable blocks for separating adhering bars of soap, substantially as herein set forth.

2. The combination of the stationary blocks I and movable blocks J, arranged alternately, and a movable or sliding frame, B, for operating the movable blocks, substantially as and for the purposes herein set forth.

3. The blocks J, grooved and cutout described, and provided with the end projections *d*, in combination with the grooved bars F G of the main frame, for the purposes herein set forth.

4. The blocks J, grooved as described, and provided with lips *i*, in combination with the sliding frame B and grooved bars F G, for the purposes herein set forth.

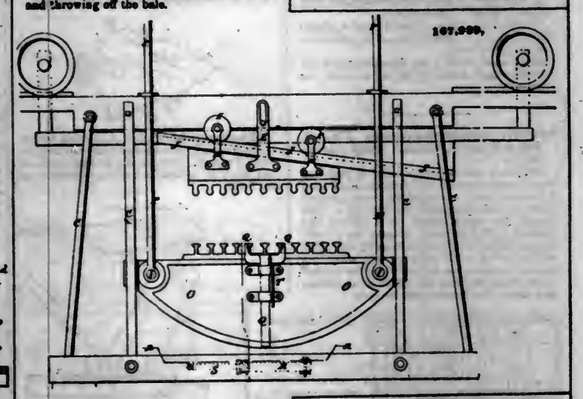
5. The combination of the series of blocks I J, arranged as described, and a series of fingers, B, connected together and fitting in the grooved bars F G and fast grooves of the block, substantially as and for the purposes herein set forth.



167,927. BUTTON-HOOKS. Antonio Restrepo and Thos. E. D. Power, New York, N. Y. [Filed June 16, 1875.]

Brief.—The end of the cylinder is slotted to conceal the hook when it is screwed in.

The screw extension-case, made with the transverse slot *b*, in combination with the traverser *d* and button-hook *c*, as and for the purposes set forth.

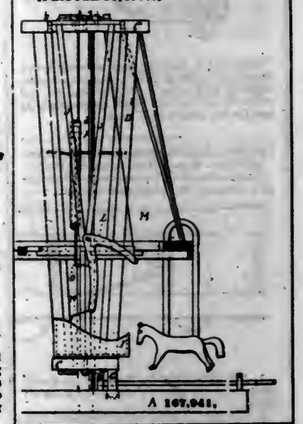


167,928. CLIPS FOR FELLOES AND TIRES. Robert Bay, Carrollton, Miss. [Filed Aug. 21, 1875.]

The improved felly and tire clip, composed of bars A and fingers B D E, substantially as specified.

167,929. AUTOMATIC BALE-HOLDING ATTACHMENTS FOR COMPRESSORS. H. Riesel, Galveston, Tex. [Filed Aug. 6, 1875.]

Brief.—The bale having been pressed and bound, the follower sinks with it, and in doing so a bar at its side, with prong extensions under the bale, is caught and caused to rise by a spring-bar within the frame, thus tilting and throwing off the bale.



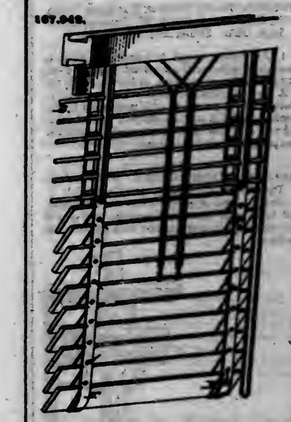
The bar Q, provided with two or more forwardly-projecting prongs upon its upper end, the spring-latch R S, and the inclined bar T, in combination with the follower O and base A, substantially as herein shown and described.

167,930. DEVICES FOR HOLDING GARMENTS-SKIRTS. O. F. Goldsbury and O. S. Wells, New Haven, Conn. [Filed June 10, 1875.]

Brief.—A coiled spring, in the shape of a frustum, is placed between the shoulders of the mandrel, and, when the die is forced down upon the cloth, prevents, by its yielding pressure, the end walls of the cone from wrinkling.

The frustum-shaped and coiled spring A in combination with the piece B, substantially as and for the purpose described.

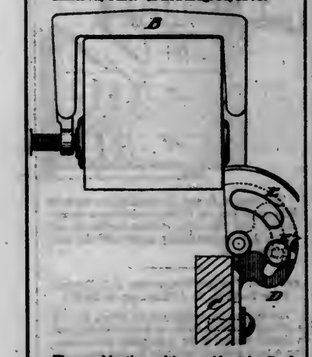
167,931. ROUNDABOUTS. Levi Schaeffer, Philadelphia, Pa., assignor of one-half his right to Theophilus Wagner, same place. [Filed Jan. 30, 1875.]



1. In a revolving pleasure-carriage having laterally-swinging frames and seats, the bell-crank levers L and cords M M', in combination with each frame and the revolving carriage-frame, whereby the lateral position of the seats is regulated by the riders, substantially as set forth.

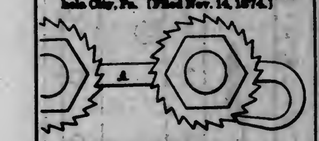
2. In a revolving pleasure-carriage having laterally-swinging frames provided with seats, an air pump or spring to prevent the sudden return of the seats to their inward position when the revolution of the carriage-frame is arrested, substantially as described.

3. In a revolving pleasure-carriage, the laterally-swinging frames J', in combination with the cross-frames H and pivoted hangers K, substantially as and for the purpose described.



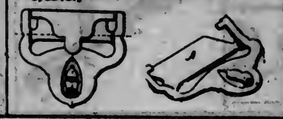
167,932. DRESS SKIRTING. John Seaman, Andover, N.Y.; Emeline Seaman, administratrix, assignee of one-half interest to Jas. Ford, same place. [Filed Feb. 19, 1875.]

167,933.



In a window-blind, the straps F, in combination with the loops K and recessed slots B, united by eyelets, substantially as described, and for the purpose set forth.

167,934. PLANE-GUIDES. Walter S. Shinn, Minerva, Ohio. [Filed Aug. 14, 1875.]



The combination, with a guide-strip, C, of plane-dumping yoke B, having recessed extension B, the pivoted slotted arc-piece D, and the clamp-screw F, as and for the purpose specified.

167,935. NUT-LOCKS. John A. Shoemaker and David D. Jones, Pittsburg; said Jones assignor to H. T. Vanvoorhis, Monongahela City, Pa. [Filed Nov. 14, 1874.]

The herein-described independent spring-plate A, provided with perforations *e* for the reception of the bolts, and spring-ends A' A' curved and widened for engagement with the nut-teeth, whereby two nuts may be locked upon their respective bolts by one and the same spring-plate, and the said plate be securely held in position by the bolts and nuts, substantially as set forth.

167,936. HAY-ELEVATING MACHINES. Simon P. Siver and George H. Swords, Fishkill Landing, N. Y. [Filed Sept. 4, 1875.]

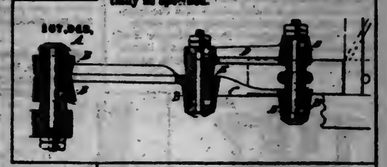
1. The combination, with the vertically-adjustable sectional hinged gate C, of the supporting ridge-pole D, rack-bars E, gear-wheel F, shaft G, and its actuating mechanism, substantially as specified.

2. The combination, with a dam having an adjustable chute-gate, C, of the outlet-dam sections H H', substantially as specified.

3. The combination, with the abutments A A', of a stationary of the side pieces M, posts *a a'*, and detachable sections H H', substantially as specified.

4. The combination with the vertically-movable outlet-dams sections H H', of the end-vibrating saws S, substantially as specified.

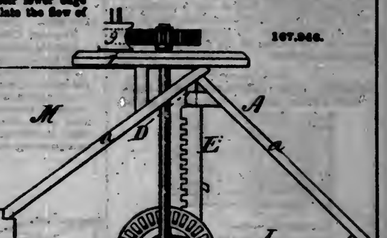
167,937. BOBBINS. Dwight L. Hoxie, Waterbury, Conn., assignor to the Waterbury Buckle Company, same place. [Filed Feb. 8, 1875.]



1. A buckle-frame, having the arms *a* formed thereon by transverse cuts *d*, with the inwardly-projecting tenacious *e*, substantially as described.

2. In a buckle-frame, substantially such as described, the bars A, struck below the plane of the part D, substantially as and for the purpose specified.

167,938. OSCILLATING JOINTS FOR PITMAN-CONNECTIONS. Albert E. Smith, Nebraska, Ohio. [Filed May 8, 1875.]



The clamping-bar D, with journal E and socket B, combined with the double journal A and rod C, having two sockets, B, substantially as specified.

167,939. SASH-HOLDERS. John Shaefer, Toronto, Canada, assignor to T. B. Fuller, same place. [Filed July 16, 1875.]

Brief.—A face-plate with retaining-cups, and provided with a segmental ratchet, is recessed beneath, for the sliding of an angular slotted plate. There is also an eccentric disk, provided with an arm and knob, the latter containing a spiral spring, which throws a ratchet-bar in and out of engagement with the segmental ratchet of the face-plate, the construction being such that when the device is tightened up to lock the sash the sliding angular plate is directly under a stationary plate on the sash-frame, preventing the raising of the sash from the outside, a similar plate also preventing the sash from falling down by the jolting of railway-cars.

167,940.

1. The combination, with the vertically-adjustable sectional hinged gate C, of the supporting ridge-pole D, rack-bars E, gear-wheel F, shaft G, and its actuating mechanism, substantially as specified.

2. The combination, with a dam having an adjustable chute-gate, C, of the outlet-dam sections H H', substantially as specified.

3. The combination, with the abutments A A', of a stationary of the side pieces M, posts *a a'*, and detachable sections H H', substantially as specified.

4. The combination with the vertically-movable outlet-dams sections H H', of the end-vibrating saws S, substantially as specified.

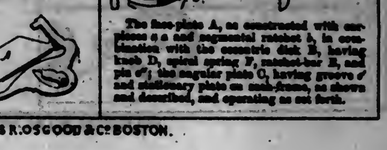
167,941. BOBBINS. Dwight L. Hoxie, Waterbury, Conn., assignor to the Waterbury Buckle Company, same place. [Filed Feb. 8, 1875.]

1. The combination, with the vertically-adjustable sectional hinged gate C, of the supporting ridge-pole D, rack-bars E, gear-wheel F, shaft G, and its actuating mechanism, substantially as specified.

2. The combination, with a dam having an adjustable chute-gate, C, of the outlet-dam sections H H', substantially as specified.

3. The combination, with the abutments A A', of a stationary of the side pieces M, posts *a a'*, and detachable sections H H', substantially as specified.

4. The combination with the vertically-movable outlet-dams sections H H', of the end-vibrating saws S, substantially as specified.



167,942. BOBBINS. Dwight L. Hoxie, Waterbury, Conn., assignor to the Waterbury Buckle Company, same place. [Filed Feb. 8, 1875.]

1. A buckle-frame, having the arms *a* formed thereon by transverse cuts *d*, with the inwardly-projecting tenacious *e*, substantially as described.

2. In a buckle-frame, substantially such as described, the bars A, struck below the plane of the part D, substantially as and for the purpose specified.

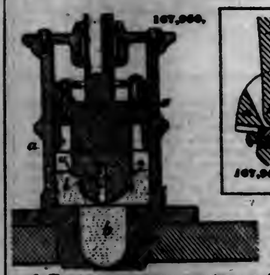
167,943. OSCILLATING JOINTS FOR PITMAN-CONNECTIONS. Albert E. Smith, Nebraska, Ohio. [Filed May 8, 1875.]

The clamping-bar D, with journal E and socket B, combined with the double journal A and rod C, having two sockets, B, substantially as specified.

167,944. SASH-HOLDERS. John Shaefer, Toronto, Canada, assignor to T. B. Fuller, same place. [Filed July 16, 1875.]

Brief.—A face-plate with retaining-cups, and provided with a segmental ratchet, is recessed beneath, for the sliding of an angular slotted plate. There is also an eccentric disk, provided with an arm and knob, the latter containing a spiral spring, which throws a ratchet-bar in and out of engagement with the segmental ratchet of the face-plate, the construction being such that when the device is tightened up to lock the sash the sliding angular plate is directly under a stationary plate on the sash-frame, preventing the raising of the sash from the outside, a similar plate also preventing the sash from falling down by the jolting of railway-cars.

167,945.



The face-plate A, as constructed with recesses *a a* and segmental ratchet *b*, in combination with the eccentric disk B, having knob D, spiral spring F, ratchet-bar E, and pin *e'*; the angular plate C, having groove *c* and stationary plate on sash-frame, as shown and described, and operating as set forth.

167,860. DASH-POTS FOR ENGINES. Ferdinand Steale, Brooklyn, N. Y., assignor to American Steam and Water Recorder Company, same place. [Filed Aug. 20, 1875.]

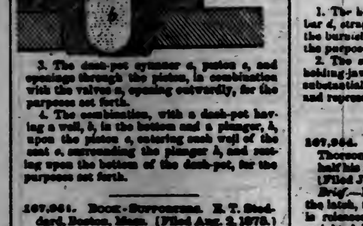
Brief.—After the plunger fills the mouth of the well oil continues to escape through the lateral opening, which is gradually closed as the plunger passes down. The oil that is confined in the well stops the movement of the valve of the engine just as the valve rests upon its seat, thereby preventing concussion. The valves in the piston allow surplus oil to escape, and also air to pass out when the engine is started

1. The plunger A, having a rounded or tapering lower end, an opening through it, and the shoulder *c*, in combination with the cylinder *a* and well *b*, substantially as set forth.

2. The air-chamber *i* in the plunger *h* of the dash-pot, in combination with the lateral discharge-opening *j*, and the well *b*, as set forth.

3. The dash-pot cylinder *c*, piston *e*, and openings through the piston, in combination with the valves *n*, opening outwardly, for the purposes set forth.

4. The combination, with a dash-pot having a well, *b*, in the bottom and a plunger, *h*, upon the piston *e*, entering such well of the cast *c*, surrounding the plunger *h*, and resting upon the bottom of the dash-pot, for the purposes set forth.

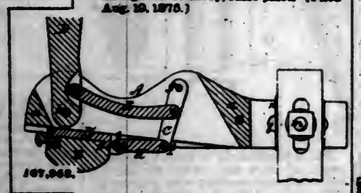


167,861. BOOT-SUPPORTERS. R. T. Shedard, Boston, Mass. [Filed Aug. 2, 1875.]

The combination, with the body A, the fixed plate B, and the sliding spring-plate C, of the slotted bar D, and pin *c*, substantially as and for the purposes set forth.

167,862. ADDRESSING-MACHINES. George E. Scott, New York, N. Y., assignor to himself, John I. Davenport, and Geo. Bliss, same place. [Filed Mar. 16, 1875.]

Brief.—The paper is fed between the impression-cylinder and the printing-cylinder, carrying the independent printing-heads, which latter are partially rotated by means of the star-wheel and stop at each revolution of the cylinder. An accelerated motion is given to the paper by the pawl and ratchet operating on the feed-rolls.

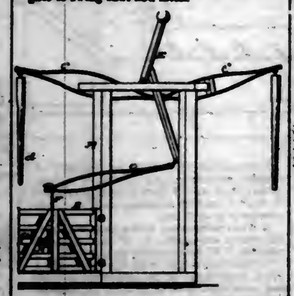


1. The combination, in a printing press, of a cylinder containing separate shafts, heads, and type-holders, turned progressively, with a series of cutters that slit the web of paper longitudinally between the lines of impressions, substantially as specified.

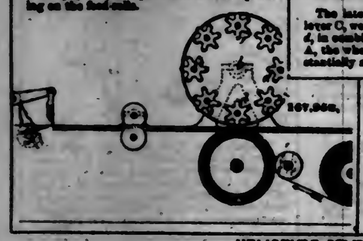
2. The combination, with a printing-cylinder, containing separate shafts, type-holders, and heads, of an impression cylinder and mechanism, substantially as described, for giving to the same an accelerated movement between one impression and the next, for the purposes and as set forth.

3. In a printing-press, a cylinder containing a series of printing heads upon shafts arranged in a circle, in combination with a star wheel at the end of each shaft, and a stationary stop that turns the shafts and heads in succession and progressively, as the cylinder revolves, substantially as set forth.

167,863. SCRUBBERS-HOLDERS. Alexander Swallow, Beloit, Wis., assignor of one-half his right to C. Libby, same place. [Filed Aug. 19, 1875.]



1. The holder or arm A, provided with the bar *d*, straps C, connecting-rod E, connecting the burnisher with the handle D, as and for the purpose specified.

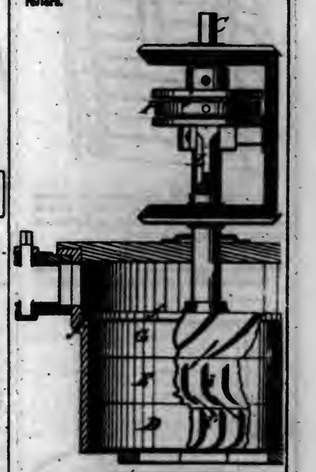


2. The shoe B', with its guiding-grooves, holding-jaws, and slot for the bar-connection, substantially as and for the purpose described and represented.

167,864. AUTOMATIC GATES. Lewis B. Thorson, Clinton, Wis., assignor of one-half his right to S. S. Northrup, same place. [Filed June 2, 1875.]

Brief.—By pulling on either of the handles, the latch, through the operating mechanism, is released and the gate swung open, the weighted lever assisting to operate the gate after it has traversed half its sweep. A reverse movement of the handles causes the gate to swing shut and latch.

The latch G, pitman H, crane F, jointed lever C, weighted-lever E, levers C', and pulls *d*, in combination with the gate B and frame A, the whole constructed and arranged substantially as and for the purpose specified.

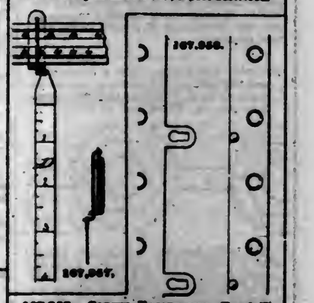


167,865. RAVEN-THROUGH HANGERS. Wm. H. Trimbur and Henry W. Trimbur, Cleveland, Ohio. [Filed Aug. 27, 1875.]

1. An eaves-trough hanger made of two parts, and adjustably connected together to fit eaves-troughs of any size, as herein set forth.

2. The combination of the longitudinally-slotted bar B, provided with projection *h*, and hooks *a* and *d d*, and the strip C, formed with a hook, *c*, at one end, substantially as and for the purposes herein set forth.

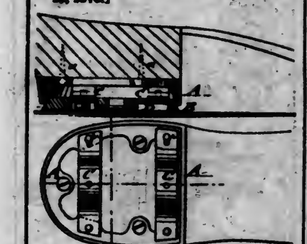
167,866. WATER-WHEELS. E. Twitchell, Peinkit, N. Y. [Filed June 19, 1875.]



Brief.—Two or more wheels are employed, all rotating in opposite directions and on different shafts, in combination with anti-friction rollers.

The wheels D and E, rotating in opposite directions and on different shafts, in combination with the anti-friction rollers *d* and plates J J', substantially as and for the purposes set forth.

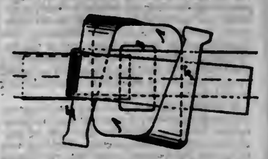
167,867. TAILORS' MEASURES. F. H. Ulbrich, New York, N. Y. [Filed Aug. 6, 1875.]



The sliding hip-indicators to clasp, having a pivoted cross-pin with hook-eye looking into a slotted flange of its base-plate, and retaining a tape-measure securely in the eye part, substantially as and for the purpose described.

167,868. CORSET-FASTENERS. Frank K. Vandervoort, Amenia, Conn., assignor of one-half his right to Wallace & Sons, same place. [Filed June 30, 1875.]

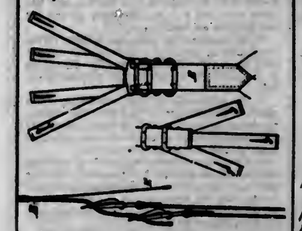
The method herein described of attaching clasps to corsets by means of the corset-flaps provided with eyelets, the lacing-cord and the clasps having corresponding perforations, substantially as set forth.



167,869. HUBS FOR BOOTS AND SHOES. Robert Vint, Brooklyn, N. Y. [Filed June 29, 1875.]

1. The combination of elastic and centrally-tapering heel-plate B, the obversely-tapering cone A, and the lead-springs C C, attached to and playing upon portions of said cone, as and for the purposes set forth.

2. A heel-piece, B, constructed with super-posed shoulders A, arranged as and for the purpose specified.

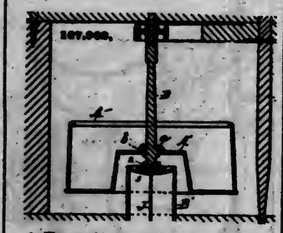


167,870. BALE-TIES. William H. Walker, Charleston, S. C. [Filed July 21, 1875.]

The improved bale-tie buckle herein described, the same being constructed of a plate, A, having central closed slot B, and the bent arms B B, the latter projecting from diagonally-opposite corners of said plate, and in opposite directions, as shown and described, for the purpose specified.

167,871. SUSPENDERS. Aaron B. Warren, Lawrence, Mass. [Filed June 18, 1875.]

Brief.—The drawers' straps are adjustable independently from the pantaloons' buttonstraps.

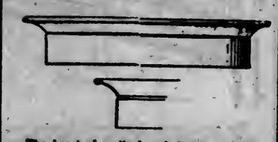


1. Suspenders composed of the dorsal and shoulder straps A A B, the two buckles to each of them, and the trousers and drawers buttoning straps of said buckles, all arranged and combined substantially as specified.

2. In combination with the subject-matter of the above, the auxiliary dorsal strap B, arranged as and for either of the purposes set forth.

167,872. CHRYSOTOGAL MACHINES. Chas. G. Webber, Holyoke, assignor to Bliss, Barton & Pyles Machine and Iron Company, Worcester, Mass. [Filed Aug. 6, 1875.]

Brief.—The drum is provided with a concave surface, which rests upon a corresponding convex surface on the main shaft. Motion is imparted to the drum solely by the frictional contact of these surfaces. The shaft terminates in a convex plate which rests in a concave plate, which latter is the larger, so as to admit of lateral motion of the lever and of the shaft.



2. The combination of the receptacle or drum A, provided with a concave hub, *c*, with the shaft B, provided with a convex supporting and driving surface, *b*, substantially as and for the purposes set forth.

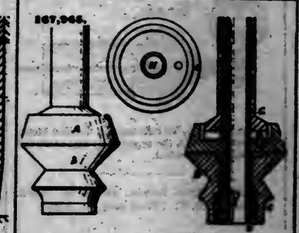
3. The combination, with the lever and 1 of shaft B and the concave supporting-surface 2 of the stand or supporting-base B', of the freely-moving convex step 3, substantially as and for the purposes set forth.

4. The combination, with the step 3 and swinging shaft B, of the vertical spring J, substantially as and for the purposes set forth.

167,873. CLOCK-CASES. Wm. H. Weeden, Waterbury, Conn., assignor to Benedict & Burnham Manufacturing Company, same place. [Filed July 20, 1874.]

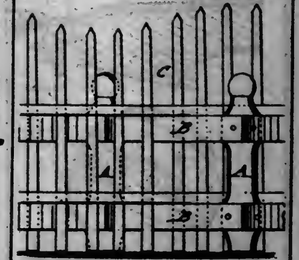
The herein-described sash for clock-fronts, formed from a single piece of metal, the shoulder *d* produced by doubling the metal inward, substantially as set forth.

167,874. WHEELS, ATTACHMENTS. Henry Weld, Hale, Ill. [Filed June 21, 1875.]



Brief.—The center-rod of a churn is connected with the pump-rod through an elbow-lever, the upper end or arm of which is connected to the frame by a fixed pivot, while the other is connected to the pump-rod through a double pivoted link. When the pump-rod is reciprocated in either direction the outer arm of said lever is caused to be reciprocated in both directions.

The combination, with the pitman or pump-rod actuated by the wind-wheel, of the sleeve-lever pivoted to the frame, and the double-pivoted link for connecting it with the pitman, arranged and operating substantially as described.



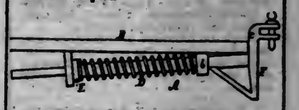
167,875. WHEELS FOR SPINNING-MACHINES. David Wilson, Jr., and Titus Hall, Lawrence, Mass.; said Wilson, Jr., assignor to said Hall. [Filed Feb. 20, 1875.]

Brief.—The whirl is held to the guard and spindle-tube by the friction of the spring, as also by taking hold of the guard the rotation of it and the bobbin may be arrested, while that of the whirl is allowed to continue.

The combination of the conical guard A, the band-whirl B, the friction-spring C, the pressing-cap D, and the tube E, provided with the opening E, all in the manner and for the purpose herein set forth.

167,876. FARM-FENCES. Jos. H. Winters, Pleasants, Ohio. [Filed Jan. 11, 1875.]

The fence, consisting of two rows of posts, A A, intermediate pailings O on stringers O', and zigzag slats B, all constructed and arranged substantially as and for the purpose specified.

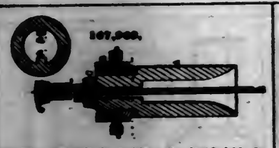


167,877. NUT-LOCKS. Joseph C. Wright, Monocacy Furnace, assignor of one-half his right to John B. Hosher, Philadelphia, Pa., and J. M. Cook. [Filed May 14, 1875.]

The contracting spring D, provided with the ratchet E, in combination with the washer A and nut C, substantially as and for the purpose set forth.

167,878. DRAW-BARS FOR STEAM-C. W. Franklin F. Adams, Erie, Pa., assignor to himself and Alonzo Farrar, Brookline, Mass. [Filed Aug. 10, 1875.]

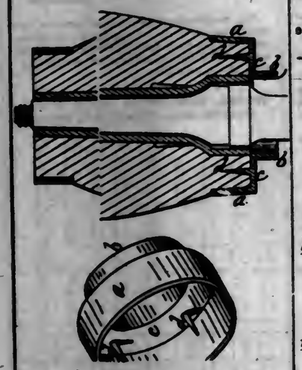
Brief.—Draw-bar adjusts itself to angle of elevation of pole.



1. The combination of coupling-clip C having abutment F, bar A, and spring D, substantially as and for the purpose set forth.

2. The combination of car-platform B, spring D, bar A, and coupling C having stop *c*, and abutment F, all substantially as and for the purpose set forth.

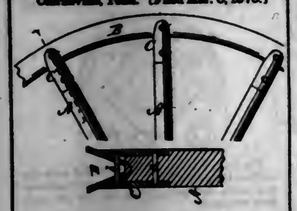
167,879. SCREENING-BEANS. Jos. Archer, Baltimore, Md. [Filed Mar. 24, 1874.]



Brief.—The bit-socket is provided with internally-arranged ribs, to serve as bearings for the divided bit.

167,969.

The socket B, for holding the dividal block A, provided with the separating-ribs *a' a'*, for the purpose specified.



167,970. HUB-REAMER. David W. Baird, Geneva, N. Y. [Filed Apr. 16, 1875.]

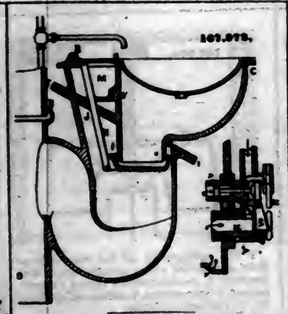
As a new article of manufacture, the combined belt-band and sand-band, consisting of the reverse flanges *a b*, vertical web *c*, and space *d d*, as and for the purpose specified.

In witness whereof I have hereunto signed my name in the presence of two subscribing witnesses.

167,971. WHEELS-WHEELS. Ephraim Ball, Clarksville, Tenn. [Filed Mar. 6, 1875.]

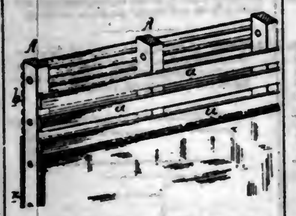
The combination of a wooden spoke, A; metallic felly B, and a metallic socket or ferrule, C, placed upon and riveted to the end of the spoke, and its outer end fitting over and riveted to the felly, substantially as set forth.

167,972. WASH-STANDS AND WATER-CLOSETS COMBINED. Robert C. Ball, Oakland, Cal. [Filed June 8, 1875.]



Brief.—On lifting the bowl the device may be used as a closet. The water-supply is controlled by raising and lowering said bowl, a tank and valve mechanism operating as described.

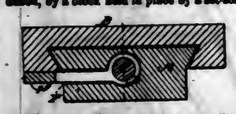
1. In combination with a water-closet, the trunk-basin A, hinged at B, when said trunk-basin operates to open the faucet K when raised its seat, substantially as and for the purpose described.



2. The rod H, connecting the pan G and trunk-basin together, so as to operate to open and close the discharge by raising and lowering the trunk-basin, substantially as described.

3. The faucet K, cylinder V, and piston T, latch W, and lever R, as in Figs. 4 and 5, operating together for the purpose and in the manner substantially as described.

167,973.

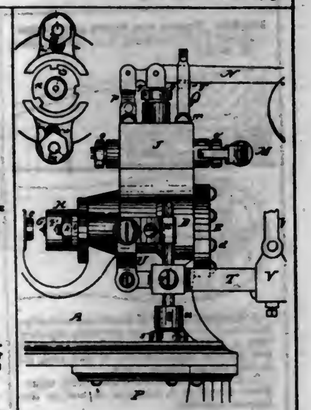


167,973. CONSTRUCTION OF WALLS. Geo. H. Ballentine, Philadelphia, Pa., assignor to Elizabeth Ballentine, same place. [Filed May 26, 1875.]

The mode herein described of forming the walls of buildings—that is to say, by first constructing a frame with posts A and strips *b* and *c*, applying plaster to form the inner sides of the rooms, then filling the body of the frame with composition and smoothing the latter on the outer face, where B issues between the strips *a*, as specified.

167,974. GLIDE-REST FOR METAL-TURNING LATHES. George F. Ballou, Pawtucket, R. I., assignor to Henry N. Fisher and John B. Whitcomb, Waltham, Mass. [Filed June 10, 1875.]

Brief.—A slot, extending out at one end, is formed in the side of the stationary part of the rest. The shank of the nut is bolted to the slide, and, when the slide is placed in position, rides in the slot referred to. The end of the slot is filled, when the nut has been introduced, by a block held in place by a set-screw.



1. The part A of the slide-rest, having the slot for the shank of the nut, and the chamber for the nut extended out through one end in such manner that the nut can be put in and taken out, and the slide put on and taken off, while connected together, substantially as specified.

2. The bush K, combined with the part A of the slide-rest having the slot for the shank of the nut, and the chamber for the nut, extended out through one end, substantially as specified.

3. The combination of the block I and the screw J with the part A of a slide-rest having the slot for the shank of the nut extended out through one end, substantially as specified.

167,975. HYDRAULIC PUNCHES. Joshua B. Barnes, Fort Wayne, Ind. [Filed July 26, 1875.]

Brief.—The oil is forced into the cylinder by means of a force-pump placed within a reservoir arranged beneath the bed of the machine. A safety-valve connected to a lever having an adjustable weight regulates the degree of pressure to the thickness of the sheet operated upon.

1. The combination, with a hydraulic punching-machine, consisting of a piston carrying a punch and working horizontally within a cylinder, and operated by a liquid forced alternately through passages communicating with the cylinder at the rear and front of the piston-head, said passages being controlled by a slide-valve, of a pump and reservoir arranged beneath the bed of the machine, substantially as and for the purpose set forth.

2. The combination, with a hydraulic punching-machine, having a reservoir and pump arranged beneath the bed of the same, of supply and exhaust passages communicating with the pump and reservoir, and the valve-chest and the cylinder, within which works the piston, the exhaust-passage also communicating with a passage to which is connected a safety-valve, each passage being arranged in relation to each other to operate substantially as and for the purpose set forth.

3. In a hydraulic punching-machine, a regulating safety-valve, by which the degree of pressure upon the piston may be regulated to the thickness of the metal sheet operated upon, substantially as described.

4. The piston F, carrying the punch G, working within the cylinder D, and the reservoir P, with a suitable force-pump, in combination with the chest K and valve L, and the ports *a a'* and *a a'*, substantially as and for the purpose set forth.

5. In combination with the safety-valve, consisting of the stem *g*, lever X, and adjustable weight O, the spring-arm Q, with cut-out *g'*, substantially as and for the purpose specified.

6. The adjustable stripper, consisting of the plate H H, with cars *i i* and slots *f f'*, whereby the stripper will admit of longitudinal adjustment in relation to the punch, substantially as and for the purpose specified.

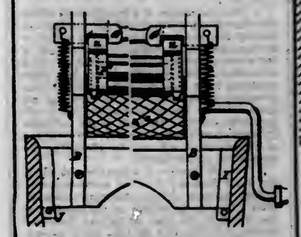
7. The piston F, carrying punch G, and the reservoir P, with suitable force-pump, and the slide and adjustable safety-valves, in combination with the arrangement of ports *a*, *a'*, *a*, *a'*, and *p p'*, substantially as described, and for the purpose set forth.

167,976. SASH-FASTENERS. E. B. Beach, West Meriden, Conn., assignor of one-half his right to H. B. Beach, same place. [Filed Aug. 26, 1875.]

Brief.—The hollow bolt-tube is constructed with an end piece projecting out beyond the attaching-plate, and this projecting end is slotted and recessed, forming a bayonet-lock, to receive the ends of a cross-pin passing through the forward end of the spring-bolt, the cross-pin being allowed to flatten over the extremity of the bolt-tube when the bolt is fully withdrawn; the construction being specially adapted for use in sashes having a central rail, and but two glasses in a sash.

The bolt-tube A, having a projecting end in front of the attachment-plate D, slotted and recessed, as herein before described, in combination with the spring-bolt B and cross-pin C, substantially as described.

167,977. THIMBLE. Jasper N. Bell, Fort Dodge, Iowa, assignor to L. L. Young and John Thistle, same place. [Filed June 14, 1875.]



Brief.—An inside supporting-spring is used with a hollow rubber pad. This spring is so arranged as to be removed and again inserted, so as to bring the pressure to bear at any required point.

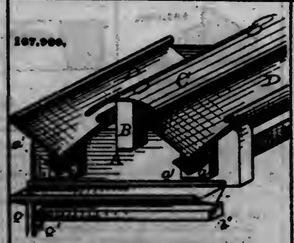
The combination, in a trunk, substantially as described, of a hollow rubber hemisphere or an elastic belt supporting a pad, and provided with a spring, which may be moved and arranged in different positions to produce a greater pressure upon any side desired, all as and for the purposes specified.

167,978. WASHING-MACHINES. Thomas P. Benton, Prairie du Sac, assignor of one-half his right to John H. Dalton, Coatsville, Wis. [Filed Apr. 26, 1875.]

Brief.—The flanged segmental plates, in which the upper rollers are journaled, are pivoted by legs to the cross-bar that moves in the slots of the standards.

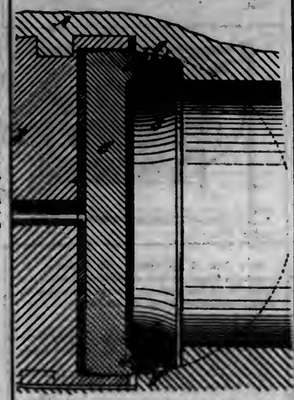
The combination, with the flanged journal-segments F, central legs *n*, and pivots *o*, of the connecting-bar G, recessed to receive said legs and pivots, and arranged to hold the segments in their angular relation with said bar while permitting free rocking motion, substantially as specified.

167,979. MARBLE-CEMENTS. Alex. Bong, Grand Rapids, Mich. [Filed Aug. 4, 1875.]



Brief.—To every one hundred pounds of calcined gypsum, dehydrated and pulverized, are added one pound of powdered alum, one-half pound of sulphate, and a half pound of sulphate of zinc.

The herein-described marble-cement, made by combining with gypsum, calcined and dehydrated, as set forth, alum, sulphate, and sulphate of zinc, substantially in the proportions and manner specified.

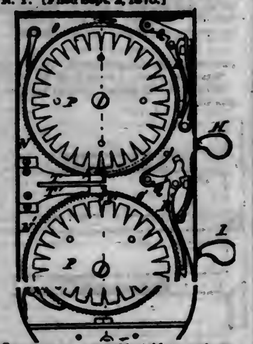


167,980. ICE-PLOUGHS FOR REFRIGERATORS. Hermann Brandish, Decatur, Ill. [Filed Aug. 10, 1875.]

In a refrigerator, substantially as described, the combination, with the stringers A and joists B, of the curved metal strips C, metal gutters D *d' b*, and wooden gutters *a* and *b'*, and the pipes *c c'*, as and for the purpose set forth.

167,981.

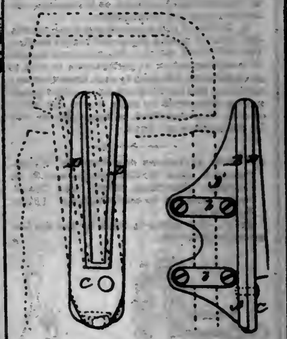
167,981. GAS-CHECKS FOR ORDNANCE. L. W. Broadwell, Fielding, near Vienna, Austria. [Filed May 31, 1875.]



1. The gas-ring, having the internal arch or convex surface *f*, substantially as herein described.

2. The combination, in a gas-ring, of the internal and external arches *f g*, substantially as and for the purpose described.

3. The groove or grooves *h*, in the external convex surface or arch *g*, substantially as and for the purposes described.



167,982. REGISTERING AND RECORDING MACHINES. Franklin W. Brooks, New York, N. Y. [Filed Sept. 2, 1875.]

One or more removable tablets, each complete in itself, combined with a passenger-register, and operated by the register mechanism while beyond the reach of the operator thereof, and constituting, when removed from the instrument, a permanent record of the number of fares received, which cannot be readily diminished or changed without detection.

167,983. REED-HOLDERS. Benj. F. Brown, Catlin, Ind. [Filed Aug. 20, 1875.]

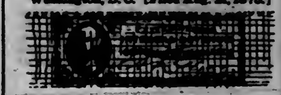
Brief.—The two plates are forked and one worked eccentrically upon the other.

The combination of the plate A, with tapering jaws B B, and the plate C, with tapering jaws D D, eccentrically pivoted to the plate A, substantially as and for the purposes set forth.

167,984. FRICTION-CLUTCHES FOR EXTENSION-CHANDELIERS. R. C. Bruen, Brooklyn, N. Y., assignor to himself and C. T. Bruen. [Filed Aug. 26, 1875.]

A friction-clutch for extension-chandeliers, constructed of a tapering shell, A, a friction-clamp, C, and of an adjusting device, E, the whole being combined and adapted to operate substantially as described.

167,985. HAT AND FUR BOXES. J. C. Budd, Brooklyn, N. Y. [Filed Aug. 31, 1875.]

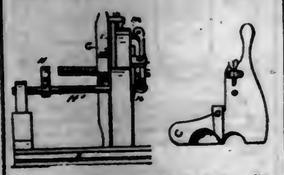


The combination of a sliding cover, A, a box, C, and a cover, B, provided with two flanges, *b c*, and an intervening filling-piece, *d*, substantially as described.

167,986. PROCESSES OF DECOMPOSING OZOKERITE. Hugh Burgess, Boyer's Ford, Pa. [Filed July 14, 1875.]

The within-described process of decomposing ozokerite—that is to say, subjecting it while it is maintained at a dull-red heat to the action of steam, which is forced into and through the mass of heated ozokerite, substantially as herein set forth.

167,987. REVENUE-STAMPS, CHECKS, &c. George W. Casilear and Wm. C. Mollenhen, Washington, D. C. [Filed Aug. 31, 1875.]

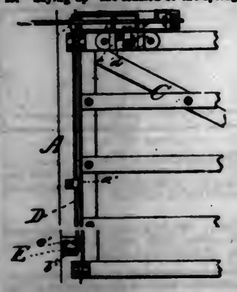


1. A postage or other stamp, check, or other evidence of value printed upon paper composed of paper-stock and an embedded open woven fabric or warp, so that the impression shall be visible partly on the paper and partly on the embedded material, as hereinbefore described, as a new manufacture.

2. A sheet of postage or other stamps, checks, &c., printed upon a paper and textile surface, the individual stamps, &c., rendered capable of ready separation by perforations or cuts, so arranged with reference to each other that any and every line between any two parallel points will be intersected by some one of the series of cuts or perforations, substantially as and for the purpose set forth.

167,889. MACHINES FOR CUTTING WOOD-SCREWS. Geo. W. Chamberlin and S. G. Cushing, Pittsburg, Mass.; said Chamberlin assignor to said Cushing. [Filed Sept. 4, 1875.]

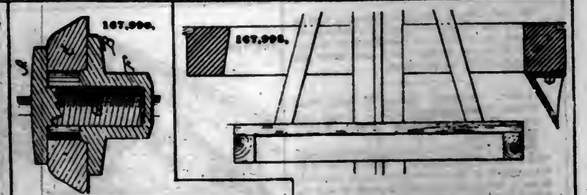
Brief.—The cutter is fixed to the die and movable therewith.



1. In a wood-screw-cutting machine, a die, F, in combination with the cutter O, substantially as and for the purpose set forth.

2. The combination of the gage H and gage-rod H' with the lever I, spring n, and pin m, for automatically operating the dies, substantially as set forth.

167,890. DOOR-SPRINGS. Orrin F. Comfort, Evansville, Wis. [Filed July 3, 1875.]



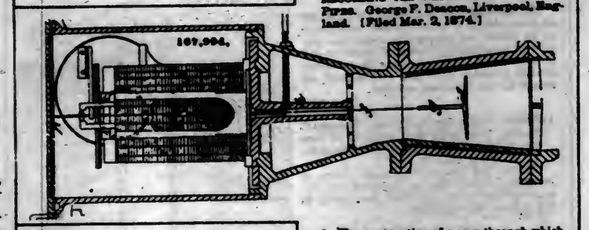
Brief.—A torsion-spring secured in suitable bearings has its upper end bent over and extended from the jamb over the top rail of the casing, thence downward beyond the upper edge of the door, and is combined with a horizontally-vibrating lever, having its fulcrum on the same top rail, and an upwardly-projecting spur or catch secured to the upper edge of the door; the construction being such that the door, when opened at any angle less than ninety degrees, will be automatically closed again; but when the arc of ninety degrees is passed, the spur automatically releases the hooked extension of the spring, and the door is held wide open. There is also at the lever end a notched plate of peculiar construction, for "laying up" the tension of the spring.

1. In a torsion door-spring, the combination of the spring D, having extensions *b b'* and hooks *c c'*, with the plate B, having notches *i*, *i'*, and *j*, substantially as specified.

2. The combination, with the spring D, having hooked extension *b* and spur *p*, for automatically releasing the spring, of the vibrating lever F, substantially as specified.

3. The combination, with a torsion-spring, D, of an upwardly-extending spur, *p*, upon the door, for automatically releasing the spring; and the horizontally-vibrating lever F, having its fulcrum upon the top rail, substantially as specified.

167,896.



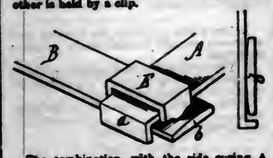
167,896.

CHAIN-PUMP BUCKETS. William Cooper, Ypsilanti, Mich., assignor of two-thirds his right to Charles E. Cooper and James C. Cooper, same place. [Filed Aug. 14, 1875.]

Brief.—The lower disk has the socket shown, to receive the screw-bolt and protect it from rust.

A hatchway whose sides consist of plates inclined to the line of ascent of the elevator, which sides are either constructed in the hatchway when new or attached to it when old, substantially in the manner and for the purpose specified.

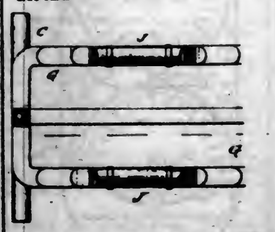
167,897. APPARATUS FOR INDICATING AND RECORDING THE VELOCITY OF WATER IN PIPES. George F. Deacon, Liverpool, England. [Filed Mar. 2, 1874.]



167,897.

The disk B, provided with a socket, F, having a closed end, in combination with the screw G of the disk A, whereby the end of said screw is protected, as set forth.

167,901. CARRIAGE-SPRINGS. James Cunningham, Rochester, N. Y. [Filed Aug. 30, 1875.]



Brief.—The end of one spring bent over the other is held by a clip.

The combination, with the side spring A and cross-spring B, of the bent end *a* of the side spring, the curved bearing *b* of the cross-spring, and the clip E, securing the said parts together, the whole arranged to operate in the manner and for the purpose specified.

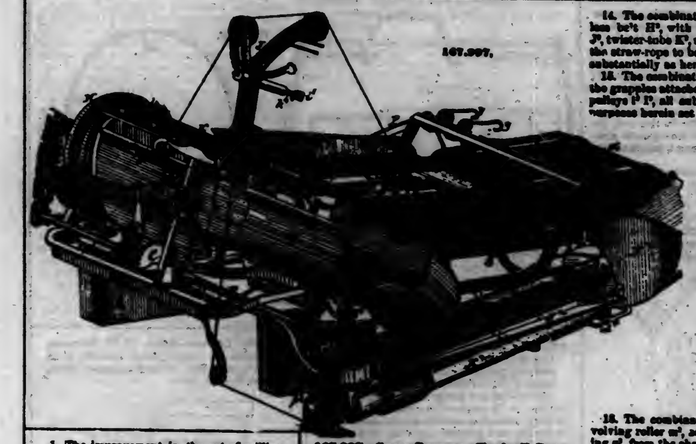
167,902. CARRIAGE-SPRINGS. H. M. Curtis, Ypsilanti, Mich. [Filed Aug. 30, 1875.]

Brief.—The U-shaped springs support the side bars.

The U-shaped springs G G, constructed as described, in combination with the head-block B, axle C, and side bars J J, substantially as and for the purposes herein set forth.

167,903. HATCHWAYS. Charles M. Dubois, Philadelphia, Pa. [Filed Sept. 4, 1875.]

1. The combination of a pipe through which the water flows, a disk or ball movable therein to vary the area of the water-way, a weight or spring acting in opposition to the pressure of the water on the disk or ball, and an indicator connected directly with the disk or ball, these members being constructed to operate in combination, substantially as hereinbefore set forth, whereby the velocity of the water will be shown by the position of the indicator without other mechanism, and the accuracy of its indications will not be affected by the momentum of the water.



2. The combination of a pipe through which the water flows, a disk or ball movable therein to vary the area of the water-way, a counterpoise acting in opposition to the pressure of the water on the disk or ball, an indicator moving with the disk or ball, and a traversing-chart actuated by clock-work independently of the indicator, which merely traverses its surface, these members being constructed to operate in combination, substantially as hereinbefore set forth, whereby the waste of flow of water during any given period may be registered automatically and accurately.

3. The combination, substantially as hereinbefore set forth, of the disk or ball, its supporting rod or wire, the pipe through which it passes, and a waste-pipe to carry off the water which leaks through between the rod and pipe, whereby a stuffing-box is dispensed with.

4. The combination of the pipe, the ball or disk, the annular induction water-way, and the stand-pipe through which the supporting-wire of the disk passes, these members being constructed to operate in combination, substantially as hereinbefore set forth.

167,904. FLOUR-MILLS. Theodore G. Delaplaine, Frederick, Md., assignor of one-half his right to Henry M. Buchanan, same place. [Filed Apr. 7, 1875.]

167,907.

1. The improvement in the art of milling, hereinbefore set forth, which consists in cooling the burrs while grinding, for the purpose of excluding air.

2. The combination, substantially as hereinbefore set forth, of the burrs, the feed-tube, and a packing encircling the tube and covering the eye of the burr, to exclude air therefrom while grinding.

3. The combination, substantially as hereinbefore set forth, of the casing-burrs inclosed therein, a tube through which the grain is fed to the burrs, and a cap or cover which seals the casing and excludes air from the burrs while grinding.

4. The grinding apparatus, herein before set forth, consisting of the combination of the burrs, a casing surrounding the burrs, packing covering the eye of the burr, a cover for the casing, and a feed-spout passing through the cover and packing, for the purposes set forth.

167,906. HANDSAWS. Henry Disston, Philadelphia, Pa. [Filed Dec. 30, 1874.]

Brief.—The handle is forced against the butt of the blade, and caused to grips the blade, by providing the back of the blade with a small shoulder, against which the upper forward part of the handle fits, and forcing the butt in the arc of a circle, and causing it to a slot corresponding therein in the handle by transverse bolts of tapering form.

The saw-blade A, its curved butt and shoulder *a*, and the handle B, adapted to the blade and shoulder, in combination with the transverse bolts, whereby the handle is caused to grips the blade, and is forced against the butt, all substantially as specified.

167,907. GRAIN-BINDERS. Charles H. Dunmellon, Indianapolis, Ind., assignor to himself, B. B. McCord, and Wm. M. Wheatley, same place. [Filed Jan. 9, 1875.]

Brief.—The endless platform-apron delivers the cut grain to a secondary apron, by which it is carried to the receiver, where it is bound automatically by a straw rope, made from straw carried for that purpose.

1. The combination of the shaft D, lever arm G, train of cog-wheels *f*, and the wheel or disk H, provided with the semicircular double rack-bar A, substantially as and for the purposes herein set forth.

2. The combination of the rotary reciprocating disk H, having lugs *i i*, the disk I, having leg *k*, and the spring-hook *m*, substantially as and for the purposes herein set forth.

3. The combination, with the rope-carrying arm J, and the grooved disk I to which it is attached, of the cord *n*, pulleys *p*, and spring *s*, arranged substantially as and for the purposes herein set forth.

4. The combination of the shaft or rod *o* with teeth *y* and crank *x*, the lever F, spring *s*, and the cam *v* on the wheel or disk H, substantially as and for the purposes herein set forth.

5. The steel springs *f'*, arranged in form a clutch for holding the rope carried down by the arm J, as herein set forth.

6. The spring-guide *h'*, attached to the rope-arm J, and provided with the semicircular flange *h*, in combination with the stationary half-circle *p* and twister R, substantially as and for the purposes herein set forth.

7. The combination of the twister R, shaft *m'*, pinions *n' p'*, shaft *s'*, clutch *s*, and main shaft B, all substantially as and for the purposes herein set forth.

8. The combination, with the shafts B *s'* and clutch *s'*, of the elbow-lever *o'*, rod *w'*, spring-arm *R'*, and projection *a'* on the rope-arm J, all substantially as and for the purposes herein set forth.

9. The combination of the shaft *s'*, crank *p'*, pitman *r'*, lever T, rod *s'*, and knife S, all substantially as and for the purposes herein set forth.

10. The carrying-aprons N N, running parallel with each other, in combination with the cutter, twister, tucker, and chutes, arranged between said aprons, and the rope-running rope-carrying arm J, substantially as set forth.

11. The combination of the tucker V, shaft *b'*, pinion *d'*, rack-bar *f'*, frame or gate W, and cam or eccentric *y*, all substantially as and for the purposes herein set forth.

12. The combination, with the shaft B and cam or eccentric *y*, of the clutch *h'*, compound lever E, spring *t'*, and cam A' on the disk H, substantially as and for the purposes herein set forth.

13. The combination, with the endless rope-carrying belt B', and its rollers, shaft *s'*, pinions *d' p'*, and shaft B, of the clutch *s'*, elbow-lever D', L-shaped lever O' with pin *o'* and the cam *b'* on the disk H, all substantially as and for the purposes herein set forth.

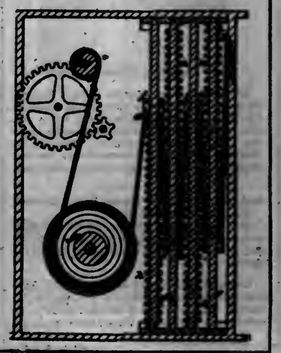
14. The combination of the hopper H', reel-bars *be't* H', with its grappers, chute-board *p'*, twister-tube K', and twister L', for making the straw-rope to be used in the grain-binder, substantially as herein set forth.

15. The combination of the endless belt H', the grappers attached thereto, and the flanged pulleys I' I', all substantially as and for the purposes herein set forth.

16. The combination of the twister L', shaft *m'*, pinion *n'*, bevel-wheel *k'*, shaft *s'*, clutch *s*, cog-wheel M', flanged pulley P, shaft *o'*, clutch *s'*, lever N', flanged pulley P', and V-belt, all substantially as and for the purposes herein set forth.

17. The combination of the shaft B, pinion *d'*, bevel-wheel M', flanged pulley P, shaft *o'*, clutch *s'*, lever N', flanged pulley P', and V-belt, all substantially as and for the purposes herein set forth.

18. The combination of the corrugated revolving roller *e'*, actuated, by means of pulley *p'*, from the shaft *s'*, and the yielding corrugated and revolving roller *o'*, substantially as and for the purposes herein set forth.

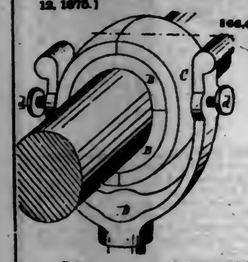


19. The rollers *b' b'* and the roller *b'* placed on a stud projecting from a slide, *q'*, for taking up the slack of the rope, substantially as herein set forth.

167,908. VALVES FOR WATER-CLOSETS. Peter D. Donnelly, New York, N. Y., assignor of one-half his right to S. Hamilton, same place. [Filed Aug. 30, 1875.]

The bellow valve G, having one or more perforations, *g*, let in face, and fitted-in the annular *b* so as to admit of water passing around and into it, in combination with the flexible disk I and the valve-cone A, with its valve-opening *d*, the inlet D, and outlet H, substantially as specified.

167,909. MECHANICAL MOVING. John W. H. Deubler, Philadelphia, Pa., assignor of one-half his right to Wm. V. T. Cramer, same place. [Filed Apr. 26, 1875.]

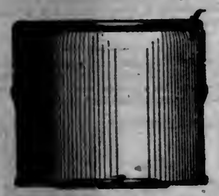


1. A mechanical motor, receiving impulse from a series of spiral springs, connected by means substantially as described, so as to produce motion corresponding in duration to their aggregate lengths.

2. The combination, with the spiral springs *h h*, of the sliding plates *f f*, the pulleys *e e* attached to said plates, and the cord *c*, passing around said pulleys from the winding-shaft, and causing the plates to rise and descend alternately when the springs are compressed, and allowed to expand, substantially as described.

3. In a motor, the double frame, constructed and operating as and for the purpose set forth.

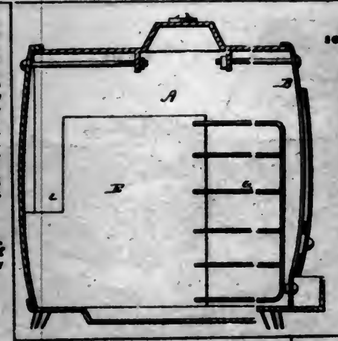
168,000. BOWLOCKS. John H. Dougherty, South Bay City, Mich., assignor to himself and Rodney Hills, same place. [Filed July 12, 1875.]



168,000.

The oar-lock described, consisting of the collar B, constructed in two parts, and having the groove *b* on its outer surface; the sleeve C, made in two parts, and having the rib *c* on its inner surface, adapted to turn in the groove on the collar B, and the forked thole-pin D, the said sleeve C, collar B, and oar being pivoted to the forked end of the said thole-pin by the trunnion-screws *d*, when the several parts are constructed and arranged to operate substantially as described and shown.

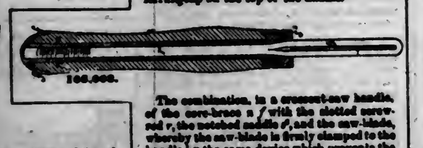
168,001. PANT-CLAMP. Jos. F. Drummond, New York, N. Y. [Filed July 24, 1875.]



The combination, with the body of the can, having a permanently closed and soldered filling-opening at its one end, and a free outside opening and fastening cover at its opposite end, of a supplementary hermetically-closed or cement-sealed cover within the free outside cover, essentially as herein described.

168,002. STOVES. James Duffy, Quincy, Ill. [Filed June 30, 1875.]

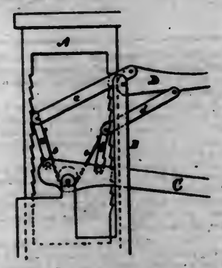
Brief.—The chamber connects with the orifice, and, together with the grating, keeps the fuel from contact with the adjacent wall of the stove.



The combination, with the stove A B C, having exit-flue D on one side of the chamber E, having rear aperture *e*, and the grating G, substantially as and for the purposes set forth.

168,000.

168,000.

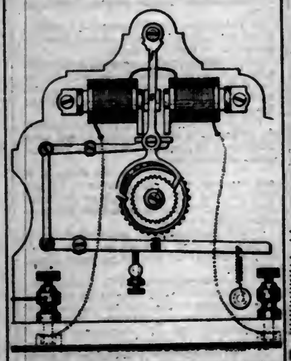


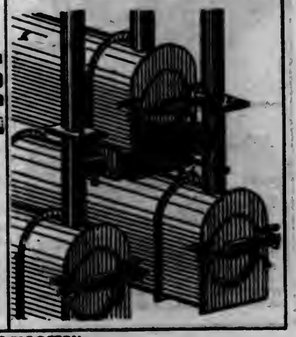
The combination, in a crescent-saw handle, of the cam-brace *n f* with the slotted screw-rod *r*, the notched saddle *s*, and the saw-blade, whereby the saw-blade is firmly clamped to the handle by the same device which prevents the latter from splitting, substantially as herein shown and described.

168,003. CROSSCUT-SAW HANDLES. John L. Edgar, Coopersville, Mich., assignor of one-half his right to H. W. Peace, Williamsburg, N. Y. [Filed Apr. 6, 1875.]

Brief.—The saw-blade is firmly clamped to the handle by means of a metal rod, passing through a circular metallic saddle, shouldered at the top and grooved upon the under side, and inserted in a longitudinal bore fitted in the lower part of the handle; said rod being provided at its lower end with a slot for the reception of the end of the blade, and having a screw-thread upon its upper end, which engages with an interior-threaded cam-brace and fixture-cap on the top of the handle.

168,004. LIFTING-JACKS. G. W. Edwards, Chatham, N. J., assignor to himself, L. M. Adams, and Ezra Codington, same place. [Filed May 11, 1875.





The lifting-jack, consisting of the frame A, cams B, levers O D, dogs *a b*, straps *c d*, and spring *e*, when operating substantially as and for the purposes set forth and shown.

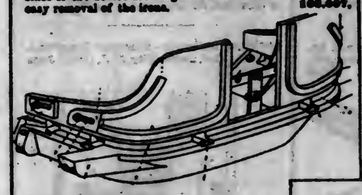
168,005. GAS APPARATUS. Frederick H. Hutchinson, Detroit, Mich., assignor of two-thirds his right to Wm. W. Morton, J. T. Salter, J. E. Sheldon, and James Allen, Chicago, Ill. [Filed Jan. 13, 1875.]

Brief.—Impregnates non-resinous wood with hydrocarbons, distills it, and fixes the gas, may place such treated wood and untreated wood in distilling-retort, passing gas from former over latter; or mixes treated and untreated woods; or places treated wood in one distilling-retort and untreated wood in the other; or places untreated wood in distilling-retorts, and passes their gases over hydrocarbon lid into the upper and inner retort, and fixes the mixture in the outer retort; or untreated wood and solid hydrocarbons in distilling-retorts, with or without liquid hydrocarbons, as above; or with the solid hydrocarbons in the inner and mixing retort.

168,006. PRINTING-TELEGRAPHS. Thomas A. Edison, Newark, N. J., assignor to the Gold and Stock Telegraph Company, New York, N. Y. [Filed June 1, 1874.]

1. Two electro-magnets in the electric circuit, with an armature moved between their cores in consequence of reversing the polarity of the pulsating current, and connecting the lever and type-wheel, in combination with the neutral cores of the electro-magnet and the armature that operates the printing-lever, as set forth.

2. The arrangement of the type-wheel lever and armature between two electro-magnets, and an armature and lever at one side of the type-wheel, operating an impression-pad at the opposite side of the type-wheel, substantially as set forth.



1. The mating-retort described, composed of the outer retort K and the inner removable retort I, having a pipe, F, which passes through a proper opening in the bottom of the retort K, substantially as described and shown.

2. In combination, the retort I, having lugs *e f*, with retort K, having steps *g h*, substantially as and for the purpose described.

3. In combination, the chamber I, the retort I, having pipe F, and the retort K, all constructed and arranged substantially as described.

168,007. FORMERS FOR BENDING CARRIAGE-SEAT IRONS. Lowe Emerson, Alexander J. Clark, and John T. Richmond, Cincinnati, Ohio. [Filed Aug. 28, 1875.]

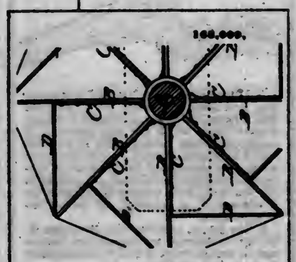
Brief.—The different irons of carriage-seats are bent by hand to the correct form upon the flanges on the outside of the former. The sides of the device are hinged to allow of the easy removal of the irons.

168,007.

The former or block, herein described, for shaping and fashioning shifting rails and seat-irons for carriages, substantially as and for the purposes set forth.

168,008. HOMINY-MACHINES. Seraphin Regnah, Cincinnati, Ohio, assignor to himself and John B. B. Lindner. [Filed July 12, 1875.]

Brief.—A box or double platform with flanges designed to slide on ways. The screens and mill-hole punches are supported on springs, so as to be forced down by a drop falling on them from above, their operative ends projecting below the table. Both screens and punches may be adjusted to different angular positions relative to a horizontal plane by set-screws.



1. The combination, in the slide or carriage A A', of the crossing-punches B B, and perforating-punches M M' n n', when adapted to operate successively upon the heated blank, in the manner explained.

2. The combination of slotted carriage B *d d* O D D', vertically-oscillating screens E F K K', and adjusting devices H H' I I' P P J J' *f*, as and for the purposes specified.

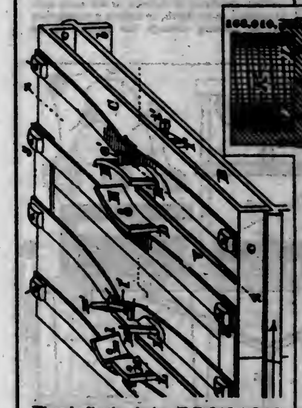
3. The combination of slotted carriage B F O L L' I I', vertically-oscillating punches M M' n n' U, and adjusting devices Q q, Q' q, R r, R' r', S S', and T T', as and for the object designated.

168,009. TURBINE WIND-WHEELS. Louis G. Palmer, Sioux Fo, M. Mer. [Filed Apr. 14, 1875.]

Brief.—A wind-wheel composed of a hub and radial parallel spokes, with sails and receivers, in combination with a suitable shaft and supporting-frame, substantially as and for the purposes herein before set forth.

168,009.

A turbine wind-wheel adapted to field use, composed of a hub, A, and radial parallel spokes B, with sails O and receivers D, in combination with a suitable shaft and supporting-frame, substantially as and for the purposes herein before set forth.

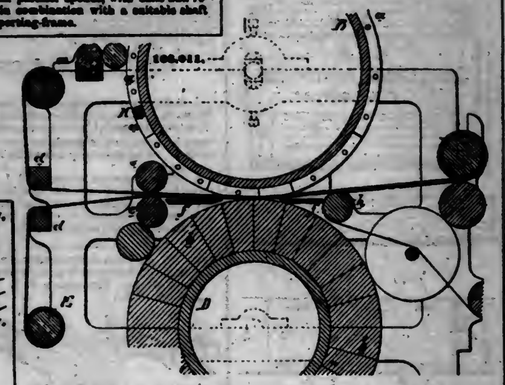


168,010. ROCK-DRILLS. Gideon Frisbee, Reading, Pa. [Filed Sept. 9, 1875.]

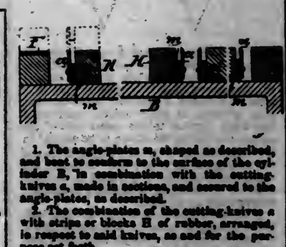
Brief.—An annular bit is provided with an inner and an outer barrel, either or both of which have channels, through which the water passes to the face of the bit without coming in contact with the core at any point. A relief-valve permits the escape of water from the inner barrel while the drill is at work, but admits air and vapor during the withdrawal of the core.

1. The combination, with an inner barrel, of an annular bit and a hollow drill-rod or outer barrel, when either the bit or the outer barrel, or both, are constructed with channels, substantially as described.

2. The combination, with a hollow drill-rod or outer barrel, of an inner barrel constructed with a relief-valve, operating substantially as described.



3. The combination, with the inner and outer barrels and the relief-valve, of the coupling K, cone G, and cap H, all constructed and arranged substantially as described.



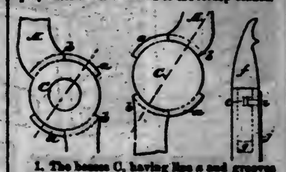
168,010.

168,011. MACHINES FOR CUTTING OUT GARMENTS. John L. Fry, Philadelphia, Pa., assignor of one-half his right to J. Keeley, same place. [Filed June 26, 1875.]

168,011.

1. The angle-plates *a*, shaped as described, and bent to conform to the surface of the cylinder E, in combination with the cutting-knives *c*, made in sections, and secured to the angle-plates, as described.

2. The combination of the cutting-knives *c* with strips or blocks H of rubber, arranged, in respect to said knives, as and for the purpose set forth.



3. The combination of the cylinders B and D with the cloth-rollers B B, stretching-bars *d d*, feed-rolls *e e*, and plate *f*.

4. The combination of the cylinders B and D with the plate *f*, roller *h*, sprue *i*, and cylinder *j*.

5. The combination of the lower cylinder D with the upper knife-carrying cylinder B, having adjustable bearings, and provided with projecting friction-rings F, as covered to the same as to be readily detachable, as and for the purpose set forth.

168,012. DRIVING PUNCHES. Louis J. P. B. Gaillard, Paris, France. [Filed July 30, 1875.]

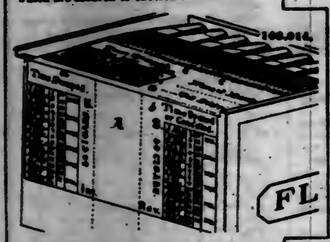
Brief.—The blades of the forceps have central bosses, with lips and grooves, which secure the parts without the aid of the usual rivet. The beak is detachable by means of an eccentric groove, which, when rotated to a certain position, lifts out the spring fastening-pin, which holds the beak to the forceps-blades.

1. The bosses C, having lips *a* and grooves A, in combination with the parts A B of a forceps, substantially as described.

2. The detachable beak *f*, provided with a cheek, *c*, adapted to fit in a socket in the end of one of the jaws of a forceps, which is provided with a spring-catch adapted to engage a crescent-shaped recess in the cheek *c* when said recess is brought opposite to it, and to be automatically thrown out of said recess by the rotation of the cheek in order to release the same, substantially as described.

168,012. DEVICES FOR SECURING AND CANCELING REVENUE-STAMPS. F. C Hamilton, New York, N. Y. (Filed July 27, 1875.)

1. The described method of applying stamps to liquor-barrels or other packages and canceling the same, to insure the collection of tax, consisting essentially of combining with a revenue-stamp of ordinary construction a strip of metal or other suitable material of less width applied to the under side of the stamp, permitting the stamp to be applied in the usual manner to the package, and leaving the interposed strip and the portion of the stamp beneath which it is placed to be freely removed in destroying or canceling the stamp, substantially as set forth.

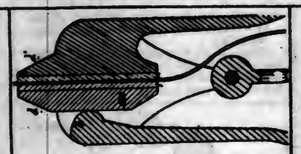


2. A stamp-holder, constructed as described, with a protecting lug or cover and lip, adapted to puncture and fold beneath the stamp, substantially as and for the purposes set forth.

3. A stamp-protector, constructed substantially as herein described, to hold and conceal a duplicate stamp or coupon, substantially as and for the purposes set forth.

168,014. REVENUE-STAMPS FOR CIGAR-BOXES. F. C. Hamilton, New York, N. Y., assignor to Edwd. J. Brooks, same place. [Filed Feb. 16, 1875.]

Brief.—The stamp carries a set of coupons equal to the number of cigars in the box, and a table showing the date of stamping, which are inclosed within the box-cover, and tables indicating the date of stamping and opening, which are secured to the box-side.



168,014.

1. The cigar-box stamp herein described, constructed with date-tables *a b c*, arranged and adapted for use in manner substantially as described.

2. The coupons *a*, provided with serial numbers, as described, and employed in connection with a cigar-box stamp, in the manner and for the purpose specified.

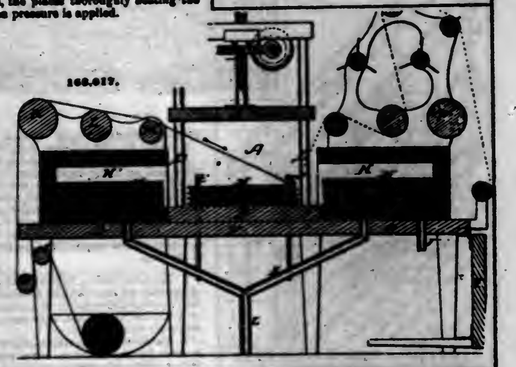
168,015. FIRE-ESCAPE. Frank M. Herman, Ottumwa, Iowa, assignor to himself and John Sinclair Herman, Tecumseh, Nebr. [Filed July 24, 1875.]

1. A fire-escape consisting of a flat metallic band, A, and a slide provided with jaws *d d'*, having flat parallel faces between which the band is passed, and to which the slide may be clamped, all substantially as and for the purpose described.

2. The combination of the band A, free at its inner end, and so annular case, G, open at the sides and adapted to receive and retain the band when coiled, and to permit the lateral withdrawal thereof, all as set forth.

168,016. SETTING-INSTRUMENTS FOR ATTACHING BUTTONS TO WEARING APPAREL. David Heaton, Providence, R. I. (Filed July 26, 1875.)

1. In the hereinbefore-described button-setting instrument, the upper jaw A, provided with a recess, E, having an inclined or wedge-shaped bottom and a slot and groove, F, in combination with the lower jaw B, provided with a dovetailed recess, G, adapted to receive a correspondingly-shaped sliding piece, H, having a die upon its upper surface, and adjusted in position through the medium of the set-screw I, substantially as described, and for the purpose set forth.



2. The jaw A, provided with the recess E, having an inclined or wedge-shaped bottom and an arched grooved slot, F, substantially as shown and described.

3. The dovetail sliding piece H, constructed with a suitable die upon its upper surface, adapted to slide in the recess G, in combination with the set-screw I and the lower jaw B of a setting instrument, substantially as and for the purpose specified.

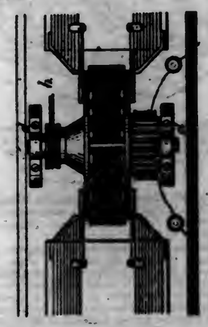
168,017. CLOTH-PRESSES. Wm. Hobden, Boston, Mass. (Filed Aug. 13, 1875.)

Brief.—Heated plates are interposed between the folds of a pile of cloth as it is placed in a press, the plates thoroughly heating the cloth when pressure is applied.

168,017.

1. The described process of papering-up and hot or warm pressing cloth, consisting substantially in making a pile composed of single layers of cloth, and heated leaves M, surfaced with paper, arranged alternately, and subjecting the pile thus formed to the action of a press, substantially as and for the purpose specified.

2. The combination of the press A, leaves M, and heating-chambers H H', substantially as described.



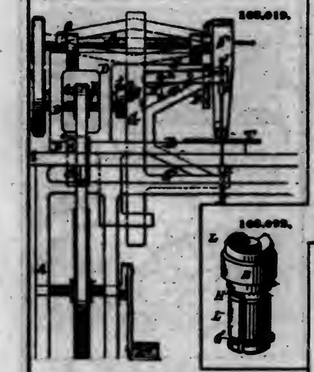
3. The adjustable guide-pins E E', in combination with the press A and leaves M, having the orifices *a*, substantially as and for the purpose specified.

4. The heating-chambers H H', having hollow walls or steam-spaces, in combination with the leaves M.

5. In a machine for pressing cloth, the combination of the press A, heating-chambers H H', leaves M, delivering and removing rollers and winding-roller Q, or folding-table T, all substantially as specified.

6. The leaves M, composed of press-paper M', inclosing a body or filling, substantially as described, for the purposes specified.

168,018. MAGNETO-ELECTRIC MACHINES. Otto Heikel, Jersey City, N. J. (Filed June 5, 1875.)



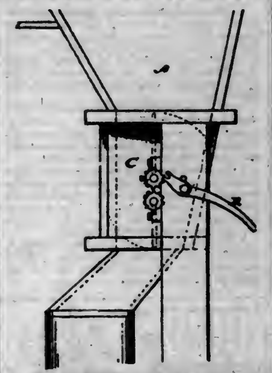
1. The magneto-electric machine, containing helices that are connected together and combined with the circuit-wires, cores, and stationary magnets, arranged substantially as set forth, to produce a continuous circulation of the electric current in one direction, as specified.

2. The revolving core *a*, contiguous to the stationary magnets, in combination with the helices, arranged in respect to the core, substantially as set forth, to induce a continuous current flowing through the helices, as set forth.

168,019. SCROLL-SAWING MACHINES. Isaac F. Hicks, Pine Plains, N. Y. (Filed July 13, 1875.)

Brief.—The machine is so constructed as to render it available for the purpose of boring and sawing in cutting scroll-work.

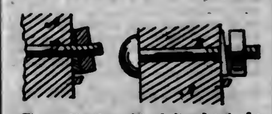
168,019.



168,020.

1. The combination of the table A, bed-plate B, arranged above the said table, the clamping-bars C C, constructed with the slots *c'*, hooked ends *c*, which hook over the edge of the bed-plate B, and the bays C', passing through the slots in the hooked bars, as and for the object specified.

2. The combination, with the saw-frame or arm G', of the guiding-rod F, arranged as shown and described, for the purpose specified.

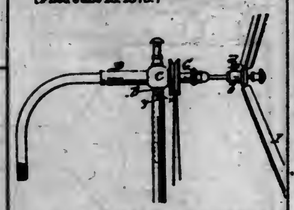


3. The combination of the hinged or pivoted frame G, shaft K, fan-wheel R, and fan-chamber P, arranged as shown and described, for the purpose specified.

168,020. DOUBLE-ACTING VALVE CUT-OFFS TO FLOUR-PACKERS. Augustin M. Hobbs, Wesapeo, Wis. (Filed Mar. 30, 1875.)

Tube C, having independent valves E, and if secured to shafts provided with cogged segments separately engaging with and operated by lever D, as and for the purpose specified.

168,021. NUT-BOCKS. Cassius Holton, Reading, Pa., assignor of one-half his right to Pulaski Farvell, Fredericksville, Ill. [Filed Mar. 6, 1875.]



The combination, with a bolt and nut, of a washer having a bearing-face for the nut inclined in respect to the axis of the bolt, as set forth.

168,022. METHODS OF SECURING SPINDLE-STEPS IN THEIR SUPPORTS. A. S. Hopkins, Pascoag, R. I. (Filed Aug. 12, 1875.)

Brief.—The body of the step is provided with grooves extending entirely around it. Part of the spring-catch fits within the upright groove, and its arms, when the step is placed in position, fall alternately into the circumferential grooves.

The improved means of securing the step B in the rail A, described, the same consisting of the connected grooves G G', and the catch L, provided with the arms E H, substantially as and for the purpose set forth and specified.

168,023. FANS FOR DENTAL ENGINES. R. B. Hopkins and G. A. Beidler, Philadelphia, Pa.; said Beidler assignor to said Hopkins. [Filed June 12, 1875.]

1. The combination of a dental engine or lathe, and a fan connected therewith and operated by the same power that operates the engine or lathe, substantially as and for the purposes herein set forth.

2. In a dental engine having a fan attachment, the combination of the ratchet-connection *x y*, with the hollow standard A, shaft B, and shaft G, substantially as and for the purposes herein set forth.

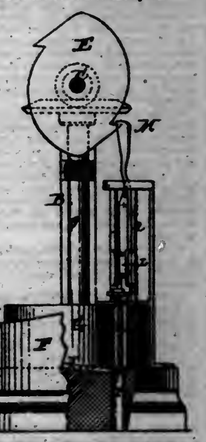
168,024. OVENS. Elijah Hunter, Scott Dale, Pa. [Filed July 15, 1875.]

1. In combination with the fly-wheel C, carrying the pin *c* and roller *c'*, and attached to a shaft located at the bottom of the oven, the damper-shaft journaled on top of the oven, and having the depending arm D terminating in a link open at its lower end, to facilitate connection and removal, substantially as shown and described.

2. The hopper G and measure cover *g'*, so arranged as to catch the splash and admit air, as set forth.

3. In combination with the reciprocating paddle D', two breakers, B B', arranged, in respect to the damper, substantially as and for the purpose specified.

168,025. COMPOSITE MANTELS FOR FIRE-PLACES. David K. Jones, Cincinnati, Ohio. [Filed June 9, 1875.]



The combination, in a fire-place mantel, of the cast-metal casing G I, beneath or behind, and cast-metal pilaster I, in front, of a flat and comparatively extended body piece, O, of slate, stone, or marble, the whole being united by concealed bolts E, substantially as set forth.

168,026. MACHINES FOR ROLLING METAL TUBES. Chester L. Johnson, Whitechorough, assignor of one-half his right to B. T. Babbitt, New York, N. Y. (Filed Apr. 26, 1875.)

Brief.—A roll and a curb bound an intervening space, that gradually diminishes in width from the lowest toward and to the highest point of the curb, in which a sheet tube, placed on a vertical mandrel, is both rotated and revolved, and thereby reduced and elongated, until finally the mandrel is withdrawn by the cam, through the medium of the hooked lifting-rod, and the tube falls through an aperture in the bottom of the space.

168,026.

1. The combination, with the roller G and rim F, of the groove J in the bottom of the channel I, for engagement with the mandrel, and the opening F at the narrowest portion of said channel, for delivering the finished tube, substantially as shown and described.

2. The combination of the lifting-cam E and vertically-reciprocating notched or forked bar M, for withdrawing the mandrel from the finished tube, substantially as shown and described.

168,027. SLEEPING-CARS. R. P. Kellogg, New York, N. Y. (Filed July 20, 1875.)

Brief.—Tubular sectional cushions stowed away during day, but fastened by legs and sleeves, so as to remain upright and rigid at night. Panels sliding in arch-arms, and so shaped as to conform to their contour when reversed, and form partition between heads and feet of successive berths.

1. The combination, in a convertible parlor and sleeping car, of the folding cushioned frames of the upper and lower berths, provided with front rails, with the removable transoms, provided with fixed leg-bosses O, and the sliding locking-sleeves K, whereby both the upper and the lower berth-front rails are secured and supported, substantially as herein set forth.

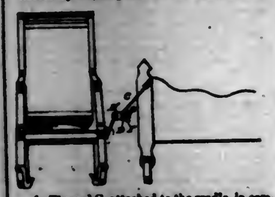
No. 168,027.

2. The berth-supporting stanchions, consisting of a brace and a middle removable section, F G, and a fixed socket-bracket, H, the section G having a fixed lag-bolt, O, and a sliding locking-sleeve, K, substantially as and for the purpose herein set forth.

3. The berth-supporting stanchions, consisting of a fixed top section and intermediate section, provided with lugs, as shown, and a base-section, which is also adapted to support a chair for day travel, substantially as herein set forth.

4. The combination of the detachable reversible panel H with the chambered and board of the chair, the panel corresponding in contour with said chair end when inserted into the same, substantially as described.

5. In combination with the stanchion E, having supporting lugs and openings, and the car-wall provided with counterpart socket-plates, the detachable partition-panel F, having pin, sliding bolt, and hooks, as and for the object stated.



6. The stanchion E, having perforated lugs m, in combination with the detachable car-rain-roll, having hooks n, as and for the purpose set forth.

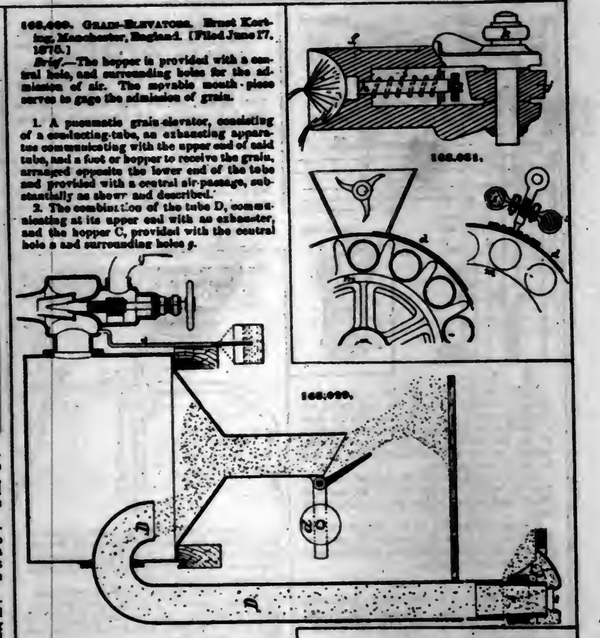
7. The combination, with the sectional removable stanchion G, provided with the pin G^1, and the pedestal F, provided with the slot b, of the sliding locking-sleeve K, substantially as and for the purpose herein set forth.

8. The combination of the stanchion-collar O, provided with the lugs m and e, with the rail S, and the removable partition F, as and for the purpose herein set forth.

168,028. DEVICES FOR ROCKING CRADLES. Lauris L. King, Lake View, Ill. [Filed May 21, 1875.]

Brief.—The cradle is rocked by a person sitting in the chair, to which the cradle is connected by a spring-rod and clamping device.

1. The rod C, attached to the cradle, in combination with a clamp, whereby the rod can be attached to the chair, substantially as and for the purposes specified.



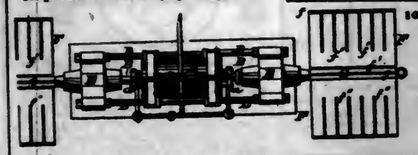
2. In combination, the bent spring-rod C, pivoted to the cradle, and provided with the block D, having therein the pins a a, the nut F, and the block D', the latter attached to the chair, provided with the screw-pin e, and having the holes d' d' therein, all substantially as and for the purposes specified.

168,029. GRAIN-ELEVATORS. Ernst Kertting, Manchester, England. [Filed June 17, 1875.]

Brief.—The hopper is provided with a central hole, and surrounding holes for the admission of air. The movable mouth-piece serves to gage the admission of grain.

1. A pneumatic grain-elevator, consisting of a conducting-tube, an exhausting apparatus communicating with the upper end of said tube, and a foot or hopper to receive the grain, arranged opposite the lower end of the tube and provided with a central air-passage, substantially as shown and described.

2. The combination of the tube D, communicating at its upper end with an exhauster, and the hopper C, provided with the central hole a and surrounding holes g.



3. In a pneumatic grain-elevator, the combination of a conducting-tube and a feed-hopper, provided with a central air-passage, substantially as shown, so that the distance between the hopper and the end of the tube may be increased or diminished at will, whereby the admission of grain may be varied, and at the same time the grain and air permitted to enter the mouth of the tube together.

4. In combination with the fixed tube D and fixed hopper C, provided with the central air-passage a, the movable mouth-piece b, provided with the external screw-thread and arranged as shown.

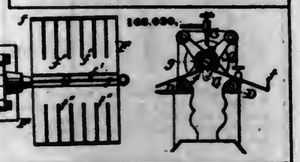
168,030. MACHINES FOR MANUFACTURING PENCILS. Reinhold Lenstrom, Cincinnati, Ohio, assignor to the United States Scoop-Stone Manufacturing Company, same place. [Filed July 19, 1875.]

Brief.—Relates to the devices for dividing the pressed bar into the proper lengths.

1. The table F, formed with oppositely-inclined leaves provided at each side with an upward-turned edge, f, and having the parallel vertical slots f'' and f''', in combination with the cylinder E and knife H, substantially as and for the purpose shown.

2. In combination with the cylinder E and table F, the bar G, provided with the vertical longitudinal flange g, pivoted to or upon said table and arranged to reciprocate within the opening f' and across the discharge-opening e', substantially as and for the purpose set forth.

168,031. COAL-AGGLOMERATING PRESSES. Antoine Germain Lasserre, Paris, France, assignor to Gratiot Washburn. [Filed July 26, 1875.]



1. The combination of the laterally and conjointly operating molding and compressing pistons f with the main wheel m, substantially as and for the purpose herein set forth.

2. The combination of the internal pistons h, with the molding and compressing pistons f, substantially as and for the purpose herein set forth.

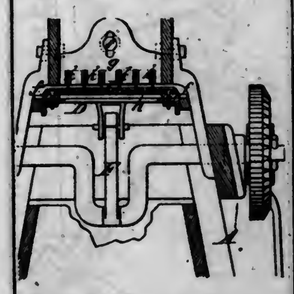
3. The combination of the curved levers i, the internal pistons h, and the retracting-springs i, with each other and with the molding and compressing pistons f, substantially as and for the purpose herein set forth.

4. The combination of the main wheel d, the molding and compressing pistons f, and the internal pistons h, with each other and with the pressure inclined planes d' d', and the retracting inclined planes h' h', substantially as and for the purpose herein set forth.

5. The arrangement of the curved apron d, with the laterally-operating pistons f and the main wheel m, substantially as and for the purpose herein set forth.

168,032. COMPOSITE ROOFS. Richard Lee, New York, N. Y. [Filed Aug. 6, 1875.]

Brief.—A series of angular slats are secured to the rafters in such a manner as to form a close sheathing where they join said rafters, and a corrugated upper surface, upon which is placed a water-proof compound, consisting of twelve gallons dissolved India-rubber, fifty gallons metallic paint, and sand sufficient to bring the mixture to a plastic state.

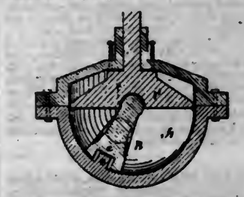


1. The sheathing-pieces B, constructed and applied substantially as above described, so that their under sides form a continuous close surface, and their upper surfaces form a succession of receptacles, D, for the reception of a coating material, substantially as set forth.

2. The combination of the sheathing-pieces B, made and applied to the rafters or floor-beams A, substantially as described, with a coating, E, in such a manner that the coating fills the depressions D formed by the sheathing-pieces, substantially as set forth.

3. The above-described composition of india-rubber, metallic paint, and sand, as a coating for roofs, substantially as set forth.

168,033. VEGETABLE-CUTTERS. J. T. Lohr, Manistee, Mich. [Filed Aug. 21, 1875.]

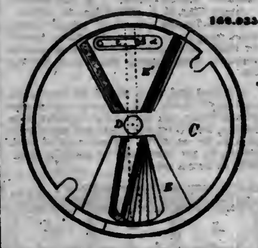


Brief.—The transverse cutting-knife is grooved on its upper surface. In this groove the shredding-knives are secured. The shredding-knives pass through combs at the completion of the cut, to clear them of the vegetables.

The horizontal transverse double-cutting knife J adjustably secured to the reciprocating hopper-bottom D, over a hole, h, and grooved longitudinally, in combination with vertical knives b and combs g, substantially in the manner and for the purpose described.

168,034. ROTARY PUMPS. William Lyon, Newark, N. J. [Filed July 30, 1875.]

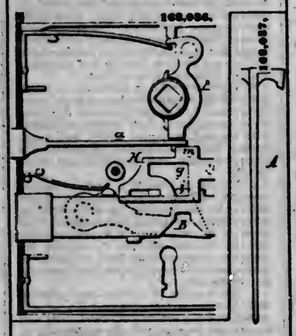
Brief.—In a hemispherical case a semicircular piston is revolved by a disk moving on the plane of section of the sphere, being hinged or jointed diametrically thereto. A stud raised on the concave surface of the hemisphere, and out of the axial line of the shaft, engaging in a slot in the edge of the piston, so modifies the motion of the latter, when revolved, that the capacities on either side of the piston alternately increase and diminish, producing the sucking and forcing action of the pump.



In a rotary pump, a semi-spherical case, A, provided with the ports b and hub or guide-pin c, the partition B, having the groove e, and the grooved disk C, constructed and arranged to operate substantially as set forth and shown.

168,035. ROTARY ENGINES. William Lyon, Newark, N. J. [Filed Aug. 20, 1875.]

Brief.—The case is provided with inclined abutments, which throw the oscillating segments into position to receive steam in their passage over them.



168,036.

In a rotary engine, the combination, with the case B, constructed as described, of the revolving disk C, provided with the segments E and E', operating in conjunction therewith, substantially as and for the purposes set forth.

168,036. REVERSIBLE LATCHES. P. Mathes, Easton, Pa. [Filed Aug. 20, 1875.]

The plate H, provided with the projection f, recess g, and lug m, in combination with the lever E b, the latch D, having the stem a, and the tumbler B, provided with the stud i, substantially as and for the purpose set forth.

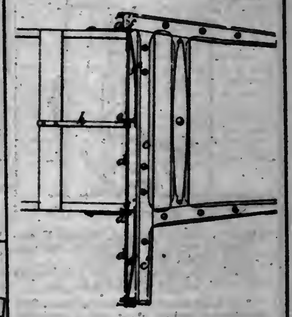
168,037. NAILS. Albert Marchiki, Jersey City, N. J. [Filed Aug. 23, 1875.]

Brief.—The nail is provided with a hook portion, either formed with the body or detachable, for the purpose of binding or steadying an adjoining piece of wood.

1. A nail, the head of which forms one or two hooks which project from one or from opposite sides of the shank of the nail, and the bottom edges of which are sharp and provided with inclined shoulders, substantially as shown and described.

2. The combination, of a detached head, B', with a nail, A, said head being provided with a hole for the reception of the shank of the nail and with a sharp-edged hook, one or more, substantially as set forth.

---



1. The combination of the casing A with the horn or spiral D, substantially as and for the purposes set forth.

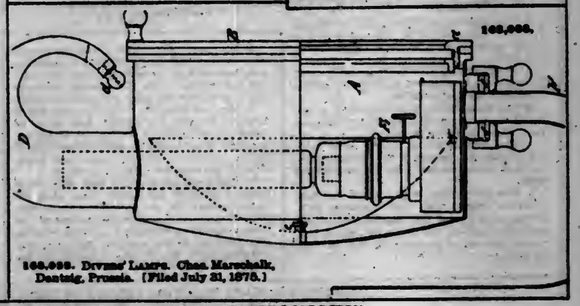
2. The casing A, horn or spiral D, face-disk B, and the tube F, of a diver's lamp, in combination with the weight H, as and for the purposes set forth.

3. The horn or spiral D, in combination with the button d, as and for the purposes specified.

168,039. SLEIGHS. George McConnell, Oconto, Wis. [Filed May 19, 1875.]

Brief.—Allows thills to be shifted to either side of the road, and dispenses with usual front cross-bar.

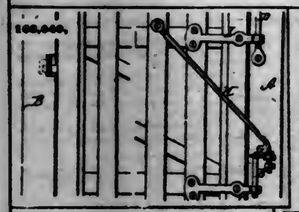
1. The combination of the thill-bar c, having the projection c', plate-bar d, of equal length therewith, springs c^2 c^2, and sleigh-frame having eyes e e attached to the runners thereof, but without the usual front cross-piece, as shown and described.



2. The combination of the thill-bar c, having the projection c', plate-bar d, of equal length therewith, springs c^2 c^2, and sleigh-frame having eyes e e, attached to the runners thereof, with the intermediate plate-brace strap k, as described.

168,040. COMBINED GATE-HINGES AND CLOSING-RODS. William H. McCormick, Muncie, Ind., assignor to himself and G. W. Stotts, same place. [Filed Aug. 6, 1875.]

Brief.—A gate-hinge of ordinary construction is provided with a double-armed staple, one portion of which serves as a bearing for an elevating and closing rod, the upper end of which is attached to the gate; the construction being such that the closing-rod acts as a brace, and the gate, when thrown open, slides upward, but closes automatically when released, thus combining the hinge with the elevating and closing devices.



The gate-hinge herein described, consisting of the rod E, double-armed staple G, and strap I, having curved end, in combination with the elevating and closing rod H, having one end attached to the gate, and the other having its bearing in the arm G, all substantially as described, and for the purposes set forth.

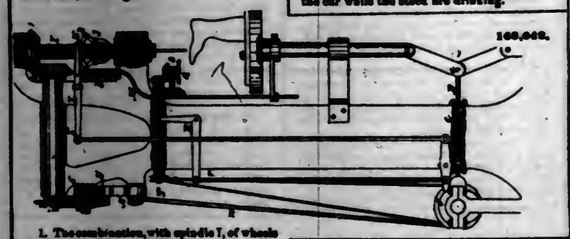
168,038.

168,041. DIVERS' LAMPS. Chas. Marschalk, Dantzig, Prussia. [Filed July 31, 1875.]

168,040.

168,041. CAR-COUPLINGS. George H. McGlothlen and C. L. McGlothlen, Clarinda, Iowa. (Filed Aug. 21, 1875.)

Brief.—The guide raises the link into the draw-head, and the lifter raises the pin.



1. In a car-coupling, the combination of the draw-bar A, having link *a*, and a vertically-vibrating link-raiser, B, and an angular pin-lifting part, D, substantially as set forth.

2. The combination of a draw-bar, A, having link *a*, a vertically-vibrating link-raiser, B, and an angular pin-raiser, D, with a draw-bar, A', having an end-iron movable and guided pin, E, and rods or ways E', for raising the link-lifter B, substantially as specified.

3. The draw-bar A, having lifter B, provided at its front end with arrow-head b' and arms *c*, in combination with rods or ways E' on draw-bar A', substantially as described, and for the purpose set forth.

168,042. SCREW-PROPELLER MACHINES. A. G. McKnight, Philadelphia, Pa. (Filed June 12, 1875.)

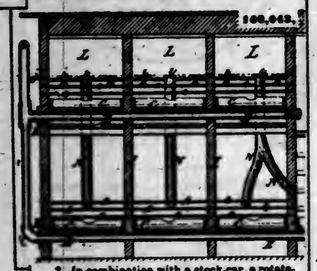
Brief.—The screw-threaded wire is automatically inserted in the leather, and the screw covered of the length desired.

1. The combination, with spindle I, of wheels 1 2 3 4 5, rock-lever H H', rod *n*, and pulley O, having wrist-pin *o*, to move the spindle up and down.

2. The combination of lever L, rod P, lever P, and shaft, having cam *p*, to lift the spring-lever L at the time specified.

3. The combination, with nippers J, of collar K, cranks *k k*, lever L, and spring *l* to cause the nippers to take on the wire.

4. The combination of rotary screw-holding spindle and nippers of the horizontal rotary and sliding cutter Q, for the purpose set forth.



5. The combination, with the rod that connects the toggles with their operating cam, of the spiral spring and fastening-sleeve, the rod being made in two parts, as shown, and for the purpose of allowing the last to yield vertically.

168,043. STOCK-CARS. J. R. McPherson, Jersey City, N. J. (Filed May 21, 1875.)

Brief.—Trough rotated by tubular shaft, which supplies it with water. Same trough for feed. Arrangements to keep apparatus protected from animals entering or leaving car.

1. A feed and water trough for stock-cars, combined with the pipe or conduit which supplies it with water, and arranged to be turned into position for feeding the stock, and out of such position for emptying the contents of such trough, by the same pipe or conduit, essentially as herein set forth.

168,043.

2. In combination with a stock-car, a rotatable feed and water trough and the conduit by which it is supplied with water, crossing the doorways, and presenting, when turned down to empty their contents, the solid sides of said trough and its conduit, for the passage thereover of the stock in loading and unloading the car, substantially as set forth.
